CIM: Future of factory management

against a plan can be made as soon as a production process is completed. The plan, however, has to be an extremely accurate projection.

CIM will improve financial projections by improving financial control.

Information model

The information model of CIM is quite simple. It is composed of four parts: input, processing, output and feedback. This model is applicable both to CIM as a whole and to each distinct business application because both the whole and the parts are closed-loop systems.

Business planning serves as the overall closed loop. It monitors output from one production application and immediately inputs modifications to related applications.

Every application functions as a discrete loop. Each element of CIM, then, is a control loop within the control loop of business planning.

From page 104

DFM aids priorities in design cycle

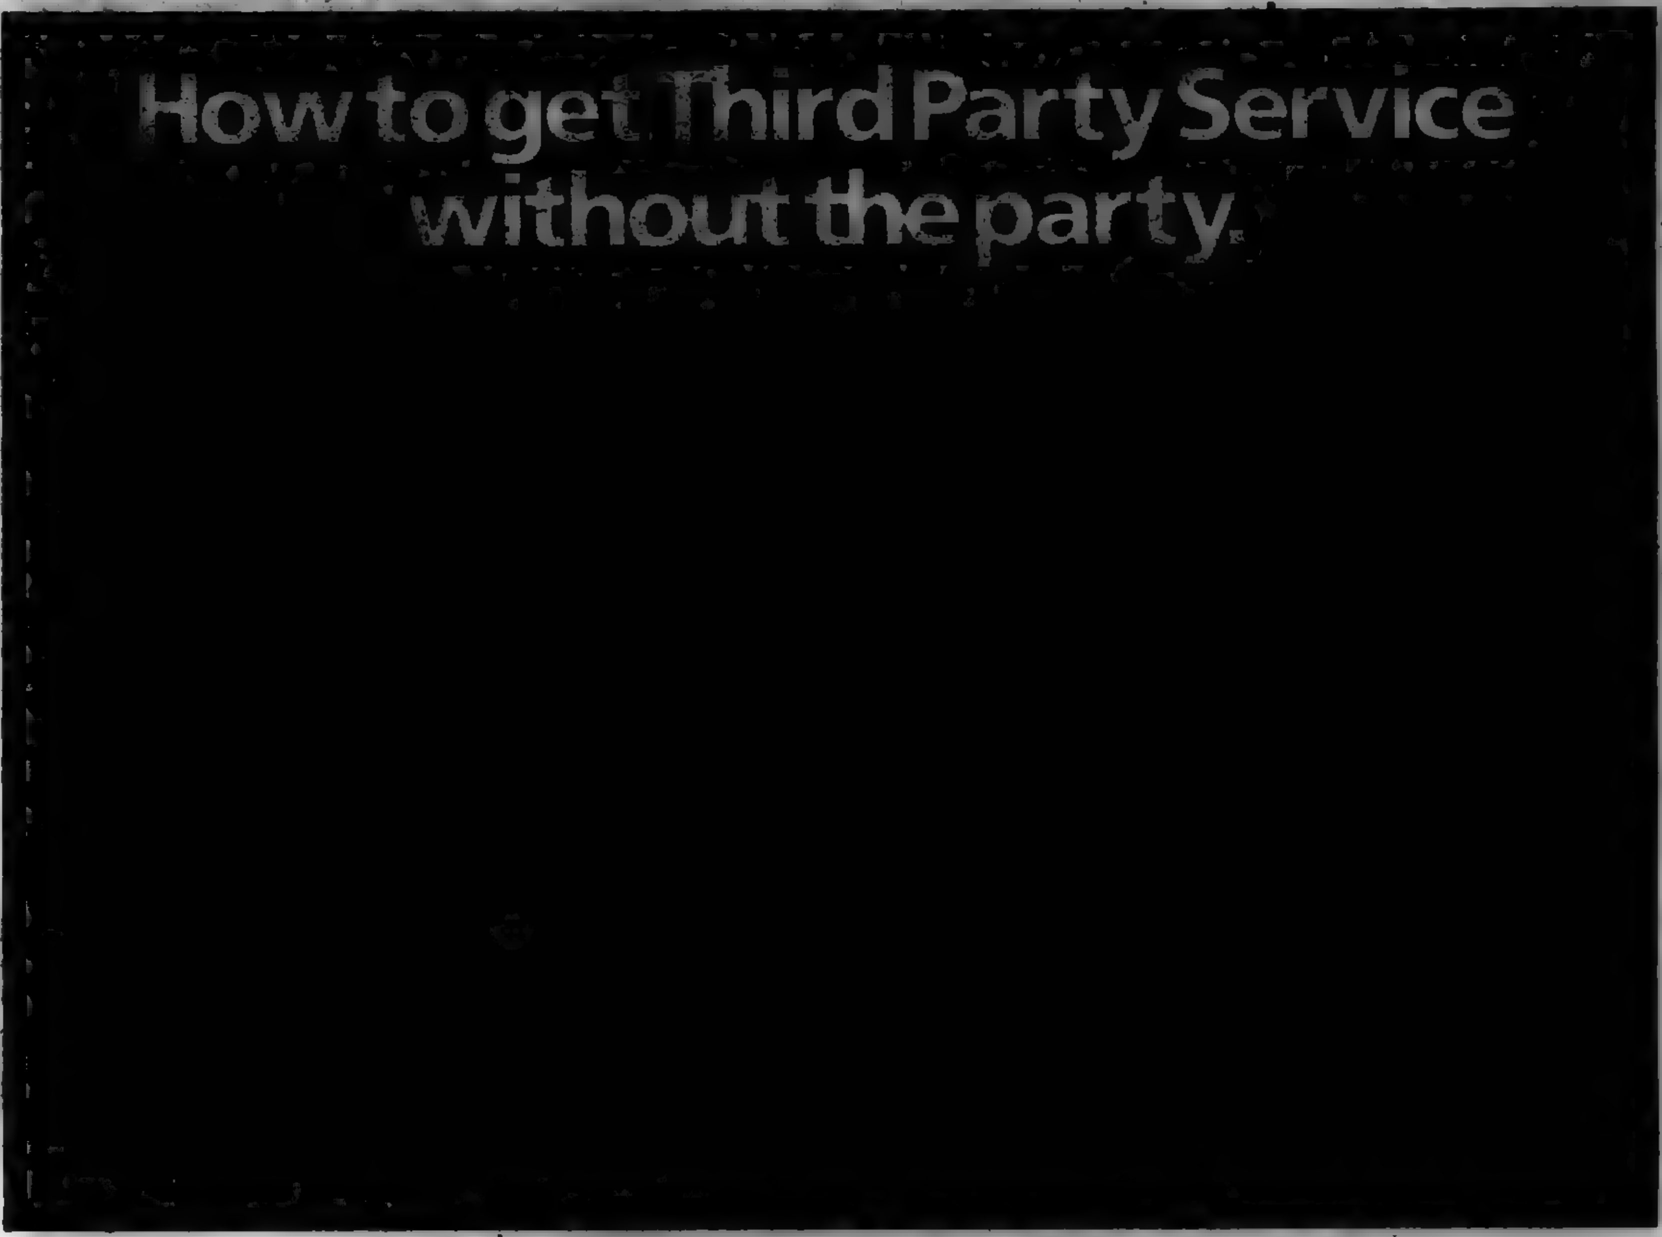
the manufacturing process or degree of automation employed. DFM methodologies will help even the smallest manufacturer who relies solely on manual assembly.

Users of DFM techniques report the following benefits:

- Direct labor and material cost reductions.
- Product consistency and quality improvement with subsequent reductions in scrap, warranty and product liability costs and improved market share.
- Production and inventory control cost reductions.
- Improved interaction between design and manufacturing.
- Employee attitude and morale improvement.

DFM works because it provides an effective tool for product analysis and evaluation, which in turn ensures that manufacturing considerations enter early into the product design cycle.

DFM is the basis for a common language between research, design and manufacturing technologies. This language will promote the cooperation and understanding needed to achieve improved manufacturing productivity.



How to get Third Party Service without the party.

Sperry CUSTOMCARE™ Service

When your system components break down, the last thing you need is a parade of repair people taking over your offices. One for each type of printer. One for each type of terminal.

And so on and so on.

But that's exactly what can happen when your system combines a lot of different brands of equipment, each with its own maintenance plan.

Now, there's an alternative to the "party"; an alternative that gives you expert service for your complete mixed-vendor system from one source: Sperry CUSTOMCARE Service.

We're the Third Party Service specialists, with a 35-year record of proven service performance. We deliver *total hardware support* for all your systems and networks. From micro to mainframe. And everything in between.

Best of all, you get all this at one of the *fastest response times* in the service industry, thanks to a team of 3500 trained Customer Engineers in the U.S. alone, strategically located in 200 dispatch centers coast to coast.

To find out more about how Sperry can give you a service program designed to meet your needs and budget, send for your FREE Information Kit, "How To Get Third Party Service Without The Party." Simply mail the coupon below or call toll-free 1-800-524-1459 today. (In New Jersey, 1-800-624-2107.)

New From Pansophic! A Landmark Achievement In Application Development Productivity

It's a fact—the power, productivity, and performance of TELON is unparalleled throughout all phases of the development cycle. With documented productivity gains of 200% to 700% reported from seasoned COBOL and PL/1 programmers, TELON has set a new standard of excellence for sophisticated application development tools.

Only TELON offers a complete, integrated application development productivity system, providing all the facilities needed to bring an application from the earliest stages of design through development and testing, to full production and maintenance in the demanding IMS/DC and OS/CICS environments. TELON simplifies development tasks by providing the flexibility required to design complex applications. And by generating efficient COBOL or PL/1 code that runs under standard IBM software, TELON allows you to build on your commitment to IBM, as well as programmers' existing skills.

TELON™

Backed by technical expertise, meticulous service, and award-winning documentation, TELON now offers unmatched application development productivity in the Pansophic tradition—a tradition built on over 24,000 installed software products including EASYTRIEVE® PLUS, PANVALET®, and GENER/OL®. Contact us today for a demonstration of TELON. . . and discover its power and productivity first hand.

choose any one of eight foreground colors on any one of eight background colors, the vendor said.

The unit costs $3,495.

Intecolor, Intecolor Drive, 225 Technology Park, Norcross, Ga. 30092.

PRINTERS/PLOTTERS

■ Florida Data Corp. has announced that it has added an internal interface capability to its matrix printer Models OSP 130 and 3000 to allow compatibility with IBM's System/34, 36 and 38 minicomputers.

The Model OSP 130 is said to have a triple paper path.

It comes with seven resident fonts and prints up to 600 char./sec. in draft mode and up to 100 char./sec. in letter-quality mode, according to Florida Data.

The Model 3000 tractor-feed data processing printer comes with six resident fonts and prints up to 675 char./sec., the vendor said.

The Model OSP 130 costs $5,995, and the Model 3000 costs $5,395, the vendor said.

Florida Data, 600D John Rodes Blvd., Melbourne, Fla. 32935.

GRAPHICS SYSTEMS

■ Lexidata Corp. has released a direct memory access interface for its LEX 90 family of graphics display systems and Digital Equipment Corp.'s Microvax II product line.

The 22-bit Q-bus interface uses burst mode operation that is said to transfer data at up to 4 bytes per memory acquisition for enhanced graphics response time.

A built-in diagnostics feature reportedly enables testing and servicing of the interface by OEMs.

The interface costs $1,595, according to the vendor.

An optional software driver and graphics library for DEC's MicroVMS operating system is said to facilitate system integration by allowing access to Lexidata's graphics commands.

The driver and library cost $2,000, Lexidata said.

Lexidata, 755 Middlesex Tpk., Billerica, Mass. 01865.

■ Raster Technologies, Inc. has announced that it has reached an agreement with Texas Instruments, Inc. of Austin, Texas, in which customers for TI's Lisp-based Explorer symbolic processor system can receive Raster Technologies' color graphics systems.

TI is said to have developed software to integrate Raster's color graphics controllers with the Explorer.

Raster has developed an interface adapter card for use with the TI Explorer.

TI will reportedly be sublicensing Raster software and acting as a marketing representative for the Raster card.

The graphics systems supplied by Raster will range from the low-end Model One/10 up to the recently introduced Model One/380, according to Raster.

Prices will range from $6,925 to $41,000 — in quantities of one — depending upon features selected, a spokesman said.

Raster Technologies, 9 Executive Park Drive, North Billerica, Mass. 01862.

From page 96

School district's drives get high marks

nance costs for the IBM and NAS equipment are about the same, he added.

Before NAS added the cache controller feature to its disk devices, Brewer bought two strings of IBM 3380s that had the controllers. Buying devices with the cache feature was an attempt to upgrade the response time performance of the computer center's CICS applications, Brewer said.

The NAS disk drives have worked as well as, and maybe better than, the two IBM 3380 strings. "We have been getting hit rates in the 90% to 98% range in the cache with the Hitachi [NAS] controllers, and we've been getting good hit rates with the IBM also . . . about 85-87% . . . but it's a different application, and I can't say that NAS is better," Brewer said.

The district has Software AG's Adabase data base to keep track of its student information. The index for that information is kept in the cache, so when a user needs data, the system does not have to seek from the disk drive controller itself.

The difference in the size of the two IBM storage device strings and the two NAS strings is slight, Brewer said.

From page 95

SI clusters Microvax II with interface to 9000

msec seek time. The unit is available in four storage configurations ranging from 120M-byte ($10,000) to 1.9G-byte ($50,000) capacity.

The company's Disk Cache Processor (DCP) reportedly reduces average access time to less than 2 msecs. The DCP allows most frequently used data from the disk to reside in the cache memory so that the CPU need not access the disk for each request. The DCP has a 2M-byte capacity and is controlled by a Motorola, Inc. 68000 microprocessor. It costs $20,000 with a six-readout LED display performance monitor system; the system costs $15,000 without the monitor.

A revolutionary idea takes the next logical step.

Not long ago, STEAMER revolutionized the data communications industry. And now, it's doing it again. Because now STEAMER has synchronous support.

Finally, you can handle synchronous data.

Now STEAMER gives you long awaited synchronous support. It can handle both synchronous and asynchronous data lines and reduce your line costs. All while improving your operating efficiency.

And it can do it for as little as $3500 per end for a 4 channel unit.

Our data compression is the best you can get.

STEAMER gets data compression efficiencies higher than anyone else, averaging 2.2:1 to 3.2:1. Which means increased throughput and operating efficiency for you.

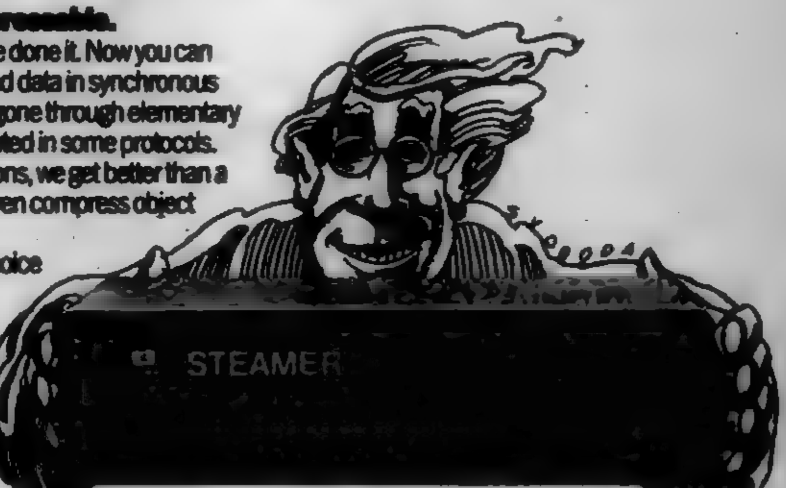
Proprietary compression algorithm: the heart of the matter.

Our proprietary compression algorithm continually analyzes the incoming data stream on a port-by-port basis and compresses the most frequent strings into shorter strings. STEAMER also analyzes the data in each direction on a port-by-port basis and builds entirely independent compression tables. That ensures that you get maximum compression efficiency.

We compress the uncompressible.

We are the only ones who have done it. Now you can compress previously compressed data in synchronous applications. Even output that's gone through elementary compression routines implemented in some protocols. Plus, in some graphics applications, we get better than a 2:1 compression ratio. We can even compress object code files.

STEAMER is really the only choice for passing synchronous and asynchronous data for data communications. Call 1-800-235-5030 now and we'll tell you more about STEAMER. Because pretty soon, STEAMER will make all other stat muxes and data compression machines obsolete.



Datagram We make networks work harder.

COMPUTER INDUSTRY

Analyst: Chip market down until 1988

By Clinton Wilder

BOSTON — The worldwide market for semiconductors will not return to its record 1984 levels until 1988, according to Jack Beedle, president of In-Stat, Inc., a Scottsdale, Ariz., semiconductor market research firm.

Beedle, speaking at a recent briefing of the Semiconductor Equipment and Materials Institute, Inc. here, predicted that a coming U.S. recession and the lack of a future chip-based product boom combine to spell continued rough times for U.S. integrated circuit vendors.

"In the computer and computer peripheral industry, a lot of the people who bought vast quantities of chips aren't around anymore," Beedle said. "And there is no new 'hula hoop' — no new super growth market that would support a continuation of runaway semiconductor usage."

Beedle cited handheld calculators, citizens band radios, digital watches, videocassette recorders, video games and microcomputers as products that have driven the semiconductor boom cycles since the early 1970s.

More ominous for the near term are the vast inventories accumulated by major computer manufacturers during the current industry slump. From March 1984 to March 1985, according to In-Stat, Apple Computer, Inc.'s inventory increased by 118%, Data General Corp.'s by 38%, Sperry Corp.'s by 33% and Digital Equipment Corp.'s by 16%. Reducing those stockpiles in a low demand period is a slow process that translates into continued slow sales of chips to computer vendors.

"Computer manufacturers increased their semiconductor purchases by 63.5% in 1984 while the industry grew only 18%," Beedle noted. "That means a lot of unsold equipment." In-Stat has predicted a 53% drop in computer vendors' chip purchases this year and a modest 2.2% decline in 1986 before an upturn the following year.

In other semiconductor market industries, such as industrial and consumer applications, a U.S. slide into recession in the near future will keep a damper on demand, Beedle said.

"The probability of recession looms over everything," he said. "The business expansion cycle, which historically lasts 36 months, has run out of gas. . . . The continuation of economic decay, spilling over into all segments of the manufacturing sector, paints a bleak picture for the semiconductor industry in the near term."

The battle for the shrinking chip market has sparked charges and countercharges between U.S. and Japanese vendors over pricing and trade barriers [CW, Sept. 2], but Beedle claimed the Japanese import issue is a very small part of U.S. chip makers' current woes.

"I really don't think these suits will amount to much," he said. "If they're talking about drastic price cutting, everyone does it."

GEM buoys Digital Research

Firm looks to corporate sales to boost revenue

By Eric Bender

FRAMINGHAM, Mass. — Shifting its emphasis from microcomputer systems software to applications packages in the past year, Digital Research, Inc. experienced a sharp downturn in sales and slashed its work force by more than half, from more than 600 people to less than 300.

But the Monterey, Calif., firm has seen strong demand for its Graphics Environment Manager (GEM) applications, with 30,000 units shipped in the first 90 days of deliveries, company President John Rowley said in an interview recently.

Additionally, a $10 million cash infusion from Motorola, Inc. and Northern Telecom, Inc. announced in July leaves Digital Research well funded for its thrust into the applications market, Rowley emphasized in an interview here recently.

"A year ago at this time, 80% of our sales was system software for OEMs, and 20% was retail," with retail business split between graphics applications and system and language products, Rowley said. Digital Research's current new business in the U.S. is about 60% retail, almost exclusively GEM applications, and 40% OEM.

He declined to give specific financial figures, stating only that Digital Research showed the highest sales figures for its fiscal year ended Aug. 31 in the fourth quarter and that he expects the current quarter

Downturn seen in service bids

By Peter Bartolik

The bid offers for third-party service companies may have already exceeded the value of such acquisitions, according to a planning executive with one of the first large systems vendors to move toward integrated systems services.

William E. Charlton, vice-president of marketing and business management operations with Honeywell, Inc.'s Customer Services Division, said in a recent interview that sales prices for third-party service organizations will probably recede to more realistic levels.

Honeywell's Customer Services Division has been involved in third-party service

CW Staff

What's good for the goose isn't good for the gander.

Lotus Development Corp. insistently holds to its policy of not granting site licenses to large users of its 1-2-3 and Symphony products. But if you want to sell something to Lotus, a different rule applies.

In an interview with the *The Boston Globe* recently, former Software Arts, Inc. Chairman and Visicalc co-developer Daniel S. Bricklin said he is developing a program for software developers, and Lotus, which bought Software Arts' assets and employed Bricklin until Sept. 1, will be a tester and first user. Bricklin said Lotus will receive a site license to use the product and a copy of source code for internal use.

●

The public relations fickle finger of fate award this week goes to Digital Equipment Corp. Attempting to track down a spokesman recently, a reporter was informed that the DEC man was at a press conference. Asked what the press conference concerned, the DEC employee informed the member of the press that, "I don't think I'm at liberty to tell you."

Good thing salesmen don't use that approach with customers.

●

At a recent press briefing in Boston, Varian Associates' Executive Vice-President Larry Hansen called for an end to trade barriers, but it was a plea with a different twist. Hansen said the biggest roadblock

Continued on page 131

PE looks to new products as buffer against slump

NORWALK, Conn. — Bucking a depressing trend for minicomputer and semiconductor vendors, Perkin-Elmer Corp. recently reported operating profits were up 38% for the year ended July 31 and up 20% for the fourth quarter, although net profits declined in the last quarter compared with last year's results.

Horace G. McDonnell, chairman and chief executive officer of the company, said in a statement announcing the results that economic conditions have weakened in recent quarters, but the company "hopes to counter these trends with new products and more focused marketing." He added that it seems clear a more difficult period is ahead.

The company posted operating profits for the year of $134.2 million, compared with $97.4 million the previous year. Operating profits in the fourth quarter were $40.3 million, up from $33.5 million a year earlier.

Net profits, including extraordinary items both years, were $82.1 million, or $1.84 per share, for the year just ended, compared with $66.1 million, or $1.49 per share, in the previous year. Excluding the extraordinary items, 1985 profits would be $1.77 per share, compared with $1.30 per share in 1984.

In the fourth quarter, net profits were $24.3 million, or 54 cents per share, down from year-earlier net profits of $29.1 million, or 66 cents per share. Excluding extraordinary items, fourth-quarter profits would be 56 cents per share, compared with 47 cents per share a year earlier.

Revenue in the fourth quarter was up approximately 3% to $350.2 million, compared with $340 million in the last quarter of 1984. For the year, revenue was up 10% to $1.3 billion, compared with $1.18 billion in 1984.

CMI lays off 160 employees in wake of lost IBM contract

CHATSWORTH, Calif. — Computer Memories, Inc. (CMI), which recently announced that IBM had declined to renew a contract for CMI's microcomputer disk drives, laid off 160 of the 440 employees at its headquarters here.

The contract to supply 20M-byte hard disk drives to IBM expires at the end of this year and accounted for 67% of CMI's sales in the fiscal year ended March 31 and 81% of sales in the quarter ended in June [CW, Aug. 19].

The dismissals took affect Aug. 30, CMI said.

Irwin Rubin, chairman and chief executive officer, said in a prepared statement that the company is seeking to reduce costs in virtually every aspect of its business.

He said the company will continue to concentrate its resources on engineering, product development, sales and marketing.

The company will continue to transfer production functions to its Singapore facility.

According to Rubin, the Singapore facility will soon be able to fill all of CMI's production requirements, including new orders.

Filing software copyrights

SECOND IN A SERIES

By Jerome Roberts
and Michael Brownell
Special to CW

Previously, we discussed steps owners of proprietary software should take to establish copyright. There are also various issues concerning the registration of software with the U.S. Copyright Office as well as an owner's legal remedies to prevent, restrain or recover damages from a copyright infringement.

REGISTRATION

Registration of software at the Copyright Office is not a precondition to owning a copyright. However, several considerations support early registration. An owner must register a copyrighted work prior to commencing an infringement suit relating to that work; moreover, timely registration creates a presumption of copyright validity as well as preserving the availability of several statutory remedies.

Registration involves completing and submitting to the Copyright Office one of several registration forms that it provides, along with a $10 registration fee and a copy of the copyrighted materials. While the registration process was designed to be simple, sometimes software-specific issues, particularly trade secret considerations, can make compliance difficult. Accordingly, the owner may wish to consult an attorney experienced in the software area prior to registering software.

Arguably, filing a source code with the Copyright Office endangers or even forfeits trade secret protection because the source code becomes a public document. However, the Copyright Office has attempted to foreclose the issue altogether by establishing an "alternative deposit" procedure for software containing trade secrets.

To use the alternative deposit option, the owner must advise the Copyright Office in writing that depositing the first and last 25 pages of source code would disclose trade secret material and submit one of the following alternative deposits: the first and last 25 pages of source code with the trade secret code blocked out, the first and last 10 pages of source code in its entirety or the first and last 10 pages of object code and 10 consecutive pages of source code.

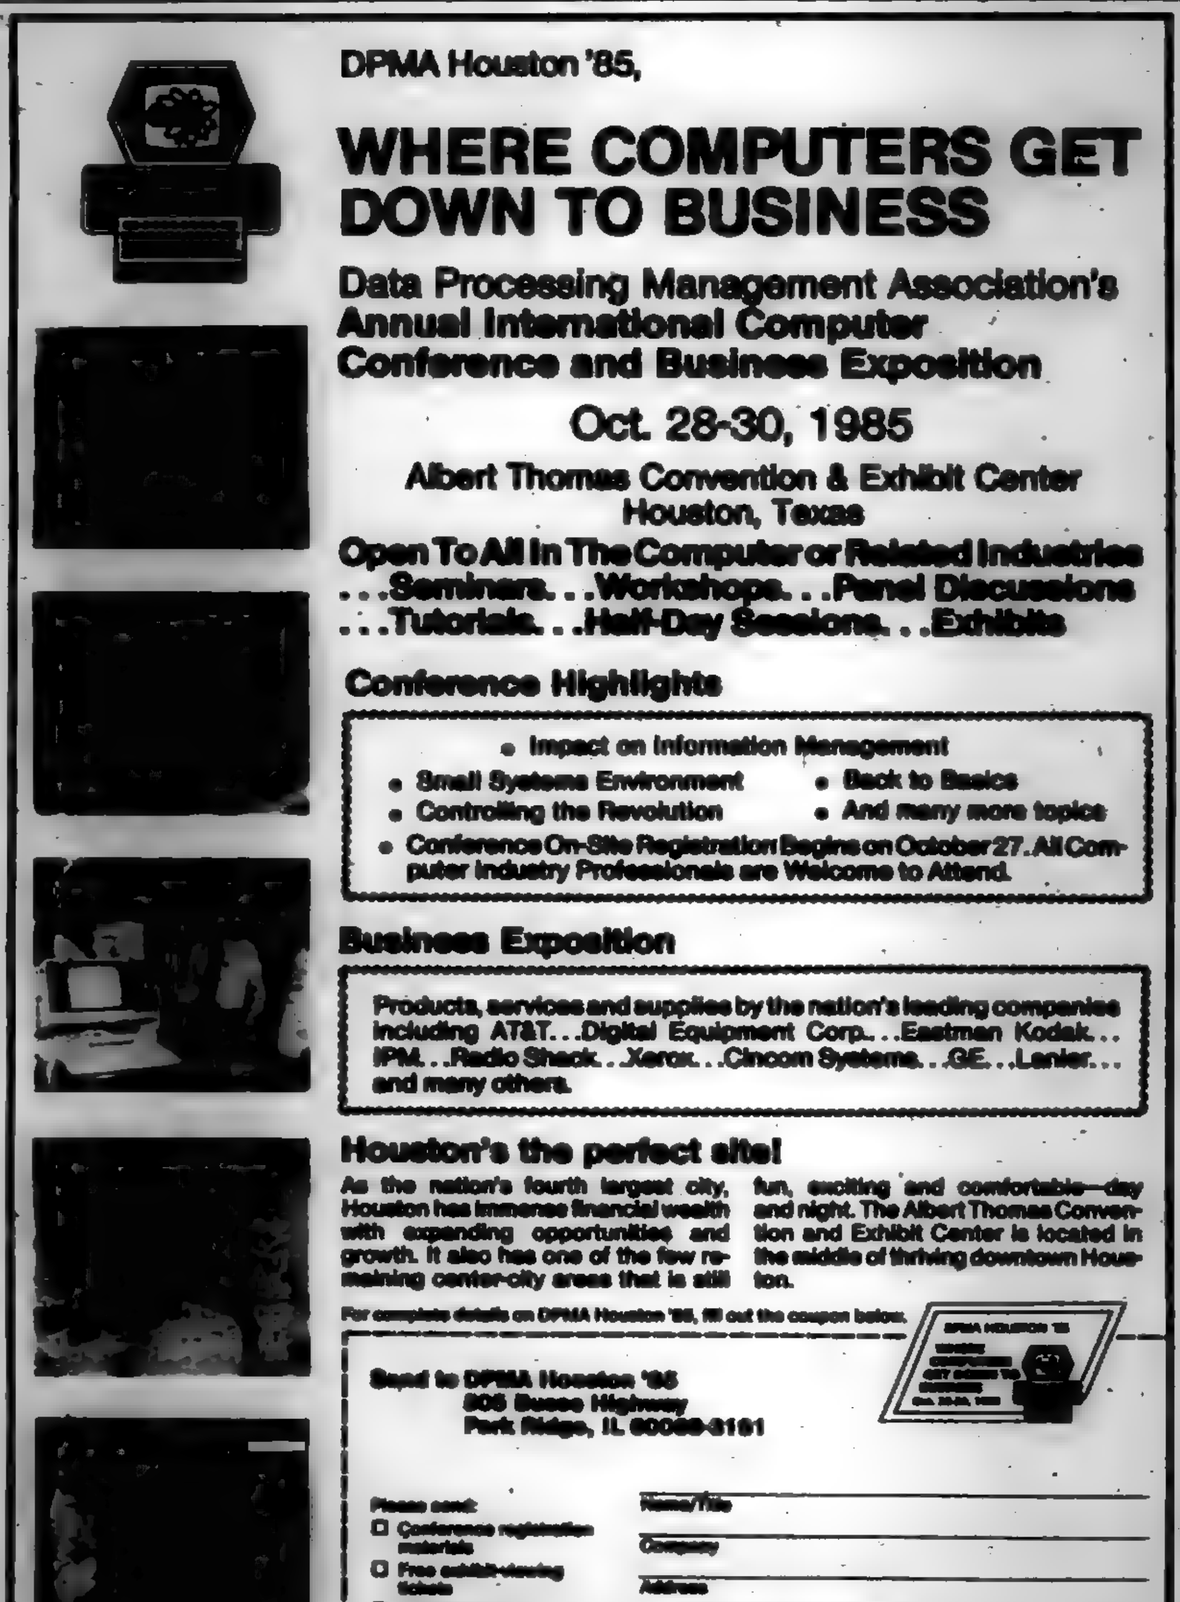
Owners sometimes deposit only object code. Although such a practice serves to lessen the likelihood of trade secret disclosure, it will prevent the Copyright Office from issuing an unqualified certificate of registration.

COPYRIGHT REMEDIES

The unauthorized exercise of any of the owner's exclusive rights constitutes copyright infringement, conferring upon the owner remedies available from federal courts:

- The owner may obtain a court injunction to prevent or restrain the infringing activity and a court order to impound and ultimately destroy the infringing articles.
- The owner may also seek monetary damages equal to its loss and/or the infringer's profits from the infringing activity.
- The owner may request statutory damages in an amount not greater than $50,000, provided the owner has registered the software under the Copyright Act in time to be eligible for statutory damages and provided it is impossible for the owner to prove actual damages.

Roberts and Brownell are attorneys with the law firm of Berman, Roberts & Kelly in Chicago. This firm's practice deals with legal issues relating to procurement, development, distribution, management and protection of computer resources.



DPMA Houston '85,

WHERE COMPUTERS GET DOWN TO BUSINESS

Data Processing Management Association's Annual International Computer Conference and Business Exposition

Oct. 28-30, 1985

Albert Thomas Convention & Exhibit Center

Mergers, acquisitions growing in info services mart

OUTSIDE LINES
Edward I. Metz

The information services and software industry is one of the most acquisitive in the U.S. economic structure.

According to the Broadview Associates/Association of Data Processing Service Organizations, Inc. Index, an annual recap of merger and acquisition activity in the information services and software industry marketplace, this relatively small ($39 billion in 1984) segment turned in nearly 150 acquisitions for the year, bringing the total for the first half of the decade to 650 completed deals with a total value of more than $6.5 billion. In fact, the information services and software industry acquisition activity is exceeded only by that of the banking and finance communities.

From the buyer's perspective, acquisition continues to satisfy traditional objectives. It provides a relatively low-risk method for adding products, services, markets and technology; a ready-made pool of talented personnel; an opportunity for rapid geographic expansion; and a method of supplementing internal growth to meet ambitious financial objectives.

While return on investment criteria have traditionally been considered, return on investment per se has not been the dominant consideration in the short run. This factor could change in the future as buyers' ranks swell with firms from outside the industry accustomed to slower growth rates and different market conditions that demand more conservative investment considerations.

There's money to be made

From the seller's point of view, enormous personal wealth is being created through these transactions, as more and more entrepreneurial owner/operators achieve financial independence. The acquisition of Electronic Data Systems Corp. (EDS) by General Motors Corp. in 1984 produced more personal wealth for EDS' largest stockholder than the total of the top 50 entrepreneurs who took their companies public during that year.

The high rate of merger and acquisition activities is having a profound effect on the overall structure of the industry. In the past five years, the number of firms with annual revenues in excess of $100 million has more than tripled from 20 companies in 1979 to nearly 70 in 1984. These include some of the most acquisition-oriented firms in the industry, such as Automatic Data Processing, Inc., EDS, McDonnell Douglas Automation Co. and Computer Sciences Corp.

In the past five years, a number of new forces has been at work driving the merger and acquisition apparatus in this industry even harder.

The initial public offering window is closed for all but extraordinary cases, making mergers and acquisitions the only viable alternative for many firms in need of capital infusion.

At the same time, the venture capital community's focus on shoring up their portfolios by pruning the less promising properties will continue to serve as an effective blockade to firms seeking venture capital funding.

With these two avenues blocked at a time when second- or third-round financing is required, dozens and perhaps hundreds of firms will be driven to the merger and acquisition alternative to keep momentum going, if not to stay afloat.

During the past 10 years we have seen aerospace and energy firms enter the market through acquisitions. More recently, publishers, insurance companies, banks and hospital services have joined in, and even more banks are expected to join the fray. Communications firms and hardware manufacturers will almost certainly see more action.

The net result is more acquisitions of smaller services and software firms. These firms offer the acquirer the venue to build complex systems, attract competent information professionals and penetrate specialized vertical market niches. Smaller information services and software industry firms often provide earnings and growth rates far exceeding those in traditional, more mature industries.

Larger firms in this industry are also poised for a higher level of merger and acquisition activity. Others are recognizing the need to shift from functional or cross-industry marketing strategies to vertical industry approaches.

The purging of the micro industry, which began in 1984, will continue for the next several years as the result of far too many products in already saturated distribution channels. Although there will be failures, there will also be some highly creative solutions applied to the bailout and rescue problem. The information

Automated Software Support For The Structured Techniques

Our pioneering with the Structured Techniques in the early '70's created a new environment for systems development, leading to a decade of building systems that are now easier to operate, and free from the costly bugs which plagued earlier systems.

The ANALYST TOOLKIT™ is a computer-assisted design software product that automates the process of systems analysis. It offers graphic capabilities to draw Data-Flow Diagrams, State-Transition Diagrams, and Entity-Relationship Diagrams, as well as free-form sketch capabilities. All this adds up to a more cost efficient way to develop and document systems specifications.

The ANALYST TOOLKIT™ runs on the IBM® PC -XT and AT, and the WANG Personal Computer and can be adapted to support any graphic system development techniques.

Attend one of our product demonstration seminars listed in the right side of this ad. We'll show you how the TOOLKIT™ can truly *simplify* your systems analysis efforts. Contact us for a descriptive brochure by calling

1-800-223-2452. In New York, 212-391-2828.

We believe we'll change the way you develop systems-again.

Trade group to develop data base standards

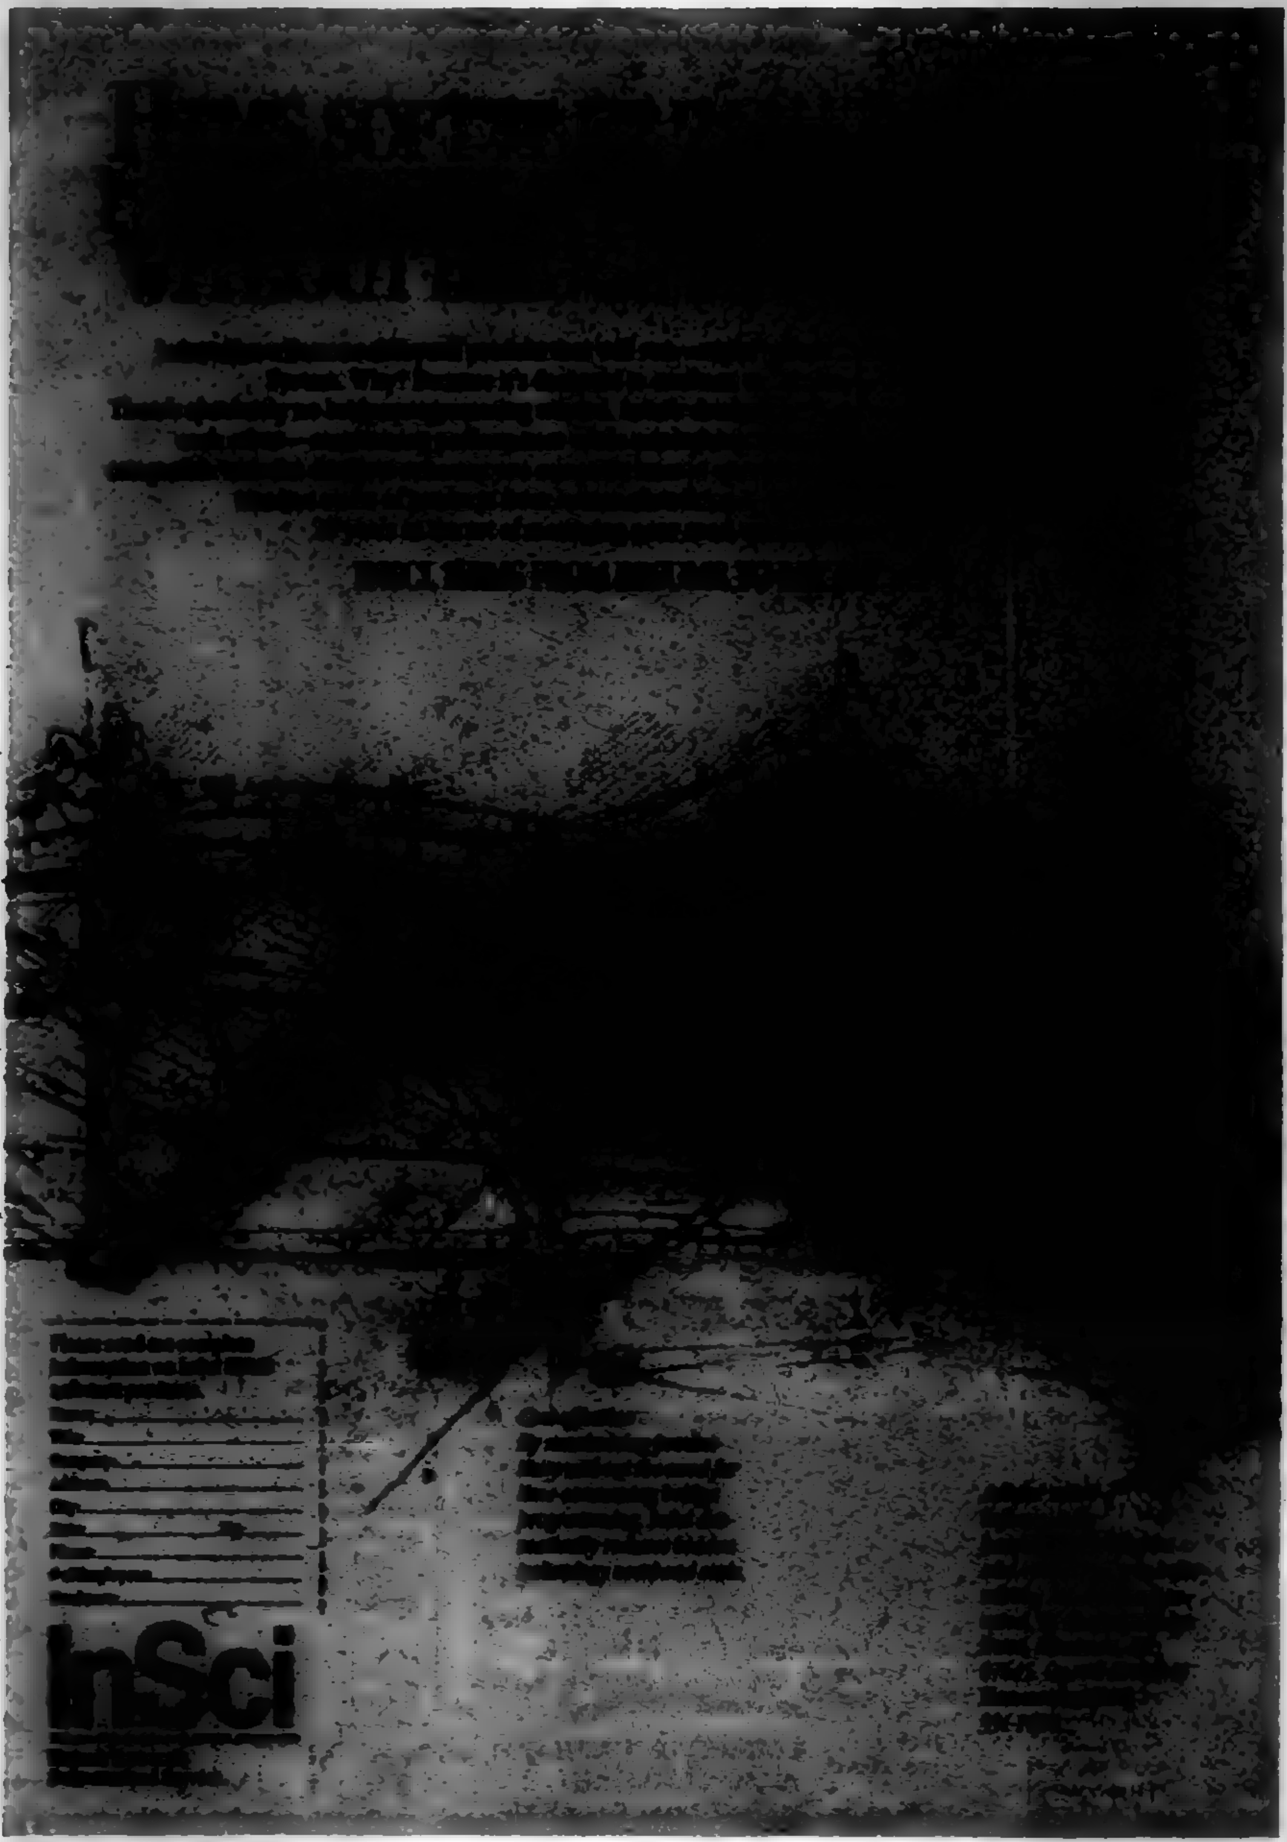
LAS VEGAS — Executives from 11 hardware vendors recently announced here the formation of a trade association to create technical standards for and promote a number of related data base environments.

The group, in announcing its formation, left little doubt that part of its intent is to promote data base environments as a better alternative to AT&T's Unix and variants.

"The operating systems we use are closely related to each other," said Leonard M. MacKenzie, chairman of General Automation, Inc. and acting chairman of the new association. "There is at least as much transportability between these sophisticated relational data base managers as there is in the so-called Unix world."

Hosting the meeting of the vendors and named as the association management company for the group was the International Data Base Management Association, a trade group devoted to promotion of Pick Systems, Inc. Pick operating system-based machines and variants.

Firms represented at the meeting were CDI Information Systems, Inc.; CIE Systems, Inc.; Cosmos, Inc.; Datamedia Corp.; Fujitsu Ltd.; General Automation, Inc.; McDonnell Douglas Computer Systems; Nixdorf Computer Corp.; Prime Computer, Inc.; Systems Management, Inc.; and Ultimate Corp.



Tandon cuts work force by 131

CHATSWORTH, Calif. — Disk drive manufacturer Tandon Corp. recently announced the layoff of 131 employees, most of them from manufacturing positions.

The company said the cutbacks resulted from a decision to combine its floppy disk drive manufacturing and engineering operations, previously located at company headquarters here, with its Winchester disk drive operations in Simi Valley, Calif.

The company said the action reduces its domestic work force to about 1,000 people. The company, which has suffered financial setbacks in recent quarters due to a transition to new products, has located much of its production offshore.

Shareholders OK Harvard Software sale

MOUNTAIN VIEW, Calif. — The shareholders of Harvard Software, Inc. approved the company's acquisition by Software Publishing Corp. late last month, marking the final step in the $4.2 million purchase.

The shareholders agreed to terms under which they will receive 400,000 shares of Software Publishing, the developer based here of the PFS series of business microcomputer software.

Software Publishing has closed Harvard Software's former headquarters in Littleton, Mass., and has moved the operation to California. Software Publishing will market and sell Harvard's Project Manager and Total Project Manager software from the West Coast office.

Software Publishing retained only eight of Harvard's 30 employees. Those who were not retained were offered severance packages.

In another development, Software Publishing recently sold its Power Up! division to a new spin-off firm, of which it owns 10%. The firm, Channelmark Corp., will sell accessory software "the way L.L. Bean sells outdoor gear," according to President Edward Lauing, former head of Software Publishing's catalog division.

Channelmark will move next week from Software Publishing's headquarters to a new office in San Mateo, Calif.

Hitachi to purchase U.S.-made products

Datacom, Microsoft gain major contracts

NEW YORK — Datacom Industries, Inc. of Middlebury, Conn., and Microsoft Corp. of Bellevue, Wash., were among the contract winners as Hitachi Ltd. recently announced agreements to purchase $25 million worth of U.S.-made computer and electronics products.

The Japanese industrial giant said it will announce additional contracts with U.S. vendors totaling $15 million in the next two months, part of its plan to buy $400 million worth of U.S. products in fiscal 1986.

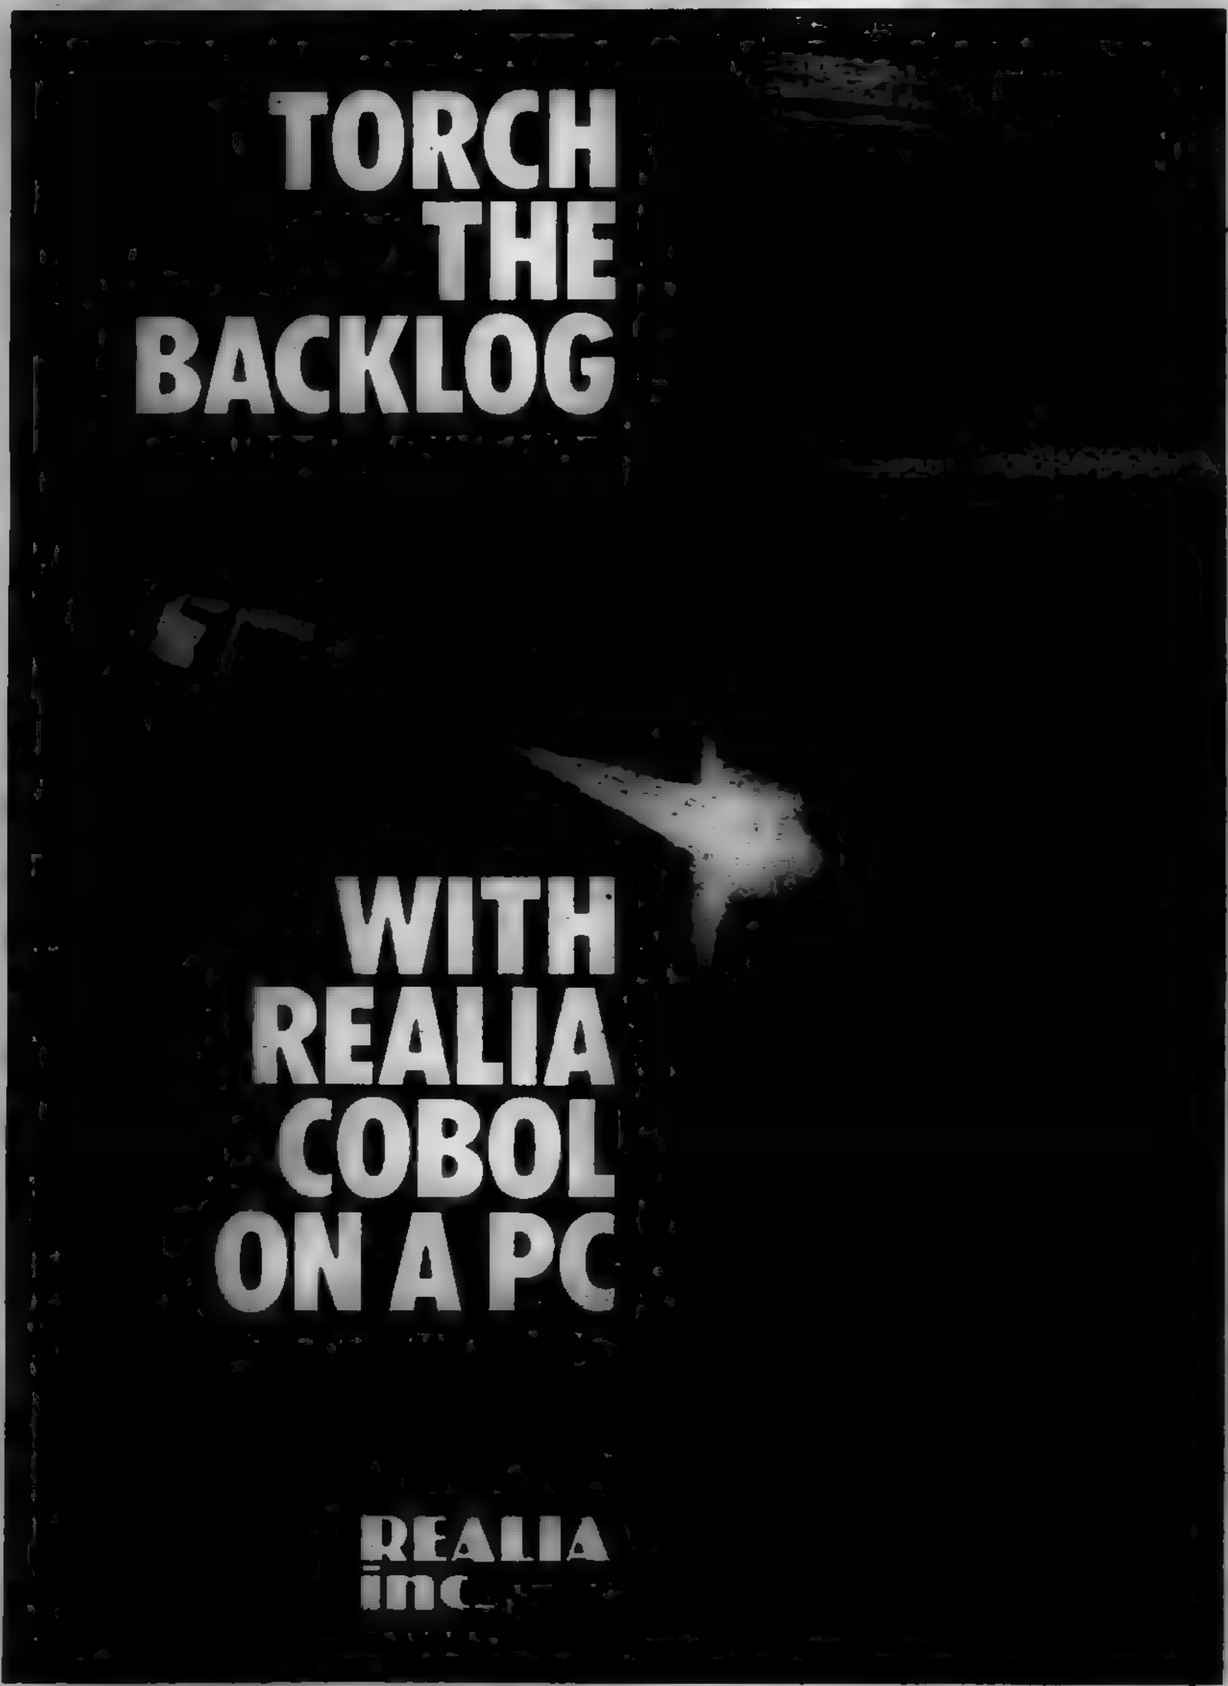
Datacom Industries, with a contract worth $4 million, and Technology for Communications International, Inc. of Mountain View, Calif., with a $3 million contract, shared Hitachi's $7 million purchase in the telecommunications field.

Microsoft's $2.3 million contract represented the lion's share of Hitachi's $4.3 million investment in industrial components and other products, which include software.

The largest product category involved in the purchases was manufacturing, research and development equipment, in which Hitachi signed contracts worth $12 million and reached agreement on $15 million in additional contracts to be announced.

Major U.S. vendors included were Digital Equipment Corp. with a $1 million contract, Hewlett-Packard Co. with a contract worth $1.3 million, Genrad, Inc. with a $1.3 million contract and Tektronix, Inc., which won a $700,000 contract.

Notably absent from the purchase list were U.S. semiconductor manufacturers, some of which have accused Hitachi of predatory pricing and other unfair trade practices in their campaign for greater access to Japanese markets. Hitachi Executive Vice-President Shiro Kawada said the company will be sending an "import promotion team" to the U.S. by the end of the year specifically to purchase U.S.-made chips.



AT&T Spain venture gets U.S. license

BERKELEY HEIGHTS, N.J. — AT&T announced recently it has received a U.S. Department of Commerce project license required to begin construction of a proposed semiconductor plant in Spain.

AT&T said the license marks formal approval to move forward with plans for a joint venture with Telefonica, Spain's national telephone company.

The venture, called AT&T Microelectronics Espana, will be located outside of Madrid, and the plant is scheduled for completion in 1987, a spokesman said.

The plant will manufacture Cmos integrated circuits. AT&T said the venture will employ approximately 700 people and will not have any adverse impact on AT&T's domestic work force.

NAS announces Korean venture

MOUNTAIN VIEW, Calif. — National Advanced Systems Corp. (NAS), the mainframe manufacturing subsidiary of National Semiconductor Corp., recently announced the formation of a joint venture company with Hyosung Corp. of Seoul, South Korea, to distribute NAS data processing equipment in the Republic of Korea.

Hyosung is a $2 billion diversified manufacturing company with more than 20 subsidiaries producing a broad range of products, including some DP equipment.

The joint venture began operations Aug. 29. At the same time, Hyosung-NAS announced its first sales, an AS/8083 system purchased by the South Korean government for the Korea Advanced Institute of Science and Technology and an AS/6630 purchased by Tongyang Nylon Co.

Xebec settles with Miniscribe

SAN JOSE, Calif. — Xebec Corp. and Miniscribe Corp. recently announced an out-of-court settlement of a disputed $2.2 million contract on which litigation had been pending since April.

Miniscribe, of Longmont, Colo., had sought to collect the amount from Xebec, which had contracted to purchase Miniscribe's 5¼-in., 10M-byte disk drives.

In a counterclaim, Xebec, based here, had charged that Miniscribe broke the contract by changing the specifications and performance of the drives.

In the settlement, Miniscribe agreed to offer Xebec price discounts and most-favored-customer status.

What workstations deliver up to six times the speed of IBM PC/AT?

Dyna found guilty of copyright violations

SANTA CLARA, Calif. — computer retail store has been ordered to forfeit its entire inventory of alleged Taiwanese copies of Hercules Computer Technology, Inc. graphics cards.

In an Aug. 5 ruling in U.S. District Court in San Jose, Calif., Judge William A. Ingram ruled that retailer Dyna Systems violated trade, copyright and unfair competition laws by selling copies of the Hercules Graphics Card, a monochrome graphics expansion board for the IBM Personal Computer.

Dyna Systems, a single-store operation, was ordered to pay Hercules' legal expenses for the July 5 suit and turn over the boards, software diskettes and operating documentation to Hercules for either destruction or disposal.

'Unfair competition'

"It was unfair competition and was causing confusion in the marketplace," said Michael W. Hall, attorney for Berkeley, Calif.-based Hercules.

"The strategy of Hercules is to go after stores that are selling rip-off copies of our products. We will be watching the marketplace and will monitor complaints from our customers to ensure they are not using copied products," Hall added.

Hall said he did not know the number of boards that Dyna Systems will turn over to Hercules.

Franklin pays debts, issues stock

PENNSAUKEN, N.J. — Franklin Computer Corp. recently issued more than 70,000 shares of its common stock to creditors in the latest phase of its bankruptcy reorganization plan.

The vendor of Apple Computer, Inc.-compatible microcomputers issued the shares to 500 creditors to settle approximately $7 million in debts by issuing one share per $100 of debt. Under its reorganization plan approved by the federal Bankruptcy Court in Philadelphia last February, Franklin may issue up to 250,000 shares to settle its accounts.

The creditor-shareholders will share ownership of the company with management and the New York venture capital firm of Renaissance Technologies. Renaissance partner Morton E. David is Franklin's chairman, chief executive officer and president.

In order to reemerge in the personal computer market, Franklin plans to shift much of its production to the Far East.

Last month, Franklin acquired Cord Electronics, Inc. of Westbury, N.Y., an OEM vendor of electronic components and subassemblies from its plants in Japan, Taiwan, Hong Kong and South Korea. "It is anticipated that a substantial portion of Franklin's future product lines will be manufactured in Asia," according to a spokesman.

Franklin is expected to announce a microcomputer product line, the Ace 2000 series, later this month.

NICKELS AND DIMES

Xidex Corp. reported revenue for the fiscal year of $259.5 million, an increase of 46% over the $178.2 million for the previous year. Profits for the year were $24.5 million, or 81 cents per share, compared with $24 million, or $1.06 per share, in the like period one year earlier.

Revenue for the quarter ended June 30 was $88.4 million, up 73% from $51.2 million for the same three months a year ago. Profits were $7.9 million, or 19 cents per share, compared with $6.4 million, or 28 cents per share, in the comparable period one year earlier.

Looking for the first CICS applications development tool that's as versatile as you are?

As a data processing manager, you wear a lot of different hats. Constantly balancing programmer resources, machine resources and time demands to get your different jobs done.

That's why you need CONSENSUS™ from Martin Marietta Data Systems. The first on-line applications development tool to let you develop applications three different ways and in whatever operating environment you choose.

With CONSENSUS, you can develop applications in COBOL and in 4GL procedural and non-procedural languages. CONSENSUS accesses almost every popular database and lets you develop in CICS, CMS, VM/PC or batch environments. And, most importantly, all CONSENSUS components are compatible with one another and with existing applications.

CONSENSUS is truly a breakthrough product. One which can change the way you develop CICS applications. It's another of Martin Marietta's Natural Selection® products—an interrelated family of products that work with an extraordinary variety of machines, environments, applications needs and degree of user sophistication.

If you thought you'd never find an applications development tool that's as versatile as you are, you're in for a nice surprise.

It's ready now.

enue for the second quarter of $1.4 million, compared with $4.3 million in the like quarter one year ago. The company reported a net loss of $3.4 million, or 10 cents per share, compared with a net loss of $59.3 million, or $1.57 per share, in the corresponding quarter one year earlier.

■

Timeplex, Inc. announced revenue for the year ended June 30 of $96 million, an increase of 45% over the fiscal 1984 revenue of $66 million. Profits were $10 million, or $1.15 per share, compared with $1.1 million, or 13 cents per share, in the same quarter last year.

Revenue of $26.3 million for the fourth quarter of fiscal 1985 increased 36% over $19.3 million for the same quarter a year ago. Quarterly profits were $2.4 million, or 28 cents per share, compared with $1.9 million, or 22 cents per share, in the comparable quarter last year.

■

Network Systems Corp. reported revenue for the second quarter ended June 30 of $24.3 million, up 51% from $16 million a year ago. Profits for the quarter were $5.3 million, or 18 cents per share, compared with $3.4 million, or 12 cents per share, one year ago.

■

Endata, Inc. announced second-quarter revenue results of $12.8 million, compared with $12.4 million in the corresponding quarter last year. Net income was a loss of $354,000, or 8 cents per share, compared with profits of $581,000, or 14 cents per share, in the comparable quarter one year earlier.

Computer Memories, Inc. reported revenue for the first quarter of fiscal 1986 of $50.5 million, an increase of 164% over $19.1 million in revenue for the comparable quarter last year.

Profits were $4.8 million, or 43 cents per share, an increase of 408% over $948,000, or 9 cents per share, in the like period one year earlier.

■

Masstor Systems Corp. reported a net loss of $3.4 million, including $2.5 million in operating losses, in its second quarter ended June 30, compared with a net loss of $5.3 million in the same period a year ago.

Second-quarter revenue rose to $8.1 million, compared with $4.7 million the second quarter last year.

■

Archive Corp. announced profits of $15.8 million for the third quarter ended June 28, an increase of 55% from the $10.2 million reported a year ago.

Profits for the quarter were $383,000, or 4 cents per share, from the $636,000, or 6 cents per share, reported a year ago.

■

Research, Inc. reported a 233% increase in profits for the fiscal year ended June 30 of $19 million, or $1.96 per share, compared with $5.7 million, or 69 cents per share, in the corresponding period one year ago. Revenue was $138.6 million, compared with $63.8 million in the prior year's quarter.

Fourth-quarter profits were $6.7 million, or 61 cents per share, on revenue of $42.4 million, compared with profits of $1.7 million, or 20 cents per share, on revenue of $23.8 million in the comparable period one year ago.

■

Seagate Technology, Inc. reported profits for the fourth quarter of $712,000, or 1 cent per share, including a tax benefit of $1.7 million; in the year-earlier period, the company reported profits of $10.5 million, or 22 cents per share. Revenue was $71.8 million, down from $100.5 million in the like quarter last year.

Despite a pretax loss of $10.2 million for the year ended June 30, net profits were $1 million, or 2 cents per share, including a tax benefit of $11.3 million; in the previous year, net profits were $39.4 million, or 84 cents per share. Revenue for the year was $214.6 million, compared with $343.9 million the previous year.

■

Xicor, Inc. reported revenue for the second quarter ended June 16 of $6.5 million, compared with $8.6 million last year. The firm posted a loss of $4.6 million, or 40 cents per share, compared with a net income of $1 million, or 9 cents per share, in the same quarter one year ago.

■

VLSI Technology, Inc. announced second-quarter revenue of $19.6 million, compared with $17.6 million a year ago. Profits for the quarter ended June 30 were $115,000, or 1 cent per share, compared with $2 million, or 10 cents per share, in the comparable period one year ago.

■

Duquesne Systems, Inc. reported revenue for the third quarter ended June 30 of $2.9 million, up 48% from $1.9 million for the same period a year ago. Profits for the quarter were $563,000, or 26 cents per share, compared with $390,355 or 19 cents per share, in the like period a year ago.

■

Tseng Laboratories, Inc. announced revenue for the second quarter ended June 30 of $719,982, a 33% increase from $539,828 in the same period one year earlier. Profits for the quarter were $82,385, or 5 cents per share, compared with $58,235, or 2 cents per share, in the corresponding period last year.

■

IPL Systems, Inc. reported a loss of $471,000, or 9 cents per share, on revenues of $520,000 for the quarter ended June 29. A year earlier, the company reported a loss of $2.3 million, or 46 cents per share, on revenue of $1 million.

■

Cambex Corp. reported a net loss of $383,000, or 20 cents per share, compared with profits of $71,000, or 4 cents per share, in the same quarter

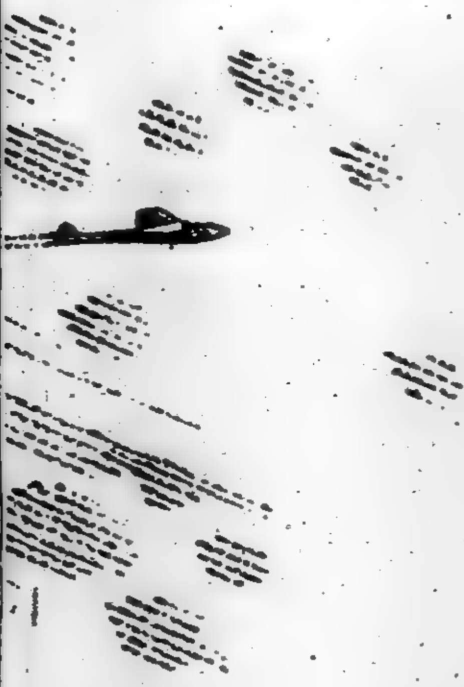
Why settle for a Local Area Network when you can have a Total Information Utility.

From A Company Called TRW.



Great advances in industrial society give rise to the utilities that support them. Waterworks. Electricity. Gas. Telephones. And now, Information.

The TRW Concept 2000 Total Information Utility starts with a broadband Local Area Network (LAN) that supports data, video, and voice communications. But the similarity with other LANs ends there.

With TRW Concept 2000 you can support incompatible networks or connect dissimilar devices on a single cable. Channeling information from office to office—no matter how frequently employees move.

Preserving your in-place investment. Today and tomorrow.

Surprised? We've been designing, installing and supporting large-scale networks for ten years. At major corporations, hospitals, universities and government departments. So we know you're concerned with service, support and cost. Not baud rates and protocols.

TRW's total systems integration includes off-the-shelf standard LAN products. Or custom features if you need them. Backed by over 200 TRW service centers nationwide.

Call the Information Networks Division at (800) 526-4879 for our booklet on "The Total Information Utility." (In CA: (800) 523-6619). Or write us at 23800 Hawthorne Blvd., Torrance, CA 90505, Attn: Customer Support.

And get a head start on the Information Age.

BUILDING A COMPUTER CENTER?

If you're planning a new, expanded or remodeled DP facility, you need Datasphere's help.

Since 1968 Datasphere's unique combination of services has saved dollars, frustration and time for large and small firms around the world.

From turnkey—design/build computer rooms to consultation on the smallest project, we'll do all or part—on schedule, within budget! Datasphere is unique—we're engineers, consultants, planners and builders specializing in computer facilities.

Datasphere's engineers are expert in all computer support systems including:

- *Uninterruptible Power Systems*
- *Computer Power Centers*
- *Computer Fire Protection Systems*
- *Computer Type Air Conditioning*
- *Gas Turbines/Diesel Generators*
- *Operation Command Centers*
- *Elevated Flooring*
- *Frequency Converters*
- *Line Filters*
- *Security Systems*
- *Systems Monitors*
- *Voltage Regulators*

Downturn seen in service bids

for more than two years, after the company made the strategic decision to try and capitalize on the service organization it built to maintain its own products [CW, March 5, 1984]. With hardware prices declining and equipment becoming more dependable, asset utilization requirements essentially dictate that systems vendors attain higher service force productivity by maintaining equipment sold by other vendors.

The $179 million that Bell Atlantic Corp. paid last year for Management Assistance, Inc.'s Sorbus, Inc. service division and the $177 million bid that TRW, Inc. recently [CW, Aug. 26] offered for the Intelogic Trace, Inc. service spin-off of Datapoint Corp. have added impetus to the race to build nationwide organizations that can service integrated systems incorporating equipment from many vendors.

Prices outpace value

But in Charlton's view, those prices have outpaced the value of the acquisitions. "At some point, the law of supply and demand will take hold, and the value of these deals will get back to a realistic level."

TRW's recent offer could prove to be a problem for a company that has traditionally expanded through acquisition, according to Charlton. By bidding up the cost of such deals, TRW may actually make its long-term acquisition strategy too expensive, he speculated.

Some consolidation in the burgeoning service industry is inevitable, according to Charlton. But he said he thinks greater attention will be devoted to the actual profit and loss potential of the acquisition target.

Complete service

The ultimate goal of the leading tier of service companies is to be able to establish a nationwide organization capable of offering complete maintenance service to any particular business. All major vendors — even IBM to a limited extent — are moving toward offering complete service for equipment tied into their own proprietary products.

Among the large vendors, Control Data Corp., Sperry Corp., NCR Corp. and even AT&T have moved into or are exploring the profit potential of integrated service.

Charlton said that, given the continued performance and dependability of hardware, "service companies will be transitioning to software support, networking and communications support, as opposed to hardware."

Although service of large numbers of commodity machines, such as microcomputers, will always be selected based mainly on pricing, the service of integrated information systems is increasingly selected based on the ability to obtain on-site service and keep the system running, he said.

No easy feat

Putting together a nationwide organization capable of servicing varied software in large businesses is no easy feat, however. Honeywell's approach, according to Charlton, is to build up to that capability.

One key aspect, he said, is developing agreements with value-added resellers to provide complete service for the integrated systems those suppliers provide.

In addition to third-party agreements signed with more than 40 hardware suppliers, the Customer Services Division has signed up more than 60 value-added resellers, distributors and dealers that offer their customers Honeywell service contracts. Another aspect of the Honeywell strategy is its nationwide remote diagnostic service, which is much more effective for dealing with software service than hardware service, according to Charlton.

ANNOUNCING THE FIRST BUSINESS MODELING SYSTEM WITH ARTIFICIAL INTELLIGENCE

INGOT is the first DSS which simulates decision making of a chief financial officer to minimise capital costs. INGOT takes into account daily financial events, corporate policies, interest rates, and your business forecasts. INGOT's CASHMOD command makes simultaneous equations obsolete.

Other standard capabilities in INGOT give you more for your DSS dollar, including:

- PERT project management with automatic calendaring.
- Times series forecasting and advanced statistical methods.
- Flexible graphics for floor plans, maps and diagrams.
- Data entry with automatic validation and user defined HELP files.
- Optimisation with linear and integer programming.
- Built-in financial and manufacturing models as commands.
- 100% of reference manual on-line for easy use.

INGOT runs on IBM MVS/TSO, DEC VAX, Prime, Tandem, DG AOS/VS, Apollo, CDC/NOS-VE, HP 9000, Honeywell GCOS, and most UNIX systems. Ask us about any others.

Get the Facts. Call 800-323-7820 or in Illinois 312-869-5556.

2550 Crawford Ave., Evanston, IL 60201
PANSOPHIC SYSTEMS AFFILIATE

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212)564-9147

Mergers, acquisitions on the rise

services and software industry's 35-year history has seen few, if any, significant failures.

There remain several thousand companies that fall into the less than $10 million revenue class. Although these smaller firms have provided a comfortable living for their founders and have continued for 15 or 20 years as reasonably stable enterprises, current market conditions are forcing drastic changes in the way these companies operate.

These firms are major acquisition targets for the last half of the 1980s, as their founding entrepreneurs begin to examine methods of achieving liquidity and diversification of their portfolios.

The industry as a whole is alive, vital and growing in importance annually. Continued consolidation through the merger and acquisition process will help keep it so for the remainder of this decade.

From page 115

Lotus position inconsistent

to selling semiconductor manufacturing and fabrication equipment overseas comes not from the Japanese, but from the U.S. government.

Because of U.S. Department of Defense security regulations, any export of new, sophisticated chip making technology requires the acquisition of a license for the particular buying country. That translates into the inevitable delays of the bureaucratic red-tape labyrinth — up to 18 months in many cases, according to Hansen. And we're not talking about sales to Libya or Iran but to France, Japan and other allies.

The DOD obviously can't regulate everybody, so it is a simple process for the buying nation to obtain similar technology from someone else — a West German vendor, for example — rendering the security risk issue essentially moot.

"When we're trying to compete against a country, Japan, whose government subsidizes its companies, the actions of our own government are really counter to our efforts," Hansen said.

●

Although Franklin Computer Corp. of Pennsauken, N.J., appears to be climbing back admirably from the depths of Chapter 11 protection under the Federal Bankruptcy Act, its unbridled press release optimism seems a little premature. In a recent public relations document, Franklin Chief Executive Officer Morton David talked about "embarking on the adventure of the second wave of growth in the personal computer market."

The adventure part seems credible enough, if adventure means not being exactly sure where those stormy seas will take you. If nothing else, the past and present computer industry shakeout should have sobered everyone into a more realistic view of future demand, growth rates and customers' real needs.

But the implication that the next computer boom is just over the horizon sounds ominously like the would-be computer gurus of the early 1980s who are busy eating their words — and going into consulting.

From page 115

GEM buoys Digital Research

to be profitable.

Rowley predicted that, in the U.S. market, Digital Research's future system software revenue figures will be roughly flat, with growth coming in the applications market. "GEM brings us right into the mainstream of the IBM environment," he said. "Our target market is the Fortune 2000."

In this arena, "an absolute trend is that the information center and the DP manager are getting control of purchasing," he noted. Digital Research currently is finalizing details for a number of site licensing options, which will be released this month.

The firm has demonstrated GEM to the 50 largest corporate users of personal computers, often in conjunction with IBM, he said. IBM's National Accounts Marketing Division "has worked closely with [Digital Research] since we introduced the product."

IBM's reported offer downplayed

Rowley downplayed recent press reports that IBM prepared to offer GEM as a third-party product and then withdrew that endorsement. The two firms have signed an agreement covering a number of software offerings, he said. "The products that do compete are [Digital Research's] Concurrent PC-DOS and Topview," he remarked. "If there's any problem, that's what it is."

The development deal announced last month between IBM and Microsoft Corp. for future Personal Computer system software products simply "reports an extension to a five-year contract," Rowley suggested. "In terms of its impact on us, that's already been felt."

At present, 17 firms have signed OEM agreements for GEM worldwide, and 65 independent software vendors are developing packages for the GEM environment. Rowley estimated that about 100 GEM applications will be available by December, with at least half coming from European firms.

Digital Research will ship two additional GEM applications, GEM Wordchart and GEM Graph, in October, while several other products are well along in development.

"The next generation of software will move heavily into the graphics enhanced segment," he said. "Data bases and spreadsheets are logical targets."

IF YOU HAVE NEVER SEEN SPITAB®, YOU HAVE NEVER SEEN AN ON LINE TABLE MANAGEMENT SYSTEM!

Your applications use a huge quantity of tables.

SPITAB will simplify the task of organising and managing tables.

SPITAB reduces developement and maintenance costs by eliminating the need to write programs to manage tables.

Allows your end users to maintain their own tables. Improves the performance of your applications by optimizing accesses to tables.

SPITAB supports DOS, MVS with CICS (VSAM, DL1), IMS/DC, IDMS.

SPITAB®

THE NEW ON LINE TABLE MANAGEMENT SYSTEM.

SPITAB® is a registered trademark of SPI.

Systems engineers. Programmers/analysts.

We have excellent openings in our Los Angeles, Dallas and Chicago area offices for talented programming people. The jobs involve designing, coding, testing and updating software, plus installing systems and tailoring them for specific customer needs. If you enjoy a challenge (like the one above), you'll like CYBERTEK.

CYBERTEK is a leading supplier of sophisticated information processing systems to the financial services industry. As that industry experiences its most explosive changes in a century, CYBERTEK offers outstanding growth opportunities for smart, motivated men and women.

At CYBERTEK, individual ability is valued highly. Quality of life is emphasized. You'll work in pleasant communities outside major urban centers. Salaries are good; benefits are exceptional.

Positions require 2-8 years programming and analyst experience, with background in financial and life insurance applications helpful. Please indicate your experience in COBOL, BAL, IMS DB/DC, OS, DOS, CICS and IBM mainframe architecture. Send resume to T. Jerry Lee, Vice President, CYBERTEK Computer Products, Inc., 6133 Bristol Parkway, Culver City, CA 90230.

CYBERTEK®
The challenges don't ever stop.

Exciting Changes are Taking Place at Eastern

Four successive profitable quarters, employee ownership, international route expansion, and new salary structures for data processing personnel are just a few of the exciting changes taking place at Eastern.

If you have a minimum 2 years experience in PL1, BAL, IMS Database Administration, or any ACP/PARS programmer experience, we would like to offer you an opportunity to:

- *Increase your annual earnings.*
- *Participate in an employee profit sharing program.*
- *Surround yourself with state of the art technology which includes our real-time transaction processing system featuring 4 IBM 3033s, 3 IBM 3083s, and 2 IBM 3081s.*
- *Work for a company which offers rapid career growth to individuals with exceptional performance.*

Being a member of the Eastern family also affords you an opportunity to live in the cosmopolitan cities of Fort Lauderdale or Miami. The diversified area offers unique opportunities to those who enjoy exciting night life, fine restaurants, and a casual outdoor lifestyle where sunny skies, white beaches, and warm temperatures prevail year round.

If an exciting change is what you're looking for in your career or lifestyle, please send your resume with salary history to: Eastern Airlines, Management Recruiting, Department VQ, International Airport, Miami, FL 33148.

Equal Opportunity Employer M/F

Director — Application Systems & Programming

Northwestern Memorial Hospital, one of the Midwest's foremost medical centers and a healthcare leader in the use of information management technology, seeks an accomplished executive to direct the activities of the Hospital's Systems and Programming Department.

Primary responsibility of the position is to provide leadership and coordination to our users and five Project Managers in the development of new application systems plus enhancement and maintenance of current system capabilities. Other significant duties include working with the Director — Information Systems and key users to formulate long and short range application software and manpower plans, while providing back-up for the Director — Information Systems as needed.

The successful candidate will possess a Bachelor's or Master's degree in MIS or a related field and at least 10 years data processing experience leading to present success at the Director level. A strong knowledge of hospital information systems, preferably using IBM's PCS under MVS, is required, and previous exposure to operations management will ensure promotability.

Northwestern Memorial Hospital offers a commitment to excellence in a state-of-the-art environment, an attractive compensation package, and an ideal location on Chicago's lakefront. Interested applicants should send a resume and salary requirements in confidence to:

Mr. Michael V. Sullivan
310 East Huron
Chicago, Illinois 60611

"GESCO offers you the next dimension in data processing."

Meeting the information processing needs of the dynamic financial industry is GESCO's main task. Each system we develop is tailored specifically to meet the needs of our clients . . . today and tomorrow.

At the heart of our operation you will find the finest array of advanced equipment. We use the latest multiple IBM mainframes (30XX, 43XX) within an OS/MVS JESII environment. In addition, the Tandem Non-stop II hardware and ACI Base 24 software offer us new systems capabilities that in turn we pass on to our customers throughout the savings industry.

Beyond the state-of-the-art equipment lies the main resource of our company—*our people.* We have assembled the finest technical and financial minds in the industry to produce an effective, cohesive team of data processing professionals—what we believe to be the best team in the business. Their combined efforts have made GESCO the pacesetter it is today.

If you share our commitment to technical excellence, we encourage you to investigate GESCO's progressive opportunities in *programming* and *operations.* Challenge, growth-potential and a supportive team-oriented environment await the *experienced professional.* Join us as we set the standards in the next dimension in data processing.

For additional information, send resume to:
Human Resources–1st Floor, GESCO Corporation, 1455 E. Shaw Avenue, Fresno, CA 93710. Equal Opportunity Employer M/F.

An Equal Opportunity Employer M/F

Director Of Information Services

Strong Memorial Hospital

Strong Memorial Hospital, a regional tertiary hospital and the primary teaching facility of the University of Rochester School of Medicine and Dentistry is looking for someone to direct a comprehensive reorganization of the Hospital's Information Systems Division, including not only the replacement of most existing systems but also including major development initiatives focusing on medical information and case management systems.

The Director will be primarily responsible for providing both the administrative leadership for the overall planning, organizing, staffing, and budgetary activities of the Information Systems Division and the control of information systems development, and performance within the Hospital's computing environment.

The successful candidate will have approximately 5-10 years of hospital or service-oriented data processing experience; the major portion in a large, "around-the-clock" on-line IBM environment. Graduate degree preferred. Supervisory experience required. We are committed to a compensation package which is fully competitive and recognizes the responsibilities and authority of the position we are seeking to fill. Apply: Search Coordinator, Box 636W, University of Rochester, Rochester, New York 14642. Equal Opportunity Employer, M/F.

UNIVERSITY OF ROCHESTER

England

TASK FORCE

SYSTEMS OPPORTUNITIES

Tangram Systems Corporation is a young, aggressive software R & D firm with positions created by growth. We are tired of reading mediocre resumes, so please contact us if you believe that you exceed the minimum requirements listed below.

The successful candidate is probably not job hunting and, if you are, you can go anywhere in the country. Come join a multidisciplinary team in the heart of North Carolina's Research Triangle area. We offer a competitive compensation package which includes bonus and stock option plans. Stop being the resident guru, and join others who can challenge you and be challenged by you.

IBM PC Assembler Programmer

You have technical proficiency in 8088/8086 Assembler Language, debugging at the machine language level and interfacing with PC DOS BIOS. You have experience writing PC DOS device drivers or interrupt handler routines, with 3270 emulation hardware (such as IRMA), and basic knowledge of communications hardware/software. You are familiar with the implementation of a high-level programming language, such as PASCAL, and interfacing assembler routines with it. You like to write slick, tight code.

If you like to read PC technical journals, only to find that others are just discovering what you already know, if you know the DOS Technical Reference backwards and forward, if you consider your technical knowledge underutilized and unappreciated, and if you are tired of handholding spreadsheet users and explaining simple things over and over again to "programmers", then we can challenge you.

VTAM Assembler (Systems) Programmer

You have technical proficiency with IBM System/370 Assembler Language programming and debugging in MVS, XA, or VS1. You have experience with more than one of the following: SNA protocols; 3270 data stream programming; ACF/VTAM application programming; MVS supervisor and data management services; VTAM/NCP service aids; managing large-scale SNA networks; installing, maintaining and modifying ACF/VTAM and associated CNM products. You understand the purpose and function of bracket protocol, direction indicators, and the SNA bind. You like to write exits, mods, and inventive programs in Assembler.

If you are a network systems programmer who knows these things and you are tired of doing NCP gens, updating VTAMLST, and babysitting network operators, and you're looking for an opportunity to design and build network software for the large scale IBM mainframe environment, we want to talk to you.

MVS Systems Programmer

We have the machine and all the latest MVS software. We need you to provide the technical expertise to make them work well together. You know the job description. If you don't, don't bother calling us. For this position, we are looking more for talent than experience.

If you don't have a current resume, please send us a letter briefly detailing your background. We'll recognize you with or without a resume writing service. PRINCIPALS ONLY. Write to: **Bill Stair, Vice-President Systems, P.O. Box [illegible], Raleigh, NC 27622.** EOE M/F/H.

Announcing the 1985 National Computer Career Conference

Over 6,000 career opportunities, $21,000 – $108,000
Call Dave Grinnell at 1-800-821-7700, extension 800B from 8 am to 8 pm any day this week

Do you know if you're in the best position? Are there other opportunities that will provide leading-edge exposure, greater income and maximum potential for long-term career growth? Are there better opportunities in other areas of the U.S. or Canada?

We'll provide all the facts

The Source Edp Computer Career Conference is designed to help computer professionals evaluate the current job market, and find out where they stand professionally and financially—all in complete confidence. Key information systems executives in your area and across North America will be available throughout the Conference—at your convenience—to explain their long-range plans and where you might fit in.

Exploring has never been easier

Firms participating in the Conference represent a broad cross section of user, consulting, vendor and service organizations. They are diverse in industry, size and location, and range from the dynamic new start-up to the larger well-established, growth-oriented company. Compensation levels are outstanding.

In all, over 6,000 specific positions are represented. The Conference offers you a convenient way to investigate a wide variety of career options—all in complete confidence. There are no forms to fill out—nor is a resume necessary. You will meet only those firms that you are interested in—or that have interest in you. Discussions will be held in strict privacy, at a time and day that's most convenient for you.

How to participate

The Source Edp Computer Career Conference is scheduled in a city near you soon. There is absolutely no charge for your involvement or attendance since participating client companies will assume our fees. And, all inquiries are held in confidence. To ensure your reservation and to learn about Conference dates in your area, call Dave Grinnell today at 1-800-821-7700, Ext. 800B. Or write: Career Conference Director, Source Edp, Dept. C-5, P.O. Box 7100, Mountain View, California 94039. Following is a summary of the kinds of positions and compensation offered.

Applications Programming
$23,000 – $54,000

Those with two or more years experience in applications programming will have an opportunity to learn new skills while ensuring maximum compensation. Positions exist in environments ranging from the largest scale mainframes through mini and microcomputer user, consulting and vendor firms.

Positions are available using a variety of languages including COBOL, PL/1, Assembly, RPGII, PASCAL, "C" or BASIC; operating systems like OS/MVS, VM/DOS/VSE, UNIX, AOS, and data base and data communications like IMS, CICS, INFOS, TOTAL, IDMS, ADABAS, System 2000, ADDS-0 and more. Significant opportunities exist for those with solid programming backgrounds to move into systems development, software, EDP auditing or systems evaluation.

Software Development/ Software Engineering
$28,000 – $60,000

Individuals with two or more years of software design and development or software engineering experience will be able to gain experience in and develop some or all of the following: operating systems, capacity planning and performance enhancement tools (OMEGAMON, MEAGAMON), compilers (C, PASCAL, ADA), I/O and device handlers and program generation tools. This development work will take place on a variety of systems including IBM 3083's, VAX 11/780's, Tandem Non-Stop, and variety of other mini and micro systems (Motorola 68000, Intel 8080's).

Many of the companies participating in the Conference offer formal training and experience in leading-edge technology as well as day-to-day contact with some of the top technical professionals in the country. A number of opportunities with new venture companies offer exceptional growth and equity potential.

Data Base/Data Communications
$25,000 – $55,000

Many openings exist for individuals with backgrounds in database and/or data communications. Exposure to a variety of technologies is possible, including: IMS DB/DC, ADABAS, IDMS, TOTAL, FOCUS, CICS, ENVIRON/1, TCAM/NCP, SDLC, SNA, X.25 and other database and/or data communications software.

Companies participating in the Conference include major computer and software manufacturers, Fortune 500 companies, prestigious consulting firms as well as many emerging high technology firms.

Systems Programming
$24,000 – $55,000

Opportunities provided by client firms that are participating in the Conference are broad and unique. Those with at least one year of systems programming experience will be able to strengthen their skills as well as gain knowledge of some or all of the following: UNIX, CPM, CICS, IMS, OS/VS, DOS/VS, ADABAS, DL/1, modems, duplex lines, switches, and more in both mainframe and mini or micro environments. Assignments range from program development and enhancement to systems support.

EDP Auditing
$25,000 – $58,000

Exploding opportunities exist in EDP auditing. There are many openings for those professionals who have a good technical background in programming or design plus exposure to accounting applications. Large firms are expanding their EDP auditing departments and are providing specific training in auditing for Programmer Analysts—particularly those with over two years experience.

Technical Writing
$21,000 – $38,000

Those Technical Writers/Documentation Specialists who have writing experience with state-of-the-art hardware and software are now in a position to capitalize on those skills due to high demand. Positions range from creating technical documents for users to the development of marketing and sales brochures for new products. Because of the growth of new hardware products and new software packages, the need for good technical writers has grown rapidly. In addition to a great need for creative writing, there are also many opportunities for the more senior level writers to become Technical Writing/Documentation Managers.

Systems Development/ Management Consulting
$31,000 – $78,000

A broad variety of openings exist for persons with systems design and development backgrounds ranging from systems analysis to senior project management and/or management consulting. Many leading-edge communications and data base-oriented information systems projects are being planned by Conference client firms. In addition, a number of small to intermediate size firms are just beginning to make their initial thrusts into computing—especially in mini/micro areas—and need new applications development expertise. Several nationally-respected management consulting firms will also be represented for those persons who are interested in a variety of new development assignments with high visibility to corporate management.

Sales, Marketing and Technical Marketing Support
$23,000 – $108,000

Those professionals who attend the Conference will learn about new opportunities in computer sales, marketing and marketing support. Many alternatives exist in various product areas including mainframes, mini/microcomputer technology, terminal systems, time-sharing, facilities management, proprietary software packages, OEM's, consulting and more. Many firms are just now entering new markets and will provide exceptional career and compensation growth potential—as well as equity participation.

Our National Career Conference is happening now in 36 major metropolitan areas across North America. Call 1-800-821-7700, extension 800B to ensure your reservation.

NATIONAL UNIVERSITY OF SINGAPORE

RESEARCH SCHOLARSHIPS

The National University of Singapore awards Research Scholarships to outstanding university graduates for research leading to a master's or doctor's degree in various disciplines at the University. These persons should have academic qualifications admissible to, or have been registered in, postgraduate degree programs of the University.

The Scholarships are tenable for one year in the first instance and, subject to satisfactory progress, renewable annually for another two years.

The value of each Scholarship ranges from S$[illegible] to S$1,[illegible] per month (U.S. $[illegible] – [illegible] approximately) and is not subject to income tax; the actual emolument is determined by the candidate's qualifications and experience. No travel or other allowance is provided.

Research Scholars may be asked to assist in the work of the Departments to which they are attached for not more than three hours a week. They will be remunerated for the work done.

The University will help Research Scholars find off-campus accommodation.

Application forms may be obtained from:

THE DIRECTOR
NATIONAL UNIVERSITY OF SINGAPORE
North American Office
780 Third Avenue, Suite [illegible]
New York, NY 10017
United States of America.

THE REGISTRAR
NATIONAL UNIVERSITY OF SINGAPORE
Kent Ridge
Singapore 0511
Republic of Singapore.

In your request for application forms, please state:
(a) the field of research you intend to undertake; and
(b) your highest educational qualification.

Applications must be received by The Registrar, National University of Singapore by 31 OCTOBER 1985.

Hardware Configuration Manager

We currently have a job opportunity available for a Hardware Configuration Manager in the Data Processing Division, located at our Corporate Offices in Framingham, Mass.

Reporting directly to the Manager of Hardware Services, this position shall be responsible for all Zayre hardware configuration planning and review of hardware performance and capacity, along with the responsibility for making recommendations for new, or upgraded hardware.

In order to qualify you must have had at least 5+ years of solid data processing experience, with a proven track record of advancement from equipment operating through hardware planning and analysis for a large computer installation. (e.g. IBM 303x through 308x installations) Must possess strong analytical background along with both good oral and written skills.

If you feel that you can meet these qualifications and are up to this type of challenge, we would like to hear from you.

For confidential consideration, please forward your resume along with salary history to: Zayre Corp., Technical Recruiting Department, Speen Street, Framingham, MA 01701. Selected candidates will be contacted by 10/10/85. An equal opportunity/affirmative action employer.

***Zayre**

Data Base Administration Specialist

Could your career use a world-class connection?

Where General Electric in Waterford, NY is a recognized leader in silicones—as inventor and developer of the technology, as creator of new applications and markets, as pioneer in manufacturing process controls, as a state-of-the-art operation in every phase, every department. Product Manager &
Sales Support Professional

UNIX* EXPO—New York NCR Would Like To Meet You There September 18-20

To arrange an interview appointment with our Product Managers, call us this week collect (803) 791-6303.

NCR will be demonstrating the TOWER 32, our latest UNIX success at the UNIX EXPO on September 18-20 at the New York Hilton Hotel. Don't miss this opportunity to talk with us and discover firsthand the career advantages awaiting you at NCR. As a $4-billion industry leader, we can offer you the stability, recognition and high-growth future you seek.

Our innovative technology is setting new standards in the UNIX marketplace. NCR was the first major corporation to make a commitment to UNIX . . . to deliver a truly commercial implementation of the system . . . and to integrate a comprehensive set of communications software with it. Now we continue to expand our impressive TOWER family of supermicro-computers . . . meeting the needs of complex distributed processing applications. Come join NCR in its achievement in the UNIX marketplace.

Product Manager

We look to you to set the strategic direction for new product development. You will have product line responsibility for future members of the TOWER family . . . managing these products through detailed development planning and into marketing release. Requires a BS in Computer Science, Engineering or Business backed by 2-4 years of experience in product development and marketing or direct sales. Knowledge/experience with UNIX, SNA, DIA/DCA, DISOSS, X.25, Ethernet, Graphics, User Interfaces and Artificial Intelligence highly desirable.

Sales Support Professional

You will provide pre- and post-sales support to our worldwide sales organization. This includes demonstrations, customer presentations, applications support, technical training, ongoing product support, seminars and trade shows. Requires a BS degree, at least 2-4 years experience in direct sales, technical or marketing support, knowledge of the computer industry, and excellent communication skills.

Position yourself for top success with our enterprising organization. We offer competitive salaries, outstanding benefits, and a superb lifestyle in Columbia, South Carolina, with affordable housing, fine schools, and a vast array of cultural and recreational opportunities. If you are unable to meet with us at the UNIX EXPO, please send your resume with salary history to: Mr. Gordon Davidson, NCR Corporation, 3325 Platt Springs Road, West Columbia, SC 29169. An equal opportunity employer.

NCR

When you know where we're going, you'll choose NCR.

TAKE A SHOT

At An Opportunity To Design And Implement Systems At The

PREMIER BANK OF THE SOUTHEAST!

A copy of your resume and a 22¢ stamp is a small investment in your career. Make it NOW!! You just might find a future you've been looking for—but didn't think existed.

NCNB Executive Management has committed support for our Systems Division to facilitate replacement of current major systems to keep pace with our march toward interstate banking as the Southeast's largest bank holding company.

Challenges exist for Programmer/Analysts and Systems Analysts with two or more years experience involving major development projects. Exposure to banking applications is not an absolute requirement. Primary emphasis is being placed on those candidates who can demonstrate a record of successful achievement on projects significant enough to be considered—MAJOR DEVELOPMENT.

Successful candidates will enjoy a state-of-the-art environment at the Corporate Headquarters in Charlotte consisting of twin 3081's with MVS/XA and IMS DB/DC . . . an environment where they will be considered professionals. Additionally, in Carolina—the Sunbelt living's great! Shimmering lakes, majestic mountains, and uncrowded beaches are all easily reached from our location.

Please forward a resume outlining your role in systems development efforts and your current salary to:

MCI: Where years of hard work and innovative thinking are paying off!

Washington, D.C. Area

Activities are moving at an accelerating rate at MCI. Much of our highly advanced network is in place. We are now able to offer customers the convenience of Dial 1 equal access in many areas. And, our lower long distance rates continue to be a significant advantage.

The result, as you would expect, is a major influx of new customers . . . and the need for ever expanding, ever more sophisticated data processing capabilities. Currently, we have a challenging opportunity available for an experienced EDP Auditor at our corporate headquarters in Washington, D.C.

You must have a Bachelor's degree and 4-5 years' experience including programming, systems analysis and EDP auditing. Our IBM MVS/XA environment supports a large terminal network running CICS and ADABAS.

For immediate consideration, please send your resumé in confidence to: **Human Resources, MCI Communications Corporation, 701 South 12th Street, Department 482, Arlington, VA 22202.** An Equal Opportunity Employer M/F/H/V.

WE SATISFY.

Martin Marietta Data Systems meets the needs of over 5,000 data processing users by meeting the needs of our systems professionals. We offer a wide range of challenges...team spirit...plenty of ways to grow...all this and more...in a large state-of-the-art IBM data center.

COMMUNICATIONS SPECIALIST

Work directly with users to define overall requirements and solve day-to-day communications problems. Make full use of your diagnostic ability, your RF, broadband and Ethernet background, and your experience with IBM applications, SNA host communications, and PC/DOS interrupts as applied to C, Assembler, FORTRAN, and Pascal programming. You will also need experience involving network protocols, network configurations, modems and telephony technologies. Requires 2-5 years experience.

ARTEMIS PROGRAMMER

Expand your solid knowledge of report writing and your familiarity with networking, bar-charts, and graphics information processing in an Artemis environment. To make the most rewarding use of our IBM mainframe or HP 1000 tools, you should have a working knowledge of planning and engineering. Requires 1-3 years experience.

PROGRAMMER ANALYST

Apply your 2 plus years COBOL and JCL experience in an IMS environment. In addition, you will need manufacturing systems and inventory systems experience.

We offer highly competitive salaries and excellent benefits including company-paid health/dental/vision coverages for you and your family, a unique performance sharing plan and a tuition reimbursement program. Join our rapidly-growing division of a Fortune 100 company, and live where others vacation. Send us your resume in strict confidence, or call us collect.

SPECIAL REPORT:

CSC Creates Strategic Growth in Logistics Command Applications

Computer Sciences Corporation, in its continued commitment to AFLC systems projects, has been awarded the SC&D contract at its Dayton facility. This new project has created the immediate need for experienced professionals in the following areas:

Systems Engineering

- Systems Architecture/Trade Studies
- DBMS Design, Management, Implementation
- Large Scale IBM Systems Integration
- PSL/PSA Utilization

Programming/Analysis

- IBM MVS/CICS/COBOL & JCL required
- ADR Ideal/Datacom DB & DD a plus

QA/Integration Test

- 4 years' QA & Integration Test experience
- AFR 300-15 & DoD STD 7935
- Large Scale Systems Design & Programming knowledge preferred

Logistics

- 9 years' experience in the technical & administrative areas of DoD LOGISTICS/SUPPLY DISTRIBUTION

Training

- BS/BA Education or related
- 3+ years' adult education & training material development

CM/DM

- CM experience in software product environment
- Familiarity with MIL-STD 480, 483; AFR 300-15; DoD STD 7935

All positions require a BA/BS degree in CS, Math, EE, or related field and 2-6 years' experience. We offer competitive salaries, excellent benefits and career advancement in a highly visible environment. Qualified candidates should send their resume with salary history in confidence to **Cathy Kimmel:**

PROGRAMMER/ANALYST AND SYSTEMS ANALYSTS

A medical center located in the historic Chattanooga, Tennessee area is beginning the second phase of its long range data processing plan. Several growth opportunities are available for dedicated data processing professionals interested in the professional challenge of implementing state-of-the-art, on-line data base systems utilizing COBOL programming and transaction processing technology. Our newly constructed data center includes dual 24 MEG Burroughs B7900's, mini computers, micro computers, and office automation systems. We offer the opportunity to expand your technical and professional skills in a progressive health care setting.

Our requirements are for individuals with 2 years experience on medium to large-scale batch and on-line systems. We seek above average skills in communications, organization, sensitivity to end user needs and a stable employment history. Burroughs and Health Care backgrounds are required.

PROGRAMMER/ANALYST

Assignments include detailed program design, coding, testing and debugging, as well as documentation and implementation of batch and on-line systems. You will assist in the system specifications, design tasks, and end user training. At least 2 years of heavy experience in COBOL program design, coding and testing. Familiarity with Assembler language programming, micro and mini computers a plus. Salary $26,500. (JOB ORDER # TN552718 — Be sure to specify this in letter of application).

SYSTEMS ANALYSTS

You will serve as liaison between users and the data systems department. Responsibilities include specification, design and installation of financial and patient care system. You will oversee programmer analysts with hands-on implementation experience with custom and application packages involving data base and data communications and the ability to handle multiple projects. A Bachelor's degree and programming background required. Salary $32,000. (JOB ORDER # TN55517 — Be sure to specify this in letter of application).

If you are ready for the challenge, send your resume to:

Tennessee Job Service
400 Georgia Ave.
Chattanooga, TN 37403
Attn: Minnie Hughley

We Are An Equal Opportunity Employer

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well

Currently, opportunities are available for persons to apply CICS experience and for persons to apply MVS/XA knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE
- **System Software Analyst—MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.
- **Senior System Software Analyst—CICS**
  Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Central and South West Corporation
P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $3 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

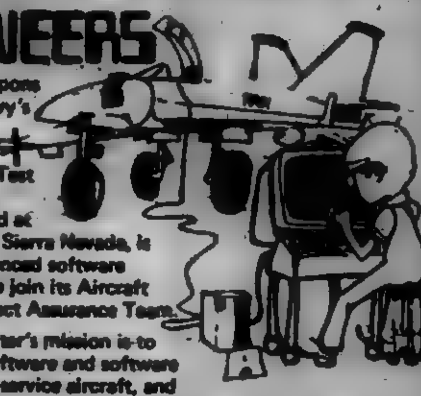
El Paso Consolidated Data Processing is seeking an experienced IBM Programmer for their [illegible] Criminal Justice Information Systems (CJIS) project team. Two years CJIS or similar systems experience is required. This highly visible position has hands on responsibilities and extensive user contacts. Salary commensurate with experience. Fringe benefits include life and medical insurance, retirement plan, liberal holiday and vacation. Contact: Personnel Director, Room 221, City County Building, El Paso, TX 79901

SOFTWARE/COMPUTER ENGINEERS



The Naval Weapons Center, the Navy's major Research, Development, Test and Evaluation Activity located at the foot of the Sierra Nevada, is seeking experienced software professionals to join its Aircraft Software Product Assurance Team.

Part of the Center's mission is to develop new software and software revisions for in-service aircraft, and test and validate the software of developmental aircraft.

We are looking for candidates with BS or advanced degrees in engineering, computer science, math or other appropriate disciplines, who are interested in working with software support activities for front-line Navy/Marine Corps tactical aircraft, including the AH-1J/T, A-6E, A-7E, AV-8B and F/A-18.

Those with experience in the following areas should apply.

- SOFTWARE QUALITY ASSURANCE
- KNOWLEDGE OF APPLICABLE STANDARDS
- SOFTWARE QUALITY TESTING
- MODERN SOFTWARE ENGINEERING PRACTICES
- STRUCTURED PROGRAMMING
- REAL-TIME SYSTEMS
- SOFTWARE CONFIGURATION MANAGEMENT
- SOFTWARE COST/SCHEDULE ESTIMATING
- QA AND CM TOOLS

SALARY TO $45,000

Naval Weapons Center / ANN-082-3108-4 / China Lake, CA 93555
An Equal Opportunity Employer / U.S. Citizenship Required

City Polytechnic of Hong Kong invites applications for the posts of Principal Lecturer/Senior Lecturer/Lecturer in the following departments which are tenable from Summer/Autumn 1986:

DEPARTMENT OF COMPUTER STUDIES

Technical areas: COBOL, PASCAL, ADA, 4th generation languages, computer systems and architecture, data base, data communications, expert systems, systems analysis, design and development, network and graphics. Application areas: accounting, banking, education, engineering, finance, management, manufacturing, marketing, process control.

DEPARTMENT OF ELECTRONIC ENGINEERING

Communications, computer engineering, digital electronics, solid-state and microelectronics.

Candidates should possess a good honours degree or professional qualification in a relevant field. For senior appointments, candidates are expected to have a higher degree or an advanced specialist qualification. A minimum of 3, 8 and 13 years of relevant professional experience since obtaining the basic entry qualification, which may include years spent on higher degree studies and/or research, is normally required for appointment to the grades of Lecturer, Senior Lecturer and Principal Lecturer respectively. Experience in teaching or planning modular programmes and successful research/consultancy desirable.

Principal Lecturer:	HKD247,920 - HKD307,280 P.A. by 5 increments
Senior Lecturer:	HKD208,920 - HKD270,720 P.A. by 8 increments
Lecturer:	HKD112,740 - HKD198,880 P.A. by 12 increments

1 US Dollar: HKD7.782 (US Dollar equivalent as at 13.8.85) except for Principal Lecturer appointees who will be given an option of either a two-year or an extended four-year contract appointments will be made initially on two-year gratuity-bearing contract terms. A 25 percent terminal gratuity on basic salary received over the entire contract period is payable upon successful completion of the contract. Generous fringe benefits include medical and dental benefits, and where appropriate, leave passages, housing accommodation or housing allowance and education allowance for dependent children.

Applicants should send detailed resume together with names of two referees who should be able to comment on applicant's academic/professional suitability, particularly over the past 5 years, to: THE GENERAL SECRETARY, CITY POLYTECHNIC OF HONG KONG, P.O. BOX 30441, TSIM SHA TSUI POST OFFICE, KOWLOON, HONG KONG by 12 October 1985. Applicants should state clearly the grade on post applied for. Information regarding the polytechnic or on posts advertised may be obtained by mail upon request. Please note that applications received after the closing date may not be considered.

HOW TO MOVE FROM INDUSTRY TO INDUSTRY WHILE WORKING FOR A SINGLE COMPANY

Join Cutler-Williams. As a Software Engineer for one of the nation's oldest and most complete DP services firms, you will have the enviable opportunity to apply your talents to an ever-challenging series of applications. Our client base comprises nearly every segment of business, industry and government. Every project you undertake will offer a new and exciting challenge...all without ever having to change jobs again.

Your responsibilities on each assignment will vary, too. You'll be an Analyst one time, a Programmer the next. You'll handle Design work today, Project Leadership tomorrow. Why perform a single function in just one field, when you could do it all with Cutler-Williams?

Immediate opportunities exist in our offices in Dallas, Houston, Tulsa, Oklahoma City, Denver, Chicago, Detroit and Cleveland for individuals with 2 or more years experience in 1 or more of the following areas:

- CICS/DL1, COBOL
- IMS DB/DC, COBOL and/or PL/1
- IDMS
- Batch COBOL and/or PL/1
- FOCUS, RAMIS, MARK IV
- System 38, COBOL and RPG

We offer a challenging developmental environment, technical growth and an outstanding compensation package including top-level salaries and overtime pay as well as fully paid medical and dental insurance, tuition reimbursement and profit sharing plans.

SYSTEMS PROGRAMMING SUPERVISOR

Union Electric, one of the largest investor-owned utilities in the nation, has an immediate management opening for an experienced Systems Programmer.

You will work at our St. Louis corporate headquarters, in an IBM MVS/XA, JES II environment. Your technical skills will be used to support CICS, SNA, VTAM and capacity planning. In addition, you will use your leadership abilities to assist and advise a team of Systems Programmers.

We require a B.S. in Computer Science or an equivalent degree, a minimum of 5 years' systems programming experience and competency in ASSEMBLER language programming. ADABAS experience is desirable.

Union Electric can offer excellent compensation and benefits plus the opportunity for rapid advancement. If you are ready to take the next step in your career, call TOLL FREE or send your resume and salary history to: Bob [illegible], Employment Supervisor; UNION ELECTRIC COMPANY; P.O. Box 149; St. Louis, MO [illegible]. We are an equal opportunity employer M/F.

CALL TOLL FREE 1-800-[illegible] or IN MISSOURI CALL 1-800-[illegible] Station [illegible].

UNION ELECTRIC COMPANY

ASSISTANT DIRECTOR, COMPUTING SERVICES DEPARTMENT

The University of Arkansas at Little Rock has an immediate opening for an Assistant Director for Computing Services. [illegible] COBOL [illegible] University of Arkansas at Little Rock, [illegible] Little Rock, AR [illegible]. The University of Arkansas at Little Rock is an affirmative action, equal opportunity employer and actively seeks the candidacy of minorities and women.

MIS PROFESSIONALS

The Information Systems Division of HealthOne Corporation, a multi-hospital, diversified, health care delivery system, has the following key positions available for persons with appropriate experience and training.

Manager, Computer Operations, responsible for the management of HealthOne's two primary data centers through subordinate Data Center Supervisors. Will direct the efforts of approximately 30 Computer Operations, Production Control and Scheduling, and Customer Service personnel at two Twin Cities locations.

Physical environment includes IBM 4381 and 4341 host processors and numerous distributed Data General, Hewlett Packard, and Series I mini-computers. Current mainframe software includes VM, DOS/VSE with CICS, VTAM, VSAM, VOLLIE, LIBRARIAN, DYNAM-T, DYNAM-D, and ZEKE.

General requirements include a working knowledge of IBM medium to large scale systems operating under VM and DOS/VSE. Experience with MVS is highly desirable. Must have five to six years of operations experience with at least three years of management experience. A Bachelor's degree in a related field is desirable.

Manager, Patient Management Systems, responsible for management of in-house analysts and programming personnel, contract programmers, software vendors, and consultants in order to successfully manage the delivery of patient accounting systems to multiple hospitals. Application software is MEDIPAC Patient Accounting and ADT with additional systems planned for 1985 and beyond.

General requirements include experience with healthcare business office systems and IBM medium to large scale systems. Hands on experience with MEDIPAC is highly desirable. Candidates should have a minimum of five to six years of experience demonstrating substantial responsibility for management at the project level and above. A Bachelor's degree in a related field is desirable. An advanced degree would be a plus.

Senior Systems Analyst, Patient Management Systems, responsible for major systems development projects within the Patient Management Systems department of HealthOne's systems development group. Work with end user managers and end users to define business requirements. Perform analysis and design activities to support programmers with systems specifications. Evaluate vendor product offerings against requirements.

General requirements include experience with healthcare business systems and IBM medium to large scale systems. Hands on experience with MEDIPAC is highly desirable. Candidates should have a minimum of four to five years of experience demonstrating two to three years systems analysis experience with a prior background in programming. A Bachelor's degree is preferred which may be offset by additional experience.

These positions will be attractive to persons whose qualifications match or exceed the requirements. We offer these positions in a challenging environment with competitive compensation and with an attractive benefit package.

To be considered for these positions, please submit your resume, with recent salary history to:

MISSISSIPPI CENTRAL DATA PROCESSING AUTHORITY

Sealed proposals will be received by the CDPA, 508 Robert E. Lee Building, Jackson, MS 39201 for the following data processing equipment and services:

Request for Proposal No. 1031, due Tuesday, November 5, 1985 at 3:30 p.m. for the execution of a fixed price contract with a consulting firm to provide services to the DEPARTMENT OF PUBLIC WELFARE (agency) in the transfer of the Technical Eligibility Computer System (TECS) from North Dakota. The services sought are for the transfer and modification of TECS through certification of the system by Federal funding agencies and, at the option of the agency, tuning of the system for one year following certification. The current schedule for the transfer, modification, and statewide implementation of the system is eighteen (18) months. A bidders' conference will be held on October 8, 1985 at 2:00 p.m. Attendance at this bidders' conference is mandatory for all consultants desiring to submit bids to this RFP.

Request for Proposal No. 1032, due Thursday, September 26, 1985, 3:30 p.m. for the acquisition of VMBACKUP or compatible system product for the UNIVERSITY OF MISSISSIPPI.

Detailed specifications may be obtained from the CDPA office. The CDPA reserves the right to reject any and all bids and proposals and to waive informalities.

ORDER FORM COMPUTERWORLD BULLETIN BOARD

Issue Dates: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be cleanly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Date(s): ______________________

Signature: ______________________

THE CLOCK IS TICKING...

Do you have time available on a computer? Or are you offering a special service? Then tell people about it with an ad in the Time & Services section of Computerworld's classified pages.

Every week, we'll deliver your sales message to more than 600,000 computer-involved professionals. The very people who are interested in what you have to offer.

And independent research by STAT Resources of Boston discovered that fully 61% of our subscribers plan to purchase outside services this year.

Place your ads today. Simply call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's
Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

A few smart reasons to buy our smart modem:

Features	Ven-Tel 1200 PLUS	Hayes
1200 and 300 baud, auto-dial, auto-answer	Yes	Yes
Compatible with "AT" command set	Yes	Yes
Can be used with CROSSTALK-XVI or Smartcom II software	Yes	Yes
Regulated DC power pack for cool, reliable operation	Yes	**No**
Eight indicator lights to display modem status	Yes	Yes
Speaker to monitor call progress	Yes	Yes
Attractive, compact aluminum case	Yes	Yes
Two built-in phone connectors	Yes	**No**
Compatible with The Source and Dow Jones News Retrieval	Yes	Yes
Unattended remote test capability	Yes	**No**
Phone cable included	Yes	Yes
Availability	Now	
Price	**$499**	**$599**

The Ven-Tel 1200 PLUS offers high speed, reliable telecommunications for your personal computer or terminal. Whether you use information services or transfer data from computer to computer, the Ven-Tel 1200 PLUS is the best product around. Available at leading computer dealers and distributors nationwide.

Also from Ven-Tel: internal modems for the IBM and HP-150 Personal Computers with all of the features of the 1200 PLUS.

You choose. The Ven-Tel 1200 PLUS – the smartest choice in modems.

Sperry adds to micro line

Launches AT-compatible desktop, Link software

By Eric Bender

BLUE BELL, Pa. — The Sperry Corp. Information Systems Group will roll out a host of micro products this month, spearheading its year-old campaign to become a major force in the microcomputer arena. Leading the charge will be a high-performance desktop system designed to compete head-on with the IBM Personal Computer AT.

Sperry's PC/IT personal computer, offering full compatibility with the high-end IBM micro and up to 45% greater throughput, will be announced and shipped today, said Michael Battaglia, marketing vice-president of Sperry's Americas Division. Built for Sperry by Mitsubishi Corp., the system carries a starting price of $3,650, about 10% less than that of the AT, Battaglia told *Computerworld.*

PC/IT beta user Edward Flynn, manager of concentrator and terminal software at Nasdaq, Inc. in Trumbull, Conn., said, "We've verified that whatever we can do on the AT, we can do somewhat better on the [PC/IT]." Noting that his shop has done only preliminary evaluations of the system, Flynn said that the PC/IT "is a very fast, powerful machine, and it appears to be a very stable machine."

The PC/IT will be joined in the next few weeks by versions of Sperry Link office automation software for Sperry and IBM micros, the PC/On-Line micro-to-mainframe link products, the mid-range PC/HT personal computer, enhancements to the Sperry Usernet local-area network and peripheral equipment.

DP spending slump into second year

By Donna Raimondi

FRAMINGHAM, Mass. — The growth of DP spending has slowed for the second year in a row, according to International Data Corp.'s annual report, "User Spending on Data Processing."

From a consistent 15% per year growth pattern that had slowed to a 13% growth projection in the 1983-84 budgets, this year's survey results show only a 10.9% overall growth for 1984-85.

The IDC 1985 survey was based on responses from more than 500 data processing directors representing a broad range of businesses and professions. The report provides data concerning the use of funds by different industry classes, different sizes of data processing functions and the corollary issues involved in personal computer control. The growth projections are compared with historical and current industry growth rates and include an analysis of how and why they tend to differ.

Staff expenses still account for the largest use of DP funds in all organizations, totaling more than 40% in all size categories, the report said. As a rule of thumb, $70,000 (salary plus expenses) is budgeted per person employed in a data processing department, no matter what size the organization is. There is a consistent relationship between the DP budget and the number of people employed in the department.

The second largest chunk of money consistently goes to hardware expenses, with an overall average of 29.1% of the budget.

Software and service expenses range from 8.7% in companies with a budget of more than $10 million to 16.1% in the smallest installations — those with a budget below $1 million. Part of the reason

Revised Cobol standard near

By John Gallant

After more than seven controversy-punctuated years, the labyrinthine approval process for the proposed Cobol 85 standard is nearly complete.

With the draft language standard awaiting only final, almost perfunctory, review at the highest levels of both the international and U.S. standards bodies, an endorsed, overhauled version of the existing Cobol 74 standard may become a reality by the end of 1985.

If approved, Cobol 85 — the name that the standard will bear if approval comes this year — will have survived years of vitriolic debate, a rift between interna-

FYI

Chicago to L.A.: Arco's moving experience

By Jeffry Beeler

As part of a recently announced reorganization, a major U.S. oil company has begun the lengthy process of relocating an information center from the Chicago suburb of Harvey and merging it with a second such facility in Los Angeles.

Although both centers belong to Atlantic Richfield Co.'s Petroleum Products Division, the one near Chicago primarily supports technical applications, and the site in Los Angeles serves nontechnical business users.

Arco attributes the merger, which is scheduled to be complete by Oct. 21, to the company's recent decision to close its Petroleum Products Division's research and development and engineering site in the Chicago area.

In its heyday, the site employed approximately 350 scientists, engineers and other active users. Recent layoffs, however, have trimmed the installation's current staff to approximately 200 users, according to David Priebe, manager of the site's information management and computing systems.

By year's end, the work force will shrink even further to 120 users, Priebe said. All those remaining will relocate to other Arco installations throughout the U.S., the majority of them moving to the Greater Los Angeles area.

For the past 4½ years, the occupants of the Chicago-area research and engineering facility have derived their computing services from an information center built around two IBM 4300 series units running VM. But after the employees complete their move, the source of their processing power will shift to the Petroleum Products Division's Information Technology group in Los Angeles. In addition to performing various corporate systems functions, the Information Technology organization runs an information center of its own, according to Robert Hahn, an Arco planning consultant.

To date, the Los Angeles center has existed primarily to meet the data base query and reporting needs of some 350 nontechnical business users in Arco's widely scattered Southern California offices. But starting Oct. 21, the center will expand the scope of its services by

PE multi-CPU supermini bows

Firm sees parallel processing technology as 'the way to go'

By James Connolly

NEW YORK — Making a long-term commitment to a parallel processing architecture, Perkin-Elmer Corp. unveiled a multiprocessor system that company spokesmen claimed offers three times the price/performance of the Digital Equipment Corp. VAX 8600. PE's Data Systems Group announced its 3280MPS multiprocessor system at a waterborne press conference held aboard a yacht on the Hudson River last week.

The Ocean City, N.J., firm said the 3280MPS, which carried the code name Cruncher during development, represents both a high-end machine for PE's 3200 superminicomputer line and a new architecture on which to build PE's future systems. "Parallel processing is the way to go, and not just for three or four years. We are every bit convinced that it is the architecture of the future," said James K. Sims, senior vice-president of the Data Systems Group. Sims added that PE has no plans to develop uniprocessor systems in the future.

The 3280MPS, consisting of up to six tightly coupled 3280 uniprocessors, will perform 4 million to 22 million instructions per second (Mips) in a commercially oriented environment or 12 million to 60 million whetstone instructions per second in a technical environment, according to PE.

The system is said to use a four-stage pipeline design, two 8K-byte caches on each processor and an integral 64-bit floating-point processor. The four-stage pipeline was designed to allow simultaneous execution of instruction fetch, address calculation, operand fetch and execution. Memory capacity starts at 2M bytes and is expandable to 16M bytes. The system includes PE's 64M bit/sec. System Bus and uses Advanced Shottky Logic.

PE said that the 3280MPS' modular design allows for plug-in expansion. The processors share memory with a single processor acting as the central processing unit and the others acting as auxiliary processing units or as I/O processors. In the event of a CPU failure an auxiliary or I/O processor can be shifted into the CPU role, PE said.

The 3280MPS supports PE's OS/32 real-time multitasking operating system and, in uniprocessor configuration, PE's Xelos, which is based on AT&T Unix System V Release 5.2.

Some Risc concepts incorporated

Sims said the system is not a reduced instruction set computer (Risc) but that PE did use some Risc concepts by installing commonly used Fortran VII, Cobol and C instructions in the microcode. Other supported languages include RPG II, Pascal, Coral 66 and Basic II.

Sims said a key benefit is that the 3280MPS is compatible with all existing PE programs used on the 3200 line. However, the other systems in the 3200 line are not upgradeable to the 3280.

The system will be distributed through value-added resellers and system integrators. It is targeted to general-purpose computer applications; real-time transaction processing, such as financial applications; government applications, such as military simulations, data communications monitoring and management; and scientific and engineering applications.

Acknowledging that the DEC 8600 is the standard with which supermini vendors must compare their products, Sims claimed that the cost of 1 Mips of computing power in the 3280MPS is $30,000, compared with $100,000 for an 8600 in a clustered environment. He also claimed that a 4-Mips configuration for an 8600 requires 16 sq ft of floor space, compared with 5 sq ft for a 16-Mips 3280MPS.

The 3280MPS is not PE's first step into the parallel processing field. Sims said there are 300 installations using PE 3260 and 3230 systems in parallel processing configurations.

Available 90 to 120 days after receipt of order, the basic 3280MPS configuration is the 3281MPS with 2M bytes of noninterleaved memory, one 10M bit/sec. direct memory interface, eight channels, a 20-slot I/O chassis, a 64-bit floating-point processor and system console. It costs $250,000 and is discountable to $150,000 in quantities of 100. Additional processors start at $120,000.

SEC settles with Paradyne

By Clinton Wilder

LARGO, Fla. — After more than two years of bitter charges and $5 million to $6 million in legal fees, the U.S. Securities and Exchange Commission's (SEC) lawsuit against Paradyne Corp. ended last week with a dull thud.

The settlement, reached just two days before the suit's scheduled trial date in federal court in Tampa, Fla., required no admission of wrongdoing by Paradyne and contained no punitive SEC action against the systems and communications equipment vendor. Paradyne simply agreed to comply with federal securities law in the future.

The highly publicized suit was one of several government actions against Paradyne, most of which remain pending. The suit alleged that Paradyne officials defrauded and deceived Social Security Administration (SSA) officials in winning a $100 million SSA nationwide computer network contract in 1981 [CW, April 4, 1983].

During the contract bid process, Paradyne employees allegedly reconfigured a Digital Equipment Corp. PDP-11/03 minicomputer and demonstrated it as a Paradyne product. The SEC further charged that Paradyne's bid included terminals and data encryption devices not yet available and that the company's prebid demonstration used "an empty box with blinking lights" for what the firm claimed was a working communications device.

Although Paradyne executives expressed satisfaction with the settlement, analyst Andy Schopick of the Stamford, Conn.-based Gartner Group, Inc. called it "a Pyrrhic victory" for the company.

"It comes too late to really help Paradyne restore its competitive position," Schopick said. "I think the damage has been done. The settlement is really a nonevent. I don't think the SEC ever had a really solid case, and it was unfortunate that Paradyne management responded in such a contentious way. Whatever the circumstances were that led up to this, I don't think the SEC had cause to be involved."

How do you spell relief from the pain of Documentation? (S-Y-D-O-C.)

Call (201) 568-9700.

Cut your COBOL Maintenance costs.

SYDOC:
STRUCTURED DOCUMENTATION SYSTEM FOR OS/VS

QUESTION: Which is a bigger headache? The COBOL-documentation problem or the high-cost-of-maintenance problem?

ANSWER: Both.

* * *

We're not kidding. Documentation and high maintenance costs are both parts of the same big headache. Here's why:

1. THE PROBLEM BEGINS WITH DOCUMENTATION: And it begins right at the program-development stage.

Most programmers hate to document. And although they may think they are producing well organized programs, they really have no way of judging. If they produce badly organized programs, they will inevitably produce badly organized documentation, too. One always equals the other.

2. BAD DOCUMENTATION LEADS TO COSTLY MAINTENANCE: Even if the documentation started out being accurate, it's probably never been updated. When modifications occur, someone's got to go back and attempt to divine the underlying logic before new code can be inserted. A long and costly operation.

No wonder COBOL maintenance may consume as much as 75% of your entire budget!

FAST RELIEF WITH SYDOC: Our Structured Documentation System takes the documentation problem off the shoulders of your programmers and puts it where it belongs—on the computer:

- **SYDOC HELPS YOU DEVELOP STRUCTURED PROGRAMS.** It not only provides structured documentation, it is also a very useful guide for the production of structured COBOL programs. Flaws and inconsistencies can be spotted at the development stage. And corrected before they start driving your maintenance costs up.

As a manager, you will—for the first time—have a tool to standardize both your documentation and the quality of your programs.

- **SYDOC MAKES IT EASY TO MODIFY EXISTING PROGRAMS.** It can analyze "orphan" programs without adequate documentation and tell you everything you need to know about the program's structure, logic, variables and relationships. Armed with this knowledge, the maintenance problem shrinks.

No longer is it necessary for skilled programmers to spend days searching for clues about the program's logic. SYDOC makes all necessary information available quickly and easily.

But the best way to find out about SYDOC is to try it. If this remedy doesn't work you'll just have to try another—A-S-P-I-R-I-N.

Datapoint launches Starship line of mini systems

By James Connolly

SAN FRANCISCO — Introducing the first product in its Starship line of minicomputers, Datapoint Corp. last week announced a system using a multiple operating system architecture and offering four times the memory and twice the disk storage capacity of its previous high-end computer.

In addition, Datapoint announced a local-area network management system, three storage subsystems, an electronic mail gateway and enhancements for its Pro-Vista office automation package.

The Starship product, the Datapoint 8850, was designed to replace Datapoint's previous high-end system, the 8800, and to be the first of a series of new or enhanced minicomputers to be released in the next year and a half under the Starship program, according to a company spokesman. He said the Starship line features an architecture that integrates multiple operating environments in conjunction with Datapoint's Attached Resource Computer (Arcnet) local-area network.

The 8850 has a minimum memory of 512K bytes and a maximum memory of 4M bytes. According to Datapoint, the 8850 supports both Datapoint DOS and Datapoint RMS, which is a capability not available on earlier systems. The spokesman said the 8800 can be traded in for credit toward purchase of an 8850.

The basic 512K-byte, 24-user 8850, which will be available in October, costs $16,500.

Datapoint announced two disk subsystems for the 8850, the 9348 and the 9349. The 9348 is a 9-in. removable disk drive providing 67M bytes of storage. The 9349 is a high-performance, 9-in. fixed drive with a capacity of 268M bytes. The 9349 can be configured in a string of four drives with a total capacity of 2G bytes. Scheduled for October deliveries, the 9348 costs $14,500, and the 9349 costs $22,500.

The Mail Gateway Facility announced last week was designed to allow interchange of information among RMS-based systems, DOS-based systems, mail systems made by other vendors and customized software applications such as order entry. Now available, the gateway costs $500.

A disk and tape subsystem was announced for use with existing Datapoint 8600 minicomputers. That mid-range storage system, the 9336 Disk/Tape Subsystem, was designed to provide 65M bytes of fixed-disk storage and a streaming tape drive. It costs $14,500.

An extension drive, the 9337, providing another 65M bytes of disk space, costs $9,500.

The Datapoint communications announcements included the Intelligent Network Management Facility (INMF) and the Intelligent Hub for Datapoint's Arcnet. The INMF consists of an Intel Corp. 80186-based diagnostic and control processor and software.

The INMF was designed for large networks of 40 to 50 computers.

The Intelligent Hub is a physical connection unit that allows up to 16 devices, including additional hubs, to be linked into Arcnet. The basic INMF system costs $13,995. Each hub costs $1,350.

AT&T touts voice system

Pitfalls, potentials of speech recognition

By Paul Korzeniowski

SAN FRANCISCO — Talking computers have been a part of American folklore since Hal starred in *2001: A Space Odessey*. Last week, AT&T announced a voice system that illustrates both the potential of such a system and the technical problems that have to be overcome to make it a reality.

At the annual conference of the American Voice Input/Output Society last week, AT&T introduced the Conversant 1 voice system. The product, designed in modular fashion, works as a system controller, sitting between up to 32 telephone lines and a host computer.

The Conversant 1 comes equipped with dual 80M- or 140M-byte hard disk drives. Telephone lines are connected through RJ-11 plugs. A variety of speech peripherals can be attached to an IEEE 488 bus. A coaxial cable attaches the device to host systems supporting asynchronous, Synchronous Data Link Control and Binary Synchronous Communications protocols. With the Conversant 1 voice system, a customer could dial a number and receive information in a process similiar to dialing up a weather report.

The Conversant 1 voice station incorporates two types of speech recognition. Speaker-dependent systems are designed to be used by one or two individuals. Users enter words so that the system later will recognize them when spoken. The principal shortcoming to these systems is that they are limited to a few individual users.

Speaker-independent systems recognize words regardless of who utters them. AT&T claimed that the Conversant 1 will recognize the words "yes" and "no" and 6,000 combinations of numbers.

"Many companies claim to have speech recognition capabilities. The important item is how accurate these systems are," noted B. H. Poetsch, an independent consultant from Anaheim, Calif., who specializes in voice recognition.

AT&T claimed that its employees were invited to test the Conversant 1 system, and the result was that 19 out of every 20 items input were understood.

The company stated that the cost for each channel without speaker recognition capabilities would be between $2,500 and $3,000. Historically, speaker recognition capabilities have been expensive, and AT&T refused to provide a price range for its systems.

To market and support the product, AT&T has formed a business unit called the AT&T Conversant System, based in Columbus, Ohio. AT&T listed credit card verification, stock quoting and market research as a few applications for the product. Fidelity Systems in Boston plans to use the product to allow its 6,000 users to access stock quote data.

Wang unveils link tools

By Paul Korzeniowski

LOWELL, Mass. — Wang Laboratories, Inc. opened its arms wide and today announced five products that connect its products to those from other vendors.

The products were designed to support AT&T Premises Distribution System, the IBM cabling plan, IBM's PC Network, Ethernet and asynchronous twisted-pair wire transmission.

"Wang is attempting to hedge its bets so that its products will work with whatever networking schemes become dominant," noted Greg Caristed, industry analyst at Dataquest, Inc., a San Jose, Calif., market research firm.

The Wang-to-IBM Cable Adapter links Wang peripherals to Wang computers via shielded twisted-pair wiring used in the IBM Cabling System. Each adapter consists of a link from a Wang device to an IBM wall link. Connections are required for both the Wang Computer and its peripheral. Cable adapters, priced at $100 a pair, are now available.

The IBM PC-Net Service enables IBM Personal Computers equipped with the IBM PC Network option to attach to Wangnet, the firm's broadband network. A Personal Computer would require Wang's IBM PC-Net Adapter as well as IBM's PC Network option to work with Wang's network offering. The IBM PC-Net Adapter costs $400 and is available now.

The Ethernet attachments enable a user to configure up to five Ethernet channels on Wangnet. A Medium Access Unit connects to Wangnet and supports up to eight Access Unit Interface ports that can drive one Ethernet device. The Access Unit Interfaces are equivalent to Ethernet transceivers. The Medium Access Unit will be available in November and will cost $3,500.

The Enhanced Asynchronous Device Controller links asynchronous terminals to Wang VS minicomputers over twisted-pair wiring at speeds of 19.2K bit/sec. The product will be available in November at a cost of $2,800.

The Wang Twisted Pair Balun connects Wang peripheral devices to Wang VS or OIS minicomputers via twisted-pair wiring. A Twisted Pair Balun is required for both the peripheral and the computer, with a maximum range of 400 feet.

The Twisted Pair Balun was developed by AT&T Information Systems for Wang. No price was given for the product, which will be available in the second quarter of 1986.

CORRECTIONS

The Hardware Roundup for mainframe systems [CW, Aug. 19] included incorrect information about various Burroughs Corp. products.

For the A9-F, the listed price of $613,000 is for a 12M-byte configuration, while the correct memory range is 12M to 24M bytes, and the channel availability is 8 to 40 channels. The correct relative performance rating for the B7900E is 199 and is 700 for the B7900K. The three-year lease price for the B7900F is $86,529 and is $127,862for the B7900H. The memory range for the B7900E is 6M to 18M bytes.

The memory range for the A 15 Model F is 24M to 96M bytes. For the B1990SP, the relative performance is 19, and the speed is .27 million instructions per second. The number of channels available on the B2925 ranges from 6 to 16, and the correct price for a 1M-byte memory upgrade for the B2925 and B3955 is $12,000. The product data listed for the B5919-2 should have been listed under the title V380.

IBM withdraws support for System/34 software

By John Desmond
and John Gallant

Members of the nearly 50,000-member community of IBM System/34 users last week expressed surprise about the timing of Big Blue's decision to withdraw software support for the minicomputer.

IBM informed System/34 users late last month that, as of Feb. 21, 1986, it will no longer support the machine's SSP operating system and a variety of other key software products. IBM has been easing out of its commitment to the System/34, which has not been sold by the company since 1984, and users said they were expecting IBM to curtail both software and hardware support sometime in the future.

But the withdrawal of software support came much sooner than expected, in a move that users and analysts said could only be interpreted as an attempt by IBM to speed user upgrades to the more expensive System/36 and to bolster the Armonk, N.Y.-based giant's fourth-quarter revenue.

"It is quite blatantly an attempt to force System/34 users over to the System/36," said Frank Gens, industry analyst with the Framingham, Mass.-based market research firm International Data Corp. (IDC). As of January 1985, IDC estimated that there were some 58,000 System/34s installed. But Gens said migrations to the System/36 have likely pared that base to more than 45,000.

IBM introduced the System/34 in 1977, and it is estimated that the machine had been installed in roughly 65,000 U.S. sites by the time the System/36 was unwrapped in 1983.

"The announcement looks like an effective way to stimulate System/36 sales in the fourth quarter. That is something IBM really needs," Gens said. "But it seems extreme for a machine that has such a huge installed base. It seems to be forcing the issue prematurely."

Tom Teresi, chairman of the Common IBM users group System/34/36 project and president of Tom Teresi, Inc., a Minneapolis-based consulting company, agreed with Gens' assessment.

"The announcement certainly came sooner than expected," he said. "IBM traditionally supports products for a longer period. But it seems [that] IBM was just thinking of itself."

Because the latest version of SSP — Release 9 — is "relatively bug free," Teresi said, the end of software support will cause few problems for current users. He said users who choose to migrate up to the System/36 can port System/34 applications fairly easily and at little cost.

"The System/34 was very popular among users," Teresi said. "It was easy to operate and easy to program for."

But, he added, "It is ironic that, while IBM dropped support, it did not lower the price for any of the software. In fact, some System/34 software product prices were increased just this June."

Norris Cox, DP manager for William T. Burnett & Co., a polyurethane foam manufacturer based in Baltimore, told *Computerworld* last week that he "does not appreciate" IBM's attitude toward its base of System/34 customers.

"The announcement does not bother me on a practical level because we have never relied on IBM's service," said Cox, whose company operates a System/34 alongside a System/36. "But it indicates IBM's attitude toward its users. They should be continuing service for a box that is so widely installed."

Several users said they had already turned to third-party maintenance firms or to independent programming contractors for System/34 software and hardware support. They said others will probably follow in those footsteps.

One such user is Framingham, Mass.-based Waters Business Systems, Inc., which relies on two System/34s to develop marketing and sales information software. Vice-president Evelyn Liffiton said, "IBM has been treating the System/34 as a nonexistent machine for more than a year. I do not think this decision will impact us because we do not require any hardware or software support from IBM."

Liffiton said the company will continue to target software products to the System/34 market. "There is no reason for us to ignore that market with so many machines out there," she said.

The Picture Perfect Information Center

SYSTEM 2000® DBMS AND THE SAS® SYSTEM

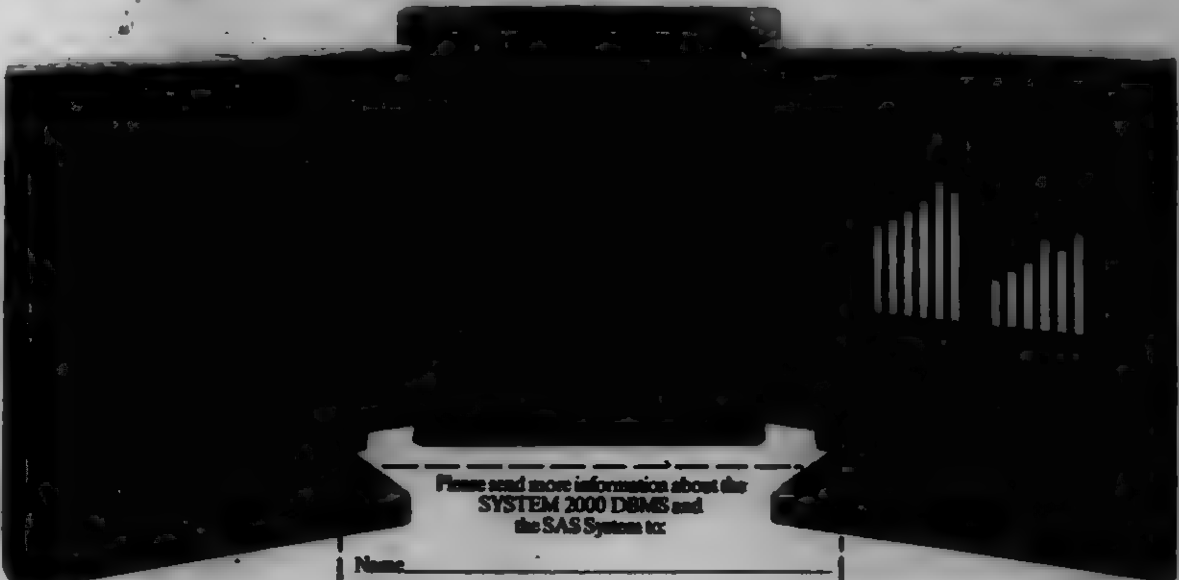
The Picture Of Practicality.

SYSTEM 2000 DBMS is the only full-function DBMS for your Information Center. It's powerful enough for production work, has fully integrated features and offers built-in flexibility. It's simple enough for end-user needs, powerful enough for applications programmers, and sophisticated enough to offer the integrity and security data base administrators need. And it's so flexible every department can use it...every day.

Perfectly Powerful.

Now, you can enjoy Information Management that's truly powerful. SYSTEM 2000 DBMS and the SAS System...combined. Thanks to a new interface built directly into SAS software. Select SYSTEM 2000 DBMS data from within a SAS session...and use a full-screen menu to do it. Or, retrieve SYSTEM 2000 DBMS data from within a SAS session just by entering query commands. With SYSTEM 2000 DBMS and the SAS System working together, you'll increase productivity, reduce your applications backlog, and put a full range of data analysis, reporting, graphics, and programming tools to work for you.

SYSTEM 2000 DBMS and the SAS System. The perfect picture of success. To discover how it can work for you, call (919)467-8000, ext. 7004.



Please send more information about the
SYSTEM 2000 DBMS and
the SAS System to:

Chicago to Los Angeles: Moving an Arco facility

co-opting all the functions of its Chicago-area counterpart, Hahn said.

■

Although the Illinois information center's 4381 and 4341 are used mainly for technical applications, they provide a "full range of functionality," including office automation, management decision support and personal computing, Priebe said. For the first two years or so after its founding in February 1981, the Harvey center relied heavily on a team of professional applications developers to address its users' in-house computing demands. Since then, however, the users have largely weaned themselves from any professional programming support, Priebe said.

"Strictly speaking, we have no central data processing staff here in this facility," he said. "We are basically an end-user operation and dedicate our mainframes to the needs of our technical and managerial clients."

In keeping with the information center ideal, many of the Chicago facility's users have long performed most of the systems tasks that might otherwise have been assigned to computing professionals. Because many of the users already had strong scientific and engineering backgrounds, they were considerably more receptive to information systems than the average computing novice and found the technology comparatively easy to master.

"Our people, because of their highly technical training, have tended not to be afraid to dig in and use the systems" at their disposal, Priebe said.

But even the most technically adept of the information center's users fell short of complete systems self-sufficiency. So throughout much of its existence, the center maintained a staff of 10 full-time user support representatives and provided access to Focus, a fourth-generation programming language that helps clients write their own applications, Priebe said.

For more than four years, the information center and its assortment of end-user computing tools stood the Petroleum Products Division's technical operations in good stead. Then, on April 29, Arco announced a companywide reorganization aimed at streamlining its operations and cutting its overhead in the face of falling world oil prices and shrinking profit margins.

The shake-up calls for the Petroleum Products Division to centralize its nationwide resources — including its information centers — in Los Angeles and, in so doing, minimize the mushrooming cost of transporting Arco's Alaskan crude oil to market.

■

Arco recently took the first step toward relocating the Harvey information center when the company shipped a copy of the end-user computing facility's software to the Information Technology group in Los Angeles.

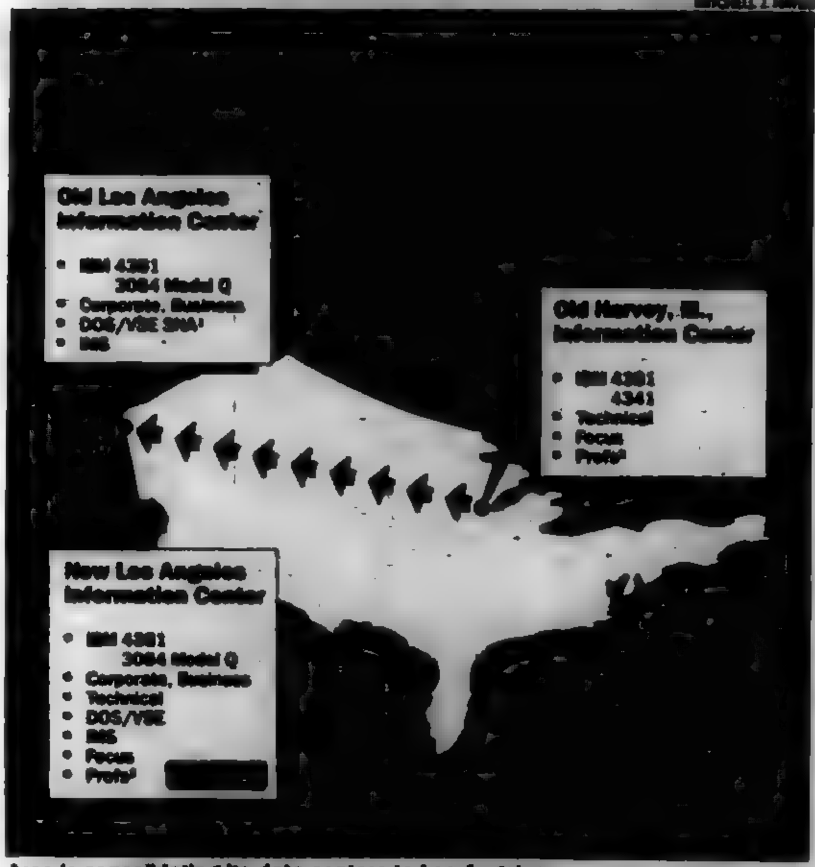
There, the programs will be merged with the West Coast information center's software. The result will be an integrated system that will be tested on an IBM 4341 Group II for three weeks, Hahn said.

In the meantime, the Petroleum Products Division will also begin to transfer the users in its Chicago-area location to their new workplaces in Southern California. The first of the transplanted employees, in fact, were scheduled to arrive at their destinations by Sept. 1, Priebe said.

During the coming four or five weeks, all the new arrivals will continue to obtain their computing services from their familiar information center back in the Midwest. But to gain access to the system, they will rely on 9.6K bit/sec. phone lines rather than the local IBM 3270 terminals they have typically used in the past, Priebe said.

At the close of business on Oct. 18, the Petroleum Products Division will permanently shut down its Chicago-area information center system and send a copy of its latest user files to Los Angeles by overnight courier. On Oct. 19, the Information Technology group will begin loading the files into the integrated information center system, which will later be moved from its test processor to a 4381 Group I that will serve as its production environment.

MITCHELL J. HAYES



Arco is consolidating its data centers to Los Angeles.

At 8 a.m. on Oct 21, the transplanted users will formally convert from the Chicago-area information center to its West Coast successor, which they will thereafter tap by means of 56K bit/sec. communications links.

Between Oct. 21 and year's end, another 50 to 70 Chicago-area users are also expected to relocate to Southern California. But before they do, they will still be able to avail themselves of the integrated information center system in Los Angeles, albeit as remote users, Priebe said.

■

But the merger of the Chicago and Los Angeles information centers involves much more than just transporting workers and shipping user files. The union will consolidate two sets of mutually complementary systems capabilities and thus enable each information center to broaden its user services by drawing upon the other's exclusive resources, Hahn said.

For the facility that will be relocating from Chicago, the merger will link users for the first time to Arco's nationwide IBM Systems Network Architecture (SNA) network and provide electronic access to the company's corporate data base. For the center in Los Angeles, meanwhile, the systems marriage will form the technological starting point for the development of both an electronic mail network and a centralized document retrieval service, neither of which the site now supports.

Most of those Arco employees who survive the Chicago site's layoffs will follow their end-user computing system to Southern California, where the two integrated information centers will share a 4381 Group I. To accommodate the expected increase in work load, the Information Technology organization plans to expand its processor to a Group II in mid-September.

The upgrade will entail little more than the installation of a few additional circuit boards and will take "only about eight hours," Hahn said. "Our parts are already on order."

■

To a large extent, the differences between the two information centers' client bases reflect a similar divergence in their installed systems resources. In Chicago, for example, users routinely avail themselves of a 50,000-item document retrieval service that depends for its existence on IBM's Professional Office System, which to date has been unavailable at the information center in Los Angeles.

On the other hand, the end-user computing facility on the West Coast supports DOS/VSE as a guest operating system under VM and thus satisfies one of the technical prerequisites for functioning in an SNA environment. The center back in the Midwest, by contrast, runs only VM, which by itself is incapable of supporting SNA.

The Los Angeles site also differs from its Chicago cousin in another important respect: Its 4381 serves as an intermediary between its customers and Arco's corporate data base, which resides in a 3084 Model Q running IMS.

"We've found over the years that IMS presents data from an accountant's or clerk's standpoint but that most of our users want to look at information from a line manager's perspective," Hahn said. "So we have a 4381-resident program that extracts corporate data from IMS, transforms it from a bookkeeper's point of view to a business point of view and downloads it through our information center to our clients."

The resulting ability to query Arco's corporate data base has hitherto remained beyond reach of the firm's information center near Chicago. But once the Illinois and California facilities merge, each will gain access to the other's systems and will be able to upgrade its computing capabilities accordingly.

VAX
Financial Software
COLLIER JACKSON, INC.
We bring software to life
813-872-9990
3707 West Cherry Street, Tampa, Florida 33607

VMSORT...
fast and REXXY.

Accept the VMSORT challenge. Run the VMSORT race in your VM data center.

VM Software is now offering a special 30-day introductory free trial so you can benchmark VMSORT in your own environment.

Save $2,500

And if VMSORT performs the way we bet it will ...you can also take advantage of our 50% introductory DISCOUNT...and save $2,500.

REXX Appeal

In addition to being fast on your CPU, VMSORT is also fast and easy for your end users...with the ability to be called interactively from a terminal as well as user exits that can be easily coded in REXX!

With more user exits (and no exit required for data introduction) VMSORT is more flexible and powerful for your end users. VMSORT can be invoked from most program languages including PL/1, Cobol and Assembler! It will even accept your existing OS and DOS sort statements without modification.

Fast in VM . . . Because It's The Only Race We Enter.

VMSORT is developed solely for the VM environment by VM Software, Inc.,...a recognized leader in software for the VM operating system. Because we concentrate 100% of our efforts in the VM environment (and not in OS or DOS)...all our software performs efficiently and dependably on your VM System...without modification.

Internal Documentation, Too!

VMSORT also takes the headaches out of reviewing and modifying sort statements with full control statement documentation ability...and statements can be kept in a file for easy retrieval.

Take Control of Your Data Center

VMSORT is available individually or as a component of VMCENTER, the most comprehensive data center management system for the VM environment.

Free 30 Day VMSORT Trial Run

Don't miss out on this exciting race. In fact, run it on your own course...and see for yourself how the new VMSORT is the ultimate sort utility...fast for you, and fast for the end user.

To take advantage of our 50% introductory discount, call or mail the coupon below—before July 31, 1985.

Revised Cobol standard may be ready in late '85

tional and American standards organizations, and efforts to reform the protracted procedures for upgrading the language. The standards makers, who weathered years of intense criticism and even threats of legal action, will have achieved their goal of making Cobol a more viable modern-day systems development tool.

According to Lemuel Skidmore, vice-chairman of the American National Standards Institute's (Ansi) X3J4 Cobol subcommittee and founder of Clinton, Conn.-based Skidmore Resource Management Co., the parent X3 Cobol committee last month forwarded the proposed Cobol 85 standard to Ansi's Board of Standards Review for final approval.

Skidmore, who has acted as chairman of the X3J4 subcommittee since the resignation of former Chairman Donald Warren, said the board will review the language document not for its technical merits but to ensure that drafters have complied with Ansi procedures for standards development. The standards board is slated to meet this month and will later vote by letter ballot on the draft standard. Warren said the draft will likely be approved before 1986.

The only possible obstacle on the U.S. side, in Skidmore's view, may be the board's concern for the "sheer volume" of negative comments the draft drew when it was released for public review.

The first period of public review drew some 2,200 responses, the majority of them negative form letters in reaction to an earlier draft's incompatibilities with the Cobol 74 and Cobol 68 standards. The second public reviewing resulted in nearly 1,000 responses, the bulk of which were also negative. The final period drew fewer than 25 responses because standards makers had addressed many of the earlier concerns.

"The fact that the number of negative comments dropped precipitously should make a big difference," Skidmore told *Computerworld* in a recent interview. "Many of the former detractors felt that their concerns had been adequately addressed."

The draft Cobol 85 standard reached the Board of Standards Review only after weathering three ballots this summer in the X3 committee, which received the final document earlier in the year from the X3J4 subcommittee. Skidmore said that throughout the balloting, a representative of the Travelers Insurance Co. of Hartford, Conn., consistently cast a negative vote, citing incompatibility concerns.

That almost-wholehearted support of Cobol 85 also characterized the last days of the International Standards Organization's (ISO) Cobol efforts. According to Mabel Vickers, convener of ISO's Working Group 4 on Cobol and programming language project officer with the U.S. National Bureau of Standards, voting by key ISO-member countries on the international Cobol standard was completed in mid-July.

Vickers said only one country, Australia, voted against the international Cobol standard, primarily because of the format in which the standard was presented. Working Group 4 is scheduled to present the Cobol 85 standard to ISO's central secretariat by the end of November. Vickers said, "The central secretariat will review the manuscript to ensure that it is in accordance with ISO's guidelines and procedures."

■

Cobol 85 includes two areas of change

Experts involved in the Cobol standardization process say the changes embodied in Cobol 85 fall into two main classes: the addition of new functions designed to make Cobol more useful, especially in structured programming; and modifications aimed at resolving ambiguities in the language.

The following is a sampling of some of the features of Cobol 85. Structured programming features include the following:

- Added EVALUATE verb, which provides a means of testing multiple conditions and specifying multiple control branches.
- Added structured conditional statements, including 19 scope terminators such as END-IF and END-READ, which allow nested conditional statements to be stated clearly.
- Allowance for nested programs, so that complete programs can be contained within other programs.
- Added INITIALIZE verb, which allows programmers to initialize at one time a series of data items.
- Added DO-WHILE and DO-UNTIL versions of PERFORM that allow testing before or after execution.
- An Added CALL-BY-CONTENT command that allows users to pass data between programs while guarding data content from modification.

Data manipulation features include the following:

- A reference modification feature that allows programmers to reference a portion of a data item without having to REDEFINE the portion.
- Seven added levels of subscripting, allowing a table to have up to seven dimensions. Only three dimensions are specified in Cobol 74.
- Added relative subscripting ability that allows a variable used as a subscript to be increased or decreased.

I/O processing features include the following:

- New variable length records.
- Added I/O status codes, which allow a programmer to distinguish a variety of exceptional conditions.
- Added communications status and error keys.

— John Gallant

■

Cobol stays healthy in changing times

Predictions of Cobol's eventual demise began to be heard not long after the programming language was born in the late 1950s.

Although such dire prognostications are not new, they have in recent years taken on new urgency. Fourth-generation languages have made inroads into many mainstream data processing environments. In some cases, they have even supplanted the venerable Cobol entirely.

Fourth-generation language vendors have been able to capitalize on perhaps the two most widely shared concerns of DP professionals: increasing programmer productivity and easing maintenance work loads. Many critics contend that Cobol is not effective in solving those problems, that it is a dinosaur born in a time when both the demand for applications and programmer salaries were much smaller.

Agreeing that portions of that criticism are valid, proponents claim the nearly ratified Cobol 85 standard does much to make Cobol a more viable tool for systems development. Advocates of Cobol say the enhancements in Cobol 85 make the language more productivity oriented and aid in the development of systems that are more easily maintained.

"In Cobol 85, we added new features, such as structured programming facilities, additional verbs and new ways of delimiting statements," said Lemuel Skidmore, vice-chairman of the American National Standards Institute's X3J4 Cobol group. "We also clarified many ambiguities."

According to Jerome Garfunkel, also a member of X3J4 and founder of Jerome Garfunkel Associates, Inc., a Litchfield, Conn.-based Cobol consulting firm (see story page 41), the increasingly onerous maintenance task was foremost in the minds of Cobol 85 drafters.

"If I had to pick one area in which Cobol 85 is strongest and [name] the group it will benefit most, it would be the maintenance function and maintenance programmers," Garfunkel said. "One of the biggest lessons we learned is that we better build systems expecting them to change. There is no language I know of that is better for that task than Cobol."

"Most of the fourth-generation languages can do what Cobol does and do it more efficiently," he said. "But you have to consider why Cobol was developed in the first place. Industry needed a common, portable language. I see nothing in the way of fourth-generation languages emerging to take on that role."

— John Gallant

TIRED OF BEING DUMPED ON?

LEARN HOW TO SOLVE THE TOUGHEST CICS INTERNALS PROBLEMS.

SysEd's CICS Internal Architecture course is for systems programmers and others who are up to their eyebrows in the toughest kind of programming, debugging, performance and recovery problems.

This demanding course eliminates the mystery surrounding the internal workings of CICS so that students have the knowledge and skills they need to approach both transactions and systems dumps confidently, and handle performance and application design problems in an organized, informed manner. There is no other source for this kind of in-depth training...*anywhere.*

SysEd's internals courses are held weekly at our computer training centers in New York City, Chicago and San Francisco—or at your own location. Special weekend courses for consultants are available.

For information, call Dave Shapiro (212) 564-9147/48/49.

SYS-ED

35 WEST 35th ST., NEW YORK, N.Y. 10001 • (212) 564-9147/48/49

ORACLE

The portable version of IBM's DB2 and SQL/DS

COMPATIBILITY

The ORACLE relational database management system is fully compatible with IBM's SQL/DS and DB2. SQL/DS and DB2 represent IBM's latest generation of database management technology for IBM's largest computers. ORACLE's capabilities and user interface - the SQL language - are identical to those of SQL/DS and DB2. Programs written for SQL/DS and DB2 will run unmodified on ORACLE.

PORTABILITY

SQL/DS and DB2 run only on IBM mainframes; ORACLE runs on IBM mainframes, DEC, DG, AT&T, HP, STRATUS, and several other manufacturers' minicomputers, and on a wide range of microcomputers including the IBM PC/XT and PC/AT. All versions of ORACLE are identical and include a complete implementation of SQL – not a subset.

CONNECTABILITY

Having the same software running on your mainframe, minis, and micros greatly simplifies the task of connecting your machines into a network. ORACLE's network software allows microcomputer users to directly access data stored in the shared database on the mainframe or minicomputer, or copy that data into the database on their micros and operate independently.

Oracle introduced the first relational DBMS and the first implementation of SQL back in 1979. Today, eight of the ten largest U.S. companies use ORACLE. In fact, INC MAGAZINE ranks Oracle as the fastest-growing software company in the USA. Surprised? Don't be. ORACLE is the number one relational DBMS, with thousands of installations on IBM mainframes, DEC, DG, AT&T, HP, STRATUS and most other vendors' minis and micros. Even the IBM PC.

To attend the next free, half-day seminar in your area or receive additional information, write Oracle Corp., Dept. C4, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350. Following is the ORACLE seminar schedule:

ORACLE Seminar Schedule

Albuquerque	Nov 26
Austin	Oct 3
Boston	Oct 15, Nov 12, Dec 11
Chicago	Oct 16, Dec 12
Cleveland	Nov 5
Columbus	Oct 8
Dallas	Oct 8, Nov 13
Dayton	Oct 9
Denver	Oct 29, Nov 20
Detroit	Oct 22, Nov 12
Houston	Oct 31, Nov 21
Kansas City	Nov 6
Los Angeles	Oct 22, Nov 19
Minneapolis	Oct 10
New Orleans	Nov 19
New York City	Oct 10, 25, Nov 6, Dec 12
Newport Beach	Oct 17
Oklahoma City	Nov 7
Omaha	Oct 24
Orlando	Oct 15
Phoenix	Oct 9

Sperry boosts microcomputer line

"We're committed to becoming a major force in the micro/personal computer world," Battaglia said. He estimated that micro-based products — ranging from personal computers to Motorola, Inc. 68000-based supermicrocomputers — will represent approximately one-third of the total bookings for his division in the fiscal year that ends in March. "Obviously, that's a pretty big number."

The new desktop system is "a very concrete example" of changes that have taken place at Sperry during the past several years, Battaglia said. "First, it's a product that we're getting from outside. The 'not-invented-here' syndrome is a cadaver at Sperry."

Other new directions include the recent move to supplement direct sales with indirect channels, with a sizable fraction of Sperry's 200-member U.S. sales staff dedicated to micro products concentrating on resellers. Finally, Sperry is marketing and promoting new products much more aggressively, he said.

Based on the Intel Corp. 80286 chip running at 6, 7 or 8 MHz, the PC/IT comes with 512K bytes of random-access memory, expandable to 5M bytes; a 5¼-in., 1.2M-byte floppy disk drive; two asynchronous ports and a parallel port; eight expansion slots; Microsoft Corp.'s MS-DOS 3.1 and GW Basic; and a clock. An expanded unit with a 44M-byte, unformatted hard disk drive and controller costs $5,150. Running under Microsoft's Xenix operating system, a $995 option, the system can support up to nine users.

Standard interface for office system

The Sperry Link software for Sperry and IBM Personal Computers, scheduled for announcement later this month, will give users of those machines a standard interface for the Sperry office system, said Joseph Gariano, director of micro products marketing. "The user will always see the same screen." Base price for a package providing the Sperry Link screen and word processor is $350, and many other Sperry Link applications also will be offered.

PC/On-Line, which Sperry quietly began shipping in August and which will officially debut later this month, is a menu-driven software package that links MS-DOS-based personal computers with the company's 1100 series mainframes. The software has the following three components:

- On-Line Disk, priced at $630, gives the micro user access to mass storage on the mainframe.
- On-Line Extract, which also costs $630, permits the personal computer user to extract Mapper data from Sperry 1100, System 11, Mapper 10 or Mapper 5 machines and then manipulate the data locally.
- On-Line Transfer, at a cost of $250, handles synchronous transfer of Ascii files between Series 1100 hosts and the micro.

The PC/HT, which Sperry began delivering in August but will be officially rolled out next week, is an enhanced version of the basic Sperry Personal Computer. A base configuration costs $2,322 with monitor and 256K bytes of internal memory. A high-end system with a color monitor and a 20M-byte hard disk drive will cost $4,750.

From page 1

IDC report: DP spending slump continues for second year in a row

for the variance is that most independent software producers charge for software licenses by site, which means that a single-CPU site would pay as much for a general ledger software package license as would a large site with several more powerful computers.

There appears to be a movement toward the need for more programmer/analysts with specific applications experience as opposed to Cobol programmers who can "crank out the code." Operations and maintenance are absorbing an enormous number of the available personnel in spite of the rise of productivity tools. "One begins to fear that the picture will take on the image of a sinking lifeboat 100 feet offshore. Everybody is bailing furiously, and nobody has the time to row or steer," the report stated.

DP spending as a percentage of revenue varies widely by industry type. In banking, DP spending as a percentage of assets was 0.35%. The highest figure was for education, which showed DP spending at 2.8% of revenue. Other industries included primary metals at 1.65%, manufacturing at 1.7%, utilities at 1.1%, insurance at 2.2%, transportation at 1.35%, state and local government at 1.7% and retail at 1.2%.

According to the report, 79% of companies with DP budgets in the $5 million-to-$10 million range claim to have full control of microcomputers in their organizations, but that claim varies widely among companies. For instance, 47% of the smallest companies, having up to $1 million budgets, claim such control, and 49% of companies with budgets of more than $10 million purport to have full control of micros. Fifty-nine percent of $1 million-to-$2 million budget companies make the claim, as do 53% of companies in the $2 million-to-$5 million range. Overall, 56% of all companies surveyed said the DP department has full control of microcomputers.

An IDC study based on other research and mentioned in this survey showed that four out of five personal computers are stand-alones, and for those that do talk to others, the communication is focused on sharing the same printer and hard disk.

The report, which costs $1,500, is available to IDC's user client base and its vendor client base.

Enable 1.0...
"everything Symphony hoped to be."
PC Magazine

"Quite simply, this package has so many outstanding attributes that even the worst skeptics of integrated software have to be impressed. The spreadsheet is very close to 1-2-3; the word processor combines the best thinking of WordStar, MultiMate, Volkswriter, and EasyWriter; the data base offers the functionality of dBASE II, but with many of the ease-of-use features of PowerBase; and the program offers business graphics and telecommunication. Taken as a whole, Enable surpasses the functionality of Symphony, Framework, Aura and Open Access."
IBM PC Update
December, 1984

"... as powerful as a collection of stand-alone programs, and it offers the benefits of integration to boot. What's more, it runs in only 192K bytes of memory."
ComputerWorld
March 20, 1985

"Offering true integration among all of its applications modules... [Enable is] a powerful production tool that can serve everyone in the office, from data entry personnel to the vice-president of marketing. Each module could stand as a full-powered application in its own right."
PC Magazine
February 19, 1985

"Enable is one of those programs that can be up and running with most of the features you need in a few hours. As you need more, you can get deeper into the program and learn at your own pace."
InfoWorld
January 21, 1985

Enable first in "Performance" rating—including speed and capacity of all modules tested. Enable first in "Versatility" rating—including power and functionality of all modules tested. Enable rated first in overall evaluation of the word processor module.
Software Digest Ratings Newsletter
Rating of 15 Integrated Products
December, 1984

"Enable, a five-function integrated system from The Software Group, merits a close look by any individual or organization interested in a solid package that is well balanced in all of its applications."
Popular Computing
March, 1985, Paul Golden, Raymond Head, Yoram Lirtzman, Michael Wilding

"... if an office is looking to step up to across-the-board integration with a multitude of functions... this is the one program to seriously consider."
Personal Computing
March, 1985

"Enable welds its five applications together with outstanding integrity—yet each is exceptionally full-functioned in its own right."
Business Computer Systems
January, 1985

"Enable... may be the first program to make you give up your dog-eared WordStar, dBASE II, Smartcom and Lotus 1-2-3 disks."
Business Software
April, 1985

"Enable may legitimately claim to be the only package you'll ever need."
Computer Buyer's Guide and Handbook
November, 1984

Ashton-Tate unveils Framework II integrated software

By Jeffry Beeler

PALO ALTO, Calif. — Ashton-Tate of Culver City, Calif., last week replaced its Framework integrated software system with an enhanced version that reportedly provides improved ease-of-use features for computing novices and increased performance for power users.

Framework II, priced at $695, made its debut during a Sept. 10 press conference, where Ashton-Tate's Publishing Group simultaneously introduced two members of its Decision Maker series of integrated software support programs.

The two modules include Project Analysis, which helps managers to prepare conceptually for upcoming jobs and to allocate available resources; and Decision Modeling, which allows executives to identify and assess competing alternatives.

Both members of the Decision Maker series reportedly complement the capabilities of Framework II, which consists of two main parts — a spreadsheet and a word processor. The halves, which are tightly integrated to permit each to exchange data with the other, are said to boast improvements over their Framework I predecessors.

On the spreadsheet side, Ashton-Tate has revamped Framework II to perform financial calculations twice as fast as its original integrated software system, according to the product's chief architect, Robert Carr. The vendor has also reportedly doubled the efficiency with which a microcomputer-resident spreadsheet uses its available random-access memory (RAM).

On the word processing side, meanwhile, Ashton-Tate has upgraded the latest version of its integrated software system with the addition of an 80,000-word spelling checker, which works equally with Framework II's spreadsheet.

Supporting the product's two primary software modules are a number of ancillary capabilities, including telecommunications, graphics and data base management, all of which are reportedly integrated with the rest of the system.

Framework II is configured to accept Ashton-Tate Dbase III and Dbase II applications automatically, and other custom applications may be installed into its pull-down menus, the firm said.

Like the year-old integrated software system it replaces, Framework II runs on IBM or "100% IBM-compatible" personal computers, according to Ashton-Tate President Edward Esber Jr. Framework II requires 384K bytes of RAM plus at least two 360K-byte floppy disk units and becomes available for shipment at the end of next month.

Through year's end, users can upgrade from Framework I to II for $140. The two Decision Maker series packages, meanwhile, each sell for a suggested retail price of $69.95.

Enable 1.1...
now 15 ways better.

When we introduced Enable in late '84, we made two promises:

1. Enable would be the industry's first truly full function, totally integrated system.
2. We would continue to enhance Enable with new features and functions to always give you the best value in microsoftware.

The reviews on the left demonstrate our success with promise number 1.

The new features highlighted below do the same for promise number 2.

And this is merely the beginning. No matter what direction future micro technology takes, Enable, with its open architecture, will continue to advance right along with it. And with you. To ensure this, we've established an end user advisory board to tell us what you want. And we *do* listen.

Now for the new.

System-wide Features

- Data transfer facility—beyond "cut and paste"—lets you transfer specific data from one module to another, linking files across all applications. For example: a field in a DBMS record can contain the name of a spreadsheet, a word processing document or selected records from another database. When viewing that record, Enable will automatically display the other "linked" file.
- User-designed menu generation—tailor Enable to your specific needs with your own unique menus, help and error messages, pop-up windows, and full choice of colors.
- Window to DOS—execute DOS functions without leaving Enable.

Word Processing

- Automatic indexing and tables of contents.
- Multiple column copy and move.
- MultiMate compatibility. (We already gave you WordStar, EasyWriter and Volkswriter.)

Spreadsheet

- User configurable—choose among 6 varied shapes from 255 rows × 255 columns to 4095 rows × 15 columns.
- 1-2-3 macro support—automatically convert your existing Lotus macros or create your own Enable spreadsheet macros with all the same macro commands you used in 1-2-3.
- Greatly increased Lotus file conversion (twenty times faster!).

DBMS

- Comprehensive file maintenance capabilities—verify, copy, update and merge functions.
- Powerful command language—commands for writing routines, reading and updating files, generating printed reports. (All the power of dBASE III without the complexity.)
- Expanded record size—up to 254 real, virtual and computed fields.
- Direct conversion of Lotus spreadsheet data into Enable database format. (Now you can use Enable's full-function DBMS instead of the limited database functions of the Lotus spreadsheet.)

Telecommunications

- Terminal emulation (VT-100 and other popular models).

Graphics

- Increased printer and plotter support (twice as many leading models).

And now for the *really* good news. All this functionality can be at your fingertips on the standard 256K IBM PC, up through the PC/AT (and true compatibles). All for $695.

You can, at last, get out of the quagmire of trying to solve your multi-purpose needs with single purpose software.

Your training and support costs will drop, data sharing will rise. Dramatically.

You can even protect your investment in Lotus 1-2-3, MultiMate, WordStar and dBASE II because Enable is fully compatible with those and other single purpose programs.

And, since trying is believing, we'll send you a demo system for a token $12.95.

If your dealer doesn't carry Enable (and you should raise Cain if he doesn't), give us a call and we'll put you in touch with one who does.

Just dial 1-800-932-0233. In New York, dial 1-800-338-4646.

Signal bows, 1-2-3 upgrade policy out

CAMBRIDGE, Mass. — Almost five months after announcing an enhanced version of its best-selling 1-2-3 productivity package, Lotus Development Corp. last week released information on its upgrade policy. As expected, separate arrangements will be available next month for corporate and single-user customers.

Separately, Lotus unveiled Signal, a $595 hardware/software combination that delivers and analyzes financial market data for personal computer users.

Upgrade kits for 99 or fewer copies of 1-2-3 Release 2 will be priced at $150 each, Lotus said. In 100- to 1,000-unit quantities, upgrades will cost $125 each, with the price dropping to $100 each for larger orders.

Lotus sales representatives will coordinate volume upgrades directly with corporate customers, the vendor said. These customers may submit purchase orders directly to Lotus and will not be required to return the original 1-2-3 disks as long as they agree to destroy them.

The vendor will mail upgrade announcement kits to individual registered users next month. Users who do not receive these kits should register for them by returning their warranty cards to Lotus. Individual users must return their system and utility diskettes to get the upgrade. All users who purchased 1-2-3 after April 23 may receive the new release for free, Lotus reiterated.

The Signal product will receive real-time market quotations broadcast via FM sideband transmission and analyze the data on a personal computer using 1-2-3 or Lotus' Symphony software.

Users will pay Lotus monthly fees, with a base fee of $80 plus $20 per exchange. They will also pay exchange access charges, said Alexander Crosett, marketing manager for Lotus' Information Services Division.

Typical users are likely to pay $125 a month and more, he estimated.

Signal is scheduled to be available the first week of October in 12 major metropolitan markets.

Reagan bans high-tech sales to South African agencies

Apartheid-enforcing groups targeted

By Mitch Betts

WASHINGTON, D.C. — President Reagan issued an executive order last week banning all U.S. exports of computer hardware and software to certain agencies of the South African government that administer its apartheid system.

In an apparent response to bipartisan support in the U.S. Congress for economic sanctions against South Africa, the president reversed his earlier opposition to sanctions and issued Executive Order 12532. The move at least temporarily kept the U.S. Senate from voting on legislation containing a computer ban and other sanctions [CW, Aug. 12].

Concerning computer technology sales, the executive order used language similar to that used in Congress' Anti-Apartheid Act of 1985. The order stated that, effective Oct. 11, the following transactions are prohibited: "All exports of computers, computer software or goods or technology intended to service computers to or for use by any of the following entitites of the government of South Africa."

The order listed the affected agencies as the military, the police, the prison system, the national security and weapons research agencies, the administering authorities for the black passbook and similar controls and any other apartheid-enforcing agencies.

Trade statutes set as legal basis

The legal basis for the order was a set of emergency trade statutes that permit the president to declare a national emergency and to issue trade sanctions. The order said the action was justified because "the policy and practice of apartheid are repugnant to the moral and political values of democratic and free societies," run counter to U.S. policies and endanger U.S. interests in South Africa.

Reagan's order also authorized the U.S. Secretary of Commerce to issue regulations that would be necessary to carry out the computer ban and to implement a system of end-use verification to ensure that any computers exported directly or indirectly to South Africa will not be used by any apartheid-enforcing agency.

The Computer and Business Equipment Manufacturers Association (Cbema), the trade group for the U.S. computer industry, announced that it will cooperate fully with the president's order.

"Our industry has long cooperated with the 1979 ban on computer sales to apartheid-enforcing agencies," said Vico E. Henriques, president of Cbema, referring to a weaker provision in the Export Administration Act. "We join all fair-minded Americans in our condemnation of South African racial policies," Henriques said.

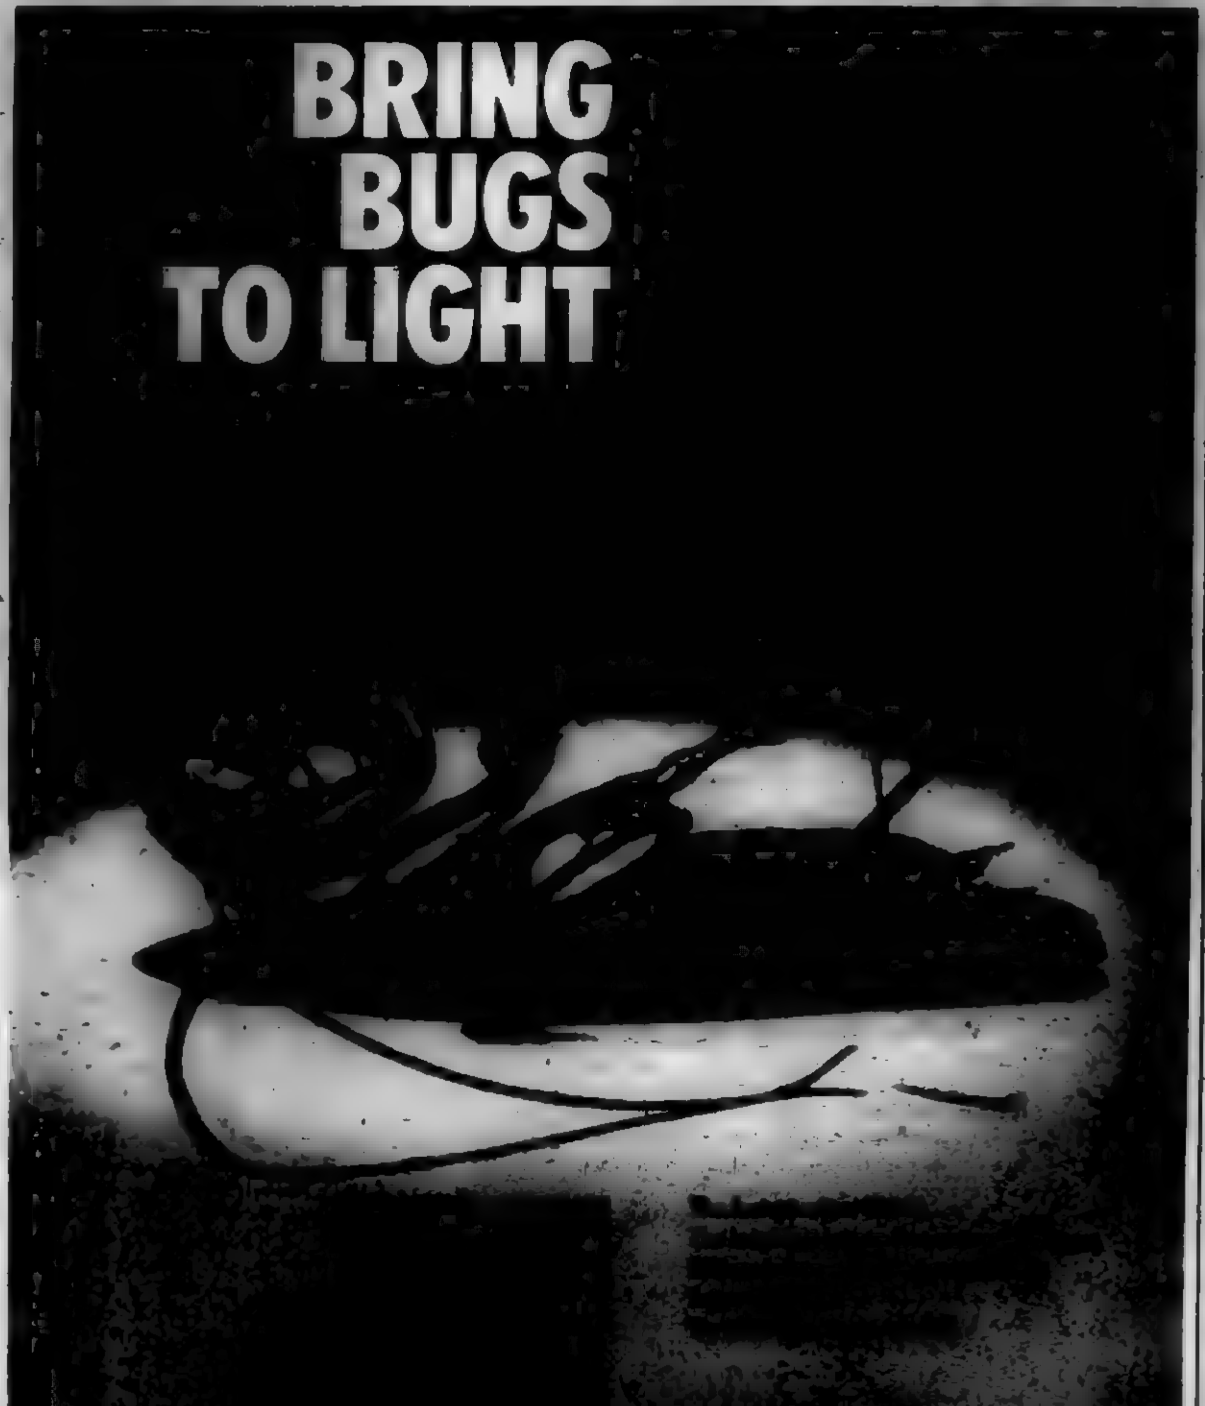
Cbema supports a ban on sales to apartheid-enforcing agencies but opposes broader prohibitions against all computer sales in South Africa [CW, June 17].

Computers used to track blacks

Congress' rationale for a computer ban was that South African agencies use computers to monitor and track blacks throughout their lives to enforce racial segregation and to identify blacks living in white areas illegally, according to U.S. Rep. Howard L. Berman (D-Calif.).

From the age of 16, all blacks in South Africa must carry passbooks indicating where they have permission to live and work, Berman explained in recent congressional testimony.

The South African government maintains extensive computerized records on all blacks — their birthplaces, employment histories, family members, residences — and this information is periodically checked against the blacks' passbooks, he said.



U.S. military to automate weapons manuals, drawings

Long-range program could create paperless Pentagon

By Mitch Betts

WASHINGTON, D.C. — A U.S. Navy official last week disclosed that the U.S. military, in cooperation with defense contractors, plans to computerize fully its weapons manuals and technical drawings.

Ultimately, the long-range automation program could create a virtually paperless Pentagon weapons operation. Technical data from the manufacturers' computer-aided design and manufacturing (CAD/CAM) systems could be fed into a central data base stored on optical disks, ready for easy updating and on-demand printing of operation and maintenance manuals and drawings.

Speaking at a special Federal Computer Conference session, William Gorham, staff engineer at the Naval Supply Systems Command, outlined the ambitious program, called Computer-Aided Logistics Support (Cals).

The Cals program was sparked by paperwork problems at the Department of Defense weapons support offices, including out-of-date manuals, incomplete and illegible engineering drawings and repositories of manuals that are "voluminous, redundant and excessive," Gorham said. With President Reagan's arms buildup, he said, "We are becoming inundated with paper and microfilm."

Furthermore, scandals about overpriced spare parts for weapons systems have pointed out that the Pentagon needs to retain even more technical data so it can encourage more competition for spare-parts contracts, Gorham said.

Recognizing these growing problems, the Pentagon and defense contractors last year conducted a six-month joint study on automating technical data about weapons systems, using the contractors' CAD/CAM systems.

Gorham predicted that the Cals program will be endorsed officially by Deputy Secretary of Defense William H. Taft IV sometime in the future.

Bradford Smith, chief of the manufacturing systems group at the National Bureau of Standards (NBS), said the Cals program "will change the way DOD does business, and by extrapolation, may affect all other government agencies."

Gorham said the key to the Cals effort will be the incorporation of data exchange and graphics exchange standards in CAD/CAM and other computer systems involved, with the help of the NBS. Pilot demonstrations in each military service are planned for the 1986-89 period to demonstrate the feasibility of the program, he said.

The transition to the fully automated system will require three phases, Gorham said, with each phase moving toward the goal of a single data base with a data dictionary.

The first phase will include the digital automation of specific types of logistics items, such as engineering drawings, operations manuals and training documents. The second phase will require consolidation of these digitized products into three major data bases, using local-area networks that link the manufacturers with the military document repositories.

Gorham said the third phase will further consolidate the data bases into a single data base that has fully interchangeable data elements and single-point updating with the help of a standard data dictionary.

The forthcoming Pentagon policy statement will officially launch the Cals program by requiring each military service to designate a major weapons system for the pilot program, Gorham said.

Oracle releases DBMS security audit features

By Mitch Betts

WASHINGTON, D.C. — Oracle Corp. of Menlo Park, Calif., announced at the Federal Computer Conference last week that the new release of its Oracle data base management system software will include a security audit facility for commercial and government users.

The software feature, part of the forthcoming Oracle Version 5 DBMS, was urgently requested by military intelligence agencies seeking the ability to conduct retrospective audits of user attempts to access data bases, according to Ken Cohen, the product marketing director..

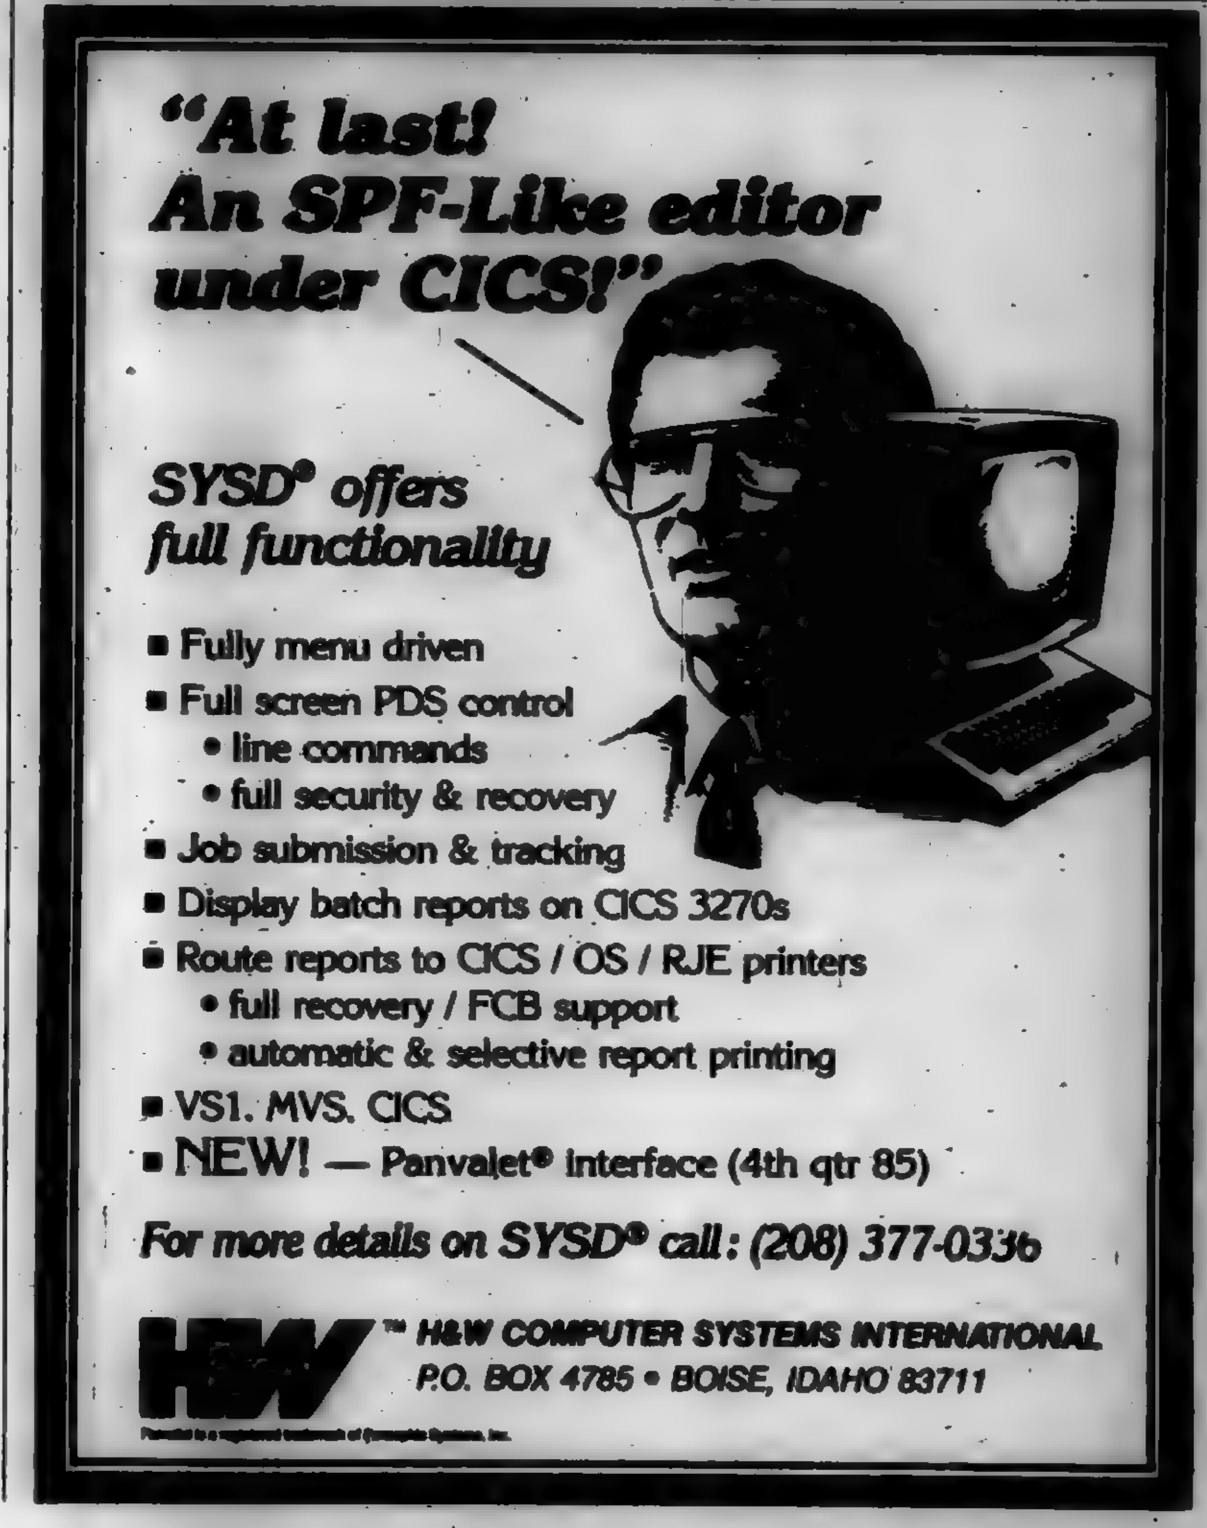
The facility provides an audit trail of the user name and identification, use or attempted use and logins and attempted logins, Cohen said. Consequently, a data base administrator or security officer can use Oracle's version of the IBM-developed SQL to produce periodic audit reports or to answer ad hoc queries about data base access, he said.

Cohen said the security facility was developed in cooperation with a U.S. Navy intelligence agency and apparently meets the audit requirements of the government's Trusted Computer System Evaluation Criteria document [CW, Sept. 17, 1984].

Oracle also announced that it will enhance the DBMS to permit administrators to restrict user access to data files based on the specific terminal from which access is attempted.

Both security enhancements will be included in the forthcoming Version 5 at no extra charge to current Oracle customers, according to Cohen.

He added that the security facilities will be released Oct. 10 for Digital Equipment Corp. VAX minicomputers and thereafter will be ported to a wide variety of hardware and operating systems, including IBM mainframes and microcomputers.



"At last!
An SPF-Like editor
under CICS!"

Encore Computer ushers in Multimax supermini line

By Mitch Betts

WASHINGTON, D.C. — Encore Computer Corp. chose the Federal Computer Conference held last week to introduce formally its Multimax line of general-purpose superminicomputers and related products.

In other efforts to appeal to computer buyers in the U.S. government, Encore officials said the firm's products will use existing government communications protocols and standards in its products and will place its eastern U.S. sales and operations headquarters in Greenbelt, Md.

Encore officials touted the Multimax as the first commercial product to permit as many as 20 main processors to share a common memory in a high-performance environment.

"With 20 processors installed, we have observed 96% of the ideal, aggregate performance on memory-intensive tests, even with I/O traffic," said Russell L. Moore, vice-president of hardware development, who added that the architecture will facilitate parallel processing.

Officials of Marlboro, Mass.-based Encore said Multimax performance is from 1.5 million instructions per second (Mips) to 15 Mips, in 1.5-Mips increments. Memory capacity is from 4M to 32M bytes, and the system contains from one to 10 I/O channels. The 32-bit multiprocessor is organized around the Nanobus, the firm's own high-speed propriety bus.

System prices begin at $112,000 for a dual processor, 1.5-Mips system with 4M bytes of shared memory, one I/O channel, one 515M-byte disk drive, one 6.3K bit/in. ½-in. tape drive and one workstation or console printer. A large system configured for parallel processing applications, with 20 processors operating at 15 Mips, 32M bytes of memory and the same peripherals, costs $340,000.

The prices for both configurations include a new multiprocessor operating system based on AT&T's Unix, program development tools and a C compiler, the vendor said.

First customer shipments are planned for October and November, officials said.

The announcement also included the introduction of the following products:

■ The Umax 4.2 multiprocessing operating environment, Encore's version of Unix 4.2 BSD with parallel and distributed processing extensions, is used as the operating system for the Multimax superminis. Officials said the design allows all processors concurrent access to system data structures.

■ The Host Station family of displays and workstations, Models 100, 110 and 550, are priced at $3,495, $3,795 and $14,000, respectively, in single-unit quantities. The Host Station 100, introduced in April, offers high-resolution graphics, and the 110 adds downloading capability for custom bit-mapped fonts for the computer-aided publishing market. The Host Station 550 has an additional 32-bit processor for interactive applications requiring local computational power and operates under the Umax operating system.

■ The Annex network communications computer is said to be a 32-bit subsystem for connecting up to 16 high-speed, 38.4K bit/sec. serial ports to local-area networks. The vendor said it provides networking and I/O processing for peripheral communications, thus freeing shared computers for user tasks. The Annex family has two models, the $6,000 UX terminal server and the $8,000 MX Multimax I/O processor.

Dema meet eyes data center productivity

By Mitch Betts

WASHINGTON, D.C. — Much of the talk last week at the Data Entry Management Association's (Dema) ninth annual conference focused on the search for methods to increase the productivity at data centers.

Carol Ann Meares, acting director of the U.S. Department of Commerce's productivity center, said U.S. companies need to have strong productivity improvement strategies to compete in the international marketplace. She said productivity improvement is an ongoing, multifaceted process — not a single program — that must have visible support from top management.

"For example, make [productivity] improvement a regular discussion topic at staff meetings. Some organizations establish a high-level steering committee to guide and review improvement efforts," Meares said.

Meares also urged managers to communicate plainly their plans to prevent a rash of negative rumors that management wants a "work speedup." She said management should encourage workers to participate in making the decisions about productivity improvement and should stress the benefits for employees.

"Employees are going to ask, 'What's in it for me?' Continue to point out how they will benefit —

Bell Atlantic readies ISDN for 1987 availability

By Bryan Wilkins

WASHINGTON, D.C. — Bell Atlantic Corp. last week unveiled its version of an Integrated Services Digital Network (ISDN) and disclosed its plans to make the service available to businesses in 1987 if business conditions warrant it.

The ISDN demonstration, centered on the regional holding company's primary central office switch in the nation's capital, made use of the company's existing Centrex service, which Bell Atlantic is vigorously trying to revive in the face of contract expirations by many U.S. agencies.

ISDN is the ability of the telephone network to permit users to perform telephone voice communications, data transmission from terminals and from computers to terminals, videoconferencing and facsimile transmission simultaneously and to serve as an electronic mail messaging system.

Digital switches essential

Permitting these types of simultaneous functions on the telephone network is essentially made possible through the installation of stored, program-controlled digital switches, devices that both local exchange telephone companies and long-distance carriers are putting in place despite the obstacles presented by the different interfaces in various vendors' equipment attached to the network.

Resolving standards issues to permit universal interface to an ISDN network will be critical to the pace of introduction and acceptance by customers, said Richard Eichorn, Bell Atlantic's assistant vice-president for product line management.

The Bell Atlantic demonstration connected four terminals, two of which were new integrated voice/data terminals manufactured by NEC America, Inc. Communications by voice and data simultaneously over the same line were carried on as well as facsimile machine transmission.

The Bell Atlantic demonstration permitting dissimilar terminals to carry on voice, data and facsimile communications simultaneously is dependent on a so-called terminal adapter located at the user's desk, which converts the protocols of each unit into standard language for transmission over Bell Atlantic's lines.

Ultimately, these protocol converters would be incorporated into vendors' equipment, Eichorn said.

An ongoing standard issue that is still to be resolved in the U.S. is whether to adopt the network interface system that has been adopted by most European countries that have established a universal interface to ISDN for equipment. In the U.S., some vendors are holding out for the interface to the ISDN network to take place at the telephone company switch where the protocol conversion would be performed.

Bell Atlantic last week said it supported the adoption of the European "T" standard interface. "It's impossible to overstate the importance of establishing one uniform set of standards for ISDN," said Roger Nucho, Bell Atlantic's staff manager for network architecture and standards.

From page 14

Dema meet eyes data center productivity

less frustration and fewer problems, improved working environment, more satisfying work, feelings of accomplishment, recognition and a better chance for raises in the future," Meares said.

She noted that there is a large amount of helpful information on productivity available from the government, productivity research centers, trade associations and trade newspapers. Meares said the Commerce Productivity Center in Washington, D.C., is a clearinghouse for such information.

Paul Banks, DP manager for Mitchell, Silberg & Knupp in Los Angeles, reported that an effective incentive pay program for data entry workers can increase productivity by 45%, as well as improve employee morale. He defined incentive pay as "compensation aimed at increasing production and encouraging progress toward company goals.

"It has been my experience that an incentive system can provide a significant return on investment — four to one or higher — for shops with 20 or more operators, based on wage costs alone," Banks said. He recommended that an incentive program be considered for data entry offices with more than six operators.

Increasing production rates is best accomplished when goals are understood, mutually acceptable to management and operators and supported by statistical information, added Frances Arakawa, manager of the data entry department at Combined International Corp. in Chicago.

Barbara A. Bradley, data entry consultant at Springs Industries, Inc. in Lancaster, S.C., stressed the importance of accurate job descriptions, rewarding career paths, fair performance standards and regular performance appraisals for data entry operators. These management practices encourage initiative and a sense of responsibility among employees, she said, and are strong motivational forces.

Ouch!

If you bought a computer system with a Unix™ operating system for business data processing, this is going to hurt. Nothing will serve your business needs better than the Ultimate™ operating system.

Sure, Unix is fine for scientific applications. After all, it was designed to serve scientific researchers—a technically sophisticated group of people. But the Ultimate operating system was designed specifically for business data processing. It's not only far easier to use—it's the most powerful tool your business can have.

But don't take our word for it. We invite you to take your business application and benchmark us against Unix or any other operating system. Odds are, we'll win every time. And for ease of use, flexibility, speed and efficiency, we always come out on top.

If that doesn't hurt enough, consider: this operating system is already in use on computers manufactured by 19 of the leading companies including IBM and DEC. Over 30,000 have been installed worldwide. And satisfaction levels are overwhelming.

Only the Ultimate operating system is implemented beyond the software—right in the hardware—to provide unmatched speed, efficiency and power. It conserves computer space and resources. It puts all the information you need for creative problem solving and decision making right at your fingertips.

Based on everyday English words and phrases, its proprietary language is a breeze for the beginner as well as the expert programmer. Its dictionary file system makes information instantly available and gives you exceptional flexibility in report writing. Unlike other systems where the reports in the system are the only reports you get, Ultimate lets you quickly design your own reports, assembling information into the form most useable for you.

The Ultimate Corp.'s powerful operating system and hardware easily meet the demands of complex applications involving timesharing, transaction processing and data base management—all running simultaneously. And, to add to your Unix pain, the Ultimate system is easily expandable, cost-effectively evolving with your changes and growth.

For those of you who just bought a Unix-based system for your business—our condolences. For those of you who have been considering it—it's not too late! Call us today at (201) 887-9222, ext. 324, and avoid the pain.

EDITORIAL

Computers and South Africa

The turmoil surrounding contemporary South Africa has spilled over into the computer community, both here and in Pretoria. *Computerworld* interviews in last week's issue reported that members of the South African computer community decried U.S. efforts to restrict sales of computers to those agencies administering the system of apartheid, labeling such action as restrictive and punitive.

The day after publication of these comments, President Reagan officially imposed computer sales sanctions against South African government security agencies. The Executive Order, in effect, superimposed the stamp of White House decree on moves that many U.S. computer manufacturers have already taken voluntarily.

No one seriously presumes, however, that the actions of President Reagan will have appreciable effect on the workings of the South African government. The real point of the U.S. sanctions is to add to the pressure building on the South African government to institute reforms, and any move in this direction must be viewed as positive.

There is another issue involved, one that speaks to the central involvement of computer usage in this dispute. To our knowledge, this is the first time that the matter of *moral effect* has been applied to computer manufacturing: Do the people who produce machines that are used in the pursuit of morally objectionable ends share responsibility for the ultimate effect with the people who actually use them?

Whether or not this is the first time this issue has been touched upon in international political debate, we are certain that it will not be the last time. As computer technology comes to play an increasingly greater role in the implementation of controversial defense, security and social policies within the U.S. and among its allies, computer manufacturers, their officers, employees and investors can expect to be confronted time and again by opponents of these policies seeking to accrue public support.

The U.S. computer community must begin to think through the implications of this issue and be prepared to deal with its ramifications.

On the specific matter of computer sales to the South African government, we believe that the U.S. computer industry has thus far acted responsibly. Now that it has become a participant — albeit unwilling — in this political struggle, more voices must be raised in this deeply important matter. There is room for debate about the motivation for and the effect of sanctions such as these now imposed by the Reagan administration. There is no room for debate over the goal.

We join all of those who denounce institutional racism as practiced by the government of South Africa.

Notes & comments

Before it recedes too far into the past, we must make mention of *Playboy* magazine's annual "Back to Campus" guide (September 1985), and the entry under the heading of The Hot Major. It read, "Ask anyone: The hottest field for the Eighties is computer science." Does this mean no more jokes about nerds in white socks toting slide rules? We'll see. Meanwhile, our congratulations to our readers for their wisdom and foresight.

LETTERS

Government certification suggested

In the Reader's Platform "Certification: A gauge for computer professionalism?" [CW, July 22], the author implied some sort of national recognition for the certificates awarded by the Institute for the Certification of Computer Professionals (ICCP). Unfortunately, no such recognition exists, although the ICCP would like to believe that it does.

Achieving national certification is indeed something for which we should all strive. However, certification must be taken out of the hands of the ICCP and properly placed with the federal or state governments just as it is for attorneys and doctors.

Up to this point, I am not sure how much influence ICCP certification would have played in my hiring practices except to tell me that the candidates were able to guess correctly at a number of inscrutable questions on a five-hour test. It would certainly not have contributed to their professional, ethical or legal postures.

VIEWPOINT

Avoiding security disasters

MANAGEMENT MATRIX
Walter F. Cutie

"Suppose," the riddler asked, "that a flood was coming. What would you do?"

"Go up to the roof," was the answer.

"Now suppose that you knew a tornado was coming. How do you prepare for that?"

"Hide in the basement, I guess."

"But what if you prepared for the tornado, and a flood came instead? What would you do then?"

While you consider the answer to that, consider the similar problem with security in information systems. It's a matter not only of how well you prepare but also for which threat you prepare.

There have been a lot of tornado warnings in recent years. We are given images of swashbuckling juveniles baffling old pros and getting book contracts for their escapades; reports of gallant attorneys with the words "computer law" on their business cards leaping to the defense, speeches by politicians rising to the challenge with bills that could well be infringements of civil liberties. Everybody into the cellar.

Although vandals with their electronic spray cans do pose somewhat of a threat to your system, they are more of a tempest in a teapot than a full-blown tornado. Given the funds, it is easy to protect yourself. The real problem is not the juvenile genius but the poorly informed financial executive who could not see the wisdom of a callback system on the corporate computer and deleted that budget item once too often.

Think about it for a moment. If you had all the requisite technology in place, who could possibly defeat a callback system? Who could change a telephone number in a secure file without leaving a trace? Who could know the key to an encrypted file? Someone on the inside, that's who.

Here lies paranoia. Security based on universal suspicion views information as a kind of intellectual crown jewel. That begets a lockup mentality, conjuring up images of cops and robbers, guards and guns.

There are two problems with the lockup approach. One is that it puts the complete responsibility for security in the hands of a separate group that can't help but be always one step behind the group that creates the thing protected. The other problem is that, since the whole setup is all stick and no carrot, there will be a natural tendency for the programming staff to view security as a nuisance, a clumsy obstacle to be circumvented. The more the staff views it that way, the more expensive, complex and ineffective the security system becomes.

> *Who could change a telephone number in a secure file without leaving a trace? Someone on the inside, that's who.*

Even when the security procedures are followed to the letter, they may not work. There is a story about a systems operator for a lockup installation who reported a problem with a disk drive and called in a service technician. The tech said that the drive would have to "go back to the shop" and trundled it out to the door. Following official published procedures, the guard checked the tech's name, identification, time of arrival and departure. He took the trouble to log the serial number of the drive and obtain authorized signatures on a fistful of forms before passing the tech and the unit out the door. Nobody had said anything about checking for a disk pack in the drive, so 300M bytes of confidential files went out the door too.

Information can't really be locked away like a valuable jewel. So who shall guard the guardians? To a great extent, the information systems staff must guard itself. Because your systems professionals are the best qualified to breach security, scary as that idea is, they are the best qualified to maintain it.

You can do it in three steps: Set up a system with a minimum number of rules; write the rules so that it is easier to follow them than to break them; enforce the rules positively so that people will want to follow them for reasons other than fear of punishment.

To minimize the number of rules, it's essential to establish a group identity. Behavior is governed more by a sense of what it means to be a good member of the group. One way to establish this is to publicize, within the group, instances where security might have been compromised but was not because of someone's sensible actions. It takes some thought to come up with rules that are easier to follow than to break, but you can do it. Let's suppose that you require passwords to be changed monthly. You can double-check and harrass and reprimand to get it done, or you can simply modify the system so that access is denied to users with passwords more than a month old.

Positive reinforcement is more effective than negative, and enforcement within the group is likely to be more effective than enforcement from the outside. One possibility is a reward for those with unblemished security records over some period. The reward could be cash or time off. Whatever it is, make it significant. Consider the expense of the alternatives before you consider the expense of the reward.

Tornados are capricious things, but floods are predictable. If everybody works together to put in flood control ahead of time, then everyone can be safe from either in the basement. Security is everybody's business.

Cutie is a senior associate with Nicholas DeMaio Associates in Bryn Mawr, Pa.

Alternative approaches for successful prototyping

QUALITY
Wayne Smith

Too frequently, the traditionally casual development group may try to excuse its ad hoc approach to software development by claiming to be doing prototyping but with little understanding of the critical prerequisites for a successful prototyping project. When we examine the prototyping issue in depth, we see that a key point of confusion lies in the term itself. Actually, there are two distinct types of prototyping.

One is known as requirements prototyping. This approach can be helpful during rapidly changing market or business conditions or during the establishment of a new business function or department. A prototype is used to approximate an initial solution to the problem quickly, say, in one to three months.

The user operates it for a period of time, analyzes feedback and makes refinements, and the process continues until a stable set of business requirements can be established. Then the prototype is discarded, and a more conventional development process is initiated using the results of the requirements prototyping process as the actual specification. In this case, prototyping is a tool that is used for requirements analysis, leaving the remainder of the application development process intact.

The second type of prototyping is known as evolutionary development. This approach is also characterized by an initial approximation of the problem, but the prototype becomes the nucleus of the evolving system. Each evolutionary cycle adds more features. In this case, prototyping becomes a replacement for the entire development process.

The salient feature of either prototyping approach is that a tangible model or prototype is used as a feedback mechanism to help define the final system solution.

All too frequently, an organization may find that prototyping, an apparently productive tool, may lead to the wrong system, to a system that falls short of user expectations or to cost overruns and schedule delays. Prototyping failures are usually caused by one or more of the following problems:

- Not selecting the correct prototyping mode, that is, requirements or evolutionary.
- Not having the proper technical environment to support the prototyping process.
- Not having a sufficiently accommodating user. This is particularly a problem for the evolutionary development mode.
- Not having an appropriate business problem. This is almost exclusively a problem of the evolutionary development mode of prototyping.

Examining the problem categories

Let's examine each of the problem categories separately. Selecting the wrong approach stems from an MIS misunderstanding of the basic motivation for the particular development effort itself.

The requirements prototyping approach should be used when no conventional or alternative technique for requirements analysis can satisfactorily identify and validate the true business requirements.

The evolutionary development prototyping approach, on the other hand, recognizes the inherent failure of the organization and its methodologies to manage change. In other words, the evolutionary development mode of prototyping results in change via the product rather than the process.

Technical environment requirements

The second problem category concerns the technical environment within which the prototyping process is to be carried out. There is much confusion about the use of fourth-generation languages and other higher order languages as prototyping tools.

In fact, prototyping does require a fairly elaborate technical environment to be successful. An integrated and active data dictionary and directory system is often vital. An integrated data base or file management system is also important. A set of on-line development and validation functions — for example, code development and regression testing — is very helpful, if not required.

Finally, a simple control and release control mechanism can be crucial to administer the many evolutionary refinements. It can also be used to help deliver the system and its variations to the end user.

Continued on page 23

Smith is vice-president, specializing in quality, at Applied Information Development, Inc. in Oak Brook, Ill.

Blazing trails the Natural way: fourth-generation tools

READER'S PLATFORM
Daniel A. Nolan

Languages are the tools used to make computers work. Fourth-generation languages are simply the product of successive refinement of these tools. The benefit that can be derived from these languages is as great as the benefit of the missile over the spear or the steam shovel over the spade.

The outstanding example of this is Software AG's Natural, used with or without the Adabas data base management system.

With this language, systems are delivered in a fraction of the time than it takes with Cobol. Systems produced this way will operate with far greater efficiency than with Cobol.

Mathematical advantage

Mathematically, the advantage of Natural over Cobol is 400 to 1. Practically, this can never be achieved. Developers that attempt to do so immediately find themselves programming systems faster than end users can review progress and formulate specifications. What the industry really needs is recognition that fourth-generation languages and relational data base management systems exist.

Using the previously mentioned Natural language as an example, we can better put into perspective the current state of fourth-generation languages as follows:

■ Application generators do, in fact, exist. What is lacking is the generation of design and specification, hampered by the muddled definition process introduced in the 1960s to reduce the expense of errors.

Rather than attempt to eliminate the errors, we have reduced the cost of a mistake to near zero and the time it takes to discover that mistake to instantly. This way, all errors can be detected and corrected before the customer ever sees them.

■ Information generators are simply application generators with an intelligent person operating the terminal. The attitude that "We have done so much with so little for so long that we can do anything with nothing at all" is giving way to "We may have all the answers, but what we don't have are any of the questions."

■ Prototype construction is being done now and should be addressed in the present, not future, tense. Entire firms specialize in this, and those organizations that have tried modeling continue to do so. That a prototype is only a working model should not be a limitation: If it works, it should be used. The definition of the final prototype is probably that it is sound enough to serve as the basis for the eventual system.

■ Screen mappers are commonly available now, with the not-so-surprising result that other tools have demonstrated. In the proper hands, they can be of some use. Like other tools, used inappropriately, they can botch up any job, no matter how simple or complicated.

■ Specification generators are more than word processing packages specific to the data processing industry. The choice of name appears to be unfortunate: What is truly needed are specifications or standards that recognize the power of these fourth-generation tools. The name "generator" implies artificial intelligence.

■ Natural is a nonprocedural language, as described. Using Cobol terms, there is no file division or no working storage division, there are only procedures. Simple mathematics shows this reduces a programming task by 75%.

Beyond that savings, there are no instructions needed to open a file, manipulate a device or direct logic. The entire program is only concerned with the task at hand.

■ Decision support languages are probably a cruel promise. The active data dictionary in the DBMS, used properly, will assign commonly used names to data. In the hands of professionals, systems developed for users will support any decision.

So far, no responsible head of a corporation has either taken the time to do this or has relinquished this task to a computer product more than once.

■ Query languages abound. One of the primary objectives of Codasyl was that all functions could be controlled by a single language. Experience has shown that to be true. We need another computer language like we need another form of electricity.

On the other hand, many firms have sprung up that provide access to data in the customer's terms to give them ready access to the information that is lurking in the computer. Software AG's Natural and Adabas alone have accounted for a number of firms providing such services.

Those in the industry who would like to reach the destination — whatever that destination might be — as rapidly as possible are not waiting for the bulldozers. They are blazing the trails with what we have now.

Nolan is president of Heuristic Developments, Inc., a DBMS software development firm based in Annadale, Va.

Digital VT220 is the real 220... software transparent for all Digital applications.

Buy, lease or rent from MTI at great prices.

Emulation appears to be the sincerest form of flattery in today's high tech world. Practically every manufacturer of video display terminals has fielded his version of Digital's famous VT220.

And yet, the popularity of the VT220 continues unabated. Some of the obvious features that make this terminal so desirable are: top-notch ergonomics, dependable performance, multinational character set, both 20mA and EIA interfaces, 20 function keys (15 programmable), VT100 and VT52 compatibility.

Plus, the VT220 is completely software transparent for all Digital applications.

MTI is an Authorized Terminals Distributor for Digital, so we can provide fast delivery on quantity-one and multiple-terminal orders.

Whether you buy, lease or rent, MTI is your one source for all the computer and data communications equipment, applications expertise and service you'll ever need. At great prices. Call MTI today and save.

Why you should never commit to a database management system without test driving the product.

There's only one way to evaluate the performance of a fourth generation language database management system. Test drive it. Put it to work developing applications for actual problems.

When you do, you'll find that no other 4GL/DBMS can beat NOMAD2. The power and richness of its language let you conquer the toughest applications with ease. And its ability to interface with your existing databases lets you read files as well as write data with barely an effort.

We're willing to run NOMAD2 through whatever obstacle course you care to set up. And against whatever products you select for comparison. Because in a comprehensive test drive situation, not only will NOMAD2 get applications up and running fast, it will leave the competition in the dust.

NOMAD2, which runs on your mainframe or ours, is another step in the NOMAD evolution that began in 1975. For information write Roger Cox, D&B Computing Services,
187 Danbury Rd., Wilton, CT
06897. Or call (203) 762-2511.

Nomad 2

THE SAS®

Fourth Generation Software

Now there's one software solution for all your Information Center needs. One solution for all your applications, for all your mainframes, minicomputers, and microcomputers. One solution—the SAS® System.

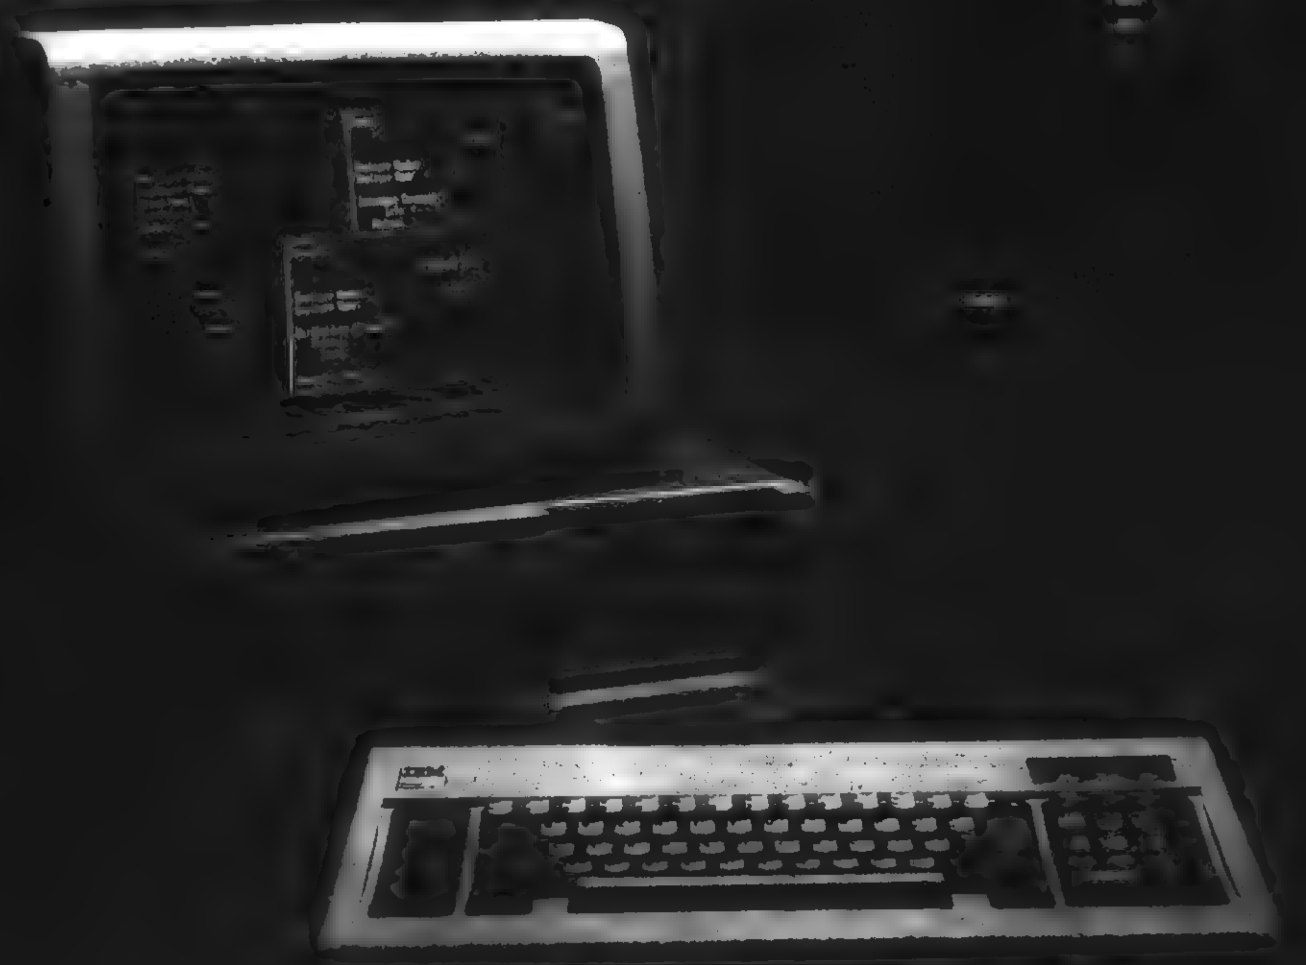
One Solution to Integrate All Your Computing Tasks.

The SAS System [illegible]

fill-in-the-blank screens. On-line help facilities make it easy to handle every application, quickly and accurately.

You can track sales leads, manage prospect [illegible]

share, and present results with the SAS System. Plus you can file employee and applicant records, analyze benefit programs, [illegible]



ONCE FAIRCHILD REPUBLIC CHOSE AT&T, ALL SYSTEMS WERE GO.

The people at Fairchild Republic are experts at designing and developing custom flight systems for air and space travel. When they needed a custom system of their own to manage their communications and information here on earth, they turned to another expert—AT&T.

The problem was to link seventeen different plant and office buildings spread out over eighty acres, and provide them with fast, cost-efficient voice and data communications.

AT&T had the answer. Our Premises Distribution System, AT&T's unique universal wiring scheme, serves as the link. It can unite not only our own communications systems, local area networks, and computers, but also those of other major vendors.

The communications system they chose is AT&T System 85, equipped with a wealth of features to speed and improve the voice and data flow throughout plant and office.

Beyond fulfilling all of Fairchild Republic's needs today, this fully integrated system is packed with capabilities waiting to be tapped as they continue to grow in the future.

What does the future hold for Fairchild Republic? In their business, not even the sky's the limit. AT&T has the technology, products, service and support to see them through.

To find out why AT&T is the right choice to help your business meet its long-term needs and goals, call your Information Systems Account Executive or 1 800 247-1212, Ext. 536.

AT&T
The right choice.

LETTERS

U.S. gives poor show

In reference to Charles P. Lecht's article "Resting on the laurels of American technology" [CW, July 22], I completely agree with him.

I recently returned from a visit to Japan. I attended Tsukuba Expo '85, which is a grand exposition, but the U.S. exhibit was a wasteland within the midst of it. Although there were some high-technology displays, there was no cohesiveness to the U.S. pavilion.

The obscure film shown at the exhibit was received so poorly by the Japanese observers that many left before it was finished.

By contrast, the IBM Japan pavilion was outstanding. It managed to convey the image of a company on the cutting edge of technology while involving attendees in that image.

I don't know if Lecht has attended other U.S. exhibits at other expositions, but I have. The U.S. traditionally has poor displays.

It is a shame that we did no better at Tsukuba Expo '85 because we are just maintaining our already shabby reputation.

Fortunately, when it comes to delivering high-technology products, we do much better.

John [illegible]

Code prediction made

I have just read a prediction in the article, "Programming teams: On the way out?" [CW, July 29] that "we are headed to where the robots manufacture software."

It reminds me of a prediction widely made in 1963, when I first joined the profession, that automatic programming would make programmers obsolete. This was about the time the first higher level language was introduced — assembly language coding.

Of course there have been many similar predictions since then. Let me make one: within 10 years someone will predict the existence of a fifth-generation language that automates the production of code.

A. C. [illegible]
Chevy Chase, Md.

X.25 recommended

The article "IBM research center: Commitment to net standards" [CW, July 29] stated that X.25 is a CCITT standard that has been incorporated into Open Systems Interconnect (OSI). Later the article stated that "OSI in no way ensures that networks will work together. . . . OSI is a skeleton. There is no software. The software is still related to the operating system of each vendor."

OSI may be a skeleton, but the CCITT recommendation of X.25 has flesh and blood. X.25 is a complete and detailed recommendation for implementation of OSI layers one through three. Conformance to CCITT X.25 does ensure that networks will work together.

That is evident by the availability of worldwide communications to anyone running X.25, regardless of the operating system of the vendor. As a provider of portable X.25, I find the statement "there is no software" misleading.

Donald Berryman
Edina, Minn.

Reader lauds section

I have worked with a number of publications regarding coverage of the computer printer marketplace. Unfortunately, I have often found that these articles rarely contain the focused depth and objectivity necessary to be fresh and instructive.

Computerworld's Update on printers, "The paper chase: Trends in printer technologies" [CW, Aug. 5], was a welcome piece of reporting on this confusing multibillion-dollar marketplace.

I commend CW's commitment to high quality and depth in the new Update format. I compliment your Update Editor, Glenn Rifkin, on a job well done.

Maureen [illegible]
Marshfield, Mass.

Prototyping approaches

The third category of prototyping problems — those associated with unrealistic user expectations — is especially troubling.

Many users have become accustomed to application systems that operate at high-peformance levels, have advanced features for ease of use and are intended to be a total system.

None of these are likely characteristics of a prototype nor do they tend to emerge as the prototyping process advances. Feature lists will increase as the prototype ages but at the expense of architecture, conceptual integrity and overall soundness.

The final category of prototyping problems deals with the nature of the application itself. Generally, although requirement prototyping is applicable to most applications, evolutionary development is best suited for the back-end processes. These are characterized by having an existing data base and reporting architecture. Conversely, evolutionary development is generally not suited to high-performance, highly complex, highly integrated transaction or event-driven processes.

Both types of prototyping can be clear winners if properly conditioned. The challenge to the MIS community is to fill the vacuum created by the lack of any effective prototyping management methods.

It is not acceptable to conclude that because the development process changes radically either the same management methods that we use for the more prescriptive and formal approaches will suffice or that we do not need any management because it will just get in the way.

Let's not allow prototyping to continue to be a crutch that props up and supports the old methods but rather a window through which we can see a better applications development process.

72 hours from now you could be using it instead of looking at it.

Ninety-five products in one neat little package. It's the Codex Direct Order Catalog. Your best source for reliable data communications products. All in-stock items are shipped within 72 hours. And all carry the full Codex warranty.

ANNOUNCING THE FIRST BUSINESS MODELING SYSTEM WITH ARTIFICIAL INTELLIGENCE

INGOT is the first DSS which simulates decision making of a chief financial officer to minimize capital costs. INGOT takes into account daily financial events, corporate policies, interest rates, and your business forecasts. INGOT's CASHMOD command makes simultaneous equations obsolete.

Other standard capabilities in INGOT give you more for your DSS dollar, including:

- PERT project management with automatic calendaring.
- Times series forecasting and advanced statistical methods.
- Flexible graphics for floor plans, maps and diagrams.
- Data entry with automatic validation and user defined HELP files.
- Optimization with linear and integer programming.
- Built-in financial and manufacturing models as commands.
- 100% of reference manual on-line for easy use.

INGOT runs on IBM MVS/TSO, DEC VAX, Prime, Tandem, DG AOS/VS, Apollo, CDC/NOS-VE, HP 9000, Honeywell GCOS, and most UNIX systems. Ask us about any others.

Get the Facts. Call 800-323-7830 or in Illinois 312-869-5556.

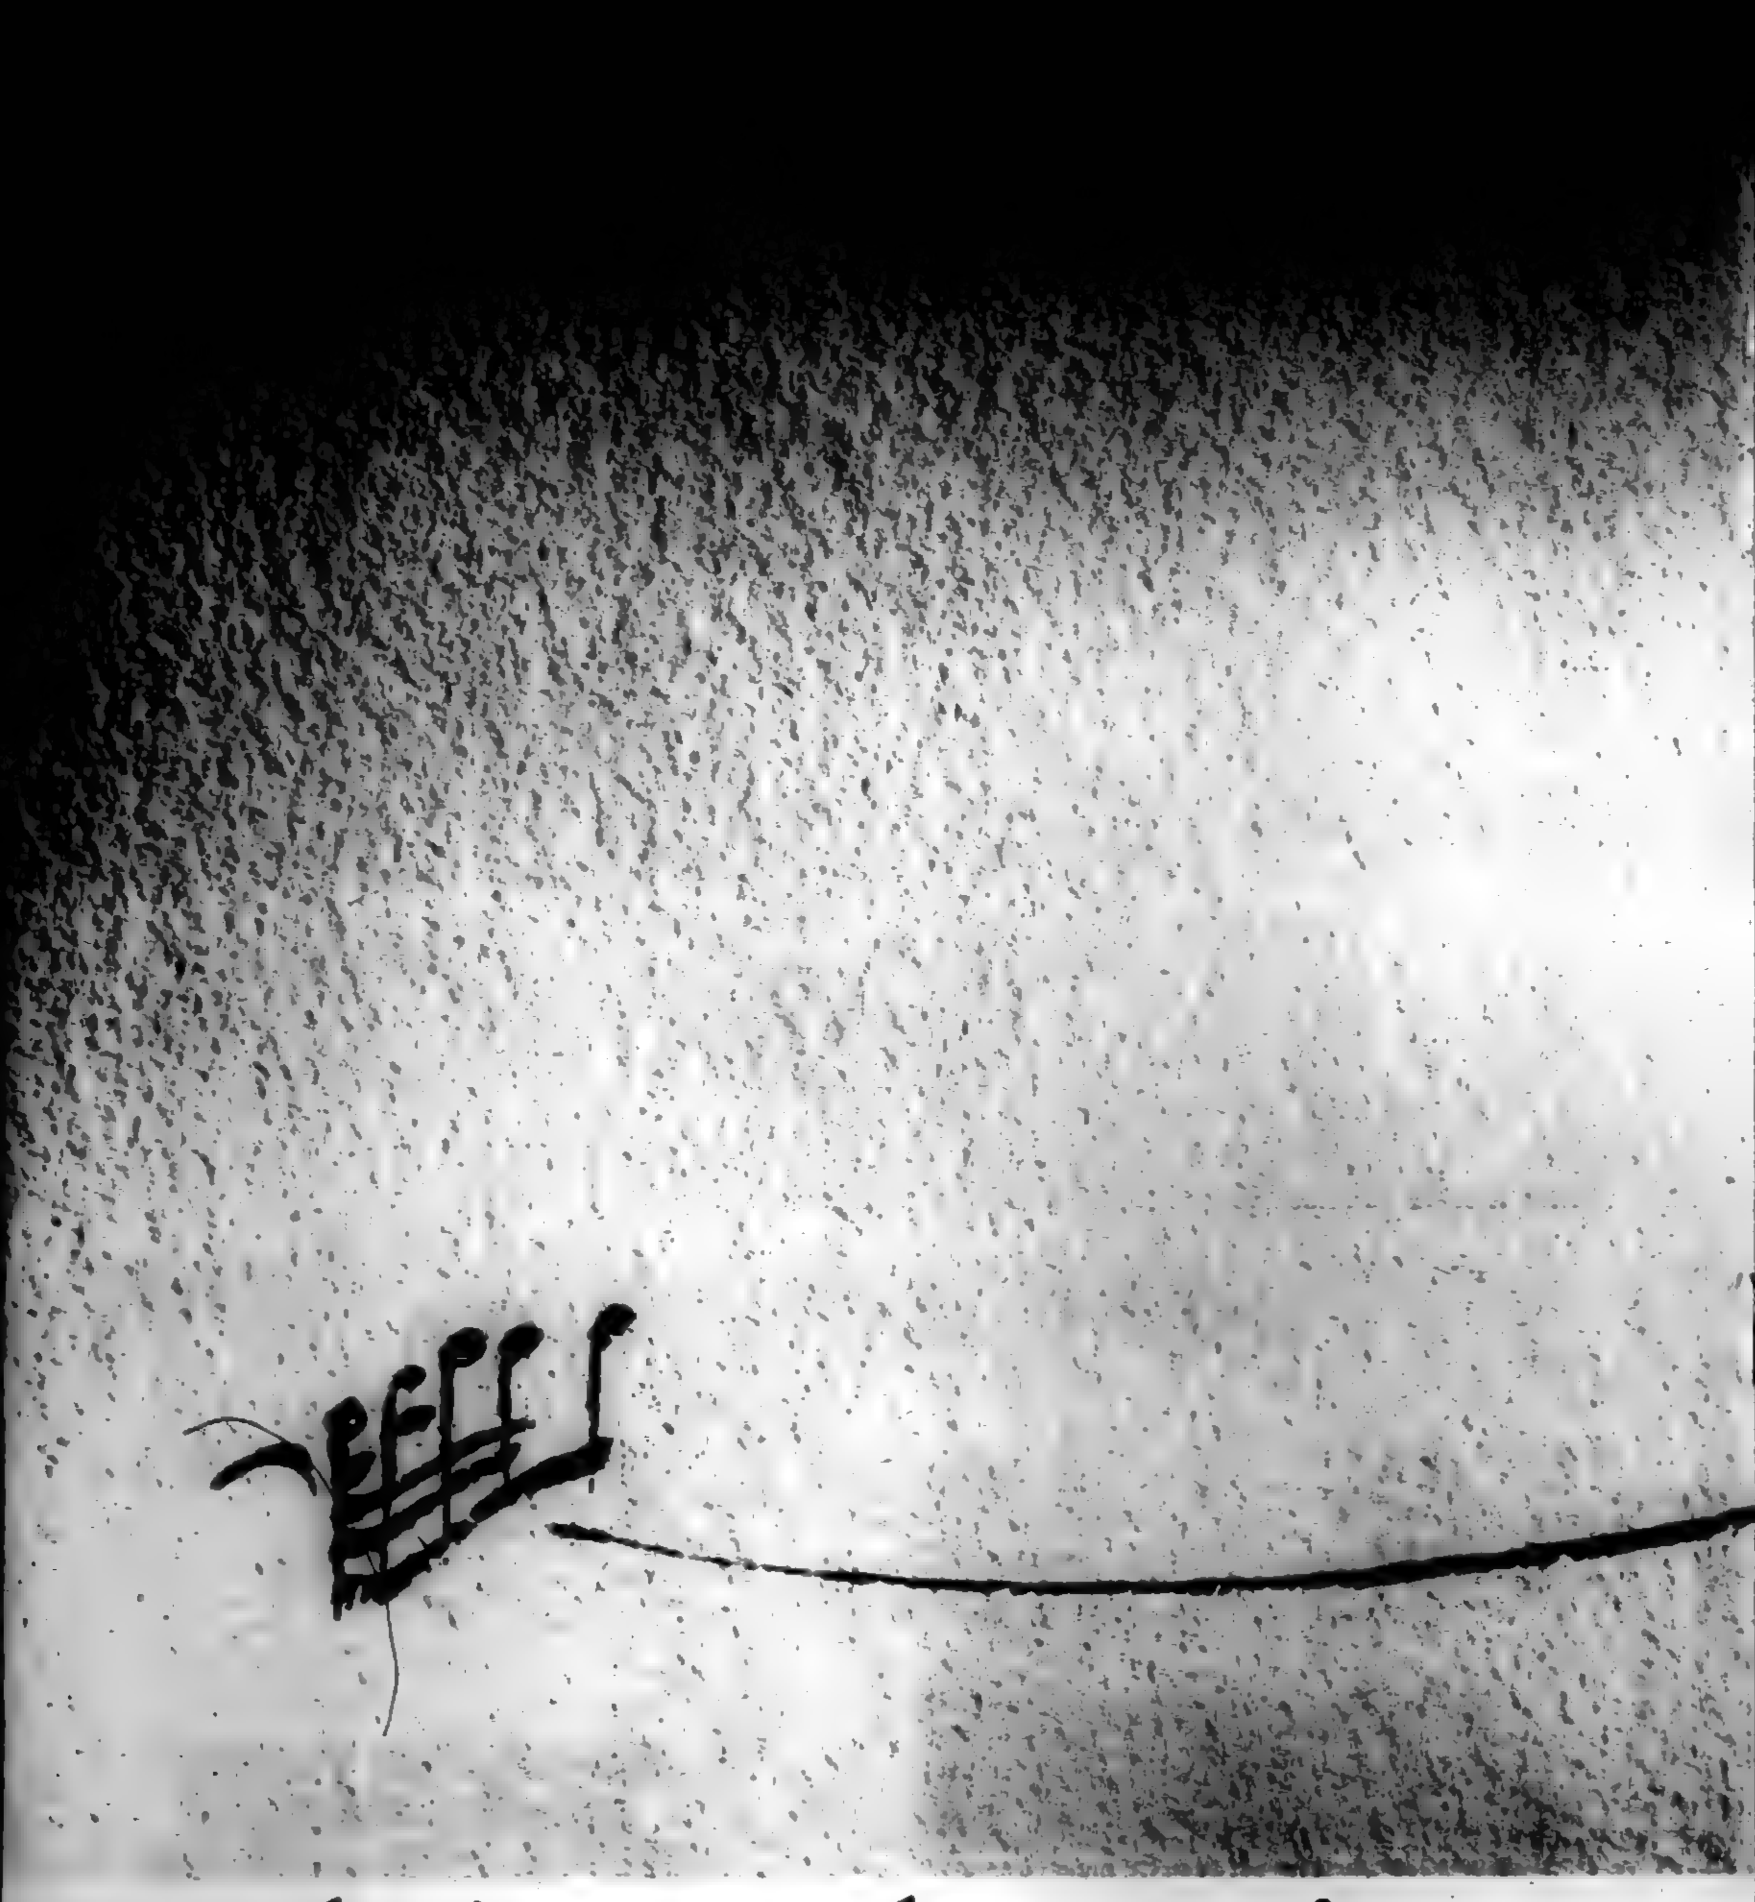
PANSOPHIC SYSTEMS AFFILIATE



Introducing Symphony's micro-to-

It's called Symphony Link.™

And yes, in some respects, it resembles what you've already seen from mainframe developers.

But Symphony Link *is* different.

First of all, Symphony Link is designed from an end-user point of view as well as a data processing point of view. It's an Add-in product designed to work *within* Symphony® software – Lotus'® 5-function management software for the IBM® PC.

Two, Symphony Link isn't just a terminal emulator and file transfer program. It goes well *beyond* that – using an IRMA™ board, it actually integrates mainframe applications into a personal computer (i.e., Symphony) application.

Three, it's an applications development tool.

Four, it's an open-ended product.

Now then. Let's look at the specifics.

Users can bring any 3270 screen directly into a Symphony application.

There is no retyping involved with data capture. That, of course, translates into the obvious benefit of error-free transfer and data integrity.

As for data transmittal, whatever data is created off-line within Symphony can be sent screen by screen back to the mainframe using a single, simple set of commands. Naturally, this allows the user to make the best use of host processing time.

Symphony Link uses the standard Lotus interface to transfer files to and from the VM/CMS and MVS/TSO operating environments.

At a user level, the standard Lotus interface enables people to work the way they are accustomed to – an important advantage considering all the capabilities Symphony can provide end-users.

Additionally, because Symphony Link

mainframe link.

utilizes 3270 networking resources and protocols, it requires no network modification.

Two unusual benefits for the data processing manager.

Symphony Link has its own command language which includes 3270 key functions. This lets you customize and control the linking of PCs to your mainframe—even develop applications—all of which helps the end-user work more productively.

Also, Symphony Link is an open-ended product. This allows Lotus to work jointly with mainframe software developers to customize Symphony Link to many mainframe applications (e.g. Cullinet's Information Center Management System™).

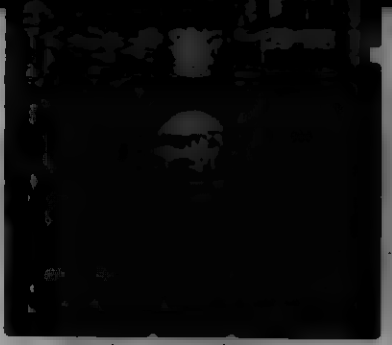
How everyone else benefits.

Symphony Link is from Lotus.

Nobody is more committed to developing effective tools for business managers, personal computer users and data processing managers than we are.

Symphony Link, like every other Lotus product, comes with the full service support and training that have become the standard in the industry.

Symphony Link isn't just another emulation product; it isn't just another link product; it isn't, for that matter, just another micro-to-mainframe product.



And that's precisely why you should find out about it. Call (617) 253-9172; outside Massachusetts, call 1-800-554-5501.

House report recommends no federal VDT regulation

By Mitch Betts

WASHINGTON, D.C. — The staff of the U.S. House of Representatives Subcommittee on Health and Safety recommended against government regulation of VDTs in the workplace. Included with that recommendation, in a new report on VDTs and health, was a call for more scientific studies of the effects of extra-low and very-low frequency radiation.

"Although current scientific knowledge suggests that there are no adverse health effects from these low and extra-low frequency radio waves, further study and research in this area could eliminate, and definitely reduce, any lingering doubts," the report concluded.

The staff report — based on a series of hearings in 1984 — strongly recommended that the research be done by the National Institute for Occupational Safety and Health or by some other scientific testing agency.

The report explained that many electric appliances, including hair dryers and electric typewriter motors, emit low-level radiation in amounts that often exceed the levels emitted by VDTs.

After reviewing such issues as VDT furniture, room lighting and work breaks to relieve stress, the subcommittee staff concluded that "these ergonomic factors are not the kind that could be legislatively standardized.

"Employers and employees are in the best position to determine what is best in each individual workplace so as to reduce complaints due primarily to ergonomic factors," it added.

> ”
>
> *'Education, not legislation, is the answer.'*
>
> — **Vico E. Henriques**
> **Cbema**

The subcommittee report was immediately praised by the Computer and Business Equipment Manufacturers Association (Cbema) here.

"The report supports Cbema's long-held position that education, not legislation, is the answer to employee complaints about VDTs," said Vico E. Henriques, Cbema president.

He also supported the idea of more studies, in order to calm public fears about VDT radiation.

"We hope that the tests the subcommittee suggests will put these fears to rest," he said.

Quality Software Since 1973

WORLD DIGEST
CW International News Network

PARIS — Hewlett-Packard Co., Ing. C. Olivetti & Co. and SMT-Goupil, a French micro maker, are each preparing to launch personal computers that are compatible with the IBM Personal Computer AT, even though the future of the AT in IBM's own strategy remains uncertain. The three new machines might make their appearance during next week's Sicob.

FRANKFURT — Control Data GmbH has announced receipt of a $3.4 million contract to deliver 5,000 hard disk drives to NCR GmbH in Augsburg, West Germany, for NCR Corp.'s recently introduced PC 8 personal computer. The PC 8 is compatible with the IBM Personal Computer AT and will probably be on display at the Systems Fair in Munich, West Germany, in late October.

TOKYO — Fujitsu Ltd. announced separate five-year contracts to extend technological assistance to two South Korean makers of personal computers and peripherals.

Under one of the agreements, with Daewoo Telecom Co., Fujitsu will deliver the parts necessary for Daewoo to develop and manufacture displays and keyboards for a Korean language version of Fujitsu's Facom 9450-II personal computer. Under a separate

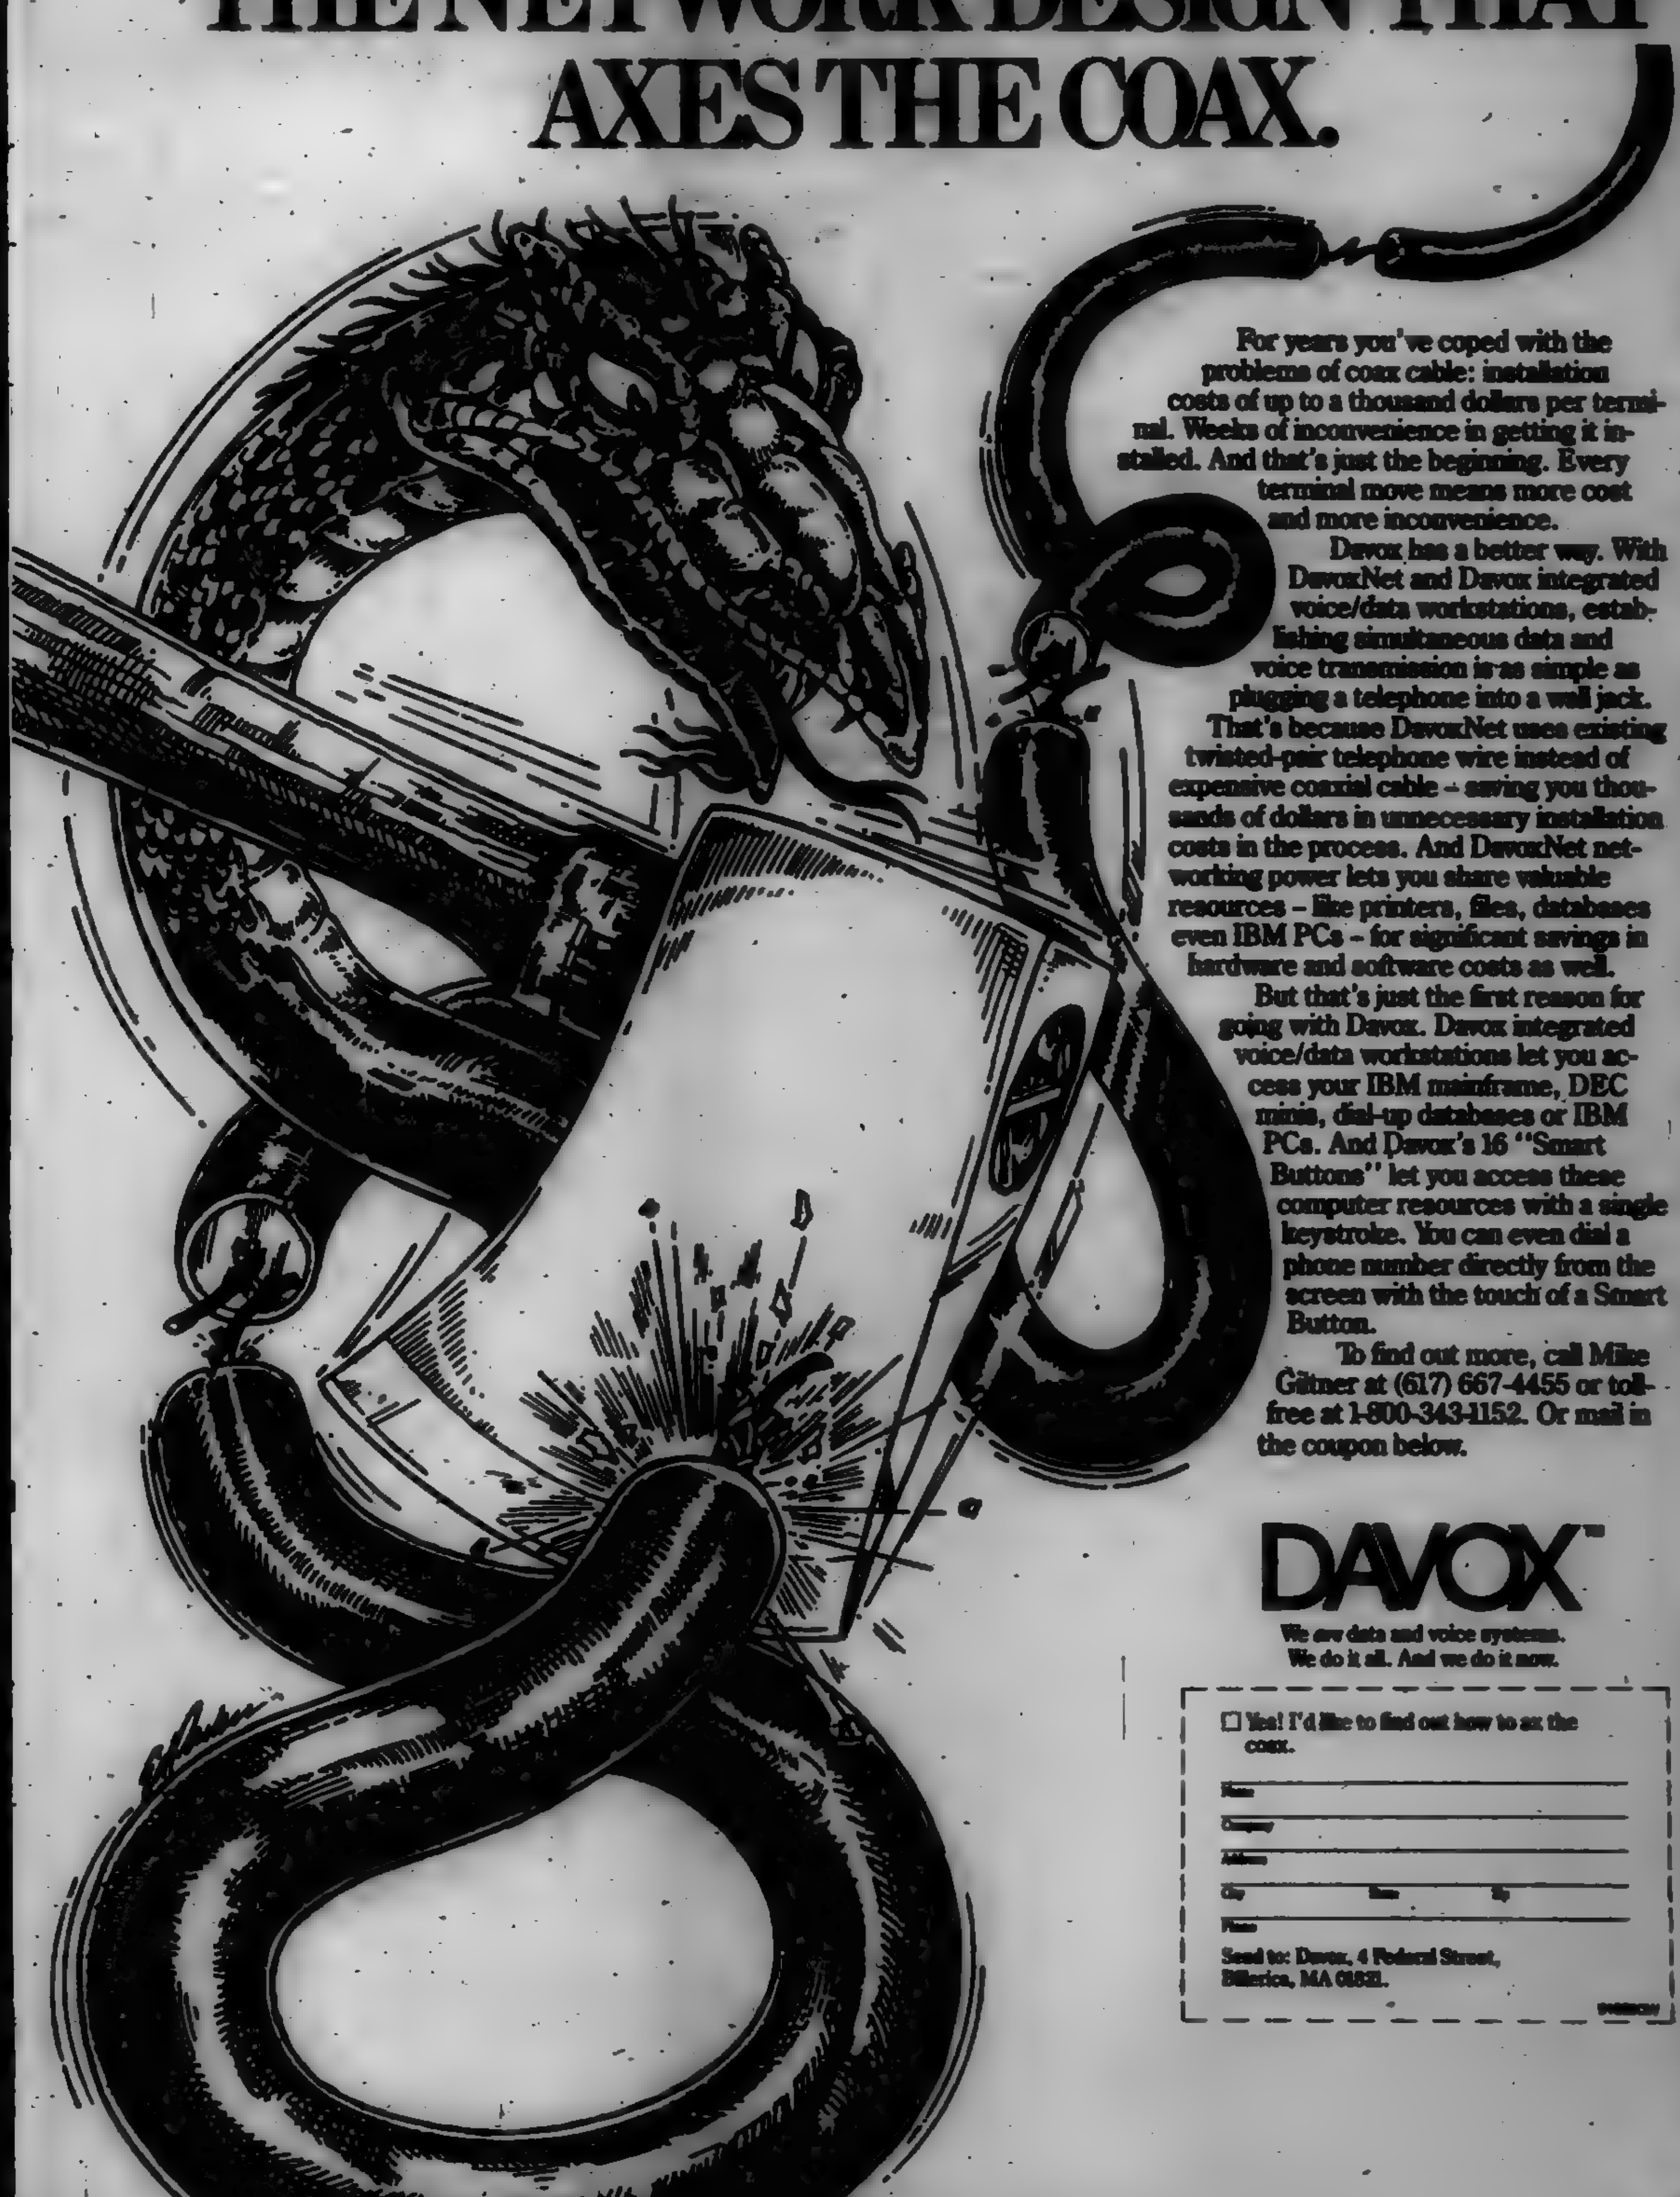
THE NETWORK DESIGN THAT AXES THE COAX.



For years you've coped with the problems of coax cable: installation costs of up to a thousand dollars per terminal. Weeks of inconvenience in getting it installed. And that's just the beginning. Every terminal move means more cost and more inconvenience.

Davox has a better way. With DavoxNet and Davox integrated voice/data workstations, establishing simultaneous data and voice transmission is as simple as plugging a telephone into a wall jack. That's because DavoxNet uses existing twisted-pair telephone wire instead of expensive coaxial cable – saving you thousands of dollars in unnecessary installation costs in the process. And DavoxNet networking power lets you share valuable resources – like printers, files, databases even IBM PCs – for significant savings in hardware and software costs as well.

But that's just the first reason for going with Davox. Davox integrated voice/data workstations let you access your IBM mainframe, DEC minis, dial-up databases or IBM PCs. And Davox's 16 "Smart Buttons" let you access these computer resources with a single keystroke. You can even dial a phone number directly from the screen with the touch of a Smart Button.

To find out more, call Mike Gitner at (617) 667-4455 or toll-free at 1-800-343-1152. Or mail in the coupon below.

DAVOX™

We are data and voice systems.
We do it all. And we do it now.

☐ Yes! I'd like to find out how to ax the coax.

World Digest

deal, Jeil Precision Co. will manufacture Korean-alphabet, 24-dot printers with Fujitsu components and technology.

LONDON — British computer firms are facing a lack of skilled DP staff as more foreign companies offer higher salaries than do firms in the UK. Overseas firms annually draw more than 1,500 of the most skilled workers, mostly data base and networking professionals with more than five years' experience, according to the recruitment agency Computer People.

TOKYO — Japan's production of mainframe systems during the first six months of this year leveled off at a weak 6,223 units, while smaller machines, including personal computers, clinched a stellar production record, according to a Ministry of International Trade and Industry report.

The report noted that the country's monthly mainframe output averaged 1,064 units during the half-year period, the same as in last year's corresponding term. As in 1984, Japan's monthly output of mainframes is expected to increase toward the year's end, the report forecast. The country's personal computer production totaled 967,742 during the first six months of 1985, compared with the 1984 yearly total of 1.5 million, the report said.

PARIS — Cimsa and Sintra, both major manufacturers of military computers in France, are involved in a merger that should finish before the end of the year. The two are subsidiaries of the same group, Thomson-CFS, but had become competitors because of the government's decision to pass Sintra from the hands of the CGE to Thomson-CFS, both nationalized firms, as part of a reshuffling of France's electronics industry last year. Increasing foreign competition and a shrinking number of military contracts began to take a toll in the earnings of both companies.

TOKYO — Nippon Telegraph and Telephone Corp. (NTT) has announced plans to reorganize its five research and development facilities into nine major laboratories. NTT will place a new stress on software production technology, a spokeswoman said.

The reorganization, effective Sept. 12, was intended to "foster close working relationships" between NTT's labs and profit centers, she said. Research by the reorganized labs is done in the areas of basic studies, telecommunications networks, information-communication processing, integrated communications, electronics components and software.

BRUSSELS — The $30 million initial implementation of a plan by the European Economic Community to develop advanced communications technology has been approved. The first phase will focus on the development of a reference model for a broadband European digital network. In the second phase, the participating companies will concentrate on the development of opto-electronics, broadband switches, software and flat video display screens.

MUNICH, West Germany — Lotus Development Corp.'s 1-2-3 tops the charts of business software in West Germany, with Lotus' Symphony and Ashton-Tate's Framework, two other integrated packages, coming in fourth and sixth on the top-10 list.

According to market research firm International Data Corp. Deutschland, the most popular software packages, behind 1-2-3, are Ashton-Tate's Dbase III, Micropro International Corp.'s Wordstar, Lotus' Symphony, Software Products International's Open Access, Ashton-Tate's Framework, Microsoft Corp.'s Multiplan, Microsoft's Word, IBM's Fibu and Bongartz & Schmidt's Word Ace, the only German product on the list.

MAN SAVED FROM A SEA OF PAPER...

Huge oceans of information can be standardized into computer output microfiche (COM) that takes up less than 5% of equivalent paper space.

And it's simply the most cost-effective storage/reproduction medium available.

For example, a 1,000-page report using old reproduction methods would cost $30.00 and take 1 hour to reproduce. An NCR COM can perform the equivalent task in 15 minutes for $1.25!

NCR's COM systems can be a real life saver.

Language tool drives auto parts maker's progress

ST. LOUIS — When Ron Perez joined the data processing department of one of the nation's oldest automotive parts manufacturers, he was confronted by two large binders chock full of application needs — and a system still running partially on card decks.

Perez is manager of system programming for Carter Automotive Co., a supplier of new and remanufactured components for fuel, cooling, air-conditioning and electrical systems. The company also manufactures fuel and emissions systems components as original equipment.

Two years ago, Perez recalled in a recent interview, Carter suffered from "a tremendous backlog in development." Project requests for applications filled two loose-leaf binders, and no one in the department had expertise in command-level CICS programming.

Today, the company's data processing center operates with a staff of seven people and uses an IBM 4341 Group 1 mainframe with 4M bytes of memory. An IBM 3705 handles front-end tasks for communications, while approximately 30 IBM 3278 and 3279 units meet terminal needs.

When Carter was in the market for an order entry system that was to incorporate billing, inventory control and systems analysis, it considered both buying off-the-shelf software and developing in-house applications using either CICS or a fourth-generation language. The company soon determined a fourth-generation language was the best route.

When selecting the product, Carter's data processing evaluation team set five goals for an application tool: short learning curve, ease of coding, assured file integrity, elimination of on-line downtime and immediate aid for the backlog. After looking at several products, Carter settled on Gener/OL from Pansophic Systems, Inc. The product was selected because of its ease of programming and a top-down structure that resembled Cobol and Basic, with which most of the programmers were familiar, Perez said.

"Gener/OL has given us the ability to program at least five times faster than with command-level statements. That means we can program in days instead of weeks and weeks instead of months," he said.

According to Perez, programmers with some CICS background were able to begin writing programs after one day of working with the product. Others with only batch programming background learned Gener/OL in two to three days.

End users involved

Carter's programming staff now has an easier time of designing screens that allow the company to involve the end user in the programming process, he said. Data processing staff members do the initial screen design and then invite the end user to the terminal.

In the two years it has used the Gener/OL fourth-generation language, Carter developed a price analysis program that lists prices and part numbers by regions. It also contains a cross-reference of part numbers and prices for competitive companies. "We can determine the effect of a price adjustment on gross profits while still remaining competitive," Perez said.

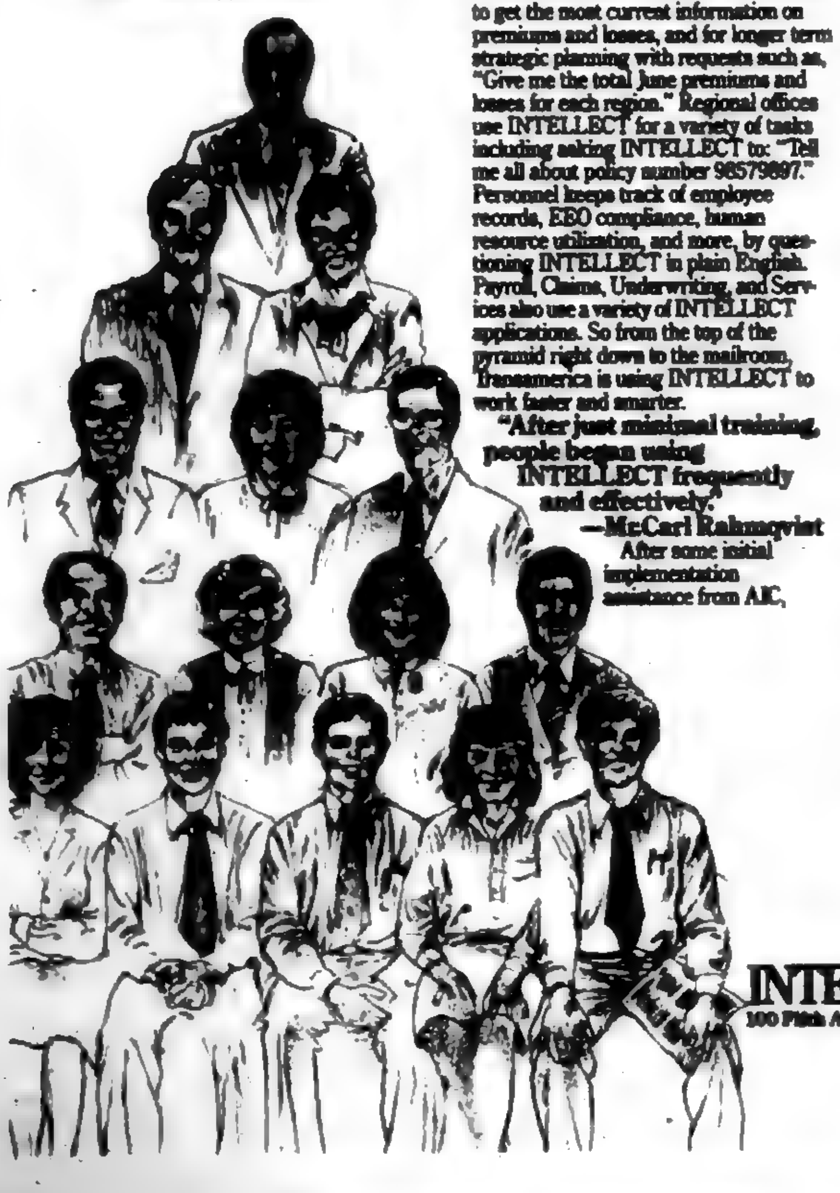
When Carter management decided it wanted to provide better customer service, the programming staff was given 30 days to come up with an appropriate application. The application gathers daily inventory information from warehouses in Arkansas and Virginia and downloads the information to Vsam files using Gener/OL. Sales people can now take a phone call from a customer and get updated information on the status of a particular part.

In the future, Perez said, the company hopes to connect its purchasing system with the customer service program.

TO INSURE THAT EVERYONE CAN ACCESS DATA, TRANSAMERICA USES INTELLECT AT EVERY LEVEL OF THE PYRAMID.

"We use INTELLECT because we want to give our users a better way to do business." —Mr. Carl Rahmqvist, Senior Systems Manager, Information Systems, Transamerica Insurance Group

Transamerica Insurance Group is recognised for the pyramid-shaped building of its parent, Transamerica Corporation, and for being one of the country's leading commercial and personal insurance companies. In some quarters, Transamerica is also recognised for its variety of innovative INTELLECT applications.



At Transamerica they see INTELLECT as more than a state-of-the-art natural language information retrieval system. They see it as a new way to do business: Giving all their end users—even those with no computer skills—instant access to more information than they'd ever had before.

"When they saw how easy, fast, and resource-effective it was to use, INTELLECT became a very popular tool." —Ms. Sandra Dahlgren, Information Center System Supervisor

One Vice President uses INTELLECT to get the most current information on premiums and losses, and for longer term strategic planning with requests such as, "Give me the total June premiums and losses for each region." Regional offices use INTELLECT for a variety of tasks including asking INTELLECT to: "Tell me all about policy number 98579897." Personnel keeps track of employee records, EEO compliance, human resource utilization, and more, by questioning INTELLECT in plain English. Payroll, Claims, Underwriting, and Services also use a variety of INTELLECT applications. So from the top of the pyramid right down to the mailroom, Transamerica is using INTELLECT to work faster and smarter.

"After just minimal training, people began using INTELLECT frequently and effectively." —Mr. Carl Rahmqvist

After some initial implementation assistance from AIC, Transamerica's Information Center took over, developing custom INTELLECT applications for each department. Mr. Rahmqvist and Ms. Dahlgren trained a group of Transamerica's "veteran" INTELLECT users to go into the field to train the company's 15 regional office personnel in using the company's many applications. Transamerica's INTELLECT Support Staff helps company personnel use INTELLECT more effectively. They've also devised several methods for enabling users to access their many INTELLECT applications. Easily understood menu screens help beginning users work faster, while experienced people can use an express mode for their application needs.

"We've found that we've saved both time and money by using INTELLECT to obtain pertinent information." —Ms. Sandra Dahlgren

Anyone who can ask a question in everyday conversational English can get the information he or she needs. Immediately. You can imagine how much time a system like that can save an information-dependent organization like Transamerica. Combine that with the ability to get more people into the system and you can see how INTELLECT has increased the pyramid's power.

Find out how INTELLECT can get your organization into better shape. Write for a free demo diskette. Or for fast action, call AIC at (617) 890-8400.

I want to know more about INTELLECT!

INTELLECT™ is a trademark of Artificial Intelligence Corporation.

Straight talk about application software packages.

"Most application software packages are functionally rich. The problem is, that's simply not enough."

While everyone agrees that packaged applications possess great potential to save time and money, you'll hear a lot of people—from MIS directors to operations managers—tell you the ones their companies have implemented fall somewhere short of satisfactory.

Typical limitations include the fact that the packages require such extensive modification that the savings they seemed to offer totally disappear. Another common complaint is that one application package fails to integrate with another. A third shortcoming, and perhaps the most common, is that packaged applications cannot be easily adapted to reflect the changing nature of the business.

You have only to look at the architecture of most of the applications currently in use to understand why these problems exist.

Many companies today depend on applications designed with technology from the 60's and 70's. Some are 2nd generation applications built without any reliance on database architecture. Others are 3rd generation applications that provide only a generalized *interface* to a database management system; in addition, many application vendors provide a common front end user interface to mask inefficient architecture. The result is that these 3rd generation applications realize only about 10% of the power of a DBMS. *And that's simply not enough.*

Without full use of the facilities of a superior DBMS, users of application software find it extremely difficult to adapt and extend an application package to their current as well as to their future business needs. And *only* when an application is built with advanced database technology can it provide the sharing of data that leads to functional integration between different application modules.

Ultimately, what's required is software that goes beyond the conventional packaged applications approach.

What's required is 4th generation applications software—software that's rich in functionality, and whose underlying architecture is built on, and takes full advantage of, advanced database technology.

Fourth generation application software is created using a comprehensive application development facility combining a fourth generation language and end user query and reporting facilities with an integrated data dictionary. Furthermore, fourth generation application packages are functionally integrated, sharing common data between independent modules. This creates an environment to easily adapt and extend an application package, and provides realtime access to all information.

Only fourth generation application software packages enable a company to realize the full potential of packaged applications.

It is clear, therefore, that all application packages of the future will be built using this technology… because it doesn't make sense any other way.

J J Cullinane

John J. Cullinane
Chairman of the Board

The only applications worth buying are 4th generation applications.

And only Cullinet offers 4th generation applications.

Simply stated, our applications are a step beyond conventional applications packages because they meet these key requirements.

1. Functional Richness

Cullinet's complete line of applications delivers leading edge functionality in all areas. Whether it's our manufacturing control system, or integrated financial reporting and cost management applications, our human resource management system, or our relationship banking system, each Cullinet application is carefully designed by knowledgeable industry professionals who have a thorough understanding of application requirements. Our integrated closed-loop, net change manufacturing, financial reporting, and cost management applications provide complete multi-company capabilities accommodating the most demanding reporting and control requirements. Our human resource management system combines complete personnel reporting and payroll processing into a single system, and our relationship banking system provides a total customer information environment for today's business executive. You can be assured that a Cullinet solution can be put into production immediately to fulfill your most pressing business requirements.

2. Functionally Integrated

Businesses today demand applications to do more than address individual functions. Businesses today need applications that recognize the interdependencies within an organization—in short, applications that can share data. For example, efficient real-time, four-way matching of invoices with receiving, purchase and inspection documents can only be achieved through true sharing of data, and this sharing of data can only be achieved with an advanced database technology which delivers that integration. Redundancies are eliminated and productivity is increased when all applications dynamically reflect the operations of the organization. By sharing an architecture that provides for optimum use of an organization's information, Cullinet's manufacturing, financial, human resources and banking applications fulfill this need.

3. Easy to Tailor

Although many businesses appear on the surface to operate in a common fashion, each, in fact, is unique. Applications must therefore be built with an optimized set of tools that permits them to be adapted to a company's way of doing business, rather than having the company have to adapt to accommodate the software. Cullinet applications are designed to accommodate change. They provide the means to personalize screen layouts, capture new information, reformat reports, resequence transactions, and change messages without impacting the entire environment. Only Cullinet's applications can provide this environment for adaptability through their integration with advanced database technology. In this way, Cullinet applications give users the independence to adapt them—quickly and efficiently—to meet the unique requirements of the business.

4. Easy to Extend

As a business changes and grows, so do its needs and requirements. Cullinet provides easy to use, menu-driven facilities that permit functional extension of an application while preserving integration. An end user can quickly react to new requirements by prototyping an application functionally, developing new reports and performing ad hoc queries immediately. MIS can efficiently develop new, associated applications sharing common data and built utilizing the existing architecture. The Cullinet architecture segments the program logic, edit and validation criteria, as well as the security and recovery process, and therefore the complexity of creating new application functionality is significantly reduced.

5. Easy Access to Information

Access to all corporate information is key to any application. Because all pertinent data must be available to the analyst and decision maker, easy access to that data, *no matter where it resides*, is mandatory. Your need for information naturally crosses applications boundaries. The ability to associate detailed information about sales orders, finished goods status, and customer credit processing before release of shipments is a prime example. Only by means of Cullinet's applications, which are completely integrated with our Information Center Management System are you provided the opportunity to create an information center that is functionally complete, meeting the information needs of the company as a whole and meeting the specific needs of the operational units of the organization. Each center of functional activity within your organization is served by the system through your mainframe or PC with GOLDENGATE software. Each has access to all corporate information. Accessibility to all information—whether it's in your mainframe, in a departmental minicomputer system, or in your personal computer—makes it readily available to you for analysis through Cullinet's complete information environment.

Print quality, speed sway firm to ion deposition system

CORVALLIS, Ore. — When a worldwide engineering company headquartered here replaced its decade-old impact printers, the new system chosen was one based upon ion deposition technology.

CH^{2}M Hill Ltd.'s computer systems — three Digital Equipment Corp. Decsystem-10s, a DEC VAX-11/750 and a VAX-11/785 with specialized software for computer-aided engineering applications — include a Digital Communications Associates, Inc. network that ties together its 35 U.S. offices. According to Stan Carpenter, Hill's data processing production manager, the systems perform engineering, scientific, technical, management and accounting processes.

"We generate many different reports for our offices around the country, and the output quality of our impact printers was just not satisfactory," Carpenter said. "They were older machines, and while we could have just replaced drums and other parts, they still were slow." The four old Data Products Corp. impact printers — a mixture of Models 2470 and 2550 — produced output on continuous three-ply forms that often required bursting, reduction to 8½- by 11-in. paper on a copier, hole punching and insertion into notebooks, he said.

After extensive research and investigation, Carpenter reported, he selected two Mercurion 1 60 page/min. printers from Southern Systems, Inc. in Clearwater, Fla. The printers reportedly cost approximately $67,000 each.

The new printers produce all originals on 8½- by 11-in. sheets, already three-hole drilled, Carpenter said. The printers also offered other features that CH^{2}M Hill will add to its DP production capabilities — logo imprinting and forms generation, he said. The company's old devices printed 900 line/min., compared with 3,600 line/min. for the new ones.

Print output volume

CH^{2}M Hill's print output volume is about 500,000 pages per month, Carpenter said. The two considerations that topped his list of requirements for new printers were cut-sheet capability and print quality. Other cut-sheet printers that Carpenter examined were either unable to print the number of copies he needed per month or were too expensive, he said. During his search, Carpenter also talked with users of the equipment he was considering.

The Southern Systems printers — installed in November 1984 — were projected to save about $24,000 per year in paper costs, but the actual paper savings has been in the $10,000 to $12,000 per year range, Carpenter said. The DP manager discovered that if he used the quality of paper that could save him $24,000 per year, it caused printer jams and none of the paper had the high-quality look that he wanted.

A big savings for the company is in maintenance fees, Carpenter said. "We sent our own staff person to the Southern Systems factory in Clearwater for a week, and we're now doing our own in-house maintenance." CH^{2}M Hill bought a $25,000 spares kit along with its new printer so that it can do all it needs to do for maintenance in-house, he said.

HOW DO YOU LEARN BEST?

Think About It
Do you learn best by reading?
By listening to a lecture?
By watching someone else perform a task?

If you are like most people, you learn best when you receive new information and *then apply it in a responsive environment.*

Hands-On Practice
This is the kind of education Amdahl courses provide—practical, thorough, lively, experiential.

Immediate Feedback
The most useful interaction takes place when and where students need it—in a pragmatic, real-world setting at the time when a question comes up. Amdahl courses give such feedback.

amdahl®

AMDAHL CORPORATION
1250 East Arques Ave. M/S 302
P.O. Box 3470
Sunnyvale, CA 94088-3470

Amdahl is a registered trademark of Amdahl Corporation

Important Curriculum Areas
Amdahl offers courses in:
MVS
VM
Communications Systems
Data Systems

Well-Equipped, Nearby Facilities
In classrooms conveniently located across the country, students receive the most current information on industry-standard technologies and operating systems. Courses are offered in:

- Atlanta
- Chicago
- Columbia, Maryland
- Detroit
- Houston
- Los Angeles
- Minneapolis
- New York
- Santa Clara, California
- Washington, D.C.

Education in the Way You Learn Best

A Special New Program
Designed for entry-level system programmers, this program prepares students to generate and maintain an MVS operating system. It combines courses at Amdahl education centers with follow-up training at students' job sites. *Entry-Level System Programmer Training* is a total learning experience integrating company goals and student needs.

CALL FOR PAPERS

THE VM SOFTWARE ANNUAL USER CONFERENCE
Washington, D.C., April 13-16, 1986

Papers for presentation at this first annual user conference are now being sought. Topics include the VM software products, in particular VMCenter, and their components.

Abstracts of presentations should be limited to one page and sent to Andrea Merritt, VM Software, Inc., Suite 366, 2070 Chain Bridge Road, Vienna, Va. 22180. Abstracts are due no later than Nov. 30, 1985.

THE FOURTEENTH INTERNATIONAL QUANTUM ELECTRONICS CONFERENCE
San Francisco, June 9-13, 1986

Original papers are now being accepted that have not been previously presented. Areas to be discussed are laser spectroscopy, ultrafast physical phenomena, fundamental nonlinear optics, quantum optics theory, surface effects, fundamental laser chemical physics, lasers, physics of semiconductor lasers and quantum wells, semiconductor physics, physics of phase conjungation, bistability and chaos, novel physics with lasers, fundamental physics with lasers, physics of free-electron lasers and other new light sources and laser biophysics.

The deadline for submission of papers is Jan. 6, 1986. Both original summary and the abstract should be forwarded to International Quantum Electronics Conference, Optical Society of America, 1816 Jefferson Place, N.W., Washington, D.C. 20036. For publicity information, contact the publicity chair: John W. Roy, Hughes Aircraft Co., 6165 El Camino Real, Carlsbad, Calif. 92008.

BOOK REVIEWS

ORCHESTRATING 1-2-3
By David Rier
and Edmundo Fine

Subtitled *Notes for Advanced Users*, this book takes on problems encountered by people who explore beyond the normal corporate use of the world's best-selling software package.

The authors are users from Dennison Manufacturing Co., and they lend a good sense of what the advanced user encounters.

The basic tenet here is that "anyone who uses 1-2-3 will sooner or later need to develop some capability of telling 1-2-3 what to do in an orderly manner — in other words, program using the macro language instructions provided within 1-2-3."

A healthy bit of the book explores macros, how to use them with ease and power and without disaster and grief.

In the "Rest of the Story" section, the authors explain saving files from within a macro, changing dates within titles, data filing and recovery and much more.

Paperback, 243 pages, $14.95, ISBN 0-201-16901-0, by Addison-Wesley Publishing Co., Reading, Mass. 01867.

THE SOFTWARE CATALOG: MINICOMPUTERS

From Elsevier Science Publishing Co., the respected international publisher, comes the latest edition of the *The Software Catalog*. This edition on minicomputers presents more than 7,000 program descriptions for all major systems.

The 450 pages of vendor listings runs from A 2 Devices to Zilog, Inc. It is also cross-referenced according to computer system, operating system, programming language, microprocessor, subject, applications and keyword indexes.

The once-a-year publication comes with a supplemental update after six months. The supplement is priced at $25.

Elsevier also publishes 1985 editions of *The Software Catalog* on microcomputers, science and engineering, business software and health professions.

Paperback, 850 pages, $125, ISBN 0-444-00962-5, by Elsevier Science Publishing, 52 Vanderbilt Ave., New York, N.Y. 10017.

THE S. KLEIN DIRECTORY OF COMPUTER GRAPHICS SUPPLIERS

The computer graphics industry has grown fourfold since 1980, at least as measured by the growth in listings contained in this directory. The fourth edition presents 550 suppliers in the computer graphics field, including computer-aided design and manufacturing, business graphics and imaging.

The directory gives bare bones corporate data, such as addresses, number of employees, person to contact and year founded. There follows a list of the types of products the company offers in the graphics hardware, software, turnkey systems and services areas.

Specific models and numbers would be helpful here, as well as some information on the model's date of introduction, target user or performance.

Paperback, 262 pages, $85, ISBN 0-914849-01-3, by Technology & Business Communications, Inc., 730 Boston Post Road, Sudbury, Mass. 01776.

Publishers wishing to have their books considered for review can direct books, prepublication galleys, press releases, catalogs or other information to George Harrar, Book Review Editor, Computerworld, *P.O. Box 880, 375 Cochituate Road, Framingham, Mass. 01701.*

GRiD
PORTABLE TERMINAL
FOR $1,950

- IBM 3101, DEC VT100, and TTY protocols
- Built-in 1200 baud modem
- Bright electroluminescent display (25 x 80)
- Rugged 10 pound portability
- $1,950 includes communication and word processing software

Equip your systems programmers with the best available terminal. Save the time and mainframe dollars it now takes to get to the problem location.
Call 800-222-GRID or 415-961-4300 x205 for more information.

SYSTEMS TO GO

TIME
Is Money in Data Communications

☐ solve user RESPONSE TIME complaints
☐ analyze SYSTEM PERFORMANCE
☐ BALANCE DATA LINES in a user friendly environment

QUESTRONICS CPA/7 provides over 75 categories of line utilization and response time information in 11 different reports (hard copy and/or data based) in such areas as:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, the Data Com manager can make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for growth.

WEEK OF OCTOBER 13

OCTOBER 13-16, WASHINGTON, D.C. — **Information Science Inc.'s 16th International Users Conference on Human Resource Management.** Contact: Information Science, Inc., 95 Chestnut Ridge Road, Montvale, N.J. 07645.

OCTOBER 14-15, SAN FRANCISCO — **Direct Response Marketing for Financial Institutions: Telemarketing, Direct Mail & Sales Training.** Contact: Alice Gibons, Inter-Financial Association, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925. Also set for Oct. 21-22 in Los Angeles.

OCTOBER 14-16, PHILADELPHIA — **Managing Application Software Support Workshop.** Contact: Infosci, Inc., Box 7117, Menlo Park, Calif. 94026.

OCTOBER 14-17, NEW YORK — **Info '85 — Information Management Exposition & Conference.** Contact: Cahners Exposition Group, Client Services, P.O. Box 3833, 999 Summer St., Stamford, Conn. 06905.

OCTOBER 14-18, BOSTON — **Management Workshop.** Contact: Judy Trelogan, Arthur Young & Co., 1950 Roland Clarke Place, Reston, Va. 22091.

OCTOBER 14-18, NEW YORK — **Structured Systems Analysis Workshop.** Contact: Elise Rabalais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop West, Houston, Texas 77092.

OCTOBER 15, CHICAGO — **Transacting Business Electronically: Insights Into a Rapidly Changing Field.** Contact: Chi/Cor Information Management, Inc., 10 Riverside Plaza, Chicago, Ill. 60606.

OCTOBER 15-16, NEW YORK — **IMS Recovery Restart.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 15-17, NEW YORK — **Implementing SNA.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 15-17, WASHINGTON, D.C. — **Data Base: A Manager's Guide.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

OCTOBER 15-17, WASHINGTON, D.C. — **The Micro-Mainframe Connection.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

OCTOBER 15-18, HOUSTON — **CMC '85 and A/E Systems — Fall.** Contact: Conference Director, CMC '85 and A/E Systems — Fall, P.O. Box 11318, Newington, Conn. 06111.

OCTOBER 16-17, LOS ANGELES — **The Yates Second Annual Unix Market Forum.** Contact: Yates Ventures, Suite 201, 3350 Bayshore Road, Palo Alto, Calif. 94303.

OCTOBER 17-18, DENVER — **Federal ADP and Telecommunications Procurement.** Contact: International Data Corp., Washington Division, Suite 240, 1500 Planning Research Drive, McLean, Va. 22102. Also being held Oct. 31 to Nov. 1 in San Antonio and Nov. 14-15 in McLean.

OCTOBER 17-18, NEW YORK — **VS Cobol II.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 17-18, PHILADELPHIA — **Rapid Prototyping Workshop.** Contact: Infosci, Inc., Box 7117, Menlo Park, Calif. 94026.

OCTOBER 17-18, ATLANTIC CITY, N.J, — **The Third Annual NCR Users Eastern America Conference.** Contact: Jack Hibberd, A.D.R., Inc., P.O. Box 429, Willow Grove, Pa. 19090.

WEEK OF OCTOBER 20

OCTOBER 21-23, SAN FRANCISCO — **Lamond on IBM.** Contact: Reggi Veatch, National Marketing, Suite E-1A, Standard Court East, 9160 Red Branch Road, Columbia, Md. 21045. Also being held Oct. 29-31 in Dallas and Nov. 4-6 in Boston.

OCTOBER 21-23, BOSTON — **Hammer Forum '85: Shaping the Second Revolution in End-User Computing.** Contact: Hammer and Co., Hammer Forum, 5 Cambridge Center, Cambridge, Mass. 02142.

OCTOBER 21-23, WASHINGTON, D.C. — **Controlling Software Projects: Management, Measurement and Estimation.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held Dec. 9-11 in Dallas.

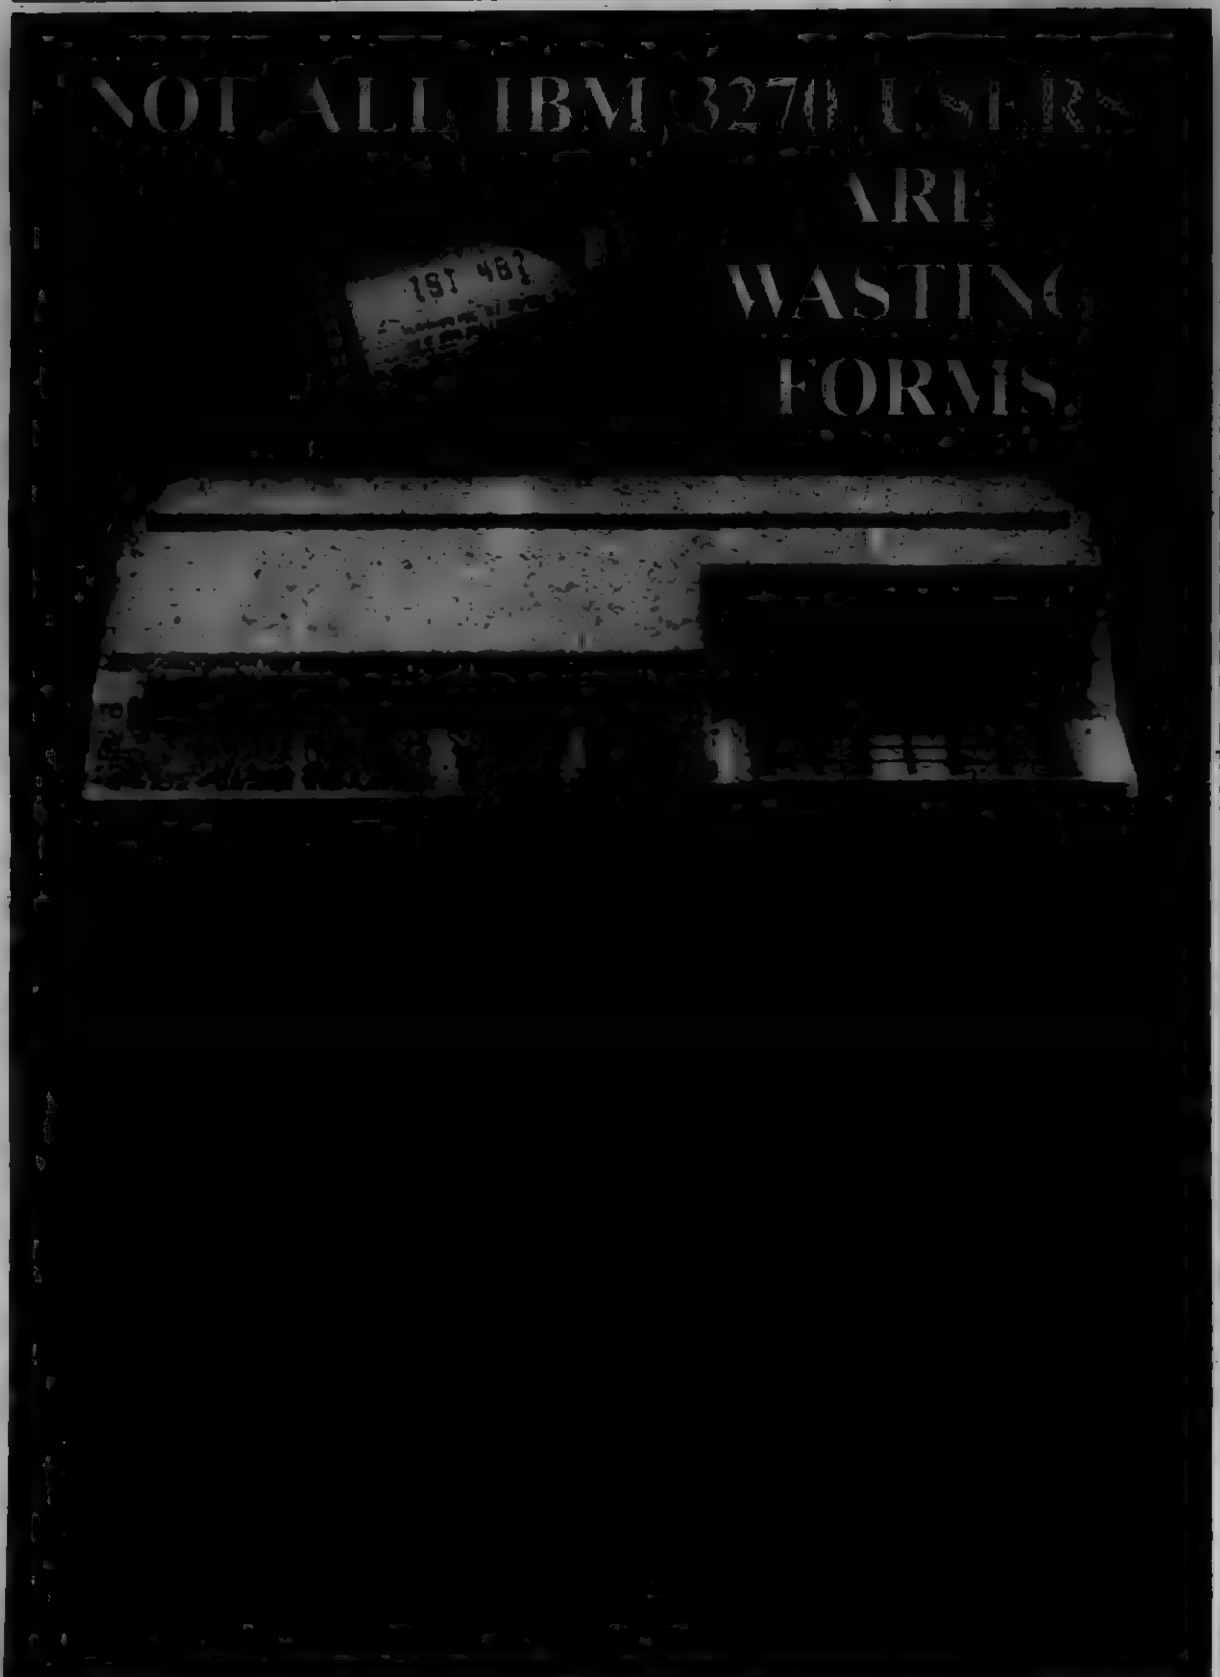
OCTOBER 21-24, CHICAGO — **Systems & Applied Technology Conference & Exhibition (Satech '85).** Contact: Satech '85, 2472 Eastman Ave., No. 34, Ventura, Calif. 93003.

OCTOBER 21-24, PITTSBURGH — **Work Measurement Techniques Workshop Series.** Contact: Institute of Industrial Engineers, Registrar, 25 Technology Park/Atlanta, Norcross, Ga. 30092.

OCTOBER 21-25, NEW YORK — **Comprehensive Course in Data Communicatons.** Contact: *Data Communications*, Special Projects Conference Management Center, c/o Information-Breakthroughs, Inc., 445 W. Main St., Wyckoff, N.J. 07481. Also being held Nov. 18-22 in Lake Buena Vista, Fla.

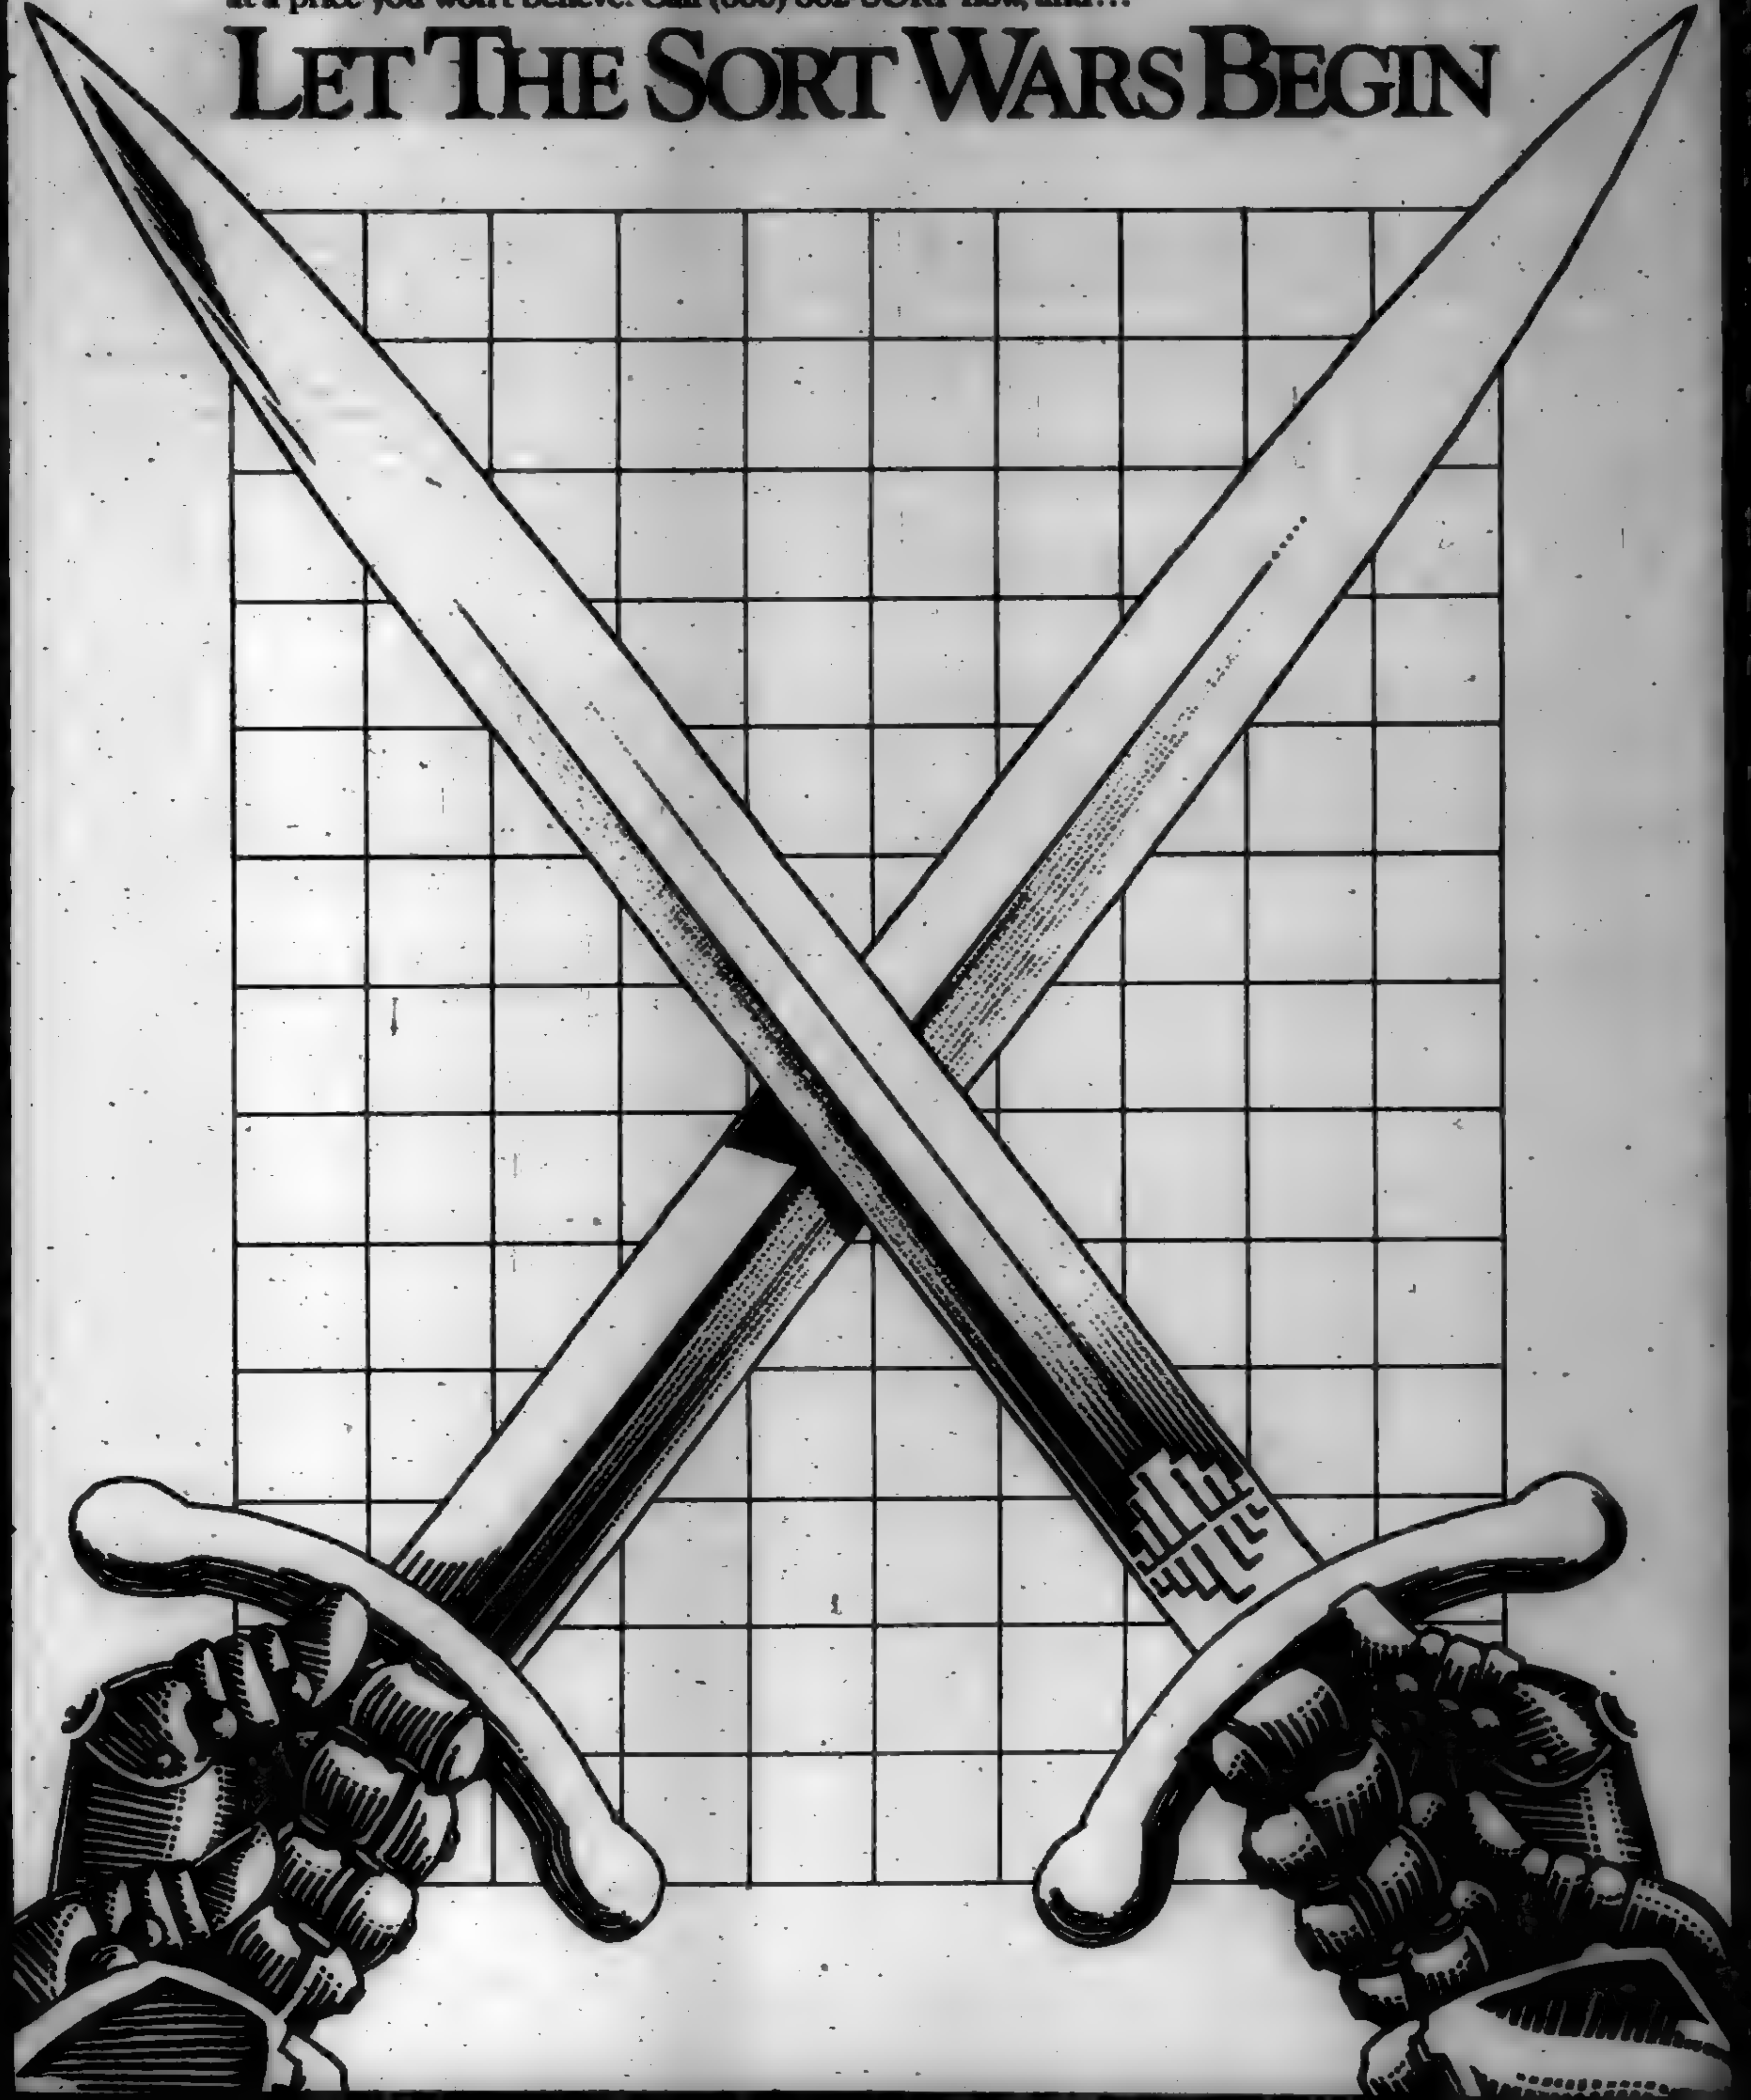
OCTOBER 21-25, WASHINGTON, D.C. — **Ada Software Engineering Workshop.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held Oct. 28 to Nov. 1 in Los Angeles.

OCTOBER 21-25, BOSTON — **Analysis Workshop.** Contact: Judy Trelogan, Arthur Young & Co., 1950 Roland Clarke Place, Reston, Va. 22091.



We didn't set out to create the best sort available…we just built one that would meet our own stringent requirements for speed, expanded capability, value, and ease…and when we were finished…our new PLSORT™ was the fastest, most cost effective, most comprehensive, and easiest VM Sort/Merge anywhere…so, we decided to offer PLSORT to wise CMS users everywhere, at a price you won't believe. Call (800) 862-SORT now, and…

LET THE SORT WARS BEGIN



QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our supersonic systems.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not* go directly to jail. But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT). First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

- **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

- **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevent records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination, headings and dates • Can often produce simple reports in one day rather than, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

Computerworld *talks with Jerome Garfunkel*

Expert addresses Cobol 85 standard

If it seems as if you have been hearing about the Cobol 85 standard — assuming that the proposed Cobol standard is approved this year as expected — for a long time, you are absolutely right. Technically, work on Cobol 85 began in 1978. The proposed Cobol 85 standard is only now entering the final stages of both American National Standards Institute (Ansi) and International Standards Organization (ISO) approval. It has been the subject of intense, sometimes vitriolic, debate. A controversy stemming from Cobol 85's perceived incompatibility with earlier standards for the language sidetracked the proposed standard for years.

With the standardization process winding down, *Computerworld* Senior Editor John Gallant talked with Jerome Garfunkel. Based in Litchfield, Conn., Garfunkel is a Cobol 85 consultant who, as a member of the Ansi X3J4 Cobol committee, was a central figure in the birth of the language. He has lectured, designed, taught training courses in the use of Cobol 85 and has written extensively on the subject.

Jerome Garfunkel

What are the final hurdles for Cobol 85?
The final part of the Ansi procedures say we [the X3J4 committee] must demonstrate that we have gone out for public review and have answered it. An Ansi committee called the Board of Standards Review is the final judge to ensure that all the procedures have been followed and that this is indeed an industry standard.

How would you characterize the period of public review?
Hectic. The first round of public comment drew 2,200 comments, 1,700 of which were negative form letters; the second round produced 925 letters, also the vast majority negative form letters; the third round produced only about 25, many of them from people withdrawing their former comments.

The last one seemed apathetic, which is sort of a good thing. I don't know any language at all that has received the kind of attention Cobol 85 has. I'm glad it was a debate [in which] people got involved. I wish that they had been a little better informed, however.

How do you react to criticism that the Cobol 85 standard took too long to be drafted?
Part of me wants to be defensive because I was part of the system. But part of me says the criticism is absolutely correct. And the prediction that Cobol won't survive unless it becomes more state of the art is probably correct. I don't mean to pooh-pooh the large inventory of Cobol programs. But if Cobol is not a good application development tool and the only reason Cobol was surviving was because of its large inventory of source programs, it will only be a decade or so before the language disappears altogether.

Cobol can only survive if it continues to be a good development tool. The new Cobol language is an essential part of that.

When does the next Cobol standardization process begin?
It has already begun. We hardly got to breathe a sigh of relief. One of the major things that happened in Vienna last year at the International Conference on Cobol

SOFTALK

Niche market vendors making comeback?

By John Gallant

In the last several years, the major applications software vendors have talked about little else than integration of their products and the delivery of so-called development or integration environments. Examples of such environments include Management Science America, Inc.'s Information Expert and McCormack & Dodge Corp.'s Millennium.

The buzzword "integration" has come to represent so many things to so many people and has been so blatantly misused by people in the industry that it has become almost meaningless. And the term "development environment" is also in danger of being rendered useless.

Those issues aside, another question comes to mind. In the rush to integrate their applications portfolios in one way or another and churn out such development environments, have the large applications software vendors forgotten something? In the drive to become one out of the handful of megasoftware companies that strives to be all things to all users, have the vendors lost sight of what those users really wanted in the first place from an applications software company?

John Landry III and Robert Weiler, former top executives of M&D, think they have. Landry and Weiler departed from M&D last month to become chairman and president, respectively, of Lexington, Mass.-based Distribution Management Systems, Inc., which, as its name implies, markets distribution management applications for the IBM mainframe and Digital Equipment Corp. VAX worlds.

The duo feels the big guys in the applications world have begun to lag in applications functionality in the quest to

Continued on page 54

Wouldn't it be nice to have a couple more terminals on your desk?

You could eliminate the inconvenience, lost productivity, and system overhead associated with logging off and on to different applications!

BIMWNDOW permits multiple terminal sessions to be active concurrently at the same physical 3270 CRT, under DOS or OS VTAM. The user may switch back and forth instantly between the terminal sessions by hitting a PA or PF key. The terminal sessions may be in the same or in different VTAM-connected partitions/regions. For example, one session might be logged on to a CICS partition or to TSO to do program editing, and another session connected to a test CICS to test the application program being developed.

Call for full documentation or free 30-day trial.

Price: OS — $3600 or $180/mo., DOS — $2400 or $120/mo.

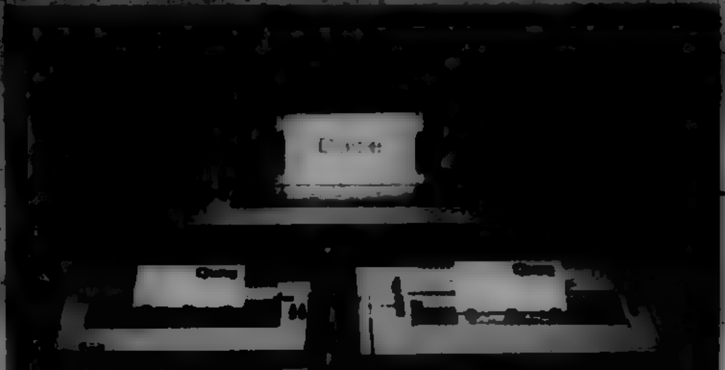
...on the line... we'll be there.

Quality is not a matter of one signature on one sheet of crisply printed correspondence.

It must be demonstrated day after day, year-in and year-out. On high-volume, multi-page documents as well as one-page letters. Through meaningful service and support. By offering a range of printers and system peripherals that truly satisfy your word processing and graphics output needs.

It means Qume.

Our printers average three years between repairs. Unmatched service and support options are provided through the combined resources of ITT's 170 SERVCOM sites and a nationwide network of authorized service outlets. We helped pioneer and set the standards in daisywheel printers. We will do the same for you in the emerging world of non-impact printing.



Let us put our name on the line for you, too. Contact your nearest Qume dealer. Or, call us at (800) 223-2479, Qume Corporation, 2350 Qume Drive, San Jose, CA 95131.

Qume.

Pyramid unveils compilers

Pyramid Technology Corp. of Mountain View, Calif., has announced optimizing Fortran 77, C and Pascal compilers for its Pyramid 90X, 90MX, 98X and 98XE processors.

The compilers work with Pyramid's Common Language Environment, a standardized high-level program development and execution environment integrated with Pyramid's OSX operating system. The operating system is said to incorporate both the University of California at Berkeley's Unix 4.2 and AT&T's System V Unix features.

The Pyramid enhanced development environment includes a source-level debugger, a fast code generator and global optimizer and runtime environment for C, Fortran 77 and Pascal. The compilers are optimized for Pyramid's reduced instruction set computer architecture.

The C optimizing compiler will be bundled and shipped with OSX. Pyramid's optimizing Pascal and Fortran 77 compilers cost $6,000.

Teknowledge's S.1 now in C

Teknowledge, Inc. of Thousand Oaks, Calif., has announced Version 2 of S.1, its development software for knowledge-based systems. The updated version has been rewritten in the C language, the vendor said.

S.1 reportedly runs on a variety of processors, including the AT&T 7300, the Digital Equipment Corp. Microvax, the Symbolics, Inc. 3690, the NCR Corp. Tower 32 and the Apollo Computer, Inc. DN320 and DN550.

Version 2 of S.1 is a combined package of software, training and support. The conversion to C was done to make S.1 available for a wider variety of processors, a spokesman said. S.1 will continue to be available for machines running Lisp, but future versions of S.1 will be built for nonspecialized implementation, the spokesman said.

S.1 has been used to develop knowledge systems for field service, plant management, engineering design and sales support, according to the vendor.

The delivery version of S.1 Version 2 will be available by year-end 1985. The full development version is scheduled for first-quarter 1986 delivery for a variety of processors running AT&T Unix or C. Prices range from $25,000 to $40,000, depending on hardware.

SYSTEMS SOFTWARE

■ **J. William Bennett Co. has announced a job scheduling utility that runs under IBM's MVS operating system.**

Jobtrac submits production and rerun library JCL. The package is capable of capturing Sysouts and supplying a tape archive. It maintains a job execution history and records Initial Program Load statistics.

The software supports Pansophic, Inc.'s Panvalet libraries for automated JCL submission and IBM ISPF editing. Jobtrac works with automatic JCL override or removal.

It runs under MVS/SP 1.1.2 and up. IBM's TSO ISPF/PDF is required for full-function TSO support.

A site license for Jobtrac is $18,500, and a yearly maintenance fee costs $1,850.

J. William Bennett, P.O. Box 96694, Houston, Texas 77213.

■ **Duquesne Systems, Inc. has released Dasd tuning software for mainframes running IBM's MVS and MVS/XA operating systems.**

The Dasdmon package is said to provide on-line information showing contention in the Dasd subsystem. The software displays path, volume, job and data set information on request. Performance-level standards are preestablished by the customer, and Dasdmon will alert the user to problems that may be slowing on-line systems response.

The Dasdmon package costs $10,000 for a 99-year lease.

Duquesne Systems, Two Allegheny Center, Pittsburgh, Pa. 15212.

■ **Boole & Babbage, Inc. has announced the CICS Manager real-time monitoring, tuning and analysis system for IBM CICS users with DOS or MVS operating systems.**

CICS Manager is intended as an aid to systems programmers in finding CICS trouble spots. The system provides on-line tuning suggestions for corrective action. Every area of CICS can be monitored in real time through overview screens. The system also incorporates a batch reporting facility for printing out and analyzing information.

CICS Manager provides a problem screen that examines areas ranging from short-on-storage conditions to transactions waiting on Vsam strings. The system also displays screens that report on activities, transactions, files, storage, terminals, programs and, for DOS environments, DL/1 activities.

The DOS version of CICS Manager costs $8,000, and the MVS copy costs $22,000. The product is available now.

Boole & Babbage, 510 Oakmead Pkwy., Sunnyvale, Calif. 94086.

■ **Unitech Software, Inc. has announced the release of four systems software products for AT&T Unix systems.**

SSL is a full-screen terminal man-

VICE-VERSA

The #1 3270 alternative for people who want more than compatibility.

Telex and IBM displays are truly plug compatible. In fact, for quality, reliability and full-system performance, they're interchangeable. But that's where the similarity ends.

When it comes to low cost displays, the Telex 078 has the advantage. Not just in price but with special features. Like green or amber monitors and a choice of keyboards. Extended highlighting. A light pen attachment and printer support. And the Telex 078 is backed by over 2,000 Telex dedicated service and support people worldwide.

Telex terminals are more than compatible. More than interchangeable. They add value and flexibility to your 3270 network.

So while IBM terminals are still the 3270 standard and Telex is the #1 alternative . . . maybe it should be vice versa.

For more information contact John Hawkins, 6422 E. 41st Street, Tulsa, OK 74135/1-800-331-2623.

IBM micros get building aid

Reportedly functions like ADS/On-Line

Online/Database Software, Inc. of New City, N.Y., has announced the Application Builder, a package for the IBM Personal Computer XT or AT promising the same functions as Cullinet Software, Inc.'s ADS/On-Line application development environment.

Using the Application Builder, Cullinet Software IDMS users can design, code and generate all their ADS/On-Line dialogues on the microcomputer and then upload them to the mainframe for execution. Or, users can download existing mainframe applications for execution on the micro, a spokesman said.

The product runs in IBM's PC-DOS, Microsoft Corp.'s MS-DOS, AT&T's Unix and Microsoft Corp.'s Xenix environments.

The Application Builder gives the user access to IBM DOS functions, offers multilevel password protection, data base control and Help facilities. The product includes an integrated data dictionary that supports IDMS and ADS/On-Line functions.

The on-line mapping function is compatible with IDMS on-line mapping. The dialogue generator is menu driven, and dialogue can be ported to most compatible computers, according to the vendor. The product's tutorial system features 16 lines of Help per field position and tutorials to help application developers learn IDMS and ADS/On-Line.

The Application Builder is priced at $3,500 per microcomputer for the MS-DOS and PC-DOS versions. The product is scheduled for November availability. Versions supporting Xenix and Unix will be available in the first quarter of 1986.

Analysis tool out for VAX

BBN Software Products Corp. has announced that its RS/1 data analysis package for scientific, engineering and industrial applications is now available for Digital Equipment Corp.'s VAX processors.

Release 2 of RS/1 is said to be faster and easier to use and is said to offer more functions than the previous version of the software, the Cambridge, Mass.-based vendor said.

Features of the release include an added table editor and improved graphics editor functions. Users can now customize the display features and provide form-like entry of data into tables. With improved graphics functions, users can now graph dates, times, money and text. The graphics editor can be used to create a data axis with a daily, weekly, monthly or quarterly format.

A command line editor allows VAX VMS users to correct misspelled words. Release 2's money format includes dollar signs, commas between thousands and parentheses for negative numbers. Additional analytical tools include spline fits, probability plots, histograms, principal components analysis and contour plots.

Release 2 will run on DEC's VAX and Microvax II series processors under VMS, DEC's Ultrix or the University of California at Berkeley's Unix 4.2 operating system. Release 2 costs from $6,000 to $69,000, depending on the processor.

Continued from page 44

ager and applications development system with automatic capabilities for menu formatting, screen and table handling and data base calls. The mainframe version costs $4,400, including a compiler.

SPR Super Spooler is a full-feature print spooling and batch job scheduling system featuring multiple device support, multiple queues, manual or automatic device assignments and background job scheduling. The mainframe version costs $975.

SSE is a full-screen editor for Unix developers and nontechnical end users with full text editing functions. The mainframe version costs $410.

S-Telex is a hardware and software telex communications management system that can be used as a stand-alone system or integrated with text and word processing systems. The mainframe single-line system costs $1,365; each additional line costs $280.

The products are available for most Unix versions.

Unitech Software, P.O. Box 7490, McLean, Va. 22106.

■ **Kolinar Corp. has announced an enhanced version of Kprobe, its system software for IBM VM/CMS systems.**

Kprobe is a program test and debug tool for software developers who design products for the IBM mainframe environment. The enhanced version of Kprobe reportedly includes a Snap Dump facility to capture main storage contents without interrupting program operation.

Kprobe is provided for a $2,600 annual license fee and an initial charge of $1,300.

Kolinar, 3064 Scott Blvd., Santa Clara, Calif. 95054

■ **Infocentive Systems has announced the Infoman software utility for IBM CICS users. Infoman is said to enable users to alter and ex-**

panel screen display data to create tutorials, help screens, coding schemes, security access control and data validations.

When applied to CICS applications, Infoman is said to modify the programs to user requirements. On-line tools are provided to make fixes to CICS application software.

Infoman is priced at $3,500 for DOS/VSE installations and $4,500 for OS/MVS systems.

Infocentive Systems, 10220 Lower Azusa Road, Temple City, Calif. 91780.

PRODUCTIVITY AIDS

■ H&A Computer Products, Inc. has announced the Query Report Program for the IBM Series/1 minicomputer.

Query Report Program allows nontechnical users to create reports tailored to their needs without help from a programmer.

Users can select, sort, format and retrieve data to run a report using a series of menus. Report specifications can be saved to run the report at a later date.

The Query Report Program is priced at $1,500.

H&A Computer Products, 522 Washington St., San Francisco, Calif. 94111.

■ Lawson Associates, Inc. has announced Access+, a dictionary-driven query and report writer system for IBM mainframe users. The product runs in DOS and OS environments.

Access+ provides on-line query capabilities or hard-copy report output and allows users to access multiple applications in one request, a spokesman said.

End users can design their own reports without assistance from DP personnel.

Access+ for DOS is priced at $22,000. The OS version is priced at $28,000.

Lawson Associates, 2021 E. Hennepin Ave., Minneapolis, Minn. 55413.

■ The John Fluke Manufacturing Co. has announced the Prolink Personal Computer Program Development Package, which links an IBM Personal Computer or Personal Computer XT or AT with the Fluke 2400B Intelligent Computer Front End.

Prolink Personal Computer simplifies creation of data acquisition and control applications that execute on the 2400B.

Prolink allows the IBM Personal Computer to download its applications programs to the 2400B. The Fluke 2400B then handles all conversions, linearizations, limit checking and data buffering.

Using menu selections, an operator can create and edit 2400B measurement and control programs. Menu choices allow programs to be checked for errors and to be downloaded to and retrieved from the 2400B. Systems with up to 100 channels can be supported by the system.

The Prolink Personal Computer package is priced at $450.

John Fluke Manufacturing, P.O. Box C9090, Everett, Wash. 98206.

■ Antek Software, Inc. has announced Allegro, systems software designed to speed the processing of IBM Vsam files under DOS/VSE without requiring modifications to files, programs or JCL.

By operating as a front end to Vsam open processing, a spokesman said, Allegro allows programs that normally use the default buffer specifications, such as Cobol programs, to use more efficient values.

Allegro is available for a permanent license fee of $2,500, an annual lease of $1,000 or a monthly rental of $100.

Antek Software, 5419 Oliver Ave. N., Minneapolis, Minn. 55430.

APPLICATION PACKAGES

■ GEC Software Ltd. has announced Gecomo, a cost estimating and project management tool for Digital Equipment Corp. VAX processors and Sun Microsystems, Inc. workstations.

Gecomo provides software managers with estimates of duration and staffing profiles before the start of a project and throughout its progress. The product is said to allow managers to examine alternative scenarios for handling a project.

Once the development approach has been decided, Gecomo is said to automatically provide estimates by work activity and by phase of development.

The system is available for the DEC Microvax and VAX-11/730 through 785 under the University of California at Berkeley's Unix 4.2 and DEC's VMS. It is also available on Sun workstations.

The first systems will be available in November and will cost $16,000 on VAX processors. The price for Sun workstations is $9,600.

GEC Software, 132/135 Long Acre, London, England WC2E 9AH.

■ Mascoglia and Associates, Inc. has announced the Stat/38 statistical analysis system for IBM's System/38 and enhancements to its Stat/36 and Stat/34 statistical analysis packages for the IBM System/36 and System/34.

Stat/38 provides an external file interface that permits statistical analysis of data stored by other applications. It copies and formats data from any internally or externally defined file to a matrix file.

The Stat/38 analysis program provides a variety of data manipulation, mathematical and statistical functions with display and report output. Features of the program include interactive, command-controlled operations, on-line assistance displays describing program operation and the use of each command and user-assigned names for the columns and rows of a matrix.

Stat/38 is licensed for a one-time fee of $17,500.

The company also announced release 3.1 of the Stat/36 and Stat/34 statistical analysis systems. The enhanced versions offer improved file handling capabilities, increased flexibility and improved statistical analysis facilities. Stat/36 and Stat/34 are licensed for a one-time fee of $5,000.

Mascoglia and Associates, Suite 102, 4970 Northwind Drive, East Lansing, Mich. 48823.

■ Matra Datavision, Inc. has announced Surfapt, a numerical control application for surface milling operations. Surfapt is used in conjunction with Matra Datavision's Euclid computer-aided design and manufacturing system.

The Euclid system is based on true three-dimensional solid modeling techniques. Surfapt runs on the Digi-

WHAT DOES DOCUMENTATION HAVE TO DO WITH PRODUCT SALES AND CUSTOMER SUPPORT COSTS?

More than you might think.

This year the documentation specialists at Xanthus conducted a national survey on consumer and reseller attitudes toward documentation. The results were clear.

Documentation influences consumer buying decisions. Why? Because documentation is more important to computer users than ever before. It's become a major selling point.

Documentation also affects product support costs. If your documentation is effective, you won't have to spend as much on customer training and support costs. And that can help reduce your overhead.

How does your documentation measure up? You can find out with the Xanthus documentation evaluation service. Your documentation will be evaluated according to the survey results. Plus you'll receive a complete report, including recommendations for improvements. Improvements that increase sales and reduce support costs.

Find out more about this special service and the other documentation services Xanthus provides. Call (512) 450-0044 or write to the address below.

Visit our hospitality suite at UNIX EXPO, September 18, 19, and 20.

How to evaluate a methodology ?

Are you grappling with high maintenance costs and a long backlog of requests? If the answer is yes, you're probably already investigating some possible solutions.

The articles and books you read may tell you that a systems development methodology can solve your problems, but when it comes to recommending which one, confusion reigns.

How do you evaluate the myriad of methodologies available and select the one that will meet your needs?

"How To Evaluate a Methodology," published by Ken Orr & Associates, Inc., may provide the answer. Based on our current research and more than a decade of experience with systems development, "How To" is a straight-forward set of questions that you need to include in your selection process.

These questions will help you to see the distinctions between methodologies, detect their strengths and weaknesses and, ultimately, discover which one will help you accomplish your goals.

You can get a free copy of "How to Evaluate a Methodology" by calling our toll-free number, 800/255-2459, or sending your business card to: Ken Orr & Associates, Inc., 1725 Gage Blvd., Topeka, KS 66604-3379.

Ken Orr & Associates is a computer software research and development company specializing in the design of industrial-grade information systems.

Durable, doable design characterizes sound data base

SOFTLINE
Frank Sweet

By Frank Sweet
Special to CW

The two hallmarks of a sound data base design are that it is durable and doable.

A durable design survives changes in the business environment. Managers and policies, products and styles come and go. But a data base represents millions of dollars' worth of painstakingly collected data about a firm, and it better not come and go with the changes.

A doable design is one that is easy to implement. It capitalizes on the one gift all people share — people get better at anything with each repetition — and it does not penalize a common flaw — that people never get anything right the first time.

Durable data bases survive the very applications that created them. One shop, for example, has been through two payroll systems, a now-defunct workmen's compensation system and two security systems in the past seven years. Yet its employee data base, which those applications used, has been chugging away without interruption since first installed. At the other extreme lies the painful case of a design so dependent on transitory management style that it was unknowingly wrecked by the stroke of an executive pen mere weeks after implementation.

Durability not accidental

Understand, durability is no accident. It is deliberately built into data base designs by modeling underlying business reality, making sure the resulting data base is sharable among applications and making it expandable with new data.

Modeling reality means that data structures reflect real events, real activities. They must not simply mimic records in other filing systems such as forms and documents. Specific forms can be abolished while the concepts of products, vendors, customers or employees cannot. Modeling reality means determining designs by the business processes they will support.

Sharing the data base among applications means that different people use the same data base for different purposes. Data base administrators call this avoiding redundancy, and there are three reasons why it is important.

First, redundant data implies redundant data updaters, and it is pointless to have two people doing the same job. Also, the more users, the greater the incentive to keep data accurate. Thus, the data becomes more timely and reliable for everyone. Finally, the more widely a data base is shared, the more durable it is. Its users anchor it against being blown away in one of the yearly tempests of reorganization.

> ”
>
> *A doable design capitalizes on a gift people share — they get better at anything with each repetition — and it does not penalize a common flaw — that people never get anything right the first time.*

Making the data base expandable to new data means developing the skills and tools to add fields to existing records, new records to existing files or new files to the data base without shutting down or retrofitting existing applications. Expandable data bases endure because each new application brings new data needs. Application developers will use the central data base if their needs are easily accommodated. Otherwise, each group will go its own way, and the centrally shared data pool idea will be stillborn.

The most doable data base designs are those that can be brought up faster and with less effort than comparable flat files. The worst, of course, are those disasters where the application quickly reaches 90% completion and stays that way month after expensive month. The two secrets of making it doable are to include only what is needed and to keep it simple.

Data design conceals a treacherous twist to the dilemma. It is the urge to include too much. Designing a vendor file for a payables system,

Sweet is corporate manager of data administration for the Charter Co., a Fortune 100 firm in Jacksonville, Fla. He has worked with major data base management systems since 1970 and is a former president of the national (Cullinet Software, Inc.) IDMS User Association.

WHO SAYS WORDSTAR® 2000 IS SO GREAT?

"Move over MultiMate, MicroPro's back on top."
—Business Software

"The new package is packed with virtually dozens of features everybody wants…Even in a dedicated machine, word processing has never been more plushly self contained and comprehensive."
—Personal Computing

"Three early users of WordStar 2000 gave the program high marks for its overall design, mnemonic command set and intelligent use of function keys."
—ComputerWorld

"I've become addicted to some of the features such as undo, windows, and automatic reformatting."
—Popular Computing

"Include WordStar 2000 on your shopping list—it's competitive with anything now on the market."
—Computers and Electronics

WORDSTAR® 2000
Now there are no limits.™

MicroPro.

CW interviews Jerome Garfunkel

was that the ISO Cobol Committee, which is the international version of the Ansi X3J4 committee, decided to change the process used to standardize Cobol to speed it up. The process is killing the language. If the process is so slow that it delivers what we need too late, it's contributing to Cobol's death.

So [the] ISO decided to adopt the concept of Cobol supplements, and every few years we will add [new features] to the language.

But we will make sure that the supplements are completely compatible so we won't start up the incompatibility controversy.

That controversy was mainly over incompatibilities between the new language and older versions.

Some observers were very vocal about these alleged incompatibilities between Cobol 85 and earlier versions. Have all these issues been resolved? Were these criticisms valid?

No, the issues have not all been resolved to the satisfaction of those people who held what I believe was a radical view. That is a fairly controversial word to use. I qualify it by an example.

We added a new verb called the EVALUATE verb that adds functionality to the language. I asked someone who was vocal about the incompatibility problems whether he was in favor of not adding the Evaluate verb because it was a new reserved word and technically — though we had an easy way of dealing with it — was an incompatibility. He said yes.

That is how adamant they were about causing no new incompatibilities.

When I heard that, I stopped taking that point of view very seriously. They had a legitimate point of view and they got us to pay attention to it. But we could not adopt that view to the point of killing the language.

Maintenance is one of the biggest concerns today. Do you think the reduction of maintenance work loads was a big enough concern to the drafters of Cobol 85?

Yes. If I had to pick one area in which Cobol 85 is strongest and who it will benefit most, it [would be] the maintenance function and the maintenance programmer.

The main beneficiary of well-structured code is the maintenance programmer. That is exactly what prompted many of these changes, the fact that systems maintenance was out of control. That is exactly what [resulted in] most of the important changes in Cobol 85.

The other concern is productivity. Is Cobol 85 geared to improving productivity?

If what you call productivity is application development productivity and you measure that by how fast an accounts receivable application can go from specification to executable code, then no, Cobol is not the most productive language to use.

We all know it is very wordy, and it is time consuming because it is self-documenting. It is not a speedy development tool. [It is] a practical solution to living with an existing system.

If we are going to build systems knowing they will need maintenance, there is no better language I know of for that task than Cobol.

Many of the fourth-generation language vendors claim that their products can handle the same programming tasks as Cobol and that eventually they will supplant Cobol. How do you respond to such prognostications?

The first part of that is true. Most of the fourth-generation languages can do what Cobol is doing, and they can probably do it a little more efficiently, in the sense that it takes fewer words to generate the same executable code.

The problem arises when you consider why we have Cobol in the first place. Industry needed a common language. I see nothing on the horizon in terms of fourth-generation languages emerging to challenge Cobol in that role. That is much too important for industry to give up.

What do you consider to be the most attractive feature of the new standard and the things that will benefit users most?

The main criticism for Cobol has been its lack of structured statements; if you wanted to write structured programs according to theories of the last decade, you couldn't do them well in Cobol.

That is no longer the case. Many new constructs of the language were added specifically to be in harmony with structured programming theories.

In retrospect, what would you like to have seen done differently in the drafting of Cobol 85?

I would like us to change the standardization rules so that what takes three years of normal procedures, forgetting about something like the incompatibility issue entering the picture, should only take a year.

We should be able to come up with a consensus without having to go through such fine detail of procedures as we do now.

BE A COMPUTER ENTREPRENEUR

"The AMI Agent Program absolutely met all our expectations."
Glen W Gordon,
Computer Resources International, Inc.,
Monroe, LA

"We're an independent computer systems house, and over the past 20 years have evaluated just about every market and product for mini and microcomputers. Today's powerful microcomputers and the vertical market for accountants clearly hold the strongest potential for revenue. AMI's Agent Program lets us enter this lucrative market quickly and profitably."

AMI's Certified Agent Program is a unique opportunity for you to profit from the microcomputer revolution with only a small investment in the tools to get your business going. You'll sell powerful turnkey solutions including AMI's Software for Professionals™ and hardware like the IBM PC-AT. There's no franchise fee, inventory, nor accounts receivable to worry about. Why the three letters you think of first for System/38 add-in memory shouldn't be IBM.™

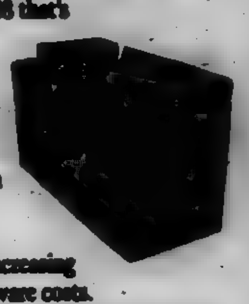
EMC introduces its 1MB memory expansion card for the System/38.

EMC has just added a feature to add-in memory for IBM's System/38 that's been sorely lacking.

Competition.



Like IBM's 1 Megabyte add-in memory, our new memory expansion card lets you boost the speed and performance of your System/38. Without increasing software or other hardware costs.

But unlike IBM, we let you do it for $2,000 less. (IBM's price is $7,500, ours is just $5,500.)

And our new 1 Megabyte memory uses newer, more reliable technology. It's so reliable, there are *no maintenance charges* of any kind.

IBM, on the other hand, charges you a memory maintenance fee of more than $1,000 a year. Every year.

Our memory comes with the industry's only unconditional warranty.

EMC is the first company to ever offer you an *unconditional lifetime warranty* on a System/38 memory card. And we offer the same warranty on every other memory card we make.

[illegible] special toll-free hotline and we'll send you a new card *within 24 hours*—absolutely free.

And our new memory expansion card is *100% plug compatible* with the System/38. So it supports all IBM memory and memory diagnostic features. Installation takes just 10 to 15 minutes (you can even do it yourself) and does not affect your IBM maintenance coverage in any way.

We're the name DEC,™ HP, Prime™ and Wang™ users remember first.

EMC is the only independent supplier of memory expansion cards for the System/38.

As well as the world's largest manufacturer of add-in memory for minicomputers. Including Wang, DEC, HP and Prime.

Among our customers are AT&T, Merrill Lynch, Ford, Bank of America, General Mills, EXXON, 3M and many other Fortune 500 companies.

But you can't appreciate all that an EMC memory board can do *for your System/38* by reading an ad.

You've got to use it.

To let you do that *before* you buy, we've come up with a special trial offer for qualified System/38 owners. Just call or write EMC Corporation at 12 Mercer Road, Natick, MA 01760—and we'll install a "no maintenance" [illegible] board for you without cost or obligation.

Then you can evaluate it for *two full weeks* on your own system, running your own applications.

Once you do, remembering our name will be a snap.

For your free two-week evaluation, call today:

1-800-222-EMC2

(In Massachusetts, call 617-655-6600)

The basics.

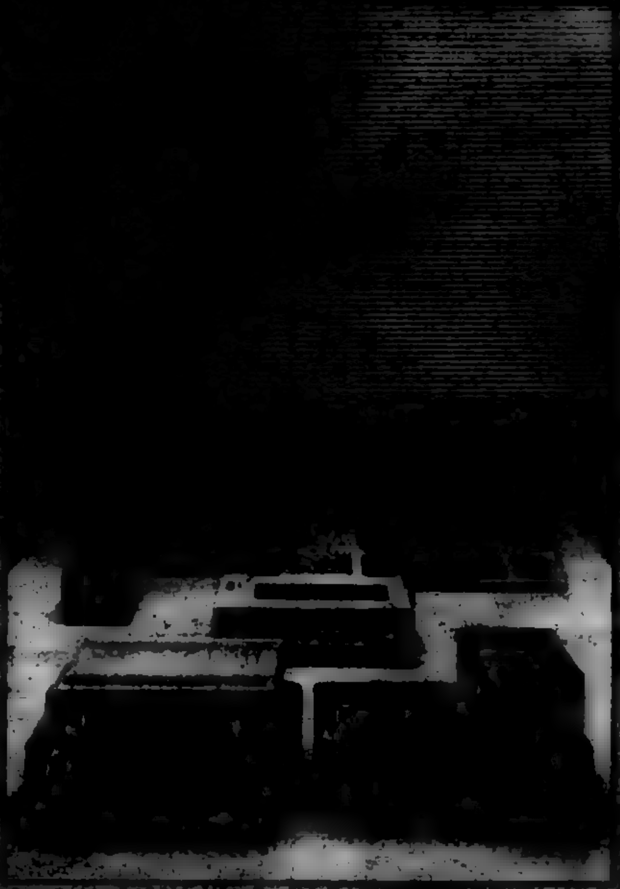
[illegible] your business depends on your data network. [illegible] System from [illegible].

The DATAPHONE II System is a new family of high-performance data communications products—modems, data service units and diagnostic control devices—that combines data transmission with real-time diagnostics and sophisticated network management and control.

It's a modular system of [illegible], designed to keep your network up and running. And to easily grow in size, speed and diagnostic capability to meet your changing needs.

Whether you have an analog or digital network, the DATAPHONE II System offers a full line of microprocessor-based private line modems and data service units to provide [illegible]

[illegible] plans with unique [illegible]



[illegible]

[illegible] the way you want.

[illegible]

Our latest [illegible]

[illegible] Controller.

[illegible] DATAPHONE II System is the right choice, giving the capability you need now with flexibility for the future.

And AT&T backs the DATAPHONE II System with the largest, most experienced sales and service force in the industry. We're available 24 hours a day to provide support and service, to troubleshoot faults and prevent problems [illegible]

To learn how our DATAPHONE II System can meet your needs from start to finish, call your AT&T Information Systems Account Executive. And ask about our flexible purchase and leasing options. Or call 1 800 247-1212 for more information.

tal Equipment Corp. VAX family of processors and the IBM 3030, 3080, 3090 and 4300 lines. Surfapt is priced from $20,000 to $60,000.

Matra Datavision, 30 Commerce St., Woburn, Mass. 01801.

LANGUAGES

■ Peat, Marwick, Mitchell & Co.'s Catalyst Group has announced a service that converts mainframe assembler language code programs to structured Cobol.

The Mainframe Assembler to Structured Cobol Translator (Mascot) reengineering service is said to deliver structured Cobol code, centralized mainline processing logic, isolated I/O for each program, performable routines and self-documenting code.

A spokesman said the cost of the Mascot translation service is typically $1.50 to $2 per line of assembler code. It varies according to program complexity and adherence to assembler language programming standards.

Peat Marwick Catalyst Group, Suite 2200, 303 E. Wacker Drive, Chicago, Ill.

REMOTE COMPUTING SERVICES

■ General Electric Information Services Co. (Geisco) has announced a service called Ascii-to-IBM 3270 protocol conversion, also known as IBM 3270 emulation, on its Mark Net Asynchronous Service.

The service is facilitated through Simware, Inc.'s SIM 3278 emulation software, available to Mark Net users in IBM VM, MVS/Vtam and PC-DOS versions. The 3270 emulation allows more than 50 different Ascii-type asynchronous terminals and microcomputers to function as IBM 3278 Model 2 terminals.

A single-CPU, perpetual SIM 3278 license for Mark Net users costs $15,500 for the Vtam version, $9,500 for the VM version and $7,500 for the PC-DOS version.

Geisco, 401 N. Washington St., Rockville, Md. 20850.

Doable design key to sound data base

you may need a vendor identification number, name, address and amount owed. You should stop, but temptation draws you on.

"We're designing a data base to be shared by future applications," you reason. "Shouldn't we find out what they'll need and include it too?" The bait looks tempting — doing a thorough job — and the risk slight — a few days' extra work.

But, to do it, you would have to identify every data element, every attribute of a vendor that any user could ever want for any conceivable purpose.

The power of data base management systems with the subschema notion, like Cullinet Software, Inc.'s IDMS, is that they enable records to be stretched to include new fields as new applications arise and do so without making users track down and recompile existing programs. So, the first way to make a data base design doable is to include only what is needed at the time the data base is designed.

The second secret of doability is to keep it simple, and this implies modularity. There is really only a handful of basic data base design patterns. They are used, like building blocks, in one application after another.

You may ask why Elgar's new UPS looks just like an IBM System/36? ...Why indeed!

• Our new UPS is indeed a perfect match for IBM. It provides the kind of power protection necessary for IBM systems. And only Elgar is plug-in compatible with both the CPU and peripherals for fast, easy installation.

• Our new UPS is packed with quality features for trouble-free performance. Only Elgar has ±4% dynamic power regulation. We deliver more precise power to your computer than any other UPS you can buy. Our new UPS costs less to install . . . to run . . . and maintain.

• Want more? It fits in your office. It's so quiet you'll hardly know it's running. And it's backed by a no-nonsense TWO YEAR WARRANTY from Elgar . . . the leader in quality power protection systems.

• Get the full story on our new T-Series UPS for mini computers.

Now you can paint your entire IMS application system.

APS

THE APPLICATION PRODUCTIVITY SYSTEM FOR IMS AND CICS DEVELOPMENT CENTERS

APS, the leader in providing productivity savings to IMS and CICS users, now features exciting new painter technology that makes application prototyping and implementation easier and faster. Using APS, your development staff can:

PAINT screens, reports, data structures and programs in a fraction of the time and cost it currently takes.

PAINT a visual "at-a-glance" representation of an entire application system that shows the relationships of all application components.

PAINT prototypes that clearly demonstrate application systems to end users—from simple screen sequences to full working prototypes that include program logic and data mapping.

LIFE CYCLE SAVINGS

Using APS, your staff can easily extend prototypes into full production systems that support your most complex functional requirements. From your painted source, APS automatically generates native COBOL code including DB/DC syntax and produces comprehensive system documentation. And, during maintenance, your staff can quickly and easily make enhancements at the productive painter level.

So unlike some productivity tools you may have seen, APS won't paint you into a corner. It simply helps you do your job better, and in a fraction of the time and cost.

To learn more about the integrated family of APS products, attend a free APS Seminar. Call us toll-free at 800-638-8703 or just send in the coupon below.

Niche market vendors making comeback?

tie systems together and offer standardized development environments. Thus, smaller vendors that work only within a specific niche market — and target their R&D efforts solely toward improving the quality of their applications — have lately been able to gain significant ground against the behemoths by addressing functionality rather than global integration.

"What happened," Landry said in a recent interview with *Computerworld*, "was that all the major players got involved in this push to integration and development environments. [M&D] was very much a part of that. But the big companies have focused almost solely on these things, and in the feature/function aspect of their applications they are floundering."

That floundering has given niche dwellers an opportunity to prosper. For example, Landry said, Sunnyvale, Calif.-based Data Design Associates has lately begun to beat up on its larger competitors in the financial software arena.

"They didn't have all the bells and whistles like the big guys," Landry said. "But they were very successful in knowing what users wanted. The large applications vendors were trying to be all things to all people, and that is just too hard to do. It will take the next two or three years for the so-called integrated applications vendors to complete all that they have said they would do. They have to live up to a lot of claims."

According to Weiler, niche, or vertical market, applications software companies are making quite a comeback.

"The niche companies got hammered hard in 1983 and 1984," Weiler said. "A lot of users bought the major vendors' pitch about integration and development tools. But now users are again checking out the niche companies, they are looking for the functionality that the big guys haven't been able to deliver. The niche guys are coming back."

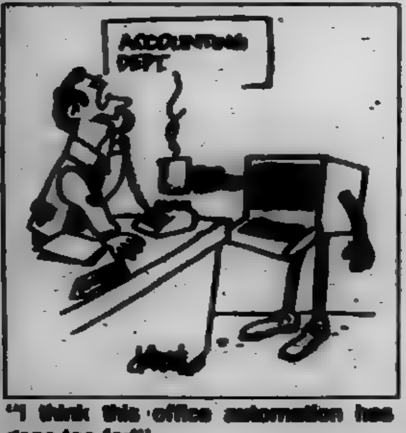
Landry's and Weiler's comments should not be misconstrued as a parting shot at their former employer or other large applications vendors. Nor are they a plug for Distribution Management Systems, undoubtedly a niche dweller — though in one of the more rapidly expanding niches.

And it must be remembered that even the biggest software companies were once niche dwellers of one sort or another and cannot be faulted solely for growing beyond their roots.

But the fact remains that the pair's views probably correspond to those of many users, those who are interested more in the quality of a particular application than in whether it can be linked to an accounts payable, manufacturing or human resource system.

Integration became a hot topic for a reason — users hoped to meld their applications into a single information resource. But integration is not the sole concern of users. In the rush to meet the demand for integrated products, applications vendors sometimes seem to have forgotten why users turned to packaged applications in the first place.

Users were looking to supplement their own development efforts with reliable systems that handled a particular business function as well, or nearly as well, as a custom, in-house application.



ACCOUNTING DEPT.

"I think this office automation has gone too far!"

FIRST, A QUICK MESSAGE FROM NEC.

19,200 bps.

AND NOW FOR THE REST OF THE STORY.

NEC proudly introduces the most sophisticated communications products available. Starting with the revolutionary new DSP19200 with O-QAM—Orthogonally multiplexed Quadrature Amplitude Modulation. This NEC innovation provides data transmission at an actual speed of 19,200 bps, over 4-wire, type 3002, D-1 conditioned lines. Because data compression is not used, the DSP19200 is insensitive to protocol. In conjunction with advanced Trellis-encoding forward error correction and carrier jitter cancellation, it offers users the highest data rates and throughput available today.

The DSP19200 features an 8-channel TDM multiplexer. For flexibility, it provides a variety of data rate combinations, with individual speeds of from 2400 to 19,200 bps per channel. Additionally, a pair of data rate fallback systems selectively compensate for both line noise and bandwidth limitations.

With its integral soft-touch keypad, alphanumeric display and sixteen LED indicators, the DSP19200 lets the user

- set the strapping options for local and remote unattended modems,
- perform diagnostics and bit error rate testing with a built-in pattern generator, local/remote analog and digital loopbacks,
- monitor transmit/receive and carrier detect levels
- monitor EIA interface control signals on all eight channels.

With its superior capabilities, the DSP19200 is a compact unit that measures just 12.6"w x 3.5"h x 15.6"d.

The new NEC DSP19200, with revolutionary O-QAM technology and highly comprehensive features, offers unmatched performance over existing telephone circuits. It is the unequalled choice for saving both time and money on high-speed data transmission.

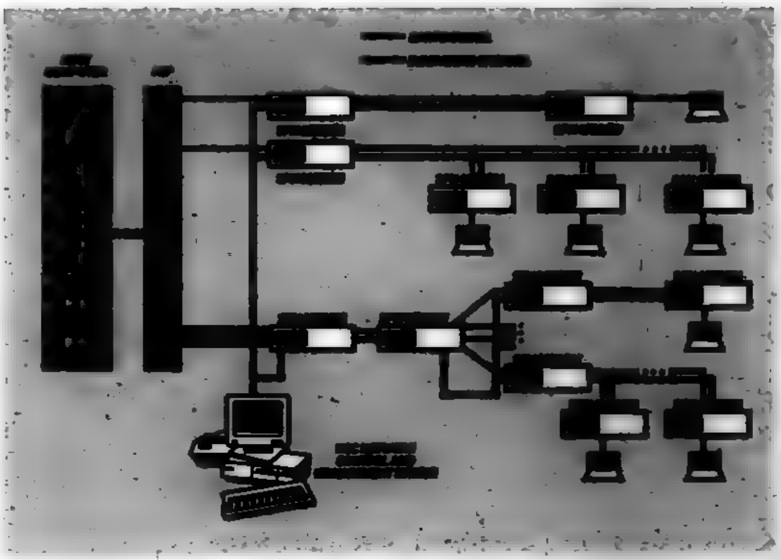
NETWORK CONTROL AND MANAGEMENT SYSTEM (NCMS).

The NEC Network Control and Management System is a powerful, user-friendly troubleshooting tool for small to medium scale networks.

The menu-driven NCMS uses high-resolution color graphics, presenting easily interpreted information on all aspects of network activity. It allows quick response to network problems, simplifies day-to-day operation, and facilitates better system management.

Based on the versatile NEC APC III Computer, NCMS operates under UNIX(R), and includes mass storage, printer, and high-resolution color display.

NCMS uses NEC SPN Series intelligent modems with operating speeds of 2400 to 14,400 bps, in a variety of configurations: point-to-point, multipoint, or tandem. And it manages from one to sixteen central site lines, providing enough control for almost any small- to medium-sized business.



NCMS offers a range of diagnostic functions, starting with continuous monitoring of eight key analog parameters, and including EIA lead status.

For measurement of error rates, NCMS provides analog and digital loopback, with multipoint, end-to-end, and self-testing. Plus automatic polling tests. NCMS even allows downline loading of modem options for easy installation and control.

Continuously monitoring the communications network, NCMS automatically alerts the system operator to problems, so they can be quickly identified, isolated and resolved. It also provides multilevel password protection for system security. And to simplify administration, NCMS generates trouble tickets and network management reports.

The NEC Network Control and Management System. The simple solution to complex networking problems.

N500A DSU/CSU

The NEC N500A is a highly efficient Digital Service Unit that operates at rates of 2400, 4800, 9600 and 56,000 bps. By using easily changed interface cards, it supports RS-232C and v.35. It offers both full- and half-duplex operation, and is completely DDS network compatible.

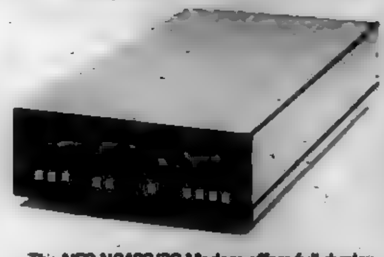
For rapid fault diagnosis, the N500A offers local and remote testing capabilities. In a multidrop environment, the N500A allows the user to address an individual DSU/CSU for testing from the central site—an industry first.

Also built in is an LCD display for front panel monitoring of equipment status, data rate, and error performance when in the test mode. Seven LEDs indicate EIA status.

The N500A ia available in both stand alone and card versions for Rack Mounting.

The New N500A DSU/CSU offers advanced technology and rapid, reliable data transmission, for the most efficient, most cost-effective system operation.

N2420/30 DIAL MODEM



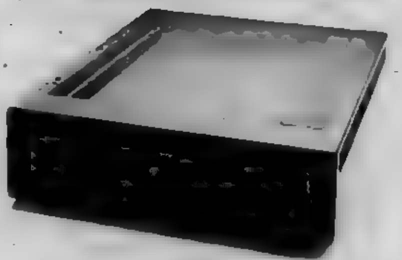
The NEC N2420/30 Modem offers full duplex operation at 300 bps, 1200 bps, or 2400 bps over two wire DDD networks. For the first time, the user can specify performance options. Including:

- Full Hayes auto-dial compatibility.
- 12 number NEC dialing with auto log-on sequences.
- Call-back security with capability for storing 96 users' codes and passwords.
- Built-in Error Control for error free data transmission.
- Synchronous dialer.

The N2420/30 modem is available in both stand alone and rack mount versions.

The NEC N2420/30 modem offers the user the ability to pick and choose performance options to meet specific telecommunications needs now and in the future.

DSP9620 DATA MODEM



The new NEC DSP9620 employs the latest in high-density LSI technology, and offer stable, reliable operation at speeds up to 9600 bps.

The auto-answer DSP9620 is compatible with CCITT v.32, v.28, v.24 and EIA RS-232C standards, and operates in full-duplex mode over the 2-wire public switched dial network or on unconditioned 2-wire leased lines. It maintains both high transmission speeds and data integrity by employing an array of innovations, including a powerful echo canceller, automatic adaptive equalization and Trellis encoding/Viterbi decoding.

The DSP9620 makes operation simple. It provides automatic fallback, easy setup, comprehensive monitoring, and a full range of diagnostics. It features eye pattern output. Plus an optional adapter for asynchronous operation.

The new NEC DSP9620. A combination of high speed, reliability and ease of operation never before possible.

ADVANCED TECHNOLOGY, SIMPLY APPLIED.

San Jose, CA 95134.

C&C Computers and Communications

DATA COMMUNICATIONS PRODUCTS

NEC

IN DEPTH

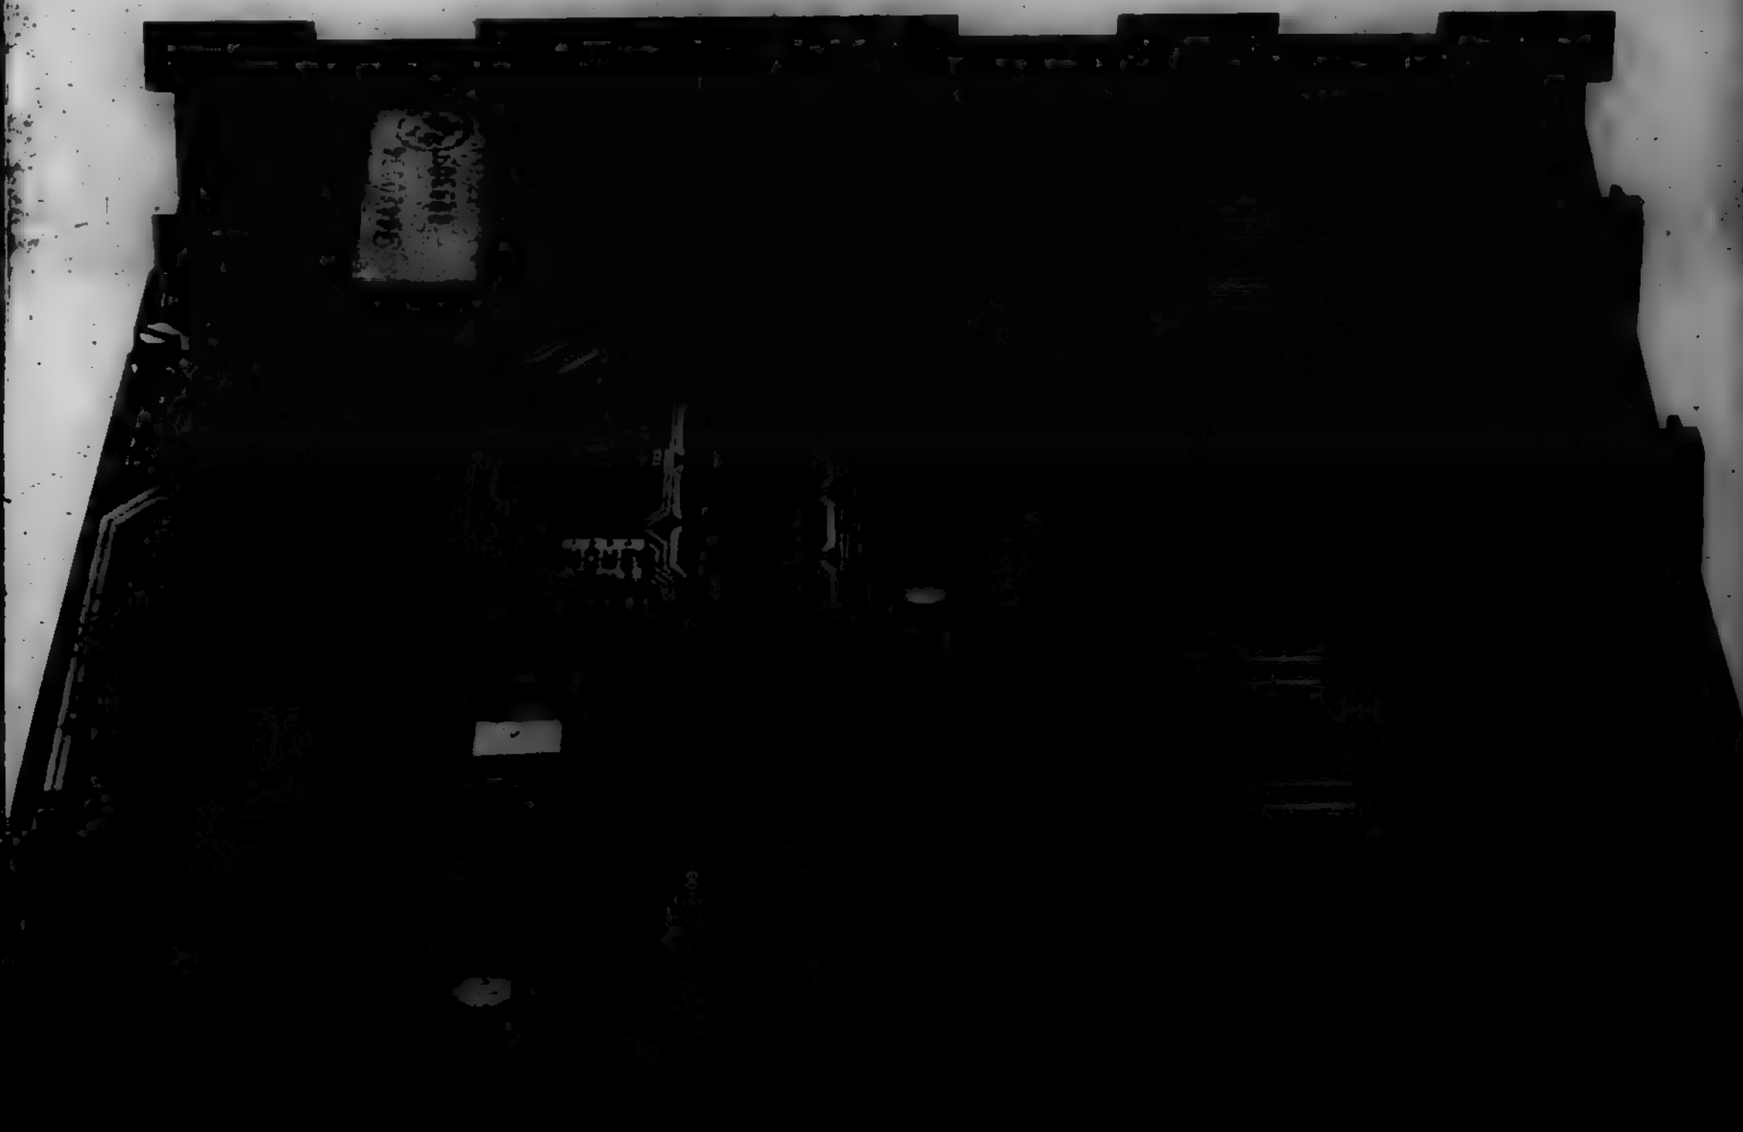
Who needs 2,400 bit/sec. modems?

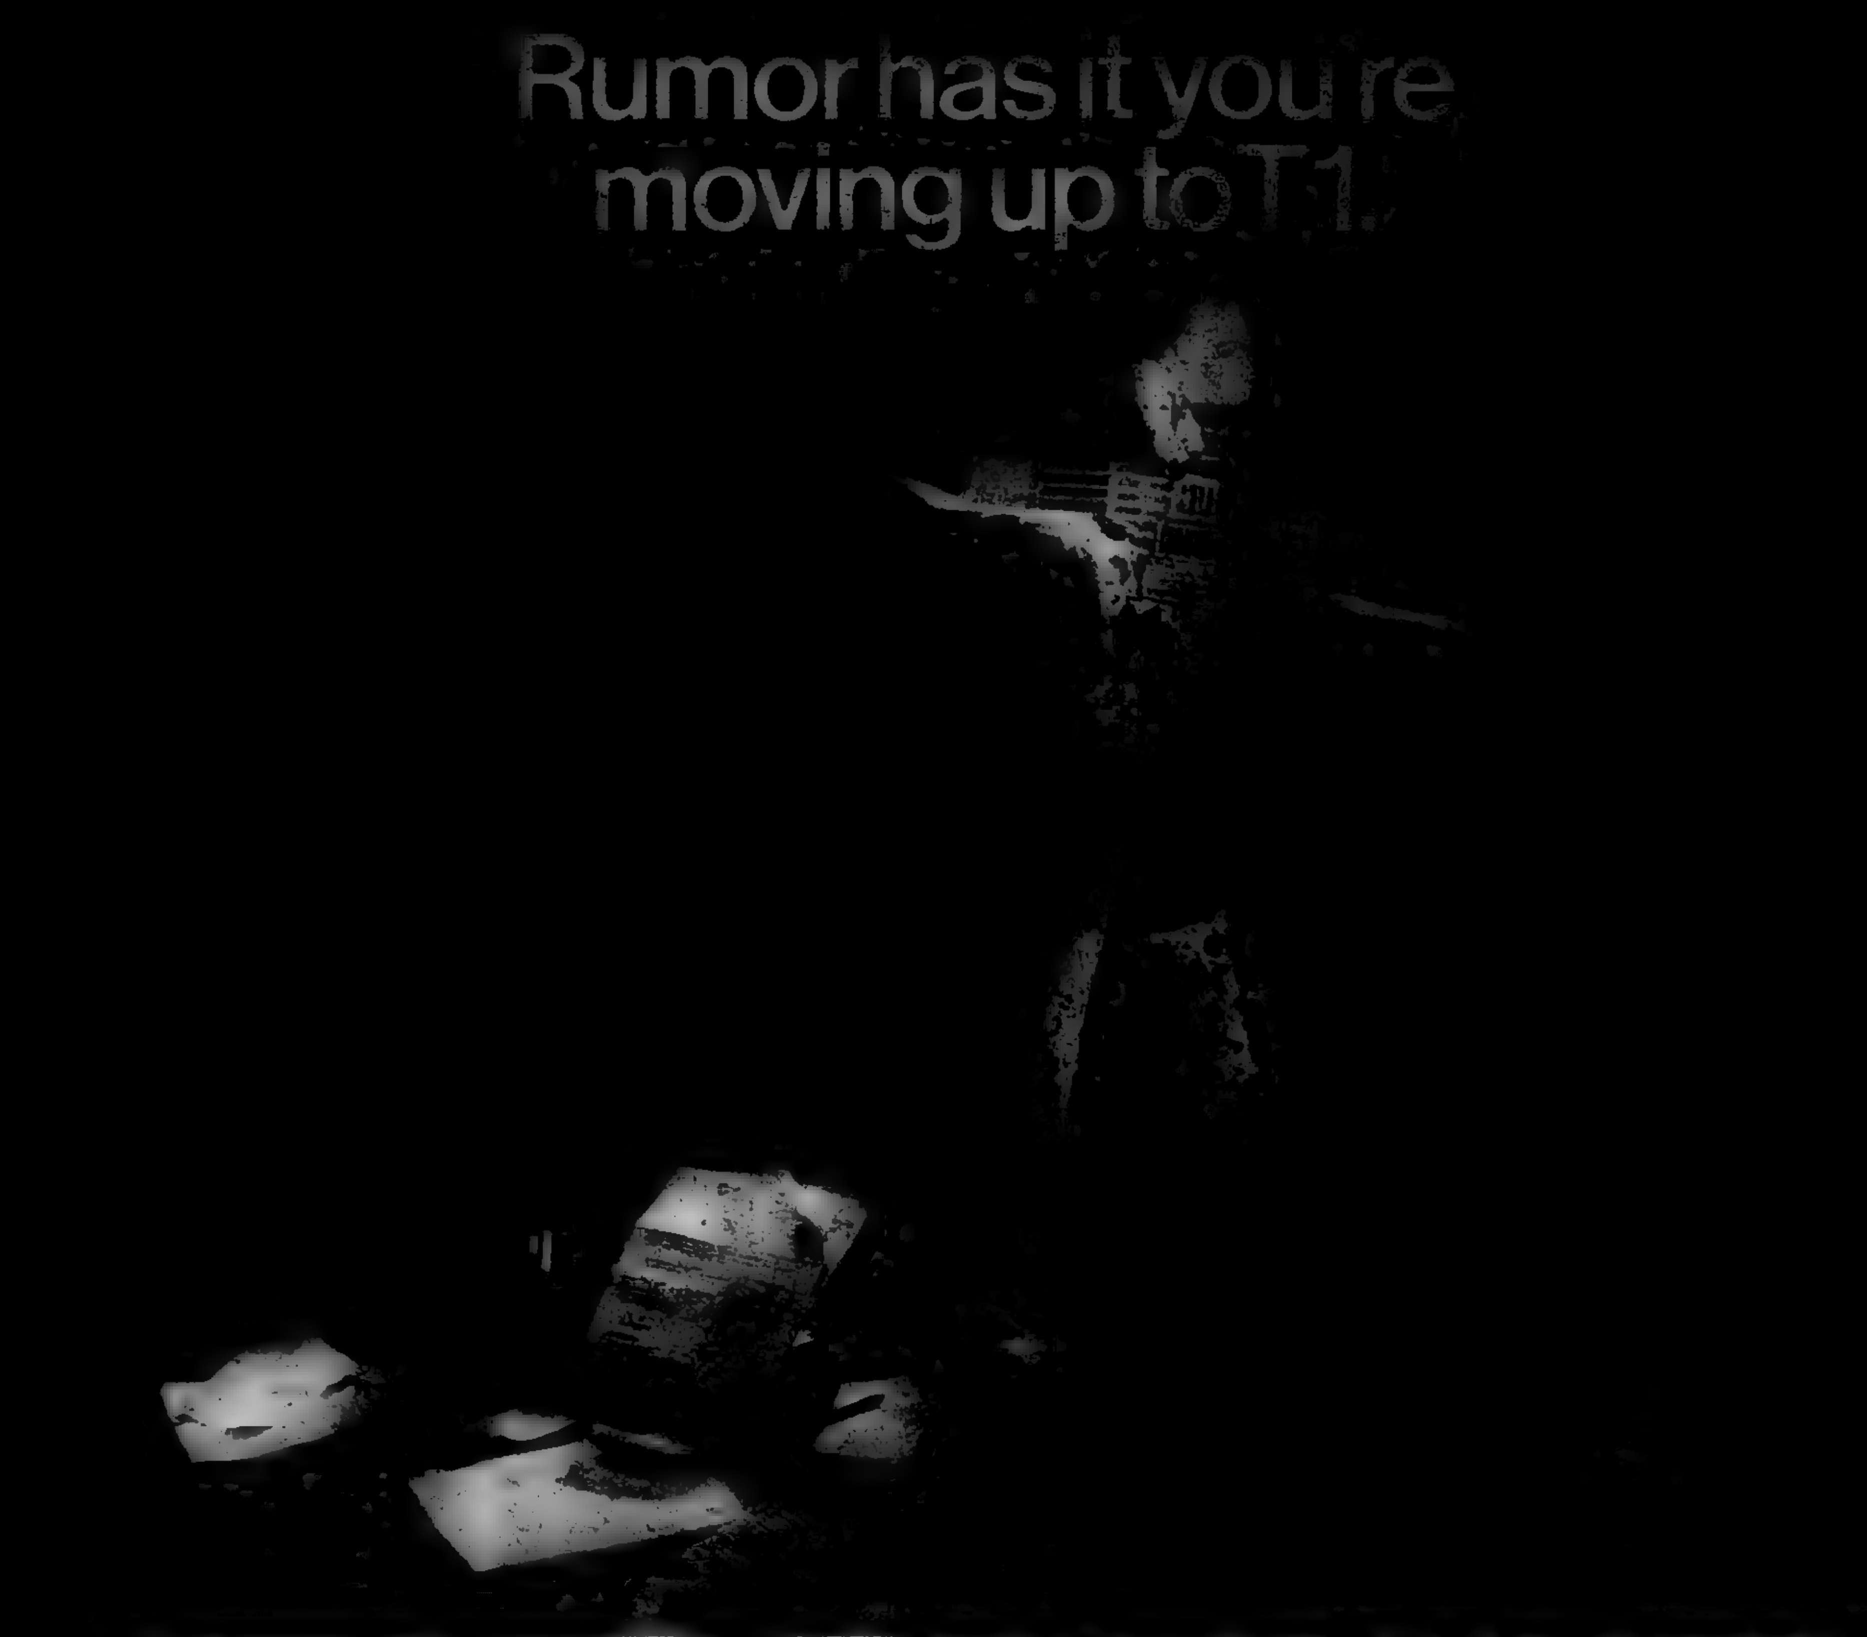
If transactions and line time are brief, you don't. But for graphics, electronic mail and lengthy file transfers, a faster modem may produce savings in a few months.

By Dale Walsh

The new 2,400 bit/sec. dial-up modems, designed to double the speed of asynchronous communications for the wide base of 1,200 bit/sec. modem users, have quickly established themselves in the marketplace. Because the price has not doubled, the faster modems have been easily cost-justified, and vendors have supplied all the hardware niceties to make the upgrade a smooth one. Complaints are rare.

Customer satisfaction is characterized by comments that the modems perform well, with none of the anticipated compatibility problems, across AT&T's U.S. telephone network. The most successful of the new products not only shine at 2,400 bit/sec. but also outperform their best-known AT&T 212A-compatible predecessors at the fall-back rate of 1,200 bit/sec., providing better line quality, easier connections and fewer errors.





Come back.

T1 speed.

It doesn't have to be as scary a project as everyone thinks. Fact is, installing T1 can be a fairly simple chore.

We're Infotron.

We design, build, and install communications networks. Reliable. Compatible. Sophisticated T1 networks that support data and compressed digital voice.

Our newest system, InfoStream™, introduces an open architecture to T1 networking based on Infotron's long-established strengths in multiplexing and switching.

We'll take care of you every step of the way. Before. During. And after the sale.

Calm down. Dust yourself off. Then call: 800-345-4636.

INFOTRON SYSTEMS

At this point, MIS and corporate DP micro managers contemplating new purchases or upgrading are no longer faced with an unproven class of products. The 2,400 bit/sec. service is expanding continually among the public information services and data networks.

Approximately 500 electronic bulletin board services presently use 2,400 bit/sec. modems, and the number is growing by more than 40 per week. Now is the time to give these products serious consideration.

The price of speed

Since the 2,400 bit/sec. devices fit easily into a 1,200 bit/sec. environment, many purchase decisions will center on cost justification. A cost/benefits analysis for high-speed modems should include these factors:

- Types of communications applications, current and planned.
- Overall performance improvement offered by 2,400 bit/sec. modems.
- Ease of transition.
- Tenure of a 2,400 bit/sec. communications standard.

For most applications, moving up to 2,400 bit/sec. yields a significant saving just on the basis of lower telephone line costs, since throughput increases substantially. The amount of the saving depends in part on distance and frequency of telephone line usage as well as type of application.

In some interactive applications where transactions (and therefore line time) are brief or where lengthy data base searches are conducted unaffected by transmission rate, savings are insignificant. But for applications that involve lengthy data transfers, the higher speed results in considerable saving, and the modems can quickly pay for themselves.

High-traffic transactions are typified by the distributed office information network and its periodic report traffic — some daily, some weekly. The sales staff reports to warehouse, inventory to operations, engineering to inventory and so on.

Applications similar in traffic volume include long-distance budget and project monitoring and electronic mail. Any corporation relying heavily on this type of communications would be a good candidate for the 2,400 bit/sec. environment.

For these users, reductions in connection charges will probably be about 30%. Users should not anticipate a straight 50% saving; although the data transmission rate is doubled, other factors, such as the time it takes to type in responses, remain the same. A firm paying $1,500/mo for long-distance data transfers might save $500/mo.

There is an additional opportunity for corporations with a large number of micro users who daily download information from external sources and services such as Dow Jones News/Retrieval or Compuserve, Inc. At the higher speed, users can expect to realise dollar savings in service connect charges, over and above line charges.

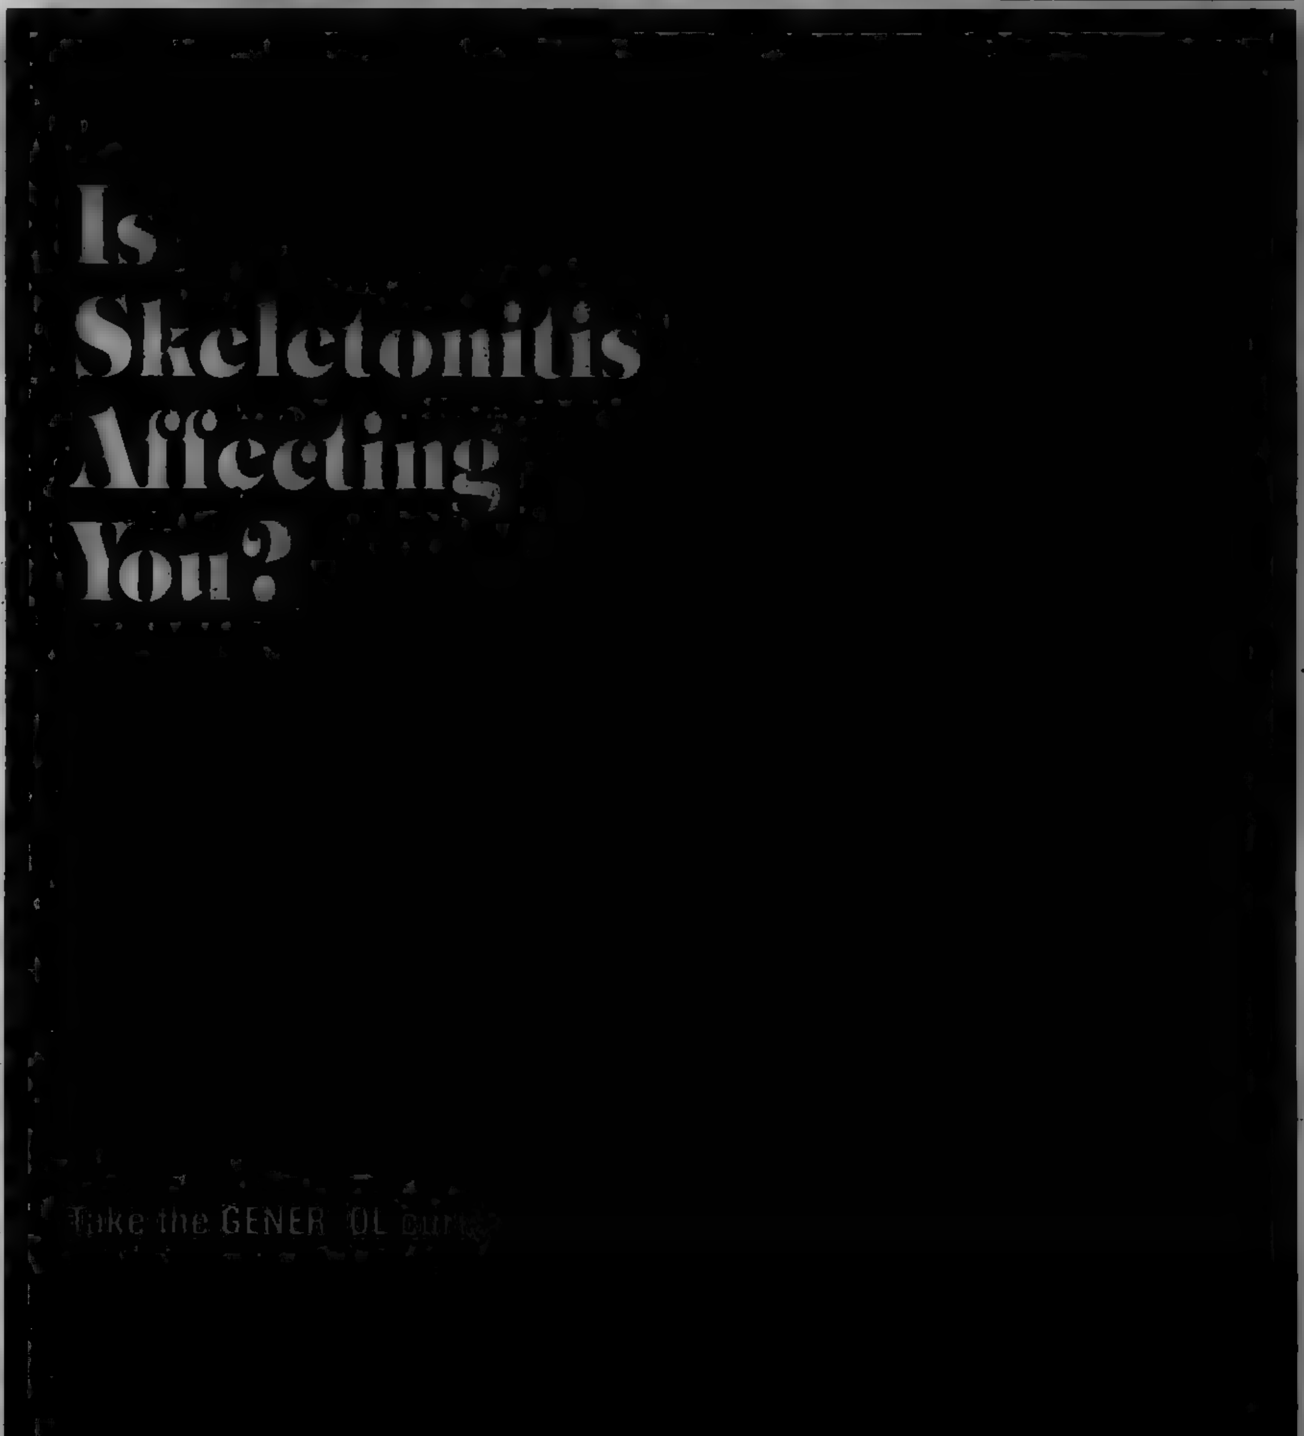
Some external services have direct 2,400 bit/sec. access, while others such as MCI Communications Corp. MCI Mail are available for 2,400 bit/sec. transactions through Tymeshare, Inc.'s Tymnet. (Compuserve will introduce direct 2,400 bit/sec. access this month in a limited number of cities.)

Users can expect most 2,400 bit/sec. services to bill a surcharge, so it is important to check that the additional charges don't offset the cost benefits of the higher speed. Source Telecomputing Corp.'s Source, for example, offers 1,200 bit/sec. service for 43 cent/min during prime time and 18 cent/min during nonprime time. Its 2,400 bit/sec. service costs 3 cent/min more in prime time, 2 cent/min more during nonprime time. MCI Mail charges an added 5 cent/min.

Figuring a payback

The estimated connection-charge savings figured against purchase costs will

> ”
>
> ***For applications that involve lengthy data transfers, the higher speed results in considerable saving, and the modems can quickly pay for themselves.***



tell users when to expect a payback. Single-unit list prices for 2,400 bit/sec. modems range from $700 to $909, with a median list price of about $775. For comparison, single-unit list prices for 1,200 bit/sec. modems range from $300 to $550, with a median list price of about $450.

Actual volume prices and street prices, of course, are lower for both groups. In general, it is safe to assume an incremental cost of $200 more per unit for 2,400 bit/sec. modems than for 1,200 bit/sec. modems.

Note that this discussion has been limited to point-to-point, terminal/microcomputer applications on standard telephone lines. It has also been limited to those "intelligent" 2,400 bit/sec. modems that implement the Hayes Microcomputer, Inc. 1,200 bit/sec. "AT" command-oriented protocol.

In the end, some monetary savings — however real — cannot be measured in dollars and cents for a cost/benefit analysis, yet it must be included in the decision. Higher speed is a boon when swift retrieval of information is crucial to client negotiations, whether the client is on the scene or on the phone. Slow response time can account for lost sales from time to time, and a faster modem may make the difference.

Because it's there

True to human nature, there may be pressure from end users to upgrade just because the higher speed is available. Many people have observed that micro users are speed addicts, and in general there is an urge within us to move fast even when we spend most of our time at stoplights.

On the other hand, satisfying those who do most of their work in front of a computer or terminal screen may be reason enough to upgrade to the higher speed modems, without resorting to a specific cost/benefit analysis.

With graphics transfer and remote word processing in particular, end users must wait approximately twice as long for screens to fill at 1,200 bit/sec. Working at the higher speed ensures greater productivity and user satisfaction.

The higher speed should not be viewed as a radical departure from the norm so much as the logical next step. There is, for example, a steady migration to 2,400 bit/sec. modems among Fortune 1,000 companies whose micro-to-mainframe links also carry heavy traffic for reports, data base file retrieval, program uploading or downloading.

TRW, Inc., for example, is using 2,400 bit/sec. modems in its Information Processing Network to set up a Telephone Gateway Interface. The network provides internal data base access for TRW's CRT and micro users as well as for commercial and military links.

> ”
>
> *A legitimate concern for prospective buyers is how soon 2,400 bit/sec. communications may be surpassed by even higher transmission rates.*

Users line up

Users at General Electric Co.'s Lighting Business Group in Cleveland use 2,400 bit/sec. modems to dial up information services such as The Source and, through a digital switch, to connect at 2,400 bit/sec. to 58 VAX computers, two IBMs and a Honeywell. Other organizations are expressing interest in rack-mounted 2,400 bit/sec. modems.

The emerging standard for 2,400 bit/sec. modems eases the transition for current users of 1,200 bit/sec. modems. The standard combines three familiar features. The first is the international V.22bis signaling scheme for asynchronous transmission at 2,400 bit/sec. All 2,400 bit/sec. dial-up modems currently manufactured in the U.S. are compatible with this standard. The cooperation among manufacturers in this regard has smoothed migration considerably.

The second is shared by most, but not all, of the 2,400 bit/sec. modems. The de facto standard at 1,200 bit/sec. is the command-oriented "AT" command set protocol. Compatibility with this established standard is key for

HOW TO
MAKE A
GREAT
IMPRESSION
AT THE
OFFICE

the 2,400 bit/sec. units as well. The third is fallback to the AT&T 212A standard, defined in V.22*bis*, and optional fallback to the AT&T 103 standard.

Higher speed waiting?

A legitimate concern for prospective buyers is how soon 2,400 bit/sec. communications may be surpassed by even higher transmission rates. Clearly, the 2,400 bit/sec. rate will be the prevailing upper standard for three to four years.

It will be at least that long before affordable faster modems are available for the installed 2,400/1,200 bit/sec. user base. A major reason is the market's relationship to modem technology.

It helps to think in terms of three classes of autodial modems: 300 bit/sec., 2,400 bit/sec. and below, and 4.8K bit/sec. and above.

At 300 bit/sec., users can read faster than the data arrives on the screen. While this may once have been useful, the rate is unacceptable for today's processor users.

A rate of 1,200 bit/sec. is more acceptable to modern computer users, although 2,400 bit/sec. is still preferable, both from connection cost and user satisfaction points of view.

Manufacturing view

From a manufacturing viewpoint, the 2,400 bit/sec. modems have much in common with the 212A-type (1,200 bit/sec.) modems that are standard in this country. In particular, the signaling rates and filter systems are similarly made. Hence, their development and production are not a great added expense, making them easily cost-competitive with the 1,200 bit/sec. products on the market.

However, the move to 4.8K bit/sec. and above is a quantum leap. The 9.6K/4.8K bit/sec. modem standard, V.32, requires a design that is approximately 64 times as complex as the 2,400 bit/sec. units in terms of multiplications per second and bits of arithmetic.

In addition, V.32 in its present form does not fit well in the U.S. communications environment. Eventually, if V.32 takes off in the U.S., the result will be a "multimodem" version that falls back to the existing modem types, including 2,400 bit/sec. modems. In any case, low-cost units at these speeds are still far down the road.

A good investment

At this point, no statistically valid study has been published that examines 2,400 bit/sec. modem performance. A limited user survey indicates, however, that users can expect performance (block error rate, for example) of these modems to be as good as that of 212A-type (1,200 bit/sec.) modems.

Based on their experience with other types of hardware, many users would expect lower speed modems to perform better than higher speed modems in terms of error rates. But in this case the adaptive equalization techniques in the new modems largely offset the difference.

In addition, performance at the fallback rate of 1,200 bit/sec. is demonstrably better than the performance of current 1,200 bit/sec. modems and for a relatively small difference in price. The incremental cost of 2,400 bit/sec. modems may prove to be insignificant when compared with the benefits of higher speed, lower connection charges and improved fallback ability.

For existing user bases, the bottom line is that 2,400 bit/sec. modems deliver twice the speed of 1,200 bit/sec. units without any loss of already-installed capabilities. Those applications that will benefit the most involve lengthy file transfers or the repeated filling of screens. Interactive applications are harder to justify in cost-savings terms, although user satisfaction may be a decisive factor.

For new installations, the savings in connection charges and improved performance afforded by the 2,400 bit/sec. modems, at costs that are fairly competitive with 1,200 bit/sec. products, mean that for many, this is the way to go. For most applications, the accrued benefits from reduced connection charges make the 2,400 bit/sec. modems an excellent investment.

IF ANY 3M, MAXELL, OR DYSAN FLOPPY DISK FAILS, WE'LL REPLACE IT WITH A NEW VERBATIM® DISK. FREE.

Most floppy disks come with a guarantee; if they ever fail, the manufacturer will send you a brand new one. But let's face it; if a particular brand of floppy disk ever loses your data, you might not want another one of theirs.

That's why Verbatim is offering a very special guarantee: If you buy a 3M, Maxell, or Dysan floppy disk — and it fails — we will replace it with a brand new Verbatim disk. Free. Why are we making this offer? Because we think it's time you use a floppy disk you can always count on. Verbatim.

© 1985 Verbatim Corporation

VERBATIM. YOU CAN COUNT ON US.

Mail your failed 8", 5¼", or 3½" disk in its original envelope, along with your name and address, and the brand and model of your computer system, to: Verbatim Offer, P. O. Box 7306, Clinton, IA 52736. Limit one refund per name and address. Offer limited to the first 100,000 3M, Maxell, or Dysan failed disks received. Offer expires October 1, 1985. Void where prohibited by law. Offer rights are not assignable or transferable.

IN DEPTH

Report from Japan:

13 Teleministers in Search of Teletopia

By C.P. Lecht

A Computerworld columnist travels to Tokyo and wonders: What joint ventures are imminent, what global communications possible? And why was John Opel really speaking at International Symposium '85?

When I first heard about International Symposium '85 (IS-85), I suspected it was going to be more than a run-of-the-mill industry event. For one thing, IBM Chairman John Opel was to speak. Certain that he wasn't in need of a speaking invitation, I wondered why he accepted this one — in Japan.

And why wasn't Charles Brown, AT&T's chairman, present? The company sponsoring the symposium, Nippon Telephone and Telegraph Corp. (NTT), is Japan's AT&T; the speakers hailed mostly from the communications industry; and the theme — "Telecommunications: Today and Tomorrow" — was more in Brown's line than Opel's.

IS-85 occurred at a time when the U.S. Commerce Department, on behalf of the U.S.' largest electronics companies, was putting the heat on the Japanese for alleged trade mischief in the international computer and communications marketplace. The symposium promised to offer one of those moments when someone calls a time-out, and a group of quarreling, even combative, contestants agrees to sit down and listen to one another's points of view.

IS-85 brought together 13 industrial, political and educational leaders from around the globe to express their views on today's world of computer and communications technologies and how they envision tomorrow's world might be.

The formal agenda was not the only one under discussion; there were many hidden agendas as well. Were the companies looking one another over for possible joint ventures? Who would be the next deregulatee?

Three months after IS-85, one can see some of the moves hinted at taking shape. The signs point to the following conclusions:

■ Hitachi Ltd. will follow the examples being set by Fujitsu Ltd. and NEC Corp. and pick a partner — McDonnell Douglas Corp.'s recently acquired Tymeshare, Inc..

■ The Mitsui group will align with AT&T's operations, selling and using AT&T's NET 1000 programmable network service.

■ The Mitsubishi group will link with IBM, selling and using the Information Network.

But these alignments tell only part of the story. The big question is, who will NTT choose as its U.S. partner, if anyone? I say it will be IBM. Why else would John Opel travel to Tokyo to speak at an NTT conference? IBM and NTT have been conducting joint research for two years on a conversion system between IBM's Systems Network Architecture and NTT's Digital Communications Network Architecture that will be announced in December.

It appears IBM and NTT will form nothing more or less than a joint venture in Japan. Together they will rule that country's computer and communications industry. For a long time to come, they will be the most powerful industrial force on the globe.

The 13 speakers at IS-85 were the ministers for Post and Telecommunications (PTT) of Japan, France and West Germany; the chairman and chief executive officer of three companies — Bell Canada, British Telecommunications plc and NEC Corp.; the chairman of IBM; and the presidents of NTT and Bell Laboratories Also present were the secretary general of the International Telecommunications Union; two educators — the senior adviser to the rector of the United Nations University and a professor of engineering from Tokyo University; and NTT's executive vice-president, the man who had organized the affair.

As the conference began, Japanese- and English-language papers were carrying stories of the seemingly endless international trade negotiations taking place in Tokyo and Washington, D.C. Headlines repeatedly featured the tough talk of one U.S. politician or another, and accompanying articles told of the consequences if some party — presumably the Japanese government — didn't clean up its act.

The Semiconductor Industry Association (SIA), was preparing a lawsuit, which it later filed, to stop Japanese imports from flowing freely into the U.S. The association was

The Power a

Introducing the 3280 MPS.

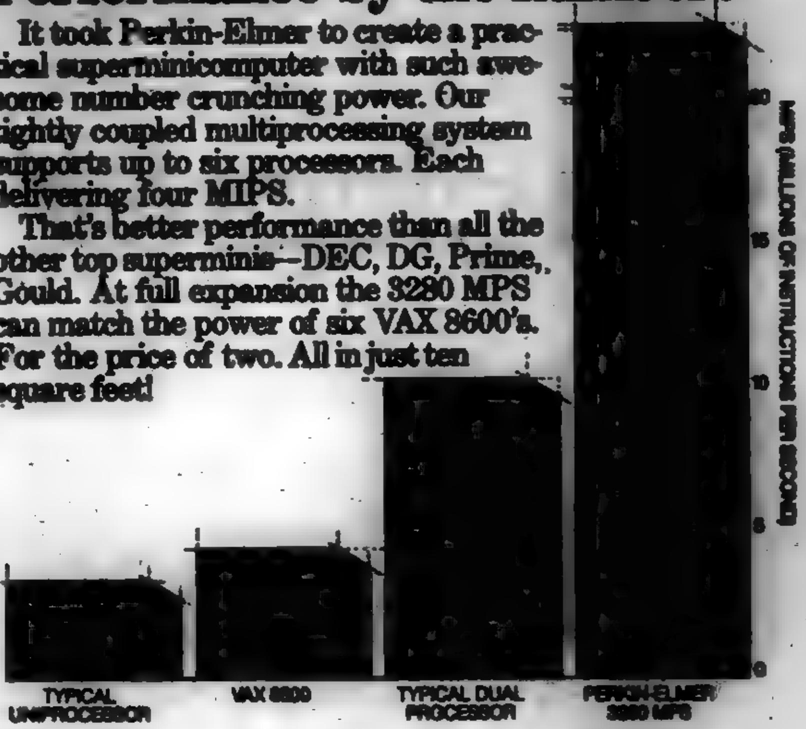
nd the Glory.

The power of six VAX 8600's for the price of two.

Performance by the numbers

It took Perkin-Elmer to create a practical superminicomputer with such awesome number crunching power. Our tightly coupled multiprocessing system supports up to six processors. Each delivering four MIPS.

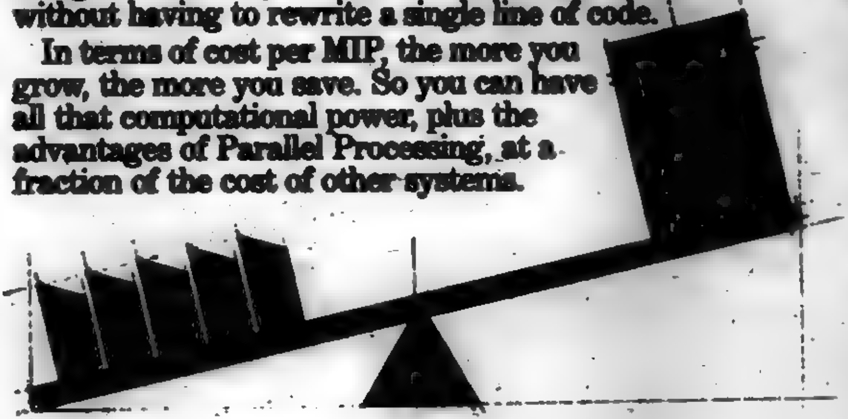
That's better performance than all the other top superminis—DEC, DG, Prime, Gould. At full expansion the 3280 MPS can match the power of six VAX 8600's. For the price of two. All in just ten square feet!



Growth: the bigger the better

With a 3280 MPS, expansion is easier than ever. Adding auxiliary processors is as simple as plugging in boards. And across-the-line software compatibility means you can grow from any of our 3200 Series superminis without having to rewrite a single line of code.

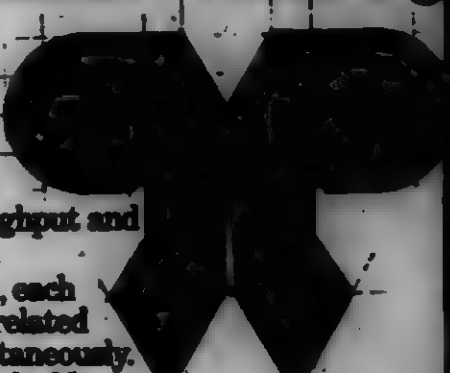
In terms of cost per MIP, the more you grow, the more you save. So you can have all that computational power, plus the advantages of Parallel Processing, at a fraction of the cost of other systems.



PERKIN-ELMER

Computers that take
the pain out of growing.

The glory of Parallel Processing



The 3280 is the culmination of Perkin-Elmer's decade-long experience and commitment to Parallel Processing, a computer technology that affords the ultimate in efficiency, throughput and sheer computational power.

In a Parallel configuration, each 3280 processor executes a related segment of your task simultaneously. Tasks run when they're ready. No bottlenecks. No waiting. So computing is far faster and more reliable than any kind of linear uniprocessing system.

Lowering the high-end cost

The 3280 costs less than other high-end systems to begin with. And as you grow, you'll find it to be ingeniously economical.

Not just in hardware cost. But in software investment. Footprint. And every aspect of overhead and operating expenses, including power consumption, air conditioning and maintenance.

There's nothing else like it. The 3280 MPS from Perkin-Elmer. For more information, mail the coupon. Or call toll-free: 1-800-631-2154.

I'M HUNGRY FOR POWER.

Fill me in on your new 3280 MPS.

blaming its members' ills on some sort of conspiracy by Japanese companies, aided by their government. One legislator recommended an old-fashioned boat blockade to prevent America's apparently insatiable appetite for goods manufactured in Japan.

Turning Japanese

Meanwhile, IBM was shifting more of its mid-range systems production to Japan and increasing its development of large systems there as well. Employing more than 20,000 already and doing in excess of $3 billion in business within Japan, IBM apparently couldn't transfer personnel to Japan fast enough — or for that matter, keep up with building new plants in the Japanese countryside.

Texas Instruments, Inc. (not an SIA member) was increasing its semiconductor production in Japan and transferring personnel there from places like Texas and Hong Kong. Motorola, Inc., the company authoring the full-page ads entitled "The Japanese Challenge," was buying up a storm in Japan.

Sato

In all the furor, no one seemed willing to state the obvious — namely, that Americans are not forced to buy Japanese products or to manufacture their own in Japan. In fact, the imbalance in the trade statistics offered is weighted with numbers generated by U.S. companies "exporting" their products manufactured in Japan.

Astonishingly, according to official U.S. and Japanese commerce department statistics, the total U.S. exports to Japan by U.S. companies plus the products manufactured by U.S. companies in Japan and sold there are roughly equal to the sum of Japanese exports to the U.S. by Japanese companies plus the products manufactured by Japanese companies in the U.S. and sold there.

Few seemed disposed to notice that it is illogical to presume that a smaller country should buy as much from a larger one as the latter may buy from the smaller. Or is Japan a special target? The net balance of trade between the U.S. and Canada favors Canada by more than a billion dollars per year, a fact rarely in the news. Japan-bashing is in vogue.

Inside the IS-85 conference hall, Teleminister H.E. Megumu Sato spoke on, "Toward the Realization of the Highly Advanced Information Society — The Telecommunications Policy of Japan." The minister of PTT said that Japan, and presumably all nations, were moving away from an industrialized society to one "which permits access at all levels, individual, corporate and governmental, to the the information flow."

Did he mean that free access to information was not possible in an industrialized society? Whether his statement was a sociopolitical one — meaning that information was restricted out of necessity — seems far less likely than that it was just a simple observation of the times.

Sato pointed out that NTT's role as a communications company would change dramatically now that its deregulation had been accomplished as of April 1. Previously, its main occupation had been eliminating telephone application backlog and handling service. Unlike AT&T before deregulation, NTT was prohibited from actually manufacturing anything. Now it is to become a full-fledged design, development and manufacturing organization while it continues, for the time being, to operate most of Japan's communications facilities.

While Sato specifically referenced "telecommunications" as NTT's business, this term means the computer systems business, too. Today the two are inseparable.

Teletopia

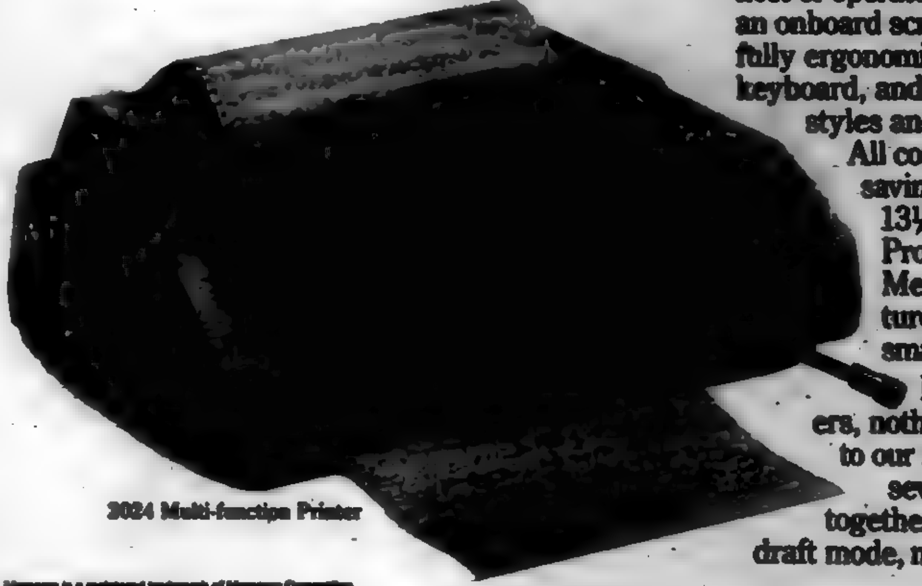
He spoke of Japan's new telecommunications plans for creation of a "teletopia," — "a highly information-oriented society linked nationally, and in the future internationally, through the introduction of communication infrastructures such as the two-way CATV and Captain systems." Thus, he emphasized his country's conversion to a society in which the barriers preventing access to information would be dismantled, replaced by high-speed telecommunications pathways.

The speakers preceding John Opel spoke of their hopes for the future. The IBM chairman addressed current times, injecting realism into the symposium. His point was that aspirations may not be realized if current problems in international cooperation were not overcome. Coming from America's highest high-tech envoy, this message served as a reminder that what was happening in the home countries of all in attendance was not that supportive of the intentions and goals of those within the conference hall.

Opel's remarks were not devoid of hope. He observed that the merging of the information processing and

Four great plugs for

2051-11 Monochrome Display



2024 Multi-function Printer

You're looking at four of the best connections in the System 34/36/38 world. All offer complete plug-compatibility. And other advantages worth plugging into:

Our 2051-11 monochrome display, for example, is designed to keep operators comfortable and productive, with features like a non-glare green or amber screen, a choice of ergonomic keyboards, and a monitor that can tilt, swivel, or even sit on a shelf.

It's energy-efficient, too, for a cooler environment, lower utility bills, and longer component life.

Hook up with our 2191 display, and you're face-to-face with the latest in ergonomic, compact design. There's a full tilt-and-swivel screen in green or amber, plus a host of operator conveniences—an onboard screen printer port, a fully ergonomic adjustable-tilt keyboard, and a choice of cursor styles and screen formats. All contained in a space-saving footprint of only 13¼ by 14 inches. Proving that with Memorex, great features can come in small packages.

In dot matrix printers, nothing comes close to our 2024 for joining several functions together—high- speed draft mode, near-letter-quality

communications industries "is creating a new era of technological progress to help with the world's work" and that it holds enormous promise. The realization of this promise will be directly influenced by "how national governments approach the public policy question of regulation vs. free market competition," he said. "International competition offers the best hope for the end user as the information era unfolds."

> *Foreign companies wishing to enter the U.S. and avail themselves of AT&T's facilities while they are here may find it more than convenient to play ball with AT&T at home first.*

The teleministers from France and West Germany voiced identical out-of-touch-with-the-times viewpoints. Not unexpectedly, French Teleminister Louis Mexandeau spoke of achievements: "In France, digitalization and integration of networks have already enabled the offering of many services which herald the information society of the 21st century." Then he catalogued all the things left to be done.

Christian Schwarz-Shilling talked of starting to do in Germany what his French compatriot claimed had already been done in France. Then he also spoke of problems yet to be overcome.

Together, the two presented viewpoints of a vanishing breed of politicians who felt that today's world hadn't really changed — that it was just a matter of changing polemics or, should I say, speechwriters. Rather than offer views on how their countries intended to cope with change, they spoke of the new era as if it were nothing more than the result of historic necessity.

Universal information

The conference offered refreshment in the remarks of Teleminister Ian M. Ross, president of AT&T Bell Laboratories. His speech, "U.S. Telecommunications and the Evolution of Universal Information Services," portrayed vividly what was happening in the AT&T world of telecommunications.

After achieving its goal of offering universal telephone services to U.S. customers, AT&T is now targeting its resources toward the realization of universal information services. This system would allow customers everywhere to access any kind of voice, data or image service in any place, at any time, with maximum convenience and economy. This is a new ball game for AT&T; until it was deregulated in January 1983, it did little of its $75 billion-a-year business abroad.

Since many countries are now deregulating their communications industries and allowing foreign competition, AT&T, the first deregulatee, will doubtless throw its hat into the international ring everywhere it can. And AT&T will do much better than most people surmise, even at roughly half its former size.

Foreign companies wishing to enter the U.S. and avail themselves of AT&T's facilities while here may find it a bit more than convenient to play ball with AT&T at home first. In fact, since AT&T is IBM's largest customer, it could not have escaped the attention of foreign high-tech companies that playing ball in AT&T's field on its side might bring even greater rewards than those obtainable by achieving mere customer status. As the symposium was taking place inside the conference hall, Fujitsu was wooing AT&T outside of it. AT&T is Amdahl Corp.'s biggest customer; Fujitsu owns 47% of Amdahl.

Teleminister Ross also spoke about the new technologies AT&T was working on in microelectronics, software and photonics. He presented his views of industry trends, emphasizing systems networking and integration, the deployment of stored program-controlled systems, computerized programmable digital networks, projected increases in packet and wide-band packet-switching systems, light-wave transmission allowing for increases in information-carrying capabilities, a growing use of software-based services provisioning (and we can only assume software provisioning, too) in the networks and greater customer control over services facilities.

Universal information services would be achieved, Ross said, in three stages: the development of overlay networks; the achievement of a true Integrated Services Digital Network (ISDN) that featured integrated access to the overlay networks (voice, data and image); and the provision of integrated access and transport systems with dynamic bandwidth allocation to permit large-scale network sharing by many different services.

If anyone on this globe deserves the title of teleminister, Koji Kobayashi — chairman and chief executive officer of NEC Corp. — does. His international outlook is unparalleled. Intensely loyal to his homeland, yet understanding and sympathetic to others, he is at once a scientist, philosopher and businessman. He is a true samurai — knight of all that counts.

Kobayashi began his talk, "Toward an Information Infrastructure Connecting the World," by stripping

System 34/36/38.

printing, and automatic sheet-feeding capabilities—in one quiet, compact, highly reliable unit. Plug into the 2024 for a printer that can process larger workloads, handle more applications, and accommodate the space and noise restrictions of the office environment.

When you want fast, high quality local printing, there's our compact 2173 screen printer. It's a direct connection for Memorex display terminals, and provides screen-content printouts at the touch of a key—without needing CPU resources or additional support programming.

And here's perhaps the greatest plug for our great plugs: affordable cost. All four come with price tags you can really get attached to.

So join forces with us. And join the thousands of people who've discovered that the best plugs for System 34/36/38 are coming from Memorex. The PCM to turn to first.

Kobayashi, left, with the author

himself of titles, saying simply, "My name is Kobayashi." He moved swiftly to talk about NTT's step into the competitive communications world.

He congratulated NTT and offered his best wishes for their future. He may have been thinking, "They'll need such wishes now that NEC is able to compete with them head-on."

NEC is a formidable rival in the newly deregulated Japanese marketplace. Like Fujitsu, NEC is expected to align itself with a U.S. company to exploit the opportunity. In this case, it will be General Electric Co., with its long-established ISDN embryo, General Electric Information Services Co. (Geisco).

Modern communications

Kobayashi went on to say he was reluctant to apply the word "modern" to communications and that he'd done so the first time at an MIT alumni meeting in 1983. He defined modern communications as the combination of computers and communications — "C&C" is NEC's equivalent of NTT's Information Services Network and AT&T's ISDN. All mean networks imbued with intelligence. There is no doubt that his company is racing to gain part of the ISN/ISDN marketplace in Japan and wherever else it can under the C&C slogan.

Kobayashi separated the communications world into three parts — information delivery, generation and storage — then noted that modern communications meant the integration of all three in a configuration capable of handling a world of multimedia. His was another way of describing the world spoken about by his predecessor, AT&T's Ross.

Noting that his idea of a truly modern communications environment was indeed a difficult one to describe because of its multilayered, multifaceted nature, Kobayashi said that he would attempt to do so using a matrix that blocked its functional aspects against its applications environments.

Environmental aspects

The functional aspects were subdivided into three categories: terminals; networks; and information service centers. The first, the one Kobayashi said was most visible to users, would require delicate human engineering in both hardware and software.

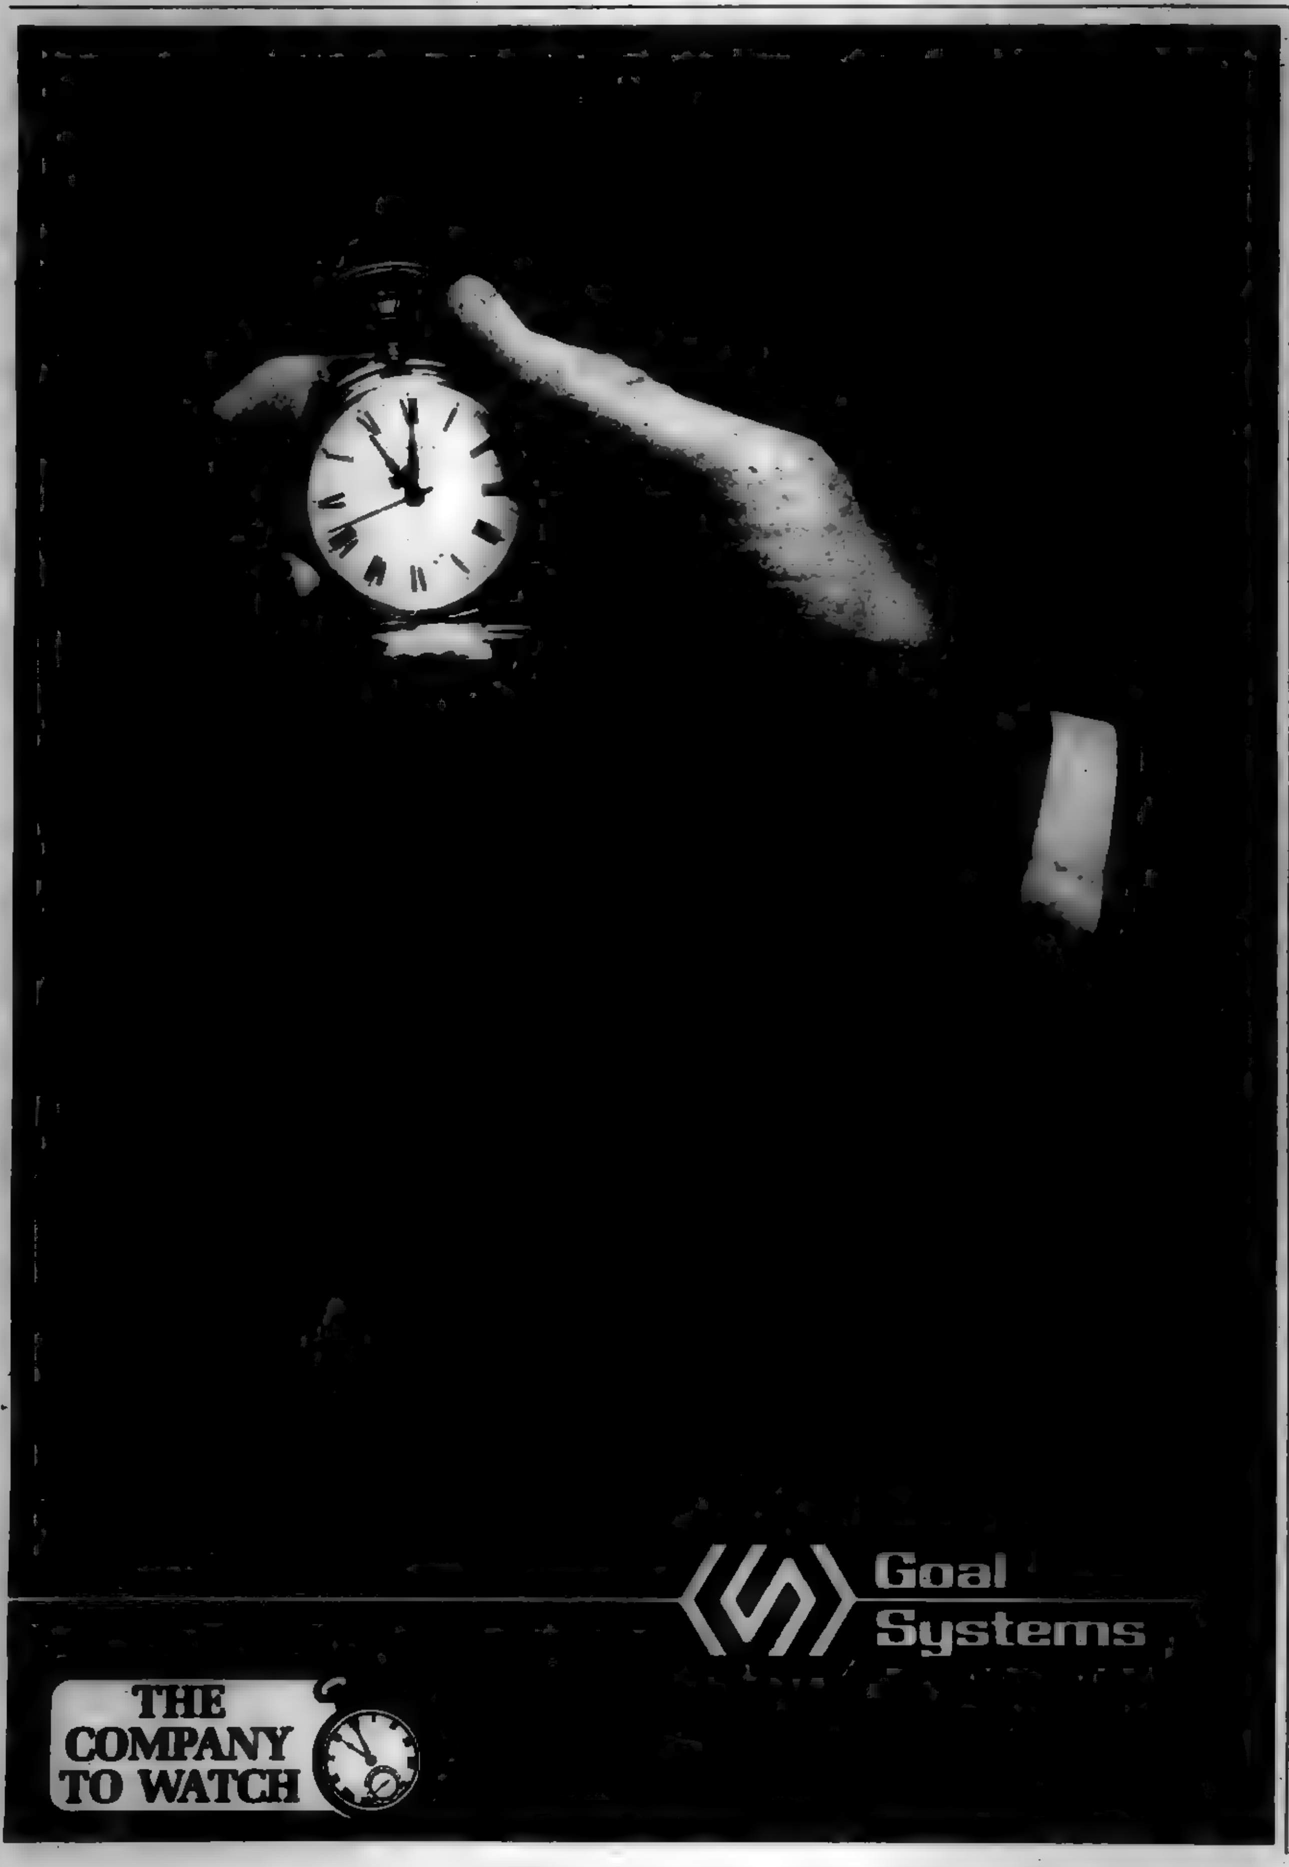
The second (the value-added networks, wide-area networks and so on) would be viewed as little more than a black box.

The third, like the first, would have deep user interest. The potpourri of services to be found in the information service centers will span the spectrum of human C&C invention from alarm (less than 10 bit/sec.) to video (billions of bit/sec.) and everything in between — including on-the-fly processing of data into information, teletext, videotex and so on.

A basic human right

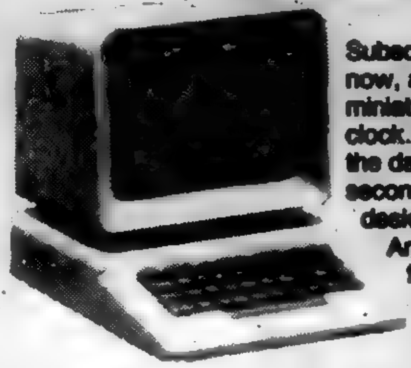
Kobayashi divided the applications environment into three sectors; public access networks; business networks (NET 100) and home networks (Source Telecomputing Corp.'s Source, for example). He noted that the first could not be overlooked because it constituted the infrastructure that could spell the difference between an underprivileged society and one that was privileged.

He avowed his belief in the inalienable right of people to have open access to information — "a basic human right," he called it — and declared that only the public networks could serve



Why the time has never been better to get your own subscription to Computerworld:

FREE CLOCK WITH YOUR SUBSCRIPTION



Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desk-top piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

UNIX is a trademark of AT & T Bell Laboratories.

☐ **Yes!** Please send me Computerworld for one year at $39 (that's $5 off the annual subscription rate of $44) plus all 10 COMPUTERWORLD FOCUS issues at no extra charge. the interests of that right. He said the provision of public networks could not be driven by economics alone and that governments had to be responsible for maintaining the high quality of public networks because they constituted infrastructures on which societies must depend for development.

Kobayashi concluded his technical discussion by speaking about the home, the place where individual preferences must be served. ISN/ISDN/C&C (call it what you will) must provide CATV wide-band optical-fiber cables to deliver high resolution to the home for better entertainment; "home work and home security" systems would also be needed.

Kobayashi ended on a note of optimism. He said it was natural for people to want to see and talk to each other and to expect a free exchange of information. There should be no hindrances to this, he said. "The international imbalance of information must be rectified. Language barriers must be broken down by development of telephones that translate conversations on the fly."

If Kobayashi's words were the kind of thoughtful fare we love to hear, those of the Canadian Teleminister Albert Jean de Grandpre were words we cannot bear to hear but must.

Veiled fears

The Canadian teleminister spoke eloquently of his country's plans and those of his soon-to-be deregulated communications company. He outlined the geopolitical and socioeconomic factors that led Canada, a country of vast land areas but small population, to develop one of the world's most technologically sophisticated telecommunications networks.

De Grandpre's words seemed a thin veil over his fears for the future. Countries such as Canada cannot hope to create and maintain a modern communications network without intense international cooperation.

As a country politically divided, burdened with inflation and unemployment and located next to a rich and united neighbor, the future of its communications industries (and thus, computer industries) cannot be judged bright.

The wolf at the border?

The problems Canadians face typify those which most nations will encounter as the new ISDN era emerges. How can a country protect its domestic communications industry from decay if it is located next to a country whose systems are far superior in price/performance? What rationale can a government come up with to prohibit its industry from taking advantage of the cost saving achieved by abandoning its home systems for those of its neighbor? How can a country preserve its own communications systems if its communications revenue must decline as the ISDN technology of its neighbor improves?

> ”
>
> *The problems Canadians face typify those which most nations will encounter as the new ISDN era emerges. How can a country protect its communications industry from decay if it is located next to a country whose systems are far superior? What rationale can a government come up with to prohibit its industry from abandoning its home systems for those of its neighbor?*

As ISDN technology in the U.S. matures to offer every conceivable communications and computing service in increasingly cost-efficient ways, Canadian companies may find the temptation to dash southward to proves irresistible. The automation of U.S.-supported Canadian industry is forcing some Canadian distributors to remain on-line because the supplier's information center contains the data that may prove crucial to a Canadian company's ability to win a bid.

With perhaps as much as 80% of Canadian industry owned by U.S. companies and financial institutions, the Canadian government has little choice but to allow some companies to remain on-line 24 hours a day, in direct violation of laws prohibiting such connections without special and costly arrangements made through the government-controlled communications company. Canadian companies have been meeting away from the public eye to lay plans to hook up their data processing centers to those of their U.S. suppliers.

For example, Albertan companies bidding against each other for delivery of heavy equipment to a construction site in northern Canada are known to be plugged into the data bases of American firms such as Caterpillar Tractor Co., Ford Motor Co. and Sperry Corp. If data can traverse the lines from south to north, so payments may be electronically transferred from north to south. Once they are in the U.S. networks, Canadian companies cannot help but notice the enhanced services available to them.

Our network can give your network the right connections.

Now there's an easy way to open your company's data network to new opportunities.

Connect your network to our network– the IBM Information Network. It's your connection to a number of computers—from small personal computers to large mainframes, both inside and outside your company.

And our network enables your company to do business in new ways, with new levels of sophistication.

Your Connection to Customers, Suppliers and Dealers

Through our network you can hook up to your customers, suppliers and dealers. And how will that benefit you?

One way might be a system of automatic reordering that could give all parties the advantages of leaner inventories and greatly reduced paperwork. You'll be able to coordinate on-demand delivery dates and production schedules. And to exchange drawings and technical specifications to speed the process.

Your Connection to Industry Networks

There are also cases where an industry benefits from the efficient exchange of information.

In the property and casualty insur-

The U.S. can do little but sympathize with the Canadian government's problems in trying to create a telecommunications policy that prevents the siphoning of much needed revenues. If Canada does allow its industry essentially open communications access to U.S. corporations, it is faced with another problem: How can it control what uses Canadian companies may make of the below-the-border networks?

Canada doesn't have enough Royal Canadian Mounted Police to police the visible border to the U.S.; how can it be expected to police the invisible telecommunications boundary? And should the U.S. be blamed for creating so enticing a communications/computer environment for its own citizens that Canadians are lured away from using their own?

It follows that a country in Canada's position must face a decline in the revenues that derive from its own communications industries. It is not hard to see how this decline could lead to a diminishing capability to create a home-controlled communications system. Without such control, this situation could ultimately lead to the capture of one nation's economy by another — electronically.

One might suspect that many who attended IS-85 were motivated in part by this fear of the future of communications services. They found there that they are not alone.

Tariffs — the bottom line

When Yasusada Kitahara, NTT senior executive vice-president, offered the keynote address, "INS — Study on Network and Tariff Structure," nothing could have been more appropriate. Someone had to talk of tariffs, "the bottom line."

He said that an INS pilot plant had initiated service on Sept. 28, 1984 in the suburbs of Tokyo. Another pilot facility began providing service at the Tsukuba Expo '85 science fair. While both were experimental (non-revenue-producing), Kitahara forecast that INS commercial revenue-producing services would be initiated in Tokyo, Osaka, Nagoya and Tsukuba this year.

Kitahara presented his company's plans to replace current analog communications facilities, both voice and data, with digital devices. He said this change, along with integrating existing networks, would reduce costs. Thus, an integration of all of Japan's existing telegraph, telephone, telex, data communications and facsimile systems would occur. Until April 1, NTT was authorized to offer these services as a monopoly.

The cost reductions would also result from the introduction of a bit-based tariff system, fiber-optic communications and a large-capacity satellite communications system. While no one doubts that these three things could indeed yield these identified areas of cost reduction, just how much a reduction might be realized was still under study as was, presumably, the form this might take.

In view of the fact that Japan is now allowing competition in communications, I wonder if we might not see a repetition of today's U.S. scene wherein cost reductions in high-volume data transfer from coast to coast were accompanied by cost increases in local voice and low-volume data transfer.

The symposium brought together 13 teleministers in search of a path to the teletopia described by Sato. Only the American and Japanese participants seemed aware of the past, present and future of telecommunications industry. The future of the rest seemed hopelessly contaminated by political unrest, if not just plain hopelessness. IS-85 confirmed my belief that if the world of open access to communications was to survive, its only chance was through American/Japanese leadership.

Kitahara

As I listened to some speakers present the possibility of an Orwellian future instead of a Utopian — teletopian — one, I could not help but wonder if anyone would conclude anything but that the new era of improved communications would offer a positive quantum leap in the quality of life.

Professor Shumpei Kumon spoke of the "games" we may well expect to be played in our coming teletopia — but were these games any different than those currently being played? The players he posited would be "sovereign states," "corporations" and "research teams." According to the professor, either the research teams would win out, or they would so influence the others that all would survive.

Microcosm to macrocosm

The second concurrent session provided a brilliant display of creative thought on how the INS network services would be instrumented. It was also a showplace of NTT know-how. Topics ranged from those in the ISN microcosm — large-scale integration chip technologies to be

IBM Information Network...The Smart Connection

found in the network infrastructures — to the ISN macrocosm and the design of its structural forms. On the conference hall screens, the embryo of a single globe-girdling computer system was shown.

Imagine a chip. Now imagine a cluster of chips, some alike, others not, but each linked to one or more chips in the cluster by wire and wireless communications. Further imagine that each of the chips in the cluster is dedicated to fulfilling a specialized purpose, such as providing memory, doing scalar computations, performing device control and so on.

Now imagine a network of such clusters, some as large as you wish them to be, others as small. Imagine a lattice of these networks, some of which vanish into the microscopic world — we cannot see them because they are too small. Others vanish into the macroscopic world — we cannot see them because we are too small.

> ”
>
> *The underlying principle of an INS/ISDN is nothing more or less than that of a common computer system possessed of uncommon power spread over the country. It is a system that, because of its open-ended architecture, is capable of at least connecting, if not integrating, all the processes we may care to automate with incredible economy of scale.*

Now superimpose the requirement that the entire lattice operate according to a set of rules that synchronizes its operation to achieve some set of goals. Finally, provide users of the lattice with the means to program it to achieve these goals.

If what I've described seems suspiciously like a computer system as we conceptualize it today, you are right. But instead of occupying the space available on a desktop or the floor of a room or even that available in a good-size building, its components are more likely to be spread in value-added network form across a city or a state, even a country.

Thus, the underlying principle of an INS/ISDN is nothing more or less than that of a common computer system possessed of uncommon power spread over the country. It is a system that, because of its open-ended architecture, is capable of at least connecting, if not integrating all the homogeneous and heterogeneous processes that we may care to automate with incredible economy of scale. The more encompassing the INS/ISDN functionality, the broader its deployment and the more that may be done with it.

That all the symposium speakers envisioned the first applications in their networks as addressing problems that have been unsolvable so far is only natural. Its application in the handling of natural and man-inspired disasters is urgent. But so are the wider application areas, such as helping the hearing impaired, the sightless and others who are severely disabled.

A global lattice

INS/ISDN uses will be extended to touch virtually every corner of our lives. Individual citizens can have their own home-based information center, process control and environmental monitoring systems. Artificial intelligence or expert systems facilities could be made available to everyone.

When capable of carrying a holographic image load, artificial experience systems will emerge, systems through which we may learn by experience, the simulation of which is so real we may never forget its message. The mind boggles at the possibilities ISN/ISDN systems may one day offer in their ultimate forms — globe-girdling lattices.

That AT&T did not initiate IS-85 may indicate what is lacking at home and contributing to the U.S.' international trade deficit problem. Of course, it may have been more difficult in these times to get Teleminister Opel to speak in Bedminster, N.J., than in Tokyo. And without Opel, would men like Kobayashi have come?

SCHEDULING, NATURE'S WAY.

Our Scheduling System Does Something Nature Doesn't Do. It Schedules Jobs For MVS Environments The Same Day It's Installed.

With *ADC2, Automated Data Center* management information system, your company is just a day away from getting its computer operations under control. That's because Cambridge designed ADC2 to be fully productive the day it's installed.

ADC2 builds schedules and makes all data center management information readily available, ensuring increased control and throughput. It can also cut processing time by *more than 25%.*

Users find this high-performance system software simple to learn and easy to use.

ADC2 monitors all jobs automatically. Performance statistics are dynamically gathered and maintained as current and historical data for quick on-line access.

For even more convenience, a decentralized scheduling feature allows different departments and remote sites to simultaneously create and manage their daily job schedules with simple commands.

So if you're wrapped up in scheduling problems, find out how to emerge with more control over your data center's activities.

Call or write The Cambridge Systems Group. Ask for an on-site, on-line ADC2 demonstration *with your own data.*

MICROCOMPUTERS

Graphics software debuts

Adds free-form visuals to Graphwriter, 1-2-3

Software for the IBM Personal Computer that reportedly expands the capabilities of other business graphics programs and permits nonartists to add free-form visuals into charts and graphs has been introduced by Graphic Communications, Inc., of Waltham, Mass.

The package, Freelance, reportedly includes more than 200 predrawn symbols that can be used to construct diagrams, flow charts, maps and other customized graphics. The program can also create and store symbols such as company logos.

Freelance runs on the IBM Personal Computer line and reportedly can be used to enhance graphics created with either Graphic Communication's Graphwriter package or Lotus Development Corp.'s Symphony or 1-2-3 packages. It may also be used as a stand-alone graphics product.

Using Freelance, word charts reportedly can be created directly on the screen or imported from word processing programs as Ascii files. Words can reportedly be combined with charts, illustrations and symbols as well.

Also included are custom grids, rules and drawing tools. With those tools, shapes can be moved, replicated, rotated, sized and edited for color, location and individual line points, Graphic Communications said.

Freelance, priced at $395, reportedly supports a variety of printers, including the Epson America, Inc. FX-80, MX-80 or RX-80 and the Hewlett-Packard Co. Laserjet. Among the plotters supported are the HP 7470, 7475 and 7550A. Several 35mm slide recorders are also supported, including the Polaroid Corp. Palette.

Freelance requires a Personal Computer with at least 256K bytes of memory and either an IBM Color Card, IBM Enhanced Graphics Adapter or Hercules Computer Technology Co. Graphics Card.

Net version of business series out

Offers supports for five IBM PC Network users

IBM's Information Systems Group in Rye Brook, N.Y., has introduced a local-area network version of its Business Management software series for the IBM Personal Computer.

The Business Management series Local-Area Network Access Edition reportedly supports up to five users sharing programs and files on the IBM PC Network. It also monitors concurrent tasks and notifies users of conflicting requests.

The network version of the software reportedly supports applications for general ledger, accounts payable, accounts receivable, payroll, order entry and invoicing and inventory accounting.

A single Business Management series application license is required for the network's server micro, and a license is required for each of up to four remote micros.

The server must be a Personal Computer XT or AT with 640K bytes of memory, a double-sided, double-density diskette drive, an 80-col. monitor, an IBM PC Network adapter card and a compatible printer supporting 132 characters per line.

Each additional Personal Computer, Personal Computer XT or AT requires 512K bytes of random-access memory, one double-sided drive, a network adapter card and a monitor. The network version of the software also requires an IBM PC Network Translator Unit. Both the server and remote micros must run PC-DOS 3.1 or higher and the IBM PC Network Program software.

A license for each remote micro costs $245. Each of the six Business Management series programs costs $695.

Software/64

Board ties AT&T, IBM micros

By Edward Warner

MORRISTOWN, N.J. — In a move that could at last bring a plethora of IBM Personal Computer software to the software-starved AT&T Unix PC, AT&T's Computer Systems Division announced that it will exclusively market a board that gives the Unix PC IBM compatibility.

The board, developed by Alloy Computer Products, Inc., includes an Intel Corp. 8086 microcoprocessor, the same as that used in the AT&T 6300 personal computer. The 6300 is not fully IBM compatible, however, in part because of differences between the 8086 and Intel's 8088 microprocessor, which powers the IBM machine.

The DOS-73 board's 8086 would override the Unix PC's Motorola, Inc. 68010 processor to permit the machine to run such IBM-compatible software as Lotus Development Corp.' 1-2-3 and Symphony, Computer Associates International, Inc.'s Micro Products Division's Supercalc3 and Multimate International Corp.'s Multimate word processor. AT&T said the board will be available in the fourth quarter of this year but did not announce a price.

Dealers said the Unix PC has been experiencing sluggish sales, largely because of the lack of Unix software available for it. An AT&T spokesman, however, said that he was unaware of sales problems with the machine and denied that the machine was in need of additional software. He also denied that the DOS-73 board marks AT&T's capitulation to the world of IBM compatibility. Alloy, of Framingham, Mass., develops and markets tape backup units, storage subsystems and expansion devices for personal computing.

Micro users groups provide freewheeling information

By John Vacca
Special to CW

Users groups, a feature of the DP landscape since the early mainframe days, have changed somewhat in recent years. Where once they were supported primarily by large corporations — such as IBM's Guide and Share and Burrough Corp.'s Cube — now they also exist for those working with personal computers. Where the large groups were once noted for the parade of vendor representatives and attendees passing through them — all with limited social contact — the microcomputer-focused groups are providing a freewheeling exchange of information and advice between members and sometimes the vendor.

Like a wagon train in the days of the old west, the microcomputer users groups permit members to pool their resources while gaining protection from the hazards of their journey. The groups can help members identify the programs they seek and alert them to potential problems and clinker products.

There are many different types of users groups, but all are either formal or informal. The formal groups, such as Guide, commonly support large mainframe organizations. Informal groups, meanwhile, largely focus on personal computing and consist of local and special interest groups, both of which have enjoyed enormous success.

> ”
>
> *The group's purpose should be adhered to, explicit and written down. Purposes and goals have a tendency to change unless they are well documented.*

Though microcomputer users groups are popping up and thriving everywhere, all must meet certain requirements to succeed in each new and uncharted territory. Among these requirements are a stated purpose, group understanding of that purpose, a leadership structure, an orientation and a sensitivity to the attention span of members.

There are, no doubt, other guidelines that the group should follow, including the issuance of publications, the receipt of nonprofit status, the acceptance of donations, the gaining of a meeting place and establishment of relationships with vendors. However, for a users group to be successful, it should first follow the five guidelines cited above.

The first guideline, maintaining the group's purpose, is essential. The group's purpose should be adhered to, explicit and written down. Purposes and goals have a tendency to change unless they are well documented.

The second guideline, that all members understand and agree with the group's purpose, means that the purpose should arise out of group concensus. It also means that written goals and guidelines should be distributed to newcomers.

Meanwhile, a leadership structure that reflects a group's purposes and size should be created. Most users know that leaders require and appreci-

Firm offers graphics aid

Business & Professional Software, Inc. has introduced its 35mm Express software for the IBM Personal Computer line and AT&T 6300 personal computer.

When used in conjunction with either a Polaroid Corp. Polaroid Palette slide film recorder or the Magi Advertising Group's Magicenter network of service bureaus, the software permits users to produce slides of business graphics, according to the vendor.

Charts created using the software may be drawn in two or three dimensions, according to the Cambridge, Mass., vendor.

Multiple images may be displayed on one slide. Line, pie, adjacent or stacked bar, area and tabular charts may be created.

User-specified elements

Users are also said to be able to specify a chart's color, font size, spacing and highlights such as drop shadows.

The software reportedly features an icon-based menu and supports the IBM Graphics Printer as well as the Epson America, Inc. MX-80, FX-80, MX-100 and FX-100 printers.

The software is priced at $695, according to the vendor. An interface to the Magicenter network, which will enable users to communicate charts via modem, will be available shortly, a vendor spokesman said.

Tool ports Apple programs

Abaton Technology Corp. of Santa Monica, Calif., has introduced a hardware and software product said to translate programs written for the Apple Computer, Inc. Apple II line into software that will run on the Apple Macintosh.

The $1,995 Abaton Transform software will be sold only to programmers, who reportedly will be able to use the product to port programs in between 15 minutes and six hours.

The product consists of a sealed add-on card for the Apple II and software on both 5¼-in. and 3½-in. diskettes for the Apple II and the Macintosh respectively. To port an application to the Macintosh from the Apple II, a cable from the add-on card is connected to the Macintosh, and the software is run on both.

A 512K-byte Macintosh is required for porting. Most resulting applications will run on the 128K-byte version of the Macintosh, Abaton said.

The porting is done at the object-code level. Once ported, the application cannot be copy protected.

To transfer an Apple II application without use of the Abaton Transform could take up to eight man-months and cost $20,000 or more, Abaton said. Further enhancements to the product, to permit programmers to add enhancements to the application they are porting, will come in several months, the company said.

Microsoft offers document design tools for Macintosh

Microsoft Corp., based in Bellevue, Wash., has introduced document design software, called Typographer, and announced an upgrade of its Macenhancer product, both for use on the Apple Computer, Inc. Macintosh.

The Typographer permits users to produce documents of any length, limited only by disk space. The software also permits free-form placement of text and graphics and the use of indented, staggered or overlapping regions of type.

Typographer users reportedly can preview each page or page spread on the screen, with accurate scaling. Instead of using word wrap, the software maintains a true line count and adjusts word spacing across the entire line. The software's hyphenation meets accepted composition standards, Microsoft said.

Typographer is said to contain several editing functions, including global search and replace, block move and insert and delete. It also can read files directly from such Macintosh programs as Microsoft Word, and Apple's Macwrite and Macpaint. Users can paste text and graphics from Microsoft Excel, Microsoft Chart and Microsoft File, among other programs, the vendor said.

Version 2 of the Macenhancer software reportedly supports additional printers, such as the Hewlett-Packard Co. Laserjet, and offers a scaling function that can set graphics and text output to the correct size for use on various printers.

The scaling function supports the Apple Imagewriter, Epson America, Inc. FX-80, FX-100, LQ-1500 and MS-100, among others.

Macenhancer, which supports multiple peripherals on the Macintosh, reportedly already includes three additional IBM-compatible ports, one parallel and two serial.

Typographer runs on both the 512K-byte Macintosh and the 128K-byte version of the machine and is priced at $195. It will be available in October.

Macenhancer works with either the 512K-byte Macintosh or the 128K-byte version of the machine. It costs $249. Current users may receive Version 2 of the Macenhancer software at no charge.

Enter the fast-growing computer market in Argentina.

Advertise in CW Communications' Argentinean publication, *Computerworld Argentina,* and reach a burgeoning South American computer community. There are approximately 4,000 general purpose computers installed in Argentina and 8,500 personal computers. Argentina's growing industrial and educational needs insure continued EDP growth in the upcoming years.

Computerworld Argentina is the publication computer professionals rely on, twice each month, for all the latest local developments in hardware, software, services and office automation. It is modeled after its sister publication in the U.S., *Computerworld,* and circulates to more than 6,000 DP professionals throughout Argentina.

CW International Marketing Services makes advertising your products in Argentina, and around the world, easy. We have over 50 publications in more than 25 countries around the world. For more information on our wide range of services, complete the coupon and mail today.

Lotus Concerto bows

Offers Basic programming

Lotus Development Corp. of Cambridge, Mass., has introduced Concerto, software for the IBM Personal Computer that reportedly permits developers to program in Basic language as they design add-ins for Lotus' Symphony.

Symphony add-ins, programs that can be attached to Symphony to operate as part of the larger product, could previously be developed only in assembly language, Lotus said. The add-ins can be used to enhance one of Symphony's five functions or to provide a link to other software programs or computers.

The $99 Concerto, developed by Leblond Software, Inc. of Indianapolis, reportedly includes several ready-to-run applications for use with Symphony, including one called goal seeking. Goal seeking permits a spreadsheet to be solved in reverse, allowing a user to work from a target profit back to the sales required to reach that target, for example. Also included are Basic routines to permit linear regression analysis and to covert Micropro International Corp.'s Wordstar files into a Symphony format.

Using the product's configuration program, users can adjust the amount of Concerto that resides in the Personal Computer's memory.

Both Lotus and Leblond will market Concerto.

Maintenance management tool out

Rantac of Bellevue, Wash., has introduced its Benchmate software for automated maintenance management at factories, hospitals, universities and other facilities.

Benchmate, for the IBM Personal Computer, reportedly can handle work orders, preventive maintenance, equipment data and history, job scheduling and a spare parts inventory.

Its scheduling module permits managers to send workers to jobs where they are needed and to create "what-if" scenarios.

Its reporting capabilities are said to include work and cost histories, jobs scheduled, projected preventive maintenance, past due preventive maintenance, completed jobs and other functions. The package is intended for use in maintenance shops with up to 75 workers.

It costs $5,000, which reportedly includes 16 hours of on-site instruction and one year of support.

TI offers Personal Consultant version

Texas Instruments, Inc., based in Dallas, has announced a second-generation version of its Personal Consultant knowledge system development software said to offer extended knowledge representation features, increased rule capacity and an enhanced user interface.

Personal Computer Plus, which runs on both TI and IBM personal computers with 512K bytes of internal memory, is priced at $2,950 and will be available in the fourth quarter.

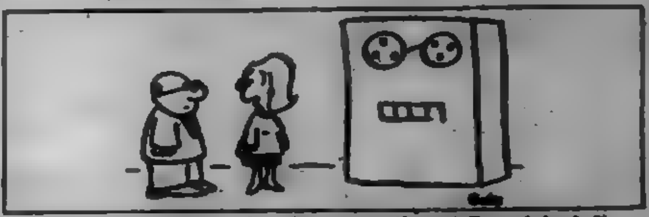
The package enhances the Personal Consultant product by incorporating extended knowledge representation capabilities such as frames, procedural functions, access methods and meta rules, TI said.

Additionally, a Lisp compiler speeds operation and allows the package to handle more information, the vendor said. Personal Consultant Plus can develop and deliver applications of up to 2,000 knowledge base elements.

During creation of knowledge systems, an interactive dialog reportedly prompts the developer only for essential information, with many default values selected by the system. The rule specification language has been expanded to provide direct access to more system features, and a full-screen editor handles modifications to any information field, according to the vendor.

The user interface also has been upgraded, with pop-up windows showing menu items and Help information.

TI also dropped the price of the original Personal Consultant to $950 from $3,000. The $950 cost can be applied toward the purchase of Personal Consultant Plus if the user decides to upgrade.



"It's almost human — it quits computing at five o'clock."

Strategy...

Technology

At GENIX, strategy and position have made us a successful Information Services Company.

The GENIX strategy is to provide customers with superior technology, quality system solutions, and the service that comes from a company whose corporate commitment is to ensure total customer satisfaction.

Quality

Our position stems from both experience and strength. Experience born of 15 years of working in virtually every discipline of information systems. Strength comes from our relationship with our parent, National Intergroup, a $2.3 billion diversified company.

GENIX remote computing is the most cost-effective solution for large users of advanced information services. At the terminal level our 2000 plus users enjoy 99% plus average availability and a transaction response time not usually delivered by the typical remote computing vendor.

Service

In addition, GENIX consultants are available to support the needs of the most demanding customer. In telecommunications networking, data base design, process control applications, capacity planning, hardware and software evaluation, data center design; GENIX consultants are expert in their fields.

The next move is yours. It's a strategy that can lead to success. Call 1-800-US GENIX.

BROOKVALE
800-645-1167

Matt's office has been winning a lot of new business lately. And it's really not much of a secret.

Because he and his co-workers have been able to make more efficient use of their resources. How? Well, Matt brought in Team Xerox.

Which includes Xerox 8010 Star

"I heard you underbid us by half a million. What's your secret?"

Workstations, high speed laser printers, file servers for organizing and storing data and communications servers for accessing mainframe data bases, all linked together with a Xerox Communications Network. For complex analytical tasks, Xerox also included a Xerox Artificial Intelligence System.

So Matt (and the people in his domestic and international offices) could create, access, share and react to information more quickly and more easily than ever before.

And since Matt's office has become so much more productive, he was able to cut costs—and enter a bid that was $500,000 less than anyone else's.

To make Matt's secret yours, call Team Xerox at 1-800-833-2323, ext. 42 or send your business card to Xerox Corp., Dept. 42013, P.O. Box 24, Rochester, NY 14292.

IBM micro gets net tool

Management program allows users to switch

Computer Associates International, Inc.'s Micro Products Division of San Jose, Calif., has released a network management software program for IBM Personal Computers running Novell, Inc. Netware or 3Com Corp. Etherseries software.

Easyplus Network Manager reportedly supports up to 10 windows, each simultaneously running a network user's application. The windows allow users to switch between programs, transfer data, size and position the windows and send text to a file, screen or printer.

The product is said to provide full local-area network support for the vendor's Plus series of accounting, word processing and other programs.

For data security, Easyplus Network Manager uses local-area network semaphores for record and file lockout, preventing users from writing to the same file at the same time.

The system requires a network server with a minimum of 512K bytes of memory, a hard disk drive and remote user stations with a minimum of 256K bytes of memory.

Easyplus Network Manager is priced at $395 for a four-unit version and $595 for an eight-unit configuration.

Connector lets IBM AT run Lotus 1-2-3 under Xenix

Uniform Software Systems, Inc. of Santa Monica, Calif., has announced a version of its The Connector software that reportedly permits Lotus Development Corp.'s 1-2-3 software to run on the IBM Personal Computer AT under Microsoft Corp.'s Xenix.

The Connector for Xenix and Lotus' 1-2-3 reportedly allows 1-2-3 to run in the protected virtual address mode of the Personal Computer AT under Xenix, offering the spreadsheet access to more than 800K bytes of memory. Under Xenix, the Lotus product can run in the foreground while other programs run in the background simultaneously.

When running under The Connector, 1-2-3 operates as it would when running under IBM's PC-DOS operating system, Uniform said. Since 1-2-3 requires use of the Personal Computer AT's console, only one user can run 1-2-3 at a time.

The Connector for Xenix and Lotus 1-2-3 is priced at $149 and is available immediately. It is one of a series of The Connector products from Uniform, others of which include The Connector for Venturcom, Inc.'s Venix and The Connector for IBM's PC/IX.

SOFTWARE

■ **Hewlett-Packard Co. has introduced Executive Card Manager (ECM) software for its Touchscreen personal computers.**

The ECM integrates a data base and telephone number filer in a system reportedly able to file the equivalent of four type-written pages of information on any record. Up to 64,000 records can be stored, HP said.

Also announced were ECM: Templates, which are said to provide ECM users with form and report layouts that can be customized.

ECM will permit the the transfer of information between ECM and other applications such as Ashton-Tate's Dbase II and Dbase III, Lotus Development Corp.'s 1-2-3 and HP's HP Access, the latter for communication with HP 3000 systems, according to the vendor.

ECM requires 256K bytes of memory and costs $295. ECM: Templates is $125.

HP, 300 Hanover St., Palo Alto, Calif. 94304.

■ **United Software Industries, Inc. has announced word processing software for the IBM Personal Computer, Personal Computer XT and PCjr.**

Einstein Writer reportedly includes automatic formatting, single-keystroke commands for the Personal Computer's 10 function keys, a split-screen mode and a 65,000-word spelling checker. Single-keystroke functions include move, copy, delete, find, replace, save, print, repeat and restore.

Other features include on-line Help screens, a 64-char. additional comment line to add detail to saved files and 125-char. text lines.

The software requires a minimum of 128K bytes of memory and one or more single- or double-sided disk drives as well as IBM's PC-DOS 1.1, 2 or 2.1.

Einstein Writer costs $169.95, the vendor said.

United Software Industries, Suite 300, 1880 Century Park E., Los Angeles, Calif. 90067.

■ **Softcorp has announced software that reportedly allows enhanced sideways printing of Ascii text files from the IBM Personal Computer.**

FUJITSU
BAND PRINTERS
The Numbers are Right.

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

6000 *Hours MTBF is a Long Time without Failure.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. For additional information, contact Fujitsu at 3055 Orchard Drive, San Jose, CA 95134, or give us a call. Our number is (800) 626-4686.

You've just been introduced to the Sperry PC/IT.

A resourceful, IBM compatible, new desk-top computer that's literally twice as powerful as the one IBM calls "the most powerful personal computer IBM has ever made".

The Sperry PC/IT has twice the basic memory of the IBM machine, and expands to a whopping 5MB (2MB more than the AT). And it has more than twice the hard-disk capacity of the AT.

The Sperry PC/IT is also faster. Processing speed is 45% faster. About a third faster for disk access.

So you can store more data, process it faster and retrieve it more quickly. All of which makes the PC/IT *the* performance computer for networking and multitasking applications.

And, not surprisingly, that's only half our story. With all this power and performance, the PC/IT is priced to make any prospective IBM customer think twice.

For further information, or to arrange a demonstration at a Sperry Productivity Center, contact your local Sperry office or your authorized Sperry dealer. Telephone toll-free 1-800-547-8362, ext. 72. Or write Sperry Corporation, Box 500, Blue Bell, PA 19424-0024.

The Sperry PC/IT. If we gave it any more power, we couldn't call it a PC.

SPERRY

IBM and Personal Computer AT are trademarks of International Business Machines Corporation.
PC/IT is a trademark of Sperry Corporation.

Sidestep reportedly allows users to select from 18 combinations of font sizes and print qualities for sideways printing applications.

Users can rotate an entire document 90 degrees.

The product can be used for printing files from spreadsheet programs such as Lotus Development Corp.'s 1-2-3 and from project management programs such as Softcorp's Advanced Project 6.

The software is said to be compatible with most dot-addressable dot matrix printers, such as the IBM Graphics Printer and Color Printer and the Epson America, Inc. MX, FX and JX series printers. It requires PC-DOS 2 or later.

Sidestep costs $60.

Softcorp, 2340 State Road, Clearwater, Fla. 33575.

■ Goldata Computer Services, Inc. has announced a local-area network version of its Goldatabase data base management software for the IBM Personal Computer.

Goldatabase Version 6 reportedly includes compatibility with 24 different local-area networks, including the IBM Personal Computer Network and offerings from 3Com Corp. and Corvus Systems, Inc. Features include record and file locking for multiple users, user-defined menus and computerized input screens.

Goldatabase Version 6 is priced at $595 for the single user, with the local-area network version price dependent on the number of concurrent users. A typical four-user local-area network license costs $1,487.50. The upgrade cost from Version 5 of the Goldatabase is $50.

Goldata Computer Services, 2 Bryn Mawr Ave., Bryn Mawr, Pa. 19010.

■ Datamate Co. has announced software that reportedly allows users of the IBM Personal Computer and Personal Computer AT and the Hewlett-Packard Co. 150 personal computer to create typesetting formats on the HP Laserjet printer.

Jetset II is said to consist of two utilities, one menu-based and one text-based, that allow formatting changes without the use of escape codes. Other features include text justification, centering and flush-right printing.

The menu-based utility reportedly supports all HP font cartridges and converts the user's choice of typeface, lines per inch and margins into escape codes, which are sent directly to the printer.

Jetset II is $99.

Datamate, Suite 128, 4135 S. 100th East Ave., Tulsa, Okla. 74146.

■ Radian Corp. has announced enhancement of its Rulemaster expert systems development software to include a new user interface. The interface reportedly simplifies the development and maintenance of expert systems.

Rulemaster, available in versions for several personal computers and minicomputers under Unix, reportedly will ship in the fourth quarter. Its new interface is said to offer screen and menu handling features, an editor for structuring applications and an editor for generating files of examples in order to create rules.

A unit license for Rulemaster is priced at $15,000 for the IBM Personal Computer AT running Microsoft Corp. Xenix, the AT&T Unix PC 7300 or the Tektronix, Inc. 4404.

A version of the software, priced at $25,000, is available for Unix-based minis.

Radian, P.O. Box 9948, 8501 Mo-Pac Blvd., Austin, Texas 78766.

■ Hypergraphics Corp. has announced four software programs in its On-Line Encyclopedia (OLE) series of instruction packages for the IBM Personal Computer, Personal Computer XT and AT.

The programs, titled Data Communications, AT&T Unix, Computer Literacy I and Computer Literacy II, reportedly reside in memory alongside IBM's PC-DOS, Basic and most applications software programs. Each OLE is organized alphabetically and by subject, allowing access and exit with a single keystroke.

The vendor also announced the OLE Tool Kit, applications generator software that allows users to create and maintain up to 80 of their own encyclopedias. The software includes an authoring graphics system, computer objects library, tutorial, encyclopedia manager and utilities to convert an encyclopedia and to create an index.

The Data Communications and Unix courses cost $69.95. Computer Literacy I and II are priced at $39.95. The OLE Tool Kit carries a one-time licensing fee of $5,000, including support and a one-day user seminar.

Hypergraphics, P.O. Box 50779, Denton, Texas 76206.

Micro users groups provide forum

ate all the help their followers can provide, but the willingness to volunteer is diminished when someone else is in charge.

Because of this, the group might want to structure itself as a self-help organization that needs everyone's participation.

As for orientation, the users groups should be oriented toward newcomers, who provide new ideas, questions and a source of volunteers. Without new volunteers universal burnout comes quickly.

Lastly, the group should be sensitive to the attention span of its members. Groups should not be bored with hours of printer talk; formal presentations should be kept to 15 or 20 minutes.

A revolutionary idea takes the next logical step.

Not long ago, STEAMER revolutionized the data communications industry. And now, it's doing it again. Because now STEAMER has synchronous support.

Finally, you can handle synchronous data.

Now STEAMER gives you long awaited synchronous support. It can handle both synchronous and asynchronous data lines and reduce your line costs. All while improving your operating efficiency.

And it can do it for as little as $3500 per end for a 4 channel unit.

Our data compression is the best you can get.

STEAMER gets data compression efficiencies higher than anyone else, averaging 2.2:1 to 3.2:1. Which means increased throughput and operating efficiency for you.

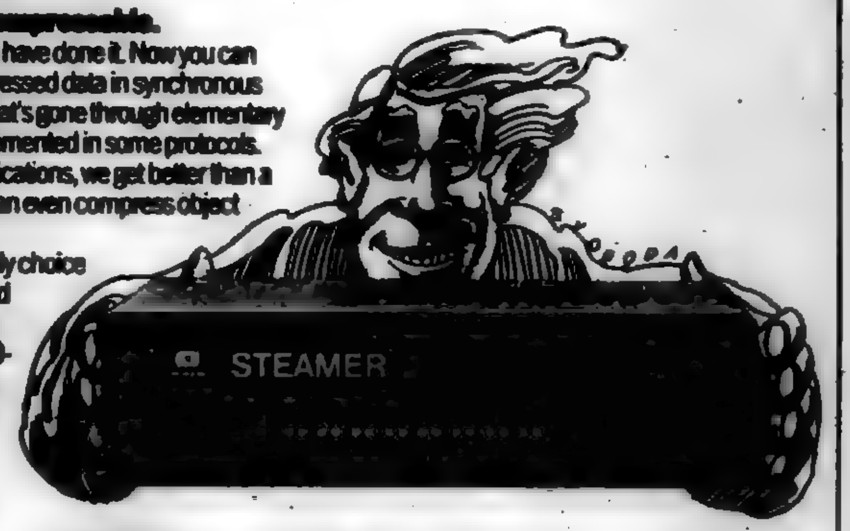
Proprietary compression algorithm: the heart of the matter.

Our proprietary compression algorithm continually analyzes the incoming data stream on a port-by-port basis and compresses the most frequent strings into shorter strings. STEAMER also analyzes the data in each direction on a port-by-port basis and builds entirely independent compression tables. That ensures that you get maximum compression efficiency.

We compress the uncompressable.

We are the only ones who have done it. Now you can compress previously compressed data in synchronous applications. Even output that's gone through elementary compression routines implemented in some protocols. Plus, in some graphics applications, we get better than a 2:1 compression ratio. We can even compress object code files.

STEAMER is really the only choice for passing synchronous and asynchronous data for data communications. Call 1-800-235-5030 now and we'll tell you more about STEAMER. Because pretty soon, STEAMER will make all other stat muxes and data compression machines obsolete.



Datagram We make networks work harder.

COMMUNICATIONS

Devices reconfigure T1 channels

By John Dix

Use of a new type of switching device for high-speed digital communications facilities will enable telephone companies to offer enhanced services and may also benefit companies that operate large private networks.

Generically referred to as digital cross-connect systems, the devices are used to reconfigure channels within T1 digital communications links. T1 facilities operate at 1.54M bit/sec. and are typically segmented by time division into 24 individual channels, each of which operate at 64K bit/sec.

Traditionally, if channels within a T1 link had to be routed to different locations, the digital signal had to be broken down into 24 individual analog signals, put through a type of patch panel and then taken back up to a digital signal, according to Ralph Genss, product support manager with Microtel Ltd., a system manufacturer in Atlanta. This requires the multiplexing devices, called channel banks, to be configured back-to-back.

Digital cross connects facilitate that operation and do away with the need for one channel bank. They support multiple inbound and outbound T1 links, enabling any 64K bit/sec. channel within an incoming T1 to be routed to any outgoing T1 link.

Although digital cross-connect technology is not new, it is only now becoming cost effective, according to Ian Sugarbroad, general manager of digital network cross connects at Northern Telecom, Inc. The cost reduction is attracting the attention of telephone companies and some companies with large private networks.

Telephone companies, hoping to capitalize on the explosion of interest in T1 facilities since AT&T's divestiture, are looking to digital cross connects as a means to provide new services. One such service, according to John Mahala, department chief of transmission product management with AT&T Network Systems in Burlington, Mass., is customer-controlled virtual private networking.

Digital cross connects will help "blur the distinction between private lines and message services," Mahala said. Customers will be able to rearrange the destination of circuits within a T1 trunk in a matter of minutes on a periodic or scheduled basis, he said.

Such capabilities would enable T1 service customers to configure the link for "voice message traffic during the day and at the end of the day have it automatically reconfigure itself to dump a lot of data to another facility," Mahala said.

Although telephone companies represent the largest market for digital cross

IBM to offer matrix switch

IBM, in Rye Book, N.Y., has announced the availability of a matrix switch that industry sources say is being provided to the mainframe maker by Bytex Corp. of Southboro, Mass., the leader in the matrix switch industry.

The IBM 3728 Communications Control Matrix Switch, like Bytex's Autoswitch product family, is intended to sit between modems and communications processors, or between modems and outgoing telephone lines. The switches enable any incoming port to be routed to any outbound port.

Matrix switches are most typically used in front of communications processors to provide sparing for networks that require high availability. In the advent of a processor failure, the switch can redirect all incoming lines to a backup system.

The IBM switch, like Bytex's Autoswitch 240, is available as a stand-alone or as a base unit that supports up to 15 exten-

NCR upgrades cut upkeep fees

NCR Comten, Inc. of St. Paul, Minn., has announced system upgrades for two communications processors that result in reduced maintenance fees. The company also announced a new lease-to-purchase conversion option that enables customers to purchase currently leased systems at substantial savings.

Users who own Comten 3650 Model X4 or 3690 Model X5 communications processors can upgrade their machines to 3650 Model X9 and 3690 Model X8 processors, respectively. The enhanced packaging and design of the new models results in a reduction of monthly maintenance charges by 34% to 44%, the company reported.

Comten customers currently leasing these processors must purchase the products before they can upgrade to the new models and reduce their maintenance fees.

To encourage that migration, Comten's lease-to-purchase conversion option allows users to apply more of the fees

Comsat adds satellite unit

Communications Satellite Corp., more commonly known as Comsat Corp., recently announced it will market a 56K bit/sec. data communications terminal and satellite dish at a $12,000 average price per unit.

Comsat, in Washington, D.C., said the unit will be initially available in the fourth quarter of 1985 and announced that it has signed a contract with Halliburton Co. of Dallas, to supply 120 dishes and a central switching control hub. The Halliburton contract is worth in excess of $1.5 million, according to Comsat Technology Products President A. William Perigard, and will also include the satellite facilities of American Satellite Corp. of Rockville, Md.

Perigard said the satellite dishes, either 1.2 or 1.8 meters in diameter, are capable of handling voice and videoconferencing communications. He said the voice quality will not be the equivalent of standard terrestrial lines. "Our data terminal repre-

Oracle announces portable version of IBM SQL/DS and DB2

Any application written for IBM's SQL/DS or DB2 relational database management systems will now run without modification on DEC, DG, AT&T, HP and several other manufacturers' minis, and a wide range of micros, including the IBM PC/XT and PC/AT.

Oracle Corporation introduced the first relational DBMS in 1979. Today ORACLE is the only relational database management system that is completely compatible with IBM's SQL/DS and DB2. Programs written for SQL/DS or DB2 will run unmodified on ORACLE.

Originally designed for IBM mainframes and DEC superminis, ORACLE is now available on a wide range of machines, from mainframes to PCs. And ORACLE includes an integrated set of 4th generation software tools not available with either SQL/DS or DB2.

■ **Why not Cullinet, ADR or Focus?** There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. Both ANSI and the US Government are in the process of adopting SQL as *the* standard database language. The Cullinet, ADR and FOCUS software packages each implement their own unique database language - each one painting the user into its own corner. Since its inception, Oracle Corporation has provided total IBM SQL compatibility.

Few shops nowadays run only IBM mainframes. Why, then, even consider a database solution that runs *only on IBM mainframes?* Applications written with ORACLE run identically on mainframes, minis, and PCs. Because all versions of ORACLE *are* identical.

FOCUS, Cullinet and ADR offer either a limited subset, a completely different product or nothing at all (respectively) for the PC. And none have minicomputer products.

■ **Why not just go with DB2 or SQL/DS?** A relational DBMS simplifies but does not by itself eliminate application programming. Additional tools are necessary if users are to create and maintain their own applications.

DB2 and SQL/DS are relational systems, period. ORACLE is a relational DBMS plus integrated 4th generation software tools for application generation, report writing, color graphics and network communications.

Furthermore, SQL/DS and DB2 run only on IBM mainframes (and are somewhat unlikely ever to run on another vendor's system). ORACLE runs on more IBM hardware and operating systems than do IBM's relational products.

■ **What about Goldengate, dBase III, Symphony or Framework?** PCs need more than PC software if they are to be usefully integrated with corporate data processing. Incompatibility with SQL, while serious, is not the only major problem with these micro packages. None provides an acceptable level of data security, integrity or recovery facilities. And their PC-to-mainframe links are functionally primitive and difficult to use.

To effectively link computers, all machines in the network should run the same software. Only ORACLE provides standard software on mainframes, minis and micros. Data and programs can then be shared among users of different machines, distributing the workload.

ORACLE is currently installed on over 1000 mainframe and supermini systems around the world, as well as on thousands of PCs. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and government agencies.

For further information, contact Oracle Corp., Dept. C2, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

Converter, net system work with IBM 3705, 3725 devices

Datastream Communications, Inc. of Santa Clara, Calif., has announced a protocol converter and a network management system designed to work with IBM 3705 or 3725 communications processors.

The 8010 protocol converter supports eight to 32 asynchronous ports at speeds up to 19.2K bit/sec. Devices can emulate 3278 terminals and 3287 printers.

The device also has two synchronous ports that support speeds up to 19.2K bit/sec. for IBM's Synchronous Data Link Control protocol or 9.6K bit/sec. for IBM's Binary Synchronous Communications protocol.

The 8030 network management system supplies the same protocol capabilities as the 8010. In addition, it records network activity at physical and logical levels for attached devices. The network management system monitors up to 32 asynchronous ports and includes a 10M-byte hard disk drive for statistical storage.

The network management system records user identifications, logical unit or device addresses, and port and synchronous line activity.

The 8010 costs $9,900, and the 8030 sells for $14,900.

MCI lowers service rates

Digital transmission costs cut 2%, 15%

MCI Communications Corp., headquartered in Washington, D.C., has cut the rates for its Terrestrial Digital Service and Digital Data Service.

Terrestrial Digital Service, a dedicated digital T1 service that operates at 1.54M bit/sec., will decrease in price by an average of 2%. A New York-to-Washington, D.C., route, for example, would have previously cost $4,100 to install and $8,856 per month. With the new rates, installation is set at $2,286, and the monthly rate is $8,807. The service is available in 69 cities.

MCI's Digital Data Service is a digital, full-duplex, synchronous service that supports transmission speeds of 2,400, 4,800, 9.6K and 56K bit/sec. The service's monthly rates will fall by approximately 15%. The installation cost of a New York-to-Washington, D.C., line will rise from $650 to $1,300, and the monthly service charge will drop from $1,772 to $1,474.

Firm adds IBM SNA protocol trace feature

Atlantic Research Corp. of Alexandria, Va., has added an IBM Systems Network Architecture (SNA) protocol trace feature to its Comstate II Protocol Analyzer.

The feature decodes SNA protocol for an operator who enters information using menu-driven commands, the vendor said.

The tracer reportedly decodes all frame identifier types and displays frame, transmission, request and response headers.

Bind commands are expanded and sense information is displayed whenever a sense data indicator is set, the vendor said.

A user can select whatever data he wants to display, for example, frame address, origination address field, destination address field, sense data indicator bit, response-type indicator bit and exception response indicator bit.

The option costs $800, according to the vendor.

From page 67

Comsat adds satellite unit

sents an application that stresses four areas: interactive data, electronic mail, high-speed facsimile transmission and thin-route voice."

According to Perigard, the product is the first to be able to make necessary high-speed satellite protocol conversion in an IBM environment, providing an interface to systems incorporating IBM's Systems Network Architecture/Synchronous Data Link Control.

He said the principal sources of competition for the interactive data communications satellite dish will be Equatorial Communications Co. of Mountain View, Calif., and M/A-Com Linkabit, Inc. of San Diego.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diane La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

Because they did their homework. They talked to our customers and found out that for over 12 years, hundreds of Fortune 1000 companies have had exceptional results from financial software systems by Data Design.

They discovered what nationally recognized software surveys confirm year after year: that Data Design has an unsurpassed record of user satisfaction.

They learned they can expect fast, trouble-free implementation with our systems.

They were told that our systems are exceptionally flexible and easy to use.

They found out about our reputation for in-depth training and responsive, knowledgeable support.

They learned that Data Design places only management level people in customer service positions. People who average over 10 years experience—not trainees.

And more.

So, if you're in the process of doing your homework on mainframe financial software, call today for our complete customer list, and you too can hear why companies like Alcon, Amdahl Corporation, Burger King, Estee Lauder, May Company Department Stores, Pillsbury, Sherwin Williams Company, Bankers Trust Company, Central Soya Company, Chicago Tribune, CIGNA Corporation, Federal Express, Litton, Midland Ross, Owens Corning Fiberglas, Perini Corporation, Royal Business Machines, G.D. Searle and Company, Security Pacific National Bank, Warner-Lambert Company, Zayre Corporation, Wisconsin Power & Light and hundreds of others decided on Data Design over other vendors.

And find out why 68% of our customers, who previously had other vendor's systems in place, have now decided to use systems by Data Design.

To learn more about the best financial software available, call toll-free 800-556-5511 or complete and mail the coupon today.

IRMA'S FASTLINK™ TRANSMITS DATA AT 10,000 BPS WITHOUT A GLITCH.

IRMA's Fastlink, the new high-speed asynchronous modem for your IBM or compatible PC, can send your data more than eight times faster than ordinary 1200 bps modems.

And, using a new version of the popular Crosstalk XVI® software called Crosstalk-Fast™, it can do it over dial-up lines.

But one thing's even more important than speed. And that's accuracy.

Whether it's transmitting at 10,000 bps or poking along at a much slower speed to accommodate a Hayes modem, Fastlink can send and receive data hour after hour over almost any kind of line, without making a single error.

Fastlink's accuracy is the result of an innovative technology that packages, transmits and verifies everything sent.

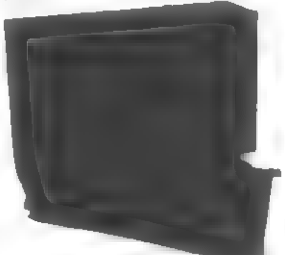
If there's noise or interference on the line that does require Fastlink to transmit your data at a slower rate, the adjustment is made automatically.

Of course, other modems adjust their speed, too. But they typically have to cut their speeds in half, from 9600 bps, for example, to 4800. In fact, under some conditions, other modems will actually disconnect in mid-transmission.

Fastlink, on the other hand, adjusts its speed a few bps at a time, so you can still maintain maximum speed at all times during transmission.

What it comes down to is this. With IRMA's Fastlink, you can now count on getting the data you need fast, getting it economically, and, most important of all, getting it right. And you can get all this from Fastlink without having to pay for expensive, conditioned, dedicated lines.

Available both as a PC card and as a standalone unit, Fastlink's compatible with both 212A and 103 type modems.



And it comes from the people who gave you IRMA™, the most successful PC-to-mainframe communications link in the world.

Call 1-800-241-IRMA to find out more about the new modem that's leaving all the other modems in the dust.

From page 67

IBM to offer matrix switch

sion units. A single switch frame has 15 card slots that can be configured with a variety of interface types, according to the vendor. Interfaces that support high speeds reduce the overall number of ports available on a given switch.

A single-unit IBM system supports 240 four-wire analog ports, or 120 CCITT V.24/RS-232C ports at speeds up to 19.2K bit/sec., or 60 CCITT V.35 interfaces at speeds up to 76.8K bit/sec. or a combination of the above.

Multiple unit systems can support 3,840 four-wire analog ports, 1,920 CCITT V.24/RS-232C ports or 960 CCITT V.35 interfaces.

A switch node can consist of one or more units — up to 16 — and be networked with up to 61 3278 Communications Control Matrix Switch systems, IBM reported.

Each 3728 must have at least one control terminal. That terminal can be a switch control console consisting of an IBM 3161 Ascii Display Station or equivalent and an IBM 4201 Proprinter with an Asynchronous Serial Interface Module; or a support processor, a dedicated IBM Personal Computer XT running the 3728 Support Processor licensed program. The XT must have at least a 10M-byte hard disk, a 320K-byte diskette and 640K bytes of random-access memory.

The 3728 Support Processor Licensed Program, which does not require DOS or any other operating system, can control all local and remote 3728s in a networked configuration.

The support processor provides a storage logging facility to trace network events, an editing function for creation of command lists, automatic execution of command lists, a security subsystem and an on-line Help facility.

The 3728 Control Mode provides control over the matrix switch, including switch initialization, line configurations and alarming for controller ports or groups of ports, according to the vendor.

Available beginning in December, the 3728 costs $15,800 and carries a $81.50 minimum monthly maintenance charge.

Interface cards that support a varying number of ports range in price from roughly $1,200 to $2,609. The 3728 Support Processor Licenced Program has a one-time charge of $12,000.

From page 67

NCR upgrades cut upkeep fees

paid during the lease toward the purchase price of the system.

Under the new option, the accrual rate and the maximum limit at which lease fees can be applied toward purchase of the systems have been increased.

The combined effect of the lease-to-purchase option and the system upgrade enables users to purchase and upgrade their X4 and X5 models at reduced rates, the vendor reported.

Users with X4 or X5 machines under two-year leases can purchase and upgrade them to the X9 or X8 model for roughly 90% of the purchase price of the those models, according to Comten.

From page 67

Devices reconfigure T1 channels

connects, manufacturers of the devices said they have had inquiries from many other large users. The systems, however, are expensive — roughly $1,200 to $1,500 per T1 port, according to Sugarbroad at Northern Telecom — and typically have a minimum of 16 or 32 ports. Northern Telecom's DNX-100, for example, has a minimum of 31 T1 ports and a maximum of 248. AT&T's digital access cross-connect system ranges in port size from 32 to 128 T1 ports.

AT&T's Mahala said there is a trend under way to downsize digital cross connects. But even today the systems will appeal to companies with at least "a dozen T1s going through their network," according to Microtel's Gana.

Private industry can take advantage of the systems in a number of ways.

"If you had a few locations feeding a hub point from which you were going to route to a long-distance carrier, the capacity from each subtending location could be packed on the [T1] at the hub," Mahala explained. "You would get higher fill over the long-distance net," thus optimizing that link.

Another application would be to use a digital cross connect in a campus environment to interconnect all company facilities. Instead of having point A connected to B, all locations could be connected to a central cross-connect hub, Mahala said. Channel capacity between locations could thus be rearranged as needed.

The hub in this scenario could also act as the point of interface for long-haul carriers, providing the optimizing consolidation capabilities.

A third potential application for digital cross connects in private industry, according to Mahala, is in disaster recovery. Companies can use a switching system to act as a bridge between a primary data base facility and a recovery site. In the event of a catastrophe, the cross connect, housed at the recovery site, could redirect user traffic to standby equipment.

Although telephone companies have the capacity to use the digital cross connects that are currently available — from which users will benefit — the technology will probably find a niche in private industry as vendors scale down their products.

COMDESIGN X.25 PAD: TX-700 SERIES

X.25 PROBLEMS SOLVED

Connecting our various hardware to a packet switching network was simple and economical with ComDesign TX-700's.

The finishing touch for X.25 networks.

We all know that X.25 packet switching networks offer an excellent solution to many distributed data processing applications. But getting a collection of hardware tied into them isn't easy. Or inexpensive.

Now there's the TX-700 Series from ComDesign. A multiple microprocessor-based X.25 PAD, the TX-700 provides exceptional throughput, network control and maximum utilization of the communications link. Plus cost savings that will help your communications dollar go a lot further.

The TX-700 supports up to 32 asynchronous channels. It performs as a terminal concentrator for host computers supporting the X.25 interface, or concentrates terminal traffic on a single communications link to a packet switching network. It is fully LAPB compatible and conforms to CCITT X.3/X.28/X.29 recommendations. True to ComDesign's modular hardware and firmware plan, TX-700's are field-upgradeable to allow convenient network growth and access to the latest operating software.

Other features include Autocall, PVC, Session Recovery, configurable subaddressing, break output, echo specification and automatic reverse charging; certified with AUTONET, TELENET, UNINET and others.

Put the finishing touches on your X.25 network design. Call toll-free (800) 235-6936, or in California (800) 368-8092 or (805) 964-9852.

SYSTEMS & PERIPHERALS

HARD TALK
James Connolly
CW Senior Editor

Please enter your cobfiuk

Monday mornings can be tough enough, particularly when they involve returning from summer weekends to face a string of project deadlines. So a person doesn't need a computer to kick off the week by calling him "Scumbag," or to start the next week with the salutation "Fatarse."

But that is what a Digital Equipment Corp. Microvax I did to Mark Welsh recently, finally hitting him with "Forize" on the third Monday morning. "My spectacles were steamed up worse than when I unload a just-finished dishwasher," recalled Welsh, a senior systems software engineer for Ex-Cell-O Manufacturing Systems Co. in Rockford, Ill.

The mysterious slurs that Welsh endured were a few of the bizarre passwords generated by an apparently creative Microvax that he shares with five other users in a networked environment. Many of the other passwords weren't insulting; they weren't even pronounceable or memorable, Welsh said.

Welsh laid the blame on an engineer or someone else involved in developing DEC's VMS 4.1 operating system.

"It's not impossible that it could have happened, but it is so highly improbable as to make you wonder," DEC spokesman Steven Kallis countered, suggesting that Welsh may have been the victim of a coworker's practical joke.

Whoever was to blame, the result was that the Microvax spewed out strange passwords through an optional VMS feature that periodically generates new pass-

'Erased' tapes present potential security threat

By Donna Raimondi

If you sell or throw away your used, erased magnetic tapes, you may be tossing your corporate information up for grabs.

All the warnings that manufacturers package with magnetic media — about not spilling coffee on the tape, not exposing it to airport X-rays and metal detectors — may lead operations people to believe the media is delicate and easily erased. It is not.

Although little evidence exists that corporate spies have lifted data from degaussed magnetic tapes (reels placed in an intense magnetic field in order to erase them), a recent paper raises questions about what to do with old magnetic tapes that might still contain valuable information.

With all these rumors of instability floating around, it is hard for people to realize just how stable and long lasting that magnetically recorded information really is, according to physicist William Manly in his paper, "Data Security and Used Magnetic Storage Media," written in July 1985.

"If you value your information, don't sell your used magnetic tapes or disks; give them away, or throw them in the trash," Manly warned.

Manly is an independent consultant with HMI Consulting in Arlington, Texas. He is not in the tape erasing business but wrote his report for two clients who were worried about the proper disposal of sensitive information.

When a file is deleted from tape, the

Sun unwraps workstations

Emphasizing that it is maintaining its open systems architecture, Sun Microsystems, Inc. of Mountain View, Calif., has introduced a family of workstations, programming environments, file servers and a floating-point accelerator.

In an announcement last week, Sun said the three Sun-3 workstations and other products are, like the earlier Sun-2 product line, based on industry-standard software and hardware components designed for full integration and future upgrades. The company said that those standards include Ethernet for local-area networking and Sun's version of the AT&T Unix and that software that runs on Sun-2 workstations is compatible with Sun-3 products.

The workstations and two file servers are based on Motorola, Inc. 68020 16.67-MHz microprocessors with a 12.5-MHz Motorola 68881 floating-point coprocessor and a full 32-bit VM-based architecture.

Sun claimed that the Sun-3 products provide twice the speed of a Digital Equipment Corp. VAX-11/780 in desktop systems for technical professionals.

The products are targeted at applications that demand high-performance graphics such as computer-aided design in the electronics and mechanical engineering fields and in architectural uses such as facility planning and landscaping.

The workstations include the Sun-3/160C color workstation, featuring eight color planes and the ability to display 256 colors simultaneously; the Sun-3/

Design, numerical control tools bow

Series of Prime systems target entry-level, mid-range mart

A series of computer-aided design and computer-aided numerical control programming packages have been introduced by Prime Computer, Inc. of Natick, Mass., to the entry-level computer-aided design and manufacturing systems markets.

The products are configured to provide new CAD and numerical control programming users with entry-level and mid-range systems that can be expanded to grow with programming needs, according to a Prime spokesman.

The CAD Starter Packages are single-user, two-dimensional systems based on the Prime 2250 minicomputer with controller. They are available with Prime's Medusa design drafting software and are offered in 50Hz or 60Hz configurations, depending on local power requirements. They include Prime's PW153 CAD terminal and the Prime PT200 graphics terminal. They are available in three configurations, priced from $35,000 to $55,000.

The Expanded CAD Packages are two-seat configurations based on the Prime 2550 minicomputer with controller and software, including Medusa, Prime's information data management/application development, supersyntax and variational geometry. Also available in 50Hz or 60Hz configurations and with the PW153 CAD terminal and PT200 graphics terminal, they are priced from $95,000 to $125,000.

The Entry-Level Computer-Aided NC Programming Packages are single-seat, stand-alone numerical control tape preparation systems based on the 2250 minicomputer. They include controllers and Cadcentre, Ltd.'s GNC 2½-axis programming software. They cost from $45,000 to $55,000, according to Prime.

The Expanded Computer-Aided NC Programming Packages also are based on the 2250 minicomputer with GNC programming software, a tape generator postprocessor program and the information data management/application development software.

They are available with the Prime PT200 graphics terminal and the Prime PGT4109 CAD terminal. There are three configurations, priced from $80,000 to $90,000.

According to Prime, all of the systems include the required cables and can be configured according to U.S. and international requirements.

Parallel processing mini introduced

A start-up company has added its first product to the growing number of parallel processing minicomputers. International Parallel Machines, Inc., of New Bedford, Mass., has unwrapped its IP-1 that runs under the company's Runix operating system.

International Parallel was started five years ago with $2 million worth of seed money from relatives and friends, according to Robin Chang, president and treasurer. No institutional investors are involved in the project, he added. The IP-1 is the company's first product.

The company uses local memory and multiaccess memory modules that are said to act like multiport memories to allow simultaneous access by different processors. An intelligent disk interface is said to allow data transfers while the processor runs at full speed.

A basic configuration for the turnkey system includes nine processors with interconnection switches, 10M bytes of main memory, 150M bytes of on-line disk storage, more than 50 I/O ports, a terminal and the Runix operating system. The basic system costs $49,950.

DATA STORAGE

■ Distributed Logic Corp. has released an enhanced small disk interface controller that is said to allow the attachment of one or two Winchester disk drives to Digital Equipment Corp.'s Microvax, Micro/PDP-11 and LSI-11 computer systems.

The DQ656 controller's universal formatting system is said to allow systems integrators to mix drives with different performance characteristics without having to specifically configure the controller board. The controller plugs into any standard DEC Q-bus quad slot. It is compatible with 5¼-in. Winchester disks drives made by Control Data Corp., Maxtor Corp., Micropolis Corp., Siemens AG, Hitachi America, Ltd. and Fujitsu America, Inc.

The DQ656 costs $1,115.

Distributed Logic, P.O. Box 6270, 1555 S. Sinclair St., Anaheim, Calif. 92806.

■ Memorex Corp. has announced a dual-path feature for its existing 3690-2 disk storage subsystem that is attachable to a Memorex 3680 or IBM 3880 storage control unit.

The feature, a 3699-2 alternate string controller, is said to improve data storage acccess time and increase data availability by doubling the number of access paths available to each disk drive in a 3690-2 string. It permits read/write operations to take place on two different drives within the string at the same time.

A minimum dual-path 3690-2 subsystem consists of a 3693-2 primary string controller and a 3699-2. Each unit provides 729.8M bytes of storage capacity. The system costs $35,480 for the 3693-2 primary string controller, $26,600 for each 3690-2 disk drive and $38,990 for the 3699-2 alternate string controller with the dual-path feature.

Memorex, San Tomas at Central Expwy., Santa Clara, Calif. 95052.

TERMINALS

■ MSI Data Corp. has announced its PDT III portable data terminal.

The PDT III comes with a memory size of either 32K or 256K bytes. The hand-held unit measures 6.7 in. long by 3.8 in. wide by 1.3 in. deep and weighs less than 18 ounces, the vendor said. It has a 51-key color keyboard that shifts to include all 128 Ascii characters. An optional scanner — either a wand or light beam gun — can be plugged directly into the terminal for scanning bar codes.

The PDT III with 32K bytes of memory costs $1,060 and with 256K bytes of memory costs $2,010.

MSI Data, 340 Fischer Ave., Costa Mesa, Calif. 92626.

PRINTERS/PLOTTERS

■ Western Graphtec, Inc. has released an eight-pen plotter for sale to OEM users.

The MP 2000 flatbed B/A3-size plotter features a speed of 10 in./sec. in the drawing mode and 16 in./sec. when the pen is raised. Five types of pens are available for the MP 2000:

Sun Microsystems unwraps workstations

160M monochrome workstation; and the Sun-3/75M desktop workstation.

The workstations have a standard 2M bytes of main memory with expansion capability to 16M bytes, except for the Sun-3/75M, which has a maximum memory of 8M bytes. The three workstations were designed to operate as diskless nodes in a network or, with the addition of local mass storage, as stand-alone systems.

The basic Sun-3/75M costs $12,900, the Sun-3/160M costs $20,900, and the Sun-3/160C costs $31,900. Optional mass storage and backup systems start at $8,500 for the Sun-3/75M and at $7,900 for the Sun-3/160M monochrome and color workstations. Mass storage can be configured to provide from 71M bytes to 1.5G bytes, using multiple 380M-byte drives. Upgrades using 68020 microprocessors were announced in June for Sun-2 workstations and cost $4,000.

The two file servers announced last week were the Sun-3/160S, a pedestal-style model, and the rack-mounted Sun-3/180S. The file servers feature 12 slots and can be configured with one or two 71M- or 130M-byte drives and up to four 380M-byte disks and a ¼- or ½-in. tape. The pedestal-style model costs $17,900 without mass storage, and the rack-mounted version costs $18,900 without mass storage.

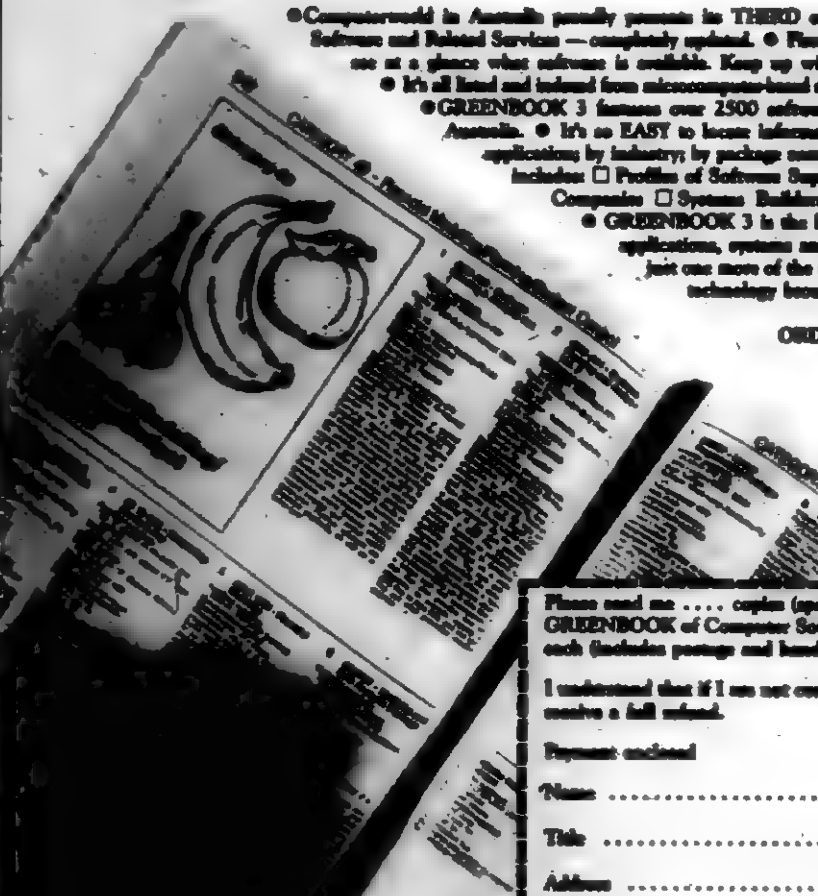
The Sun-3 workstations and file servers are available now.

Sun also announced an optional floating-point accelerator board for the Sun-3 line. It was designed to increase floating-point performance four times over the baseline performance. It costs $4,900 and will be available in the first quarter of 1986.

The two software products announced last week were the Sun Programming Environment (Sunpro) and Sun Visual/Integrated Environment for Workstations (Sunview). The products are bundled with Sun's version of Unix.

Sunpro is said to support rapid prototyping. According to Sun, once a user is satisfied with the functions of a prototype, a program can use Sunpro utilities for performance testing and tuning.

Sunview reportedly uses interface tools like windows, scroll bars, pull-down menus and pointing devices to help software engineers construct flexible, powerful user interfaces.



GREENBOOK 3 — The guide that tells you what's happening in the Australian software market.

THE ANSWER IS SIMPLY AT YOUR FINGERTIPS

●Computerworld in Australia proudly presents its THIRD edition of the GREENBOOK of Computer Software and Related Services — completely updated. ● First time computer users and current users can see at a glance what software is available. Keep up with the latest products and new companies. ● It's all listed and indexed from microcomputer-based software to software that runs on large systems. ●GREENBOOK 3 features over 2500 software products available and supported within Australia. ● It's so EASY to locate information. ● You can access GREENBOOK by applications; by industry; by package name; or host system ● Additional information includes: ☐ Profiles of Software Suppliers ☐ Description of Products ☐ Service Companies ☐ Systems Builders ☐ Contract Programmers ☐ Consultants ● GREENBOOK 3 is the largest and most comprehensive reference of applications, systems and utility software available in Australia . . . just one more of the range of information services on information technology brought to you by Computerworld Pty Limited.

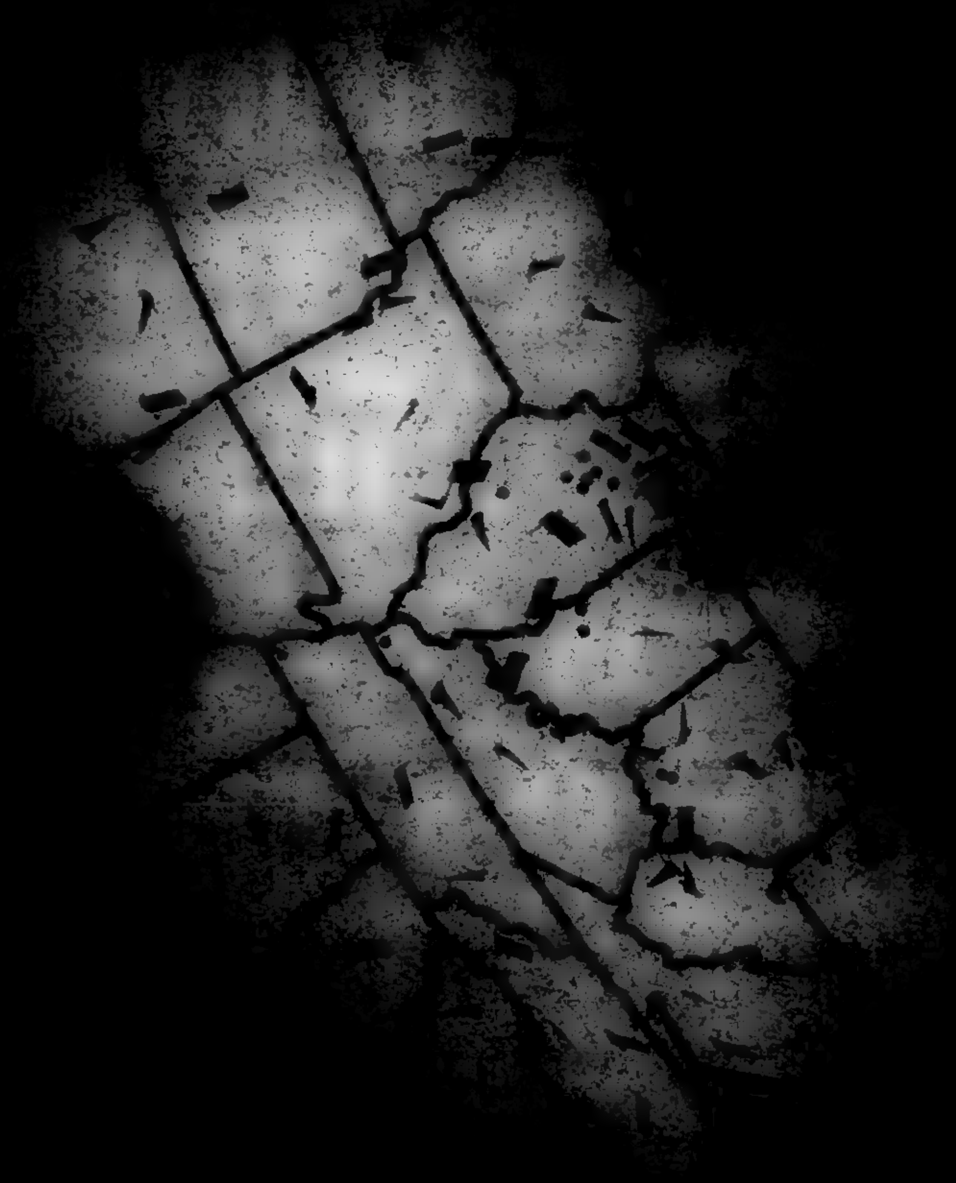
So the CEO said,
"If we could automate all our key departments and tie them into our SNA network, we'd knock the competition off the map."

And we said...



"Ready for action."

Information. It's one of the best weapons companies have to knock the competition off the map.

When all the key players in your organization have instant access to the facts they need to make decisions, you have the best chance for top performance and enhanced customer satisfaction.

And that's where Honeywell comes in.

COMPATIBLE DEPARTMENTAL SYSTEMS

Our DPS 6 family of fully compatible computers make excellent departmental systems that can help win the battle on three fronts.

First, we tie headquarters into the action through Honeywell's DSA network architecture or through SNA architecture compatible with IBM hosts. That lets the brass on the corporate level keep track of major developments in the field. We also support another state-of-the-art network, the Local Area Network. Extremely modular, cost-effective and simply connected, Honeywell LANs tie together processors and devices such as PCs, terminals, and computers to fill many basic communications needs.

Next, we give departments the tools they need to plan and execute winning strategies. It's easy because DPS 6 systems are versatile. So your sales and marketing offices can have just the systems and applications they need while accounting and purchasing have theirs. All able to communicate instantly. Honeywell gives you all this without breaking the bank, because all our systems are designed to provide you with a clear growth path that evolves with your needs.

Finally, Honeywell gives the people in the trenches, the end-users, the friendly kinds of software that make the DPS 6 system easily accessible to everyone.

SERVICE AND SUPPORT

When it comes to service, you'll be backed by Honeywell's worldwide TotalCare™ customer service program that is capable of supporting even intercontinental networks. Uptime, after all, is everything, and TotalCare provides everything you need in programs and services that can be tailored to help meet your requirements.

THE SMARTER CHOICE

Helping customers beat the competition is nothing new to us. We're veterans. For more information on Honeywell's departmental system, call 1-800-328-5111, Ext. 2790, or write Honeywell Information Systems, 200 Smith Street, MS440, Waltham, MA 02154.

Honeywell 100 Years

Together, we can find the answers.

water base and oil base fiber tip, water base ballpoint, ink and water base ceramic pens. It is equipped with dual ports for either RS-232C or Gpib-IEEE/488 interfaces and has a 6K-byte memory buffer.

The unit costs $1,290 in quantities of more than 250.

Western Graphtec, 12 Chrysler St., Irvine, Calif. 92714.

■ **Dataproducts Corp. has released its CP-1800 check-printing system designed for branch banking, real estate, insurance and corporate cash management applications.**

The unit combines a Dataproducts CP-40 magnetic ink character recognition (MICR) printer with an IBM Personal Computer XT in a cabinet. A $500 word processing option allows the user to flip a switch and, after changing the ribbon and print wheel, use the printer as a word processor.

The system includes check-printing software and prints from eight to 15 char./in. At 12 char./in., it operates at 55 char./sec. The system will produce 15 checks per minutes at 8 char./in., printing three lines of text and one line of MICR code. In MICR only, the system will print 30 checks per minute.

The CP-1800 costs $15,950. An automatic cutter/handling option, which cuts and bundles starter check sets, will be available in the first quarter of 1986 for $2,000.

Dataproducts, 6200 Canoga Ave., Woodland Hills, Calif. 91365.

'Erased' tapes present potential threat to companies' security

only thing that usually happens is that minor changes are made in the file header so that the file is ignored. Erasing the file by applying direct current through the head as the file passes by does not do the job either, Manly's report said. The signal in such a case is reduced by about 20 db, which leaves a solid 10% of it still recoverable with only a few possible errors, according to Manly.

Even a good demagnetizing bulk erase, in which the tape is removed from the drive and put into a demagnetizing machine, does not completely do the job. Demagnetizing — or bulk erasure — is a good way to begin the elimination of data from a tape, Manly's report said, but it should be considered only the first step.

As a second step, users should write random bits on the full length of the media, avoiding recognizable patterns. Then the media should be stored for about a week at about 100° Fahrenheit to imprint the random bits firmly on the media. Tapes should be carefully wound before storage, and all media should be well supported so that distortion is unlikely, the report added.

> ❞
>
> ***Demagnetizing — or bulk erasure — is a good way to begin the elimination of data from a tape, but it should be considered only the first step.***

Checks should periodically be run on each step of the process to ensure that they are working, the author advised. A wideband noise measurement after each bulk erase process will tell whether the erase is working, with residual signals showing up as periodic peaks in the noise spectrum. Temperature and sight checks should ensure that the tape is not curling in the warm space, he added.

The final procedure is to bulk erase again. There will still be a residual signal, but it will be of the random bit pattern, not the original signal, the report said.

Not everyone agrees that degaussed tapes can still be read. "We've had 1,600 cases [of breached computer security] since 1958, and none like that that I can recall," said Don Parker, senior management systems consultant at the not-for-profit computer security research and consulting firm SRI International, Inc. in Menlo Park, Calif. There is residual information left on a degaussed tape, Parker added, but finding even partial data would take a tremendous amount of work and equipment.

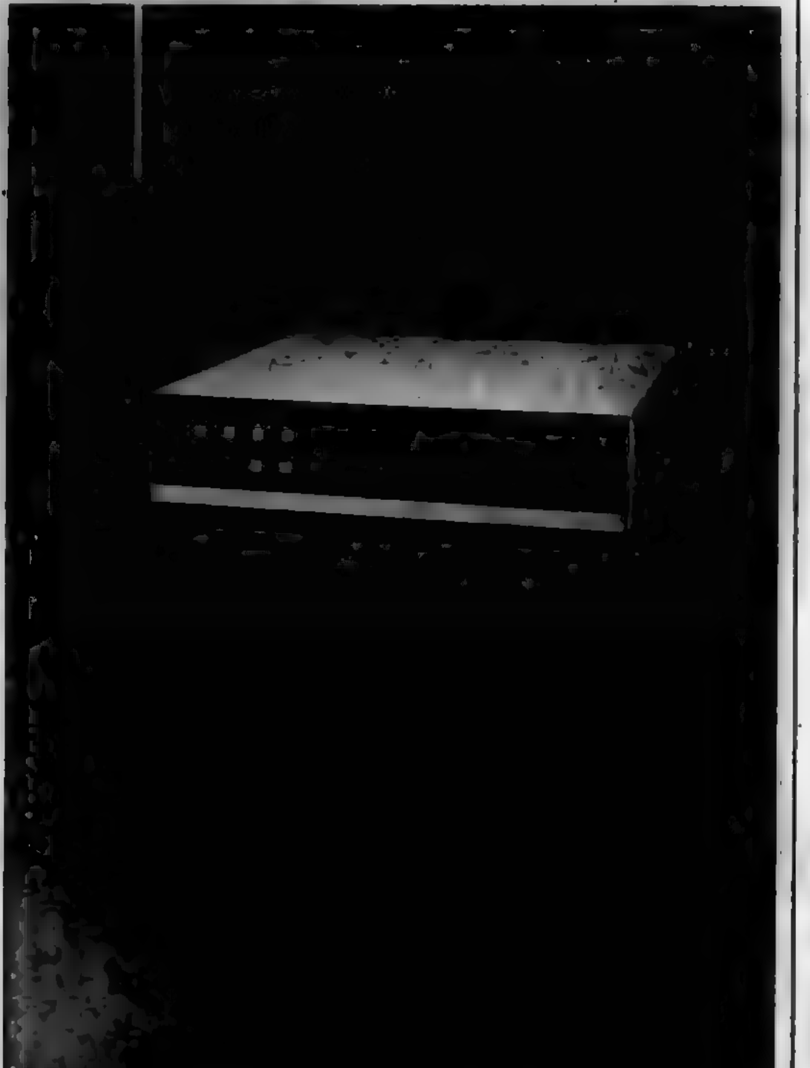
Raymond Freeman, who publishes the "Computer Tape Outlook" analysis and forecast newsletter in Santa Barbara, Calif., has not come across the problem either. "I haven't spent time being concerned about it," Freeman reported. "There are people who recover accidental erasures [the National Security Agency]. I'm not familiar with the results." Freeman did not know of any commercial services that recovered residual data from tapes.

The Social Security Administration's (SSA) tapes are degaussed at its National Computer Center in Baltimore whether or not they will be reused, according to Deputy Press Officer John Trollinger. The tapes are then reused at the SSA or declared surplus and sold by the General Services Administration (GSA) to anyone who wants to buy them.

The SSA tests random samples of the tapes that will be auctioned off by the GSA and has never found one with readable data on it, Trollinger said.

Herb Schantz, a vice-president of Graham Magnetics, Inc. in North Richland Hills, Texas, said he believes residual data is a problem. He said many of his customers have taken to destroying their old tapes with band saws to avoid expensive procedures to save them. Very large companies can justify the cost of the time, equipment and space required for making old tapes reusable, but most shops should just incinerate them, Manly said.

Media service bureaus are not set up to clean tapes as thoroughly as they need to be. If a user finds a bureau that promises to follow Manly's guidelines, the user should also make sure the service bureau can maintain security during the process, the report added.



Reach over 40,000 Spanish computer professionals.

Advertise in CW Communications' Spanish publications and sell your products directly to Spain's thriving computer community.

According to International Data Corporation (IDC), the world's leading information industry research firm, Spain is the sixth largest market in Western Europe with DP expenditures for 1984 at more than $2.7 billion (U.S.) and a projected growth to $3.5 billion (U.S.) by 1989.

Computerworld Espana is the only MIS/DP newspaper in Spain. Each week 8,500 MIS/DP executives turn to *Computerworld Espana* for information on new products and services, current applications and industry trends.

Commodore World, is a monthly publication with a circulation of 22,000. Editorial targets the Commodore user with reports on all aspects of Commodore operations.

PC World addresses the overall Spainish micro market. 12,000 owners and users of Commodore, Hewlett-Packard, Olivetti, Apple, Sinclair, DEC and IBM microcomputers read *PC World* for the latest developments and applications in the micro field.

CW International Marketing Services makes advertising your products in Spain, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

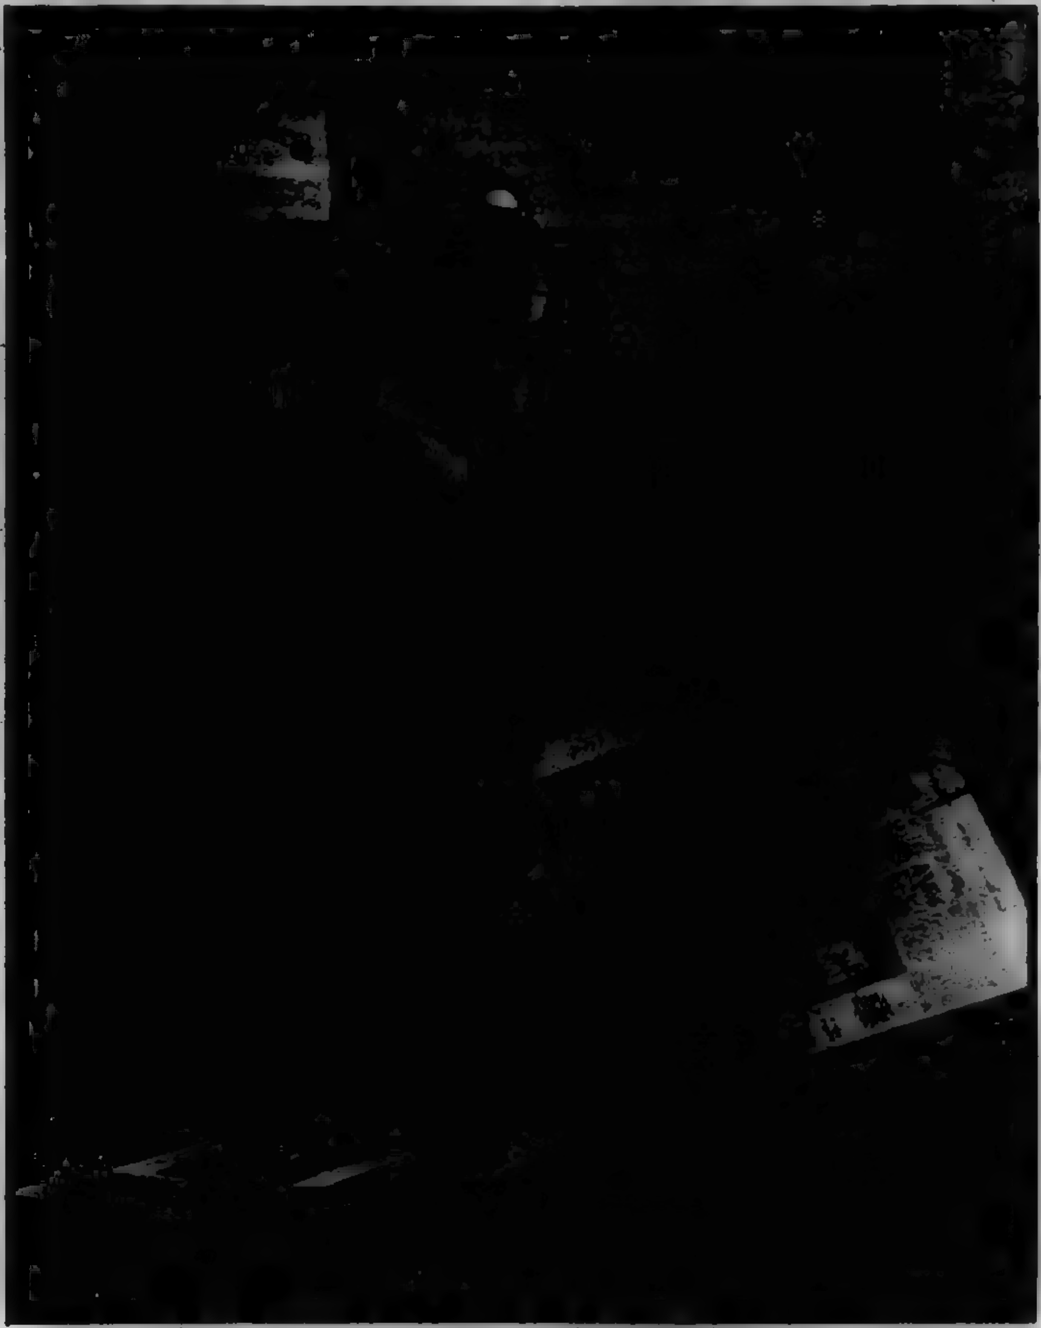
“Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect.”



EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is “. . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC.”

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, “. . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment.”

The results? “*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate.”

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing, Enertronics Research, Inc., St. Louis, Missouri.

PRINTERS

from page 78

■ Spur Products Corp. has released an adapter that is said to enable any Prime Computer, Inc. minicomputer to drive IBM 3211 printers, Storage Technology Corp. (STC) impact printers or Xerox Corp. laser printers.

The USA/Prime Universal Subsystem Adapter is said to give the system the capability of printing up to 3,000 lines of shaped char./min with an STC printer or up to 18,000 line/min. of dot matrix nonimpact printing with a Xerox 9700 printer. Used with an IBM 3211, the unit enables Prime users to have printer functions such as a slew speed of up to 80 in./sec. and interchangeable print trains, the vendor said.

The USA/Prime Universal Subsystem Adapter for the Prime minicomputers costs $6,000.

Spur Products, 13469 Beach Ave., Marina Del Rey, Calif. 90292.

■ Versatec, Inc., a subsidiary of Xerox Corp., has released an interface board that is said to support output to Versatec electrostatic plotters from Digital Equipment Corp. Q-bus computers.

The Model 126 with software driver supports output from the Microvax I and II to any Versatec monochrome or color printer/plotter. The model offers long line plotting capabilities of up to 1,000 ft. The interface and driver support 22-bit addressing for the Microvax machines and 18-bit addressing for other VAX series systems.

The Model 126 costs $2,000.

-Versatec, 2710 Walsh Ave., Santa Clara, Calif. 95051.

GRAPHICS SYSTEMS

■ KMW Systems Corp. has announced its VP-200 graphics element processor that is said to convert vector data to raster form for use by printers.

The processor is said to be suited for controlling electrostatic, laser magnetic and ion deposition imaging devices. It supports both color and intensity-modulated devices.

The VP-200 features 512K bytes of raster memory that is expandable to 8M bytes, plug-in card modules that permit configuration of up to three output devices and optional IBM channel and mini interfaces.

The VP-200 with a parallel interface costs $12,900 to start, with the price increasing depending upon additional memory or interfaces.

KWM Systems, 8307 Highway 71 W., Austin, Texas 78735.

POWER SUPPLIES

■ Elgar Corp., an operating unit of Onan Corp., has announced an uninterruptible power system (UPS) targeted at IBM System/34 and 36 users as well as at a variety of other systems, including Digital Equipment Corp. VAX-11/730 and VAX-11/750 machines.

The T series UPS provides both 120V and 208V ac single-phase output power. It comes in either 5 kVA, 7.5 kVA or 10 kVA sizes.

Prices range from $11,500 to $18,000, depending upon the configuration.

Elgar, 9250 Brown Deer Road, San Diego, Calif. 92121.

Please enter your cobfiuk

words for users. The option, available throughout the VAX product line, lets users select a password from approximately five generated randomly.

"It says, 'Choose a password from this list or hit return to get a new list.' We've had to hit return several times to get an acceptable password," Welsh said. "Forize" may have been an exception, Welsh added, noting that most passwords were unusable. He reported that a sample list gave him options such as "ropnaha, cobfiuk, ekgefwyk, ogudave and garmion."

"We reached the point where what people were going to start doing was writing their passwords down, which is a bigger problem than having them choose their own," Welsh added.

> *But the mystery remains: Who did it?*

Choose their own password

So Ex-Cell-O officials disabled the password option and went back to choosing their own passwords, such as "[their] Aunt Millie's favorite preserves, an obvious breach of security," Welsh reported.

But the mystery remains: Who did it?

Officials in DEC's Microvax group said they wouldn't have done it. They said that if they had done it, Ex-Cell-O's problems would have shown up in other users' systems. The password feature is in the operating system itself, not in the individual machines, according to DEC.

No other complaints

Kallis noted that there had been no other complaints about such rude words from users with any VAX machines.

Kallis reported that the password feature was designed to avoid words that users might find offensive, and that the system shouldn't present any of 90 nasty words on a list that DEC compiled.

If neither DEC nor the Ex-Cell-O programmers are to blame for the glitch, could the insults Welsh received have been mere coincidence? That may never be answered. At least the computer worked although Welsh criticized the Microvax I for its poor response time.

Some bugs bog down entire systems, Welsh said.

Just in case the culprit is found, Welsh has a suitable punishment: Assign that person the password "Flogme" and hope the perpetrator's coworkers act on that "very sage advice."

well, thank you. We have taught Assembler for 11 years to the most formidable captains of industry. Basics LR, ZAP, BALR, ICM, BXLE, and Advanced Re-entrant Coding, GETMAIN, ENQ/DEQ, DYNALLOC, ESTAE, Macro Writing, and of course all the popular Access Methods. Even have a brand new module for MVS/XA on 31-bit programming. Students write and de-bug actual programs. Takes 1-to-6 weeks. Write for syllabus . . . or call. Also our catalog.

COMPUTER INDUSTRY

No big changes foreseen for Sterling acquisition

Yet buy-out heralds exodus of Informatics execs

By Clinton Wilder

No further upheaval is expected in the internal organization and product lines of Informatics General Corp. in the near future as Sterling Software, Inc. moves to finalize its acquisition.

That is the view of Sterling executives and software industry analysts. However, most of Informatics' top executive staff departed prior to final approval of Sterling's buy-out proposal.

Sterling will "absolutely continue to support" Informatics' older software packages such as Mark IV, according to Phillip A. Moore, Sterling's senior vice-president of business development. Although Sterling is weighing alternatives to make Informatics more profitable, no relocation or liquidation of any product divisions are planned, Moore said.

"We are taking a look at where there would be potential synergies between Informatics' products and ours," Moore said. "We have not planned any consolidation because that implies moving one group to another location. Each division will continue to operate — with certain changes."

Moore declined to elaborate on what those changes will be, but so far, most of the change has occurred at the top. As expected, Informatics Chairman and President Walter H. Bauer resigned Sept. 1, leading the exodus of 65 of the 70 Informatics executives based at corporate offices in Woodland Hills, Calif. The Woodland Hills office will close by Nov. 1, with all top executive functions moving to Sterling headquarters in Dallas.

The only top Informatics corporate officers to remain with Sterling in their former positions are Richard C. Lemons, exec-

Datapoint saga a real cliff-hanger

By Peter Bartolik

The unceasing soap opera of Datapoint Corp. continues, and determining a logical ending may prove to be tougher than figuring out who shot J.R.

One clear point is that New York financier Asher B. Edelman has been with the company much longer than anyone expected after he won effective control in March.

ANALYSIS

Everyone expected to see an encore of his winning strategy at Management Assistance, Inc. last winter, when he browbeat the board of that company into accepting his plan to sell off parts of the company — the Sorbus, Inc. service division and the MAI/Basic Four manufacturing division — for a greater amount than the trading value of the company's shares.

Two weeks after taking over, Edelman said he was going to continue to operate the company, but analysts saw that as a bluff intended to obscure the widely held belief that Edelman's asking price — some $300 million — was more than a fair market value for the company.

Well, the service arm was spun off into a new company, Intelogic Trace, Inc., with the stock distributed to Datapoint shareholders, and already one bid, by TRW, Inc. for $177 million, has been turned down. And Edelman has offered to raise $100 million to buy the remainder of Datapoint and take it private.

For customers, this must be the worst of times. Figuring out exactly where the company is going is no easy task.

The buy-out plan was received with much skepticism by analysts who said it is probably the best deal shareholders will ever get, but countered that Edelman merely wants to capitalize on some $200

Japan to sell high-tech patents

By Takahiko Kondoh
Special to CW

TOKYO (CWN) — Japan is stepping up a campaign to boost sales of government laboratories' research and development results and patents to cope with growing foreign interests in its high technologies.

Leading the way is the Agency of Industrial Science and Technology (Aist), the Ministry of International Trade and Industry (Miti)-affiliated organization overseeing 16 state-run research labs.

The nonprofit Japan Industrial Technology Association, the exclusive nonprofit licenser of Aist's industrial properties and expertise, recently decided to send a 28-member mission of industrialists to Sweden, the UK, Ireland, France and West Germany during October.

During a two-week stay in the European countries, the Japanese group will demonstrate part of Aist's 18,000 or so high-tech patents at seminars for local entrepreneurs, academicians and government officials.

Broad areas of those patents include new materials, electronics and bioengineering. In electronics, emphasis will be placed on the amorphous silicon solar cell, isothermal capacitance transient spectroscopy for semiconductor defects and the YAG laser.

The progressive Japanese move to open

Ashton-Tate earns 407%

CULVER CITY, Calif. — Ashton-Tate last week announced second-quarter profits of $3.4 million, or 37 cents per share, up 407% from year-earlier profits of $682,000, or 7 cents per share.

Revenue for the quarter was $27.5 million, a 43% increase compared with revenue of $19.2 million in the second quarter a year ago.

The firm said the large increase in revenue and profits was due largely to sales of its Dbase III product.

International sales surged in the second quarter, compared with a year earlier, and the company said it will continue to place major emphasis on international sales. "The international market is growing more rapidly than the U.S. market, and we plan to capture a large share of that market," said Edward M. Esber Jr., president and chief executive officer.

Sperry hitches its wagon to Unix star

By Peter Bartolik

After decades of cultivating and captivating a mainframe customer base with proprietary products, Sperry Corp. last year decided to hitch its wagon to the concept that AT&T's Unix operating system would become an industry standard.

To a company that had watched IBM capture the lion's share of the mainframe market, the possibility of a standard evolving outside of IBM's control certainly holds allure. In fact, literally hundreds of companies have grasped at the prospect that Unix may someday provide users with the ability to port existing applications across vendor lines, thereby breaking the stranglehold of proprietary architectures.

That is not to say Sperry is in any hurry to relinquish its own mainframe installed base. At that level, the company offers a Unix-based SX 1100 product running as a guest operating system under its proprietary OS/1100 operating system.

But last year, Sperry attempted to shake off its image as a mainframe vendor with an array of microcomputer-to-superminicomputer products based on versions of the Unix operating system.

In the fiscal year ended March 31, Sperry boasted a 16% revenue increase and an even heftier 32% increase in profits. During the quarter ended in June, while many systems vendors experienced lagging sales, Sperry posted a 20% revenue increase and a 23% increase in operating profits.

According to two executives of Sperry's microsystems group, the new products contributed substantially to the increased bottom line. But, they added in a recent interview, that was not accomplished by selling much-needed lower end products to existing mainframe customers. "Only 10% to 20% of the new products went to installed-base customers," according to Joseph E. Garliano, director of micro products marketing, Americas division.

If anything, said Neal M. Waddington, director of product strategy, microsystems, Sperry "really has not emphasized the installed base" in its nonmainframe sales strategy. That, however, will soon change as the company educates its mainframe salesmen on the need to sell a full line of systems to existing customers, the executives said.

Sperry is selling itself as a systems integrator that can pull together many pieces to serve customer needs. It has taken that role literally, depending on other vendors to supply the actual hardware. "If you take a strictly proprietary approach, you can't keep up with the technology," Waddington said. He added, however, that even when it purchases a box from another vendor, Sperry usually has a comparable machine in devel-

DEC vs.
The Contender is a

In this corner: DEC, with the VT 100/220*–real heavyweights, listing at more than $1500 and $1095. Over there, the contender: Ampex, with its fully protocol compatible 219 and 220, both weighing in under $750.

How does the competition measure up?

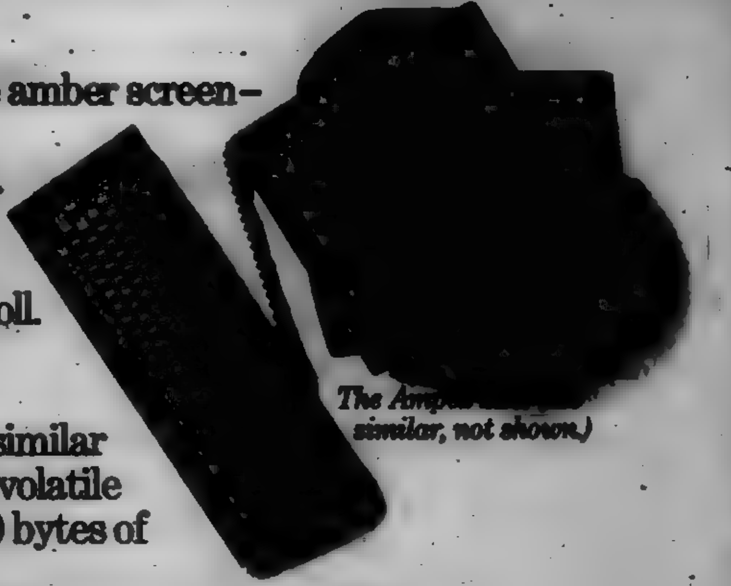
DEC's 12" green screens are 33% smaller so visibility's limited. (Ampex offers 14" amber or green screens at no extra cost.) Ampex's moves include tilt and swivel, while DEC only tilts.

Ampex's low-profile keyboards adjust for slope; DEC's cannot. DEC's VT-100 keyboard layout is similar to Ampex's 219, but handicapped by its function keys: the VT-100 has none, our 219 has 16.

Instead of the VT-100's two resident character sets, Ampex's 219 has nine–so it can adjust easily to performing in foreign arenas.

And our 219 offers two 80-column pages of display memory standard plus two more as an option. But that's not all that makes Ampex an odds-on favorite.

DEC's VT-100.



The Ampex [illegible] similar, not shown.)

In this corner—wearing the non-glare amber screen—the contender, the formidable Ampex 220.

Like the 219, it's a technical knockout.

Our 220's loaded with features DEC forgot: A fully-buffered bidirectional printer port. Block mode. Variable speed smooth scroll. A programmable user line. And three more optional pages of display memory.

The Ampex 220's keyboard layout is similar to DEC's VT-220. But instead of 256 bytes of volatile memory for its function keys, Ampex has 400 bytes of nonvolatile memory.

There's one more thing in the 219/220's corner: Ampex. With a one year warranty. International service. Plus more than 30 years of video, computer peripheral and manufacturing expertise.

Call Ampex Computer Products Division at 800 621-0292. 800 821-9473 in California. Get the details you need for a decision. You'll find it's no contest.

Trade secret laws protect software concepts, ideas

THIRD IN A SERIES

By Jerome Roberts
and Michael Brownell
Special to CW

Trade secret protection extends to an area not covered by copyright protection and, therefore, must be looked upon as an important, indeed often critical, complement to copyright protection. Copyright protects only the expression of the idea and not the idea itself. Trade secret status protects the idea in addition to its expression.

Trade secret protection is not afforded under a federal statute as is copyright protection but rather has been developed over the years as part of the common law that has been codified in several states that have adopted the Uniform Trade Secrets Act. Consequently, the availability, applicability and scope of trade secret protection is less certain than copyright protection.

Only information (for example, software logic, design concepts and coding) created or discovered by the business, not generally known and that provides the owner thereof with a competitive advantage over its competitors who do not know of or use it, is eligible for trade secret protection. Thus; the essence of such protection is a competitive advantage dependent upon secrecy.

The requirement of a competitive advantage is not subject to precise definition and must be assessed in light of the facts of each case. Software elements need not be novel in the sense of a patentable invention. However, concepts that have no independent economic value will not likely constitute trade secrets.

As a general proposition, software that satisfies the secrecy requirement discussed below should be considered to contain trade secrets to the extent that knowledge of its logical composition would be of value to the owner's competitors. Often this value is evidenced by the ability of a competitor acquiring trade secret information to eliminate its own independent software development activity and, thereby, obtain a marketing advantage. It should be noted, however, that unlike patent protection, two parties can independently develop and own a trade secret.

SECRECY REQUIREMENT

Secrecy is an essential element of a trade secret. Because maximizing the value of a trade secret normally requires some disclosure thereof (that is, to employees, consultants, customers and so forth), the law does not require absolute secrecy but, rather, "relative secrecy." There is no clear prohibition against revealing a trade secret through reverse engineering unless such a prohibition is contained in a contract between the parties. Therefore, a critical issue concerns the procedures implemented by a software owner to create such a relationship upon disclosure and thus protect the confidentiality of its trade secrets, both within its organization and upon distribution of the software.

Secrecy must also be maintained in the user environment. Written contracts in the form of licenses and, where appropriate, separate confidentiality agreements, must be used. All software intended for commercial distribution should be licensed pursuant to a carefully drafted license agreement, containing adequate restrictions on use, duplication and disclosure, and all evaluation presentations should be preceded by each potential licensee executing a confidentiality agreement. Source-code distribution as well as distribution of other materials that may explain software trade secrets should be avoided, and reasonable physical measures such as code, encryption, machine serialization and so forth are strongly recommended.

MICROCOMPUTER SOFTWARE

The existence and protection of trade secrets in mass-distributed microcomputer software is a difficult and much-debated issue. Some commentators feel that mass distribution of software, combined with the relative ease of extracting the logic thereof, terminates trade secret protection. Others argue that through written contracts, including shrink-wrap licenses, trade secret protection can be maintained even in the context of mass-marketed software.

Ultimately, the courts will have to strike a balance between the rights of the licensee, the rights of the software owner and the desire to promote commerce in this industry.

TRADE SECRET REMEDIES

The legal remedies available to an owner upon learning that its trade secrets are being wrongfully used include requesting a court injunction to prevent or restrain further wrong-

UNIX
NOW THAT IT'S HERE

IN BUSINESS • IN GOVERNMENT

A two-day management seminar for:

Current Users who want to know the opportunities for future applications and growth of their UNIX systems

Potential Users who are evaluating UNIX-based systems and new solutions to specific information processing requirements

Data Processing Managers who are concerned with the impact of UNIX and with what suppliers will be offering

Suppliers who want to better understand the current and future uses of UNIX systems in business and government

Major topics include:

THE STATUS OF UNIX SYSTEMS TODAY
- Overview of Unix
- Reasons for user and supplier interest in UNIX
- Reasons for using UNIX systems:
  - system features or applications solutions
- Market size and breakdown:
  - Government and business

INFLUENCES AFFECTING UNIX SYSTEM SELECTION AND APPLICATION PLANNING
- Federal Government specifications
- Business requirements
- Key suppliers strategies:
  - IBM, AT&T and others
- Third-party application development
- Emerging specialty applications

THE APPLICATION OUTLOOK (with selected case studies)
- Office automation
- MIS (business processing, micro to mainframe connections, networks…)
- Applications development
- Scientific applications (computer-aided design, artificial intelligence, graphics workstations)

POSITION OF UNIX SYSTEMS IN THE ORGANIZATION
- Departmental use
- Micro to mainframe integration:
  - possibilities and considerations
- Co-existence of UNIX and other operating environments

STAFFING CONSIDERATIONS FOR UNIX SYSTEMS
- Training of existing staff
- Potential staff requirements
- Supplier support

UNIX AND MS/DOS
- Where each fits:
  - contention or complement
- Applications comparisons
- Networking considerations
- Growth potential

THE NEXT THREE YEARS
- Market projections
- Key supplier strategies
- Business and Government uses

NEXT STEPS TO CONSIDER

October 21-22
Washington, D.C.
Washington Hilton & Towers Hotel

November 7-8
Toronto
Hotel Plaza II

November 18-19
San Francisco
San Francisco Hilton Hotel

Japanese consortium set

Trio seeks support for AI development

By [illegible] Kondoh
Special to CW

TOKYO (CWN) — Three firms are putting the finishing touches on plans to set up a Japanese consortium for late this month with the ultimate goal of establishing trilateral cooperation between Japan, the U.S. and Europe in artificial intelligence development.

The trio — Nissin Software Co., Structural Planning Institute and JGC Corp. — will eventually be joined by seven other Japanese firms, according to Nissin President Kazuro Fujimoto, who refused to identify the seven firms.

The planned joint venture, tentatively named Intelligence Engineering Research Institute (IERI), will be staffed by approximately 30 specialists from member companies. Its charter will pursue overall research and development on AI and explore ways to commercialize AI software, Fujimoto told CW Network during a recent interview.

On behalf of IERI, Nissin, Structural Planning Insitute and JGC are also reportedly negotiating technological cooperation with unspecified U.S. organizations.

Fujimoto said IERI will soon finalize ties with the German Center for Computer Science, West Germany's semigovernmental institute specializing in AI and other information science. A spokesman said that under the terms of this agreement, the center will provide IERI with support software for an AI development, called Babylon, a tool for designing expert systems.

Details of the German Center-IERI cooperative agreement have not yet been disclosed, but Fujimoto said that it will call on the Japanese group to supply its AI application expertise to the German Center and to initiate and enlarge joint efforts in commercializing these applications.

Fujimoto stressed that bilateral collaboration between the German Center and the Japanese jointly founded firm should grow into an international cooperation that will involve U.S. AI leaders.

Kondoh is international editor/Asia for CW Network.

National Semi arranges nine-day fall shutdown

SANTA CLARA, Calif. — The bad news continued for employees of National Semiconductor Corp. when the hard-hit chip maker recently informed its workers that it will shut down its U.S. and European operations for nine nonconsecutive days this fall.

The furlough, which affects 8,000 to 9,000 of National Semiconductor's 12,500 worldwide employees, is a continuation of the cost-cutting plan announced by the company in August. The shutdown will reportedly take place during National Semi's second quarter, which runs from Sept. 22 to Dec. 15.

National Semiconductor ordered a similar five-day furlough during the current quarter. Last June, the company laid off approximately 1,300 employees.

National Semiconductor is mired in the worst quarter in its history, and company President Charles E. Sporck has said he sees no signs of recovery in the near future.

The firm posted an operating loss of $44.3 million in the first two months of the current first quarter, and the total loss for the quarter is expected to be even greater.

Bank failure hits Flex/32 maker

DALLAS — The recent failure of the Parkwest Bank could mean a quarter-million dollar loss for Dallas-based Flexible Computer Corp. However, the company said the setback will not have a significant impact on operations.

Flexible Computer, maker of the Flex/32 parallel processing superminicomputer, reported its funds on deposit at Parkwest exceeded the amount insured by the Federal Deposit Insurance Corp., which shut down the bank at the close of business Aug. 22. The bank reopened under new ownership the following week.

Company spokesman Ron Hammond said the funds, which were letters of credit required by lessors of capital equipment to Flexible Computer, included up to $250,000 in unrecoverable funds.

Hammond said that amount is the company's maximum exposure and represents approximately 5% of Flexible's cash assets as of June 30. "We are making an effort to recover all of those funds," Hammond said. "The final result will be reflected on our financial statements when appropriate."

Flexible Computer reported sales of approximately $200,000 for the quarter ended June 30.

How to order reprints from Computerworld.

If you would like reprints of one of our articles, you can obtain them for most articles in one of the following ways:

For larger quantities (100 minimum), please contact Nancy Shannon, Rights and Permissions, CW Communications/ Inc.,
Box 880, Framingham, MA 01701, (617) 879-0700.

Single copies of articles (for personal use only) may be obtained through one of two sources:

375 Cochituate Road, Framingham, MA 01701.

COMPUTERWORLD

Wang appoints top executives

LOWELL, Mass. — Wang Laboratories, Inc. recently announced the resignation of one top officer and the promotion of two others.

Executive Vice-President Jon F. Kropper, who formerly directed Wang's worldwide manufacturing operations, will leave the company Oct. 1 to become president and chief operating officer of Hadco Corp. of Salem, N.H. Hadco is a major supplier of printed circuit boards used in Wang products.

Replacing Kropper at the executive vice-president level is J. Carl Masi, who will continue to direct Wang's international sales and marketing.

An 11-year Wang veteran, Masi has become increasingly visible since former President John Cunningham's departure, leading observers to consider him the leading candidate outside the Wang family for the presidency.

Frederick Wang, the son of Chairman An Wang, is also an executive vice-president.

The office automation company also announced the promotion of Ian Diery to senior vice-president for European, African and Middle Eastern operations.

Chairman Wang assumed the president's chair when Cunningham departed in July to head Computer Consoles, Inc. of Rochester, N.Y.

Firm cuts staff by 5%

WILMINGTON, Mass. — Compugraphic Corp. recently announced a layoff of 250 employees, or about 5% of its total work force, in an attempt to reduce expenses.

The company said it has experienced a slowdown in orders for its graphics communications equipment and that the layoff was needed to balance expenses with the current revenue level.

Affected employees included both salaried and hourly workers. The company said it will provide out-placement services to assist those employees in finding new jobs.

The action reduced the company's total work force to approximately 4,700 employees.

From page 81

Sperry hitches its wagon to Unix star

opment. "If we can compete favorably, we will take our own products to market," he said.

Waddington said that the company believes that despite problems, Unix is effectively becoming a standard to which all vendors must offer links. Sperry, he said, wants to be first with a complete line of Unix-based machines.

However, the company offers Microsoft Corp.'s Xenix version of Unix System 3 on single-user microcomputers, AT&T's Unix System V on supermicrocomputers and System V and another Unix version, University of California at Berkeley's 4.2, on superminicomputers.

But Waddington said the company is confident that Microsoft's promised update of Xenix will be compatible with System V.

Like other mainframe vendors, Sperry sees the influx of networked workstations and minicomputers as leverage to increase sales of mainframes. "The mainframe is a very important backbone to networks of systems," Waddington said. "We see the mainframe as more the keeper and dispenser of data and less of an application machine."

How to draw with

IBM 3270 PC/G

If your department gets repeated requests for presentation graphics, IBM has a simple answer.

Draw on a Smart Desk equipped with a 3270 Personal Computer/G or GX.

The 3270 PC/G or GX gives you easy access to host-based graphics and data. And, with IBM's new Graphics Editor and Picture Plotting software, you can work offline locally to draw your own high-resolution charts, diagrams and free-form sketches.

You can actually create or edit directly on the screen, using either a mouse or a tablet. What's more, you can select from a wide range of colors, lines and type styles to arrive at a presentation that works the best for you.

If you want to create foils for a business meeting, just zoom and scroll to position the graphics you want to reproduce. Then use IBM's Picture Plotting to plot the results. You also get a handy graphics index, so you can file and retrieve pictures for future presentations.

But there's more to the 3270 PC/G or GX than just pretty pictures. Each system can display up to four host graphics

Chip maker files antitrust suit

BOISE, Idaho — Micron Technology Co. fired another salvo in its battle with Japanese chip-making competitors recently by filing a $300 million federal antitrust suit against six companies. The suit is considered the first civil litigation against Japanese firms in the semiconductor industry.

Micron claimed antitrust and chip-dumping practices by Hitachi Ltd., NEC Corp., Toshiba Corp., Mitsubishi Electronics Corp., Oki Electric Industry Co., Fujitsu Ltd. and their U.S. subsidiaries. Micron charged that the six firms conspired to monopolize the chip industry, individually used predatory pricing tactics and sold their products in the U.S. below their manufacturing cost.

The lawsuit came after a recent favorable preliminary ruling by the U.S. International Trade Commission on Micron's antidumping petition [CW, July 8] to the U.S. Commerce Department against the same companies and Matsushita Electric Industrial Co. On Aug. 2 the commission voted unanimously to continue the investigation.

From page 84

Trade secret laws protect software

ful use of the trade secret, including the marketing of products based upon such a trade secret; and recovering damages from the infringing party equal to the actual loss suffered by the owner or the profits wrongfully received by the infringing party, whichever is greater. In some states, criminal sanctions may be available.

It is of critical importance to commence appropriate legal action immediately upon learning that a trade secret has been misappropriated. Failure to do so will inevitably result in the loss of trade secret protection because the secret will be passed to innocent third parties, thereby losing its status as a "secret," and because the availability of an equitable remedy such as an injunction depends upon making a timely request.

From page 81

Japan to sell high-tech patents

its technological door to foreigners coincided with Miti's recent agreement to allow IBM to use all the computer patents held by Aist.

A basic agreement, reached at the end of July, ended IBM's request for full access to the Japanese government's computer patents.

A Miti source, who asked not to be identified, said that the agreement, covering the period from 1986 to 1990, called on Aist to provide the U.S. maker with an all-inclusive right to execute related Japanese rights. Approximately 430 patents are initially subject to the IBM-Aist pact, the Miti source said.

Part of these patents apparently relate to joint developments between Aist labs and Japan's six largest computer builders, including Fujitsu Ltd., NEC Corp., Hitachi Ltd. and Toshiba Corp.

Some opposition

Some Japanese electronics executives oppose the computer patent agreement, claiming it will set a precedent for an uncontrolled outflow of Japanese technological know-how and will have serious ramifications involving piracy.

The October mission will be the third of its kind. A similar delegation was sent to France, Sweden and West Germany in 1983 and to the U.S. and Canada in 1984.

In an interview with CW Network, Hiroshi Tagaya, general research manager of the Japanese Industrial Technology Association, said that he hoped the association's patent and sales tours would help to improve the reception of Japanese industries abroad.

"Such efforts may spawn ties between Japanese and foreign firms, increasing the chance for [Japanese] firms to shift to overseas users when home markets get saturated," he said.

Traditionally, Japan had depended heavily on advanced foreign countries for innovative technologies, a fact that forced its outward technology transfer to remain at low levels.

Kondoh is international editor/Asia for CW Network.

Announcing Masterpiece:™ A Powerful Mainframe Application Software Product Built Upon A Simple Idea Called Intelligent Architecture:™

What do you call a mainframe application software product designed with such patient attention to detail that it will register the effects of one transaction on every other business transaction in a company?

What do you call software architecture so artfully conceived it will someday enable a person using an application to move from one database management system to another, or from one teleprocessing monitor to another, without a single change in his work style?

What do you call query and reporting tools so simply and powerfully rendered that even a novice will find them no more difficult to work with than a personal computer spreadsheet?

Only one name fits…

Introducing Masterpiece.

The Masterpiece series is a family of mainframe business software products—a classification and a category which may lead you to conclude that it is like other mainframe software products.

Don't leap to that conclusion.

The Masterpiece design is so clean and uncluttered that it makes current and future applications efficient to develop and easy to use. Masterpiece comes with none of the excess baggage, inherent short-comings or system limitations that have traditionally plagued the people who need business information and the people who manage it.

Masterpiece is, in every aspect, a new family of software products.

And, in every aspect, an *improvement* over the software packages you may be used to.

Or are, in fact, now using.

Intelligent Architecture Design: The Fundamental Difference.

Previous software designs have been developed to better utilize the power of the computer.

Masterpiece was designed to mirror the methods and styles of the work place and to anticipate the inadequacies of the computer.

Masterpiece design is called Intelligent Architecture. It's a new term. And a new way to build software. Now, Intelligent Architecture brings new meaning to concepts like "modularity," "borderless integration" and "event-oriented processing."

Only application-specific code is contained in the application…other coding (system code, interfaces, code common to multiple applications) is separated out and coordinated by the Intelligent Architecture itself.

This means that ultimately a user can adopt a new database management system without the slightest change in either his way of working or in the application code itself.

Only software built in this manner, is software that will endure.

The Intelligent Architecture design means that all menus and screen prompts become common to all Masterpiece applications. It means that the way users interact with an application will be the same from application to application—a significant factor contributing to greater ease-of-learning and ease-of-use.

It is this capacity, present now in the Masterpiece Intelligent Architecture design, that lifts Masterpiece beyond the promise of other software products in its class.

And *that* is the fundamental difference.

Maste

Masterpiece is a trademark of Software International Corporation. Intelligent Architecture is a trademark of Software International Corporation. MasterQuery is a trademark of Software International Corporation. MasterSecurity is a trademark of Software International Corporation.

Masterpiece: Common Functions.

The reason Masterpiece works so well is because each of its pieces work so well together.

And apart.

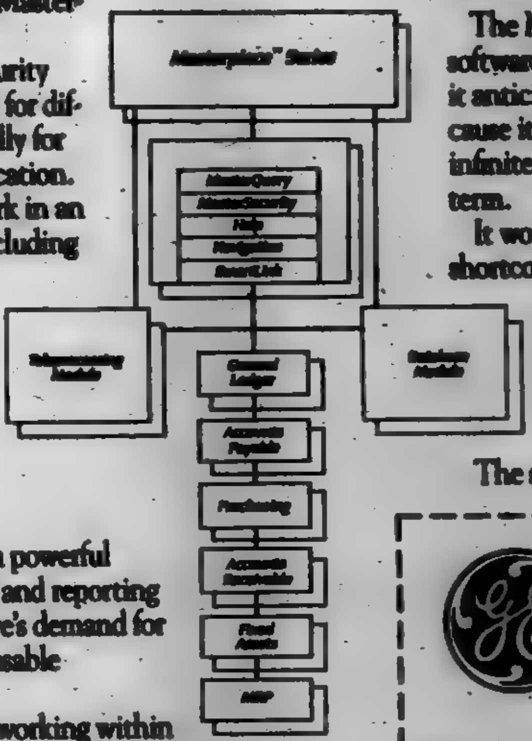
The MasterSecurity™ system, Online Help and Navigation features work across (and are common to) all Masterpiece applications.

But because they are separate from all applications, Online Help, for example, can be custom modified or even translated into different languages.

The Navigation feature lets you move from screen to screen with direct access from one Masterpiece application to another.

Levels within the MasterSecurity system can be determined not only for different applications but set specifically for transactions within the same application.

Everything is designed to work in an intelligent and modular fashion including what may now be the industry's most advanced query tool . . . MasterQuery.™



MasterQuery System.

The MasterQuery system is a powerful fourth generation borderless query and reporting tool designed to satisfy an executive's demand for instantly accessible and instantly usable information.

MasterQuery gives a person working within one application the ability to access information from another (accounts payable while working on general ledger, for instance) and to merge information from separate applications in a single report.

It also gives that person the ability to arrange his information in whatever form, format, or fashion he chooses. In whatever sequence or order. With whatever computations or projections he wants to make. With only the barest bit of computer know-how.

Masterpiece Integrated Applications.

The Masterpiece series will include these fully integrated, functionally rich business applications: General Ledger, Accounts Payable, Purchasing, Accounts Receivable, Fixed Asset Accounting, and MRP software products.

Masterpiece: The Promise The Future Holds.

The Masterpiece series is truly "built from the ground up" software. Because its architecture is so well thought through it anticipates future enhancements and applications. Because it's a product designed to be completely modular and infinitely *improveable* it represents a real value over the long term.

It won't, in short, fall prey to technological or design shortcomings. Won't dead-end at some point. Won't fail to perform as your needs expand.

For a Masterpiece demonstration, clip the coupon below or call toll free 1-800-343-4133 (in Massachusetts, call 1-800-322-0491) and arrange to attend a Masterpiece executive briefing.

The sooner you call, the further ahead you'll be.

No big changes foreseen for Sterling acquisition

utive vice-president of systems, and Vice-President Jeannette Meier Zacker, the company's top legal officer. Lemons has moved to an Informatics office in Canoga Park, Calif., while Zacker has moved to Dallas.

James R. Porter, applications executive vice-president and No. 2 man behind Bauer, resigned to become president of Triad Systems Corp. in Sunnyvale, Calif., [CW, Aug. 19].

Sterling spokesman Ray Hannon denied industry rumors that Bauer received a special financial incentive for resigning. "No special arrangements were made," Hannon said. "It had been foreseen from the very beginning of the attempted hostile takeover that he would leave. He was entitled to the same consideration as all employees who left, with compensation based on salary, position and senior''y. In most cases, it was Sterling's policy to improve upon the normal Informatics severance package."

Final stamp of approval

Informatics shareholders met last week to put the final stamp of approval on Sterling's $27 per share buy-out package. Informatics agreed to the offer in June [CW, July 1] after months of fighting against it when Sterling's unfriendly takeover price was $26 per share.

"The operating philosophy of Sterling is to run as decentralized as possible," said Informatics spokeswoman Carol Hays. "It appears there will not be major changes in areas such as marketing and research and development."

Analysts who follow the two software houses agreed that it is in Sterling's best interest to disrupt the Informatics user base as little as possible.

"Sterling has been eager to acquire new clients, and [Informatics'] Mark IV and Mark V are as widely installed as any products out there," said Ann Morley, a software analyst with International Data Corp. in Framingham, Mass. "The attraction of those accounts was a big factor in Sterling's interest [in the acquisition], so I don't think they will make drastic changes."

Morley said consolidation of research and development and marketing efforts for some products, such as Sterling's Dylacor and Informatics' Answer/DB, is likely. "It would be silly to maintain a fragmented marketing and R&D organization for similar offerings," she said. "Informatics has been pretty inconsistent in marketing in the past."

But Sterling is expected to take a hard look at each of Informatics' businesses in an effort to raise cash quickly. "Sterling will be looking to reduce the debt, and the way to do that is to enhance profitability or sell other parts of the business," said John Turo of the Houston investment firm of Rotan Mosle, Inc.

A likely candidate for sale may be Informatics' professional consulting services business, which has been profitable but has little synergy with the company's product offerings. "Clearly the existing consulting business is too large," IDC's Morley said. "Informatics' determination to be a multiproducts and multiservices vendor contributed to its fuzzy image."

Informatics reported a $579,000 loss on $55.4 million in revenue for the quarter ended June 30 [CW, Aug. 12] although the firm attributed the decline to $2 million in costs for its proxy fight during the early stages of Sterling's hostile takeover bid.

From page 81

Datapoint saga real cliff-hanger

million in assets that Datapoint encompasses. Edelman said in a recent interview that reaction to his moves has always been skeptical "since I've been in the business of acquiring companies." He added, "The only way to deal with that is to do what I'm supposed to do when I get there."

Now that $277 million has been bid for the Datapoint entities — just shy of the original $300 million asking price — it is somewhat inconsistent to impugn Edelman's motives.

But the guy is also representing investors in his arbitrage partnerships, and his modus operandi to this point suggests that his business goals depend on being able to liquidate his initial investments quickly and at a substantial profit.

Craig Symons, an industry analyst with the Gartner Group, Inc. of Stamford, Conn., noted that Edelman bought two million shares in Datapoint for an average price per share of $17 but that the current per-share trading prices of both Datapoint and Intelogic Trace totaled only about $15. In Symons' view, Edelman's previous plans "haven't worked out for him because he didn't understand what he was getting into."

Datapoint posted a $28 million loss in the third quarter and, according to Symons, must still be losing millions on a revenue base that isn't increasing. The company recently said it will be several weeks late posting financial results for the fourth quarter and fiscal year ended July 27.

Edelman said, however, that the fourth quarter was ahead of plan. And he argued that taking the company private will enable him to make it more efficient; he has previously implemented some streamlining. He also promised that products introduced in recent weeks will be delivered on time. Both factors should encourage existing customers, he said.

That may be so, but customers certainly have to be concerned about the changes in strategy outlined so far this year. There are still a great many skeptics who think that, in Symons' words, "This is just another chapter in the continuing saga — or maybe tragedy is a better word for it."

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

OBERLIN

DIRECTOR OF THE HOUCK COMPUTING CENTER

Oberlin College seeks to appoint a Director of the Houck Computing Center. The Computing Center houses the College's centralized computing facilities, a cluster of Digital Equipment Corporation VAX computers, and an array of microcomputers, which support both academic and administrative computing. There is an expanding network of departmental and personal computing equipment. Computing is well integrated into the academic programs of the College; there is a major in Computer Science. The directorship is a full-time, administrative position reporting to the Provost, and carries responsibility for the overall direction, leadership, and management of the Houck Computing Center.

Qualifications include an advanced degree and/or significant professional experience, demonstrated administrative ability, and the capacity to work effectively with faculty, students, and administrative staff. The salary is competitive and will depend upon experience and qualifications. Fringe benefits include a generous pension program, medical and long-term disability insurance, one month's vacation, and tuition support for children.

Interested persons should submit a letter of interest, resume, and names of three references to: Sam C. Carrier, Provost, Cox Administration Building, Oberlin College, Oberlin, Ohio 44074. Review of materials will begin October 15, 1985, and will continue until an appointment has been made.

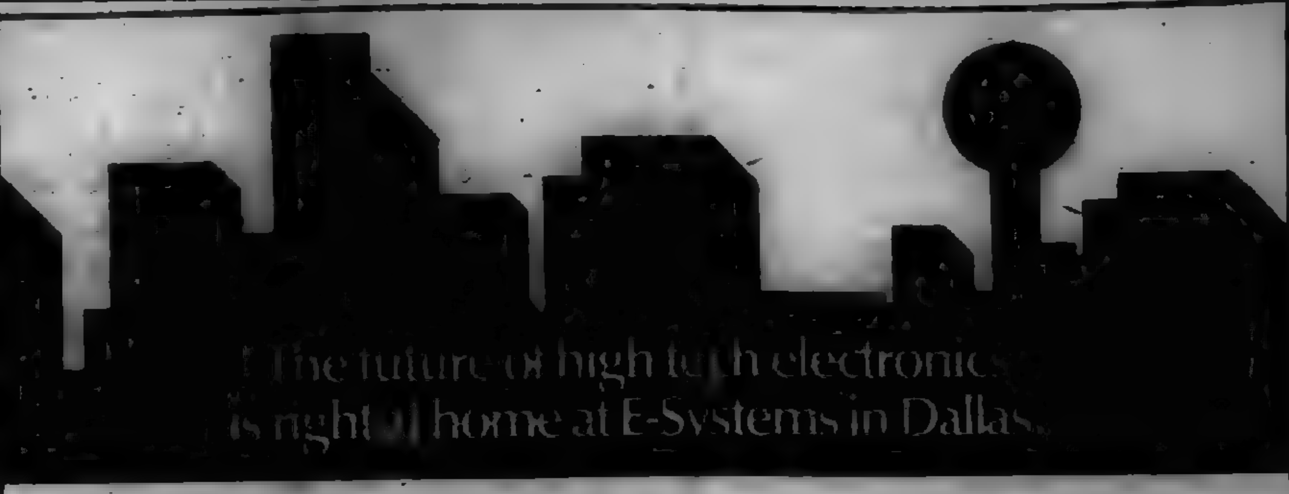
ANALYTICAL ENGINEER

[illegible]



The future of high tech electronics
is right at home at E-Systems in Dallas.

At the Garland Division of E-Systems, our primary objective is concern for you, our employee. We demonstrate this concern in areas that include superior technological programs, innovative work environments, and an excellent compensation package. E-Systems Garland Division is seeking engineering leadership in the following areas:

Contact Ann Olson for specific information about these Senior positions:

PROJECT LEADERS

Responsible for assisting software development managers with definition and implementation of tasks in software project planning, procedures, Unit Development Folders, proposal writing and cost estimation of government-type programs. BSCS, EE or Math with six plus years experience. Experience with VAX, PASCAL and MIL-SPEC standards required. These individuals will eventually assume roles in software management.

SENIOR SOFTWARE ENGINEERS

Responsible for implementing the tasks defined below on software development projects. These engineers will report to project leaders. BSCS, EE or Math with six plus years experience in definition, design, development and delivery of software systems, utilizing VAX or Motorola 68000 computers. Required fluency in PASCAL, structured FORTRAN, MACRO-11 or Assembly languages. Experience with MIL-SPEC standards required.

SENIOR VMS SPECIALISTS

Responsible for definition, development and enhancement of software development environment on VAX systems, BSEE (MS) or CS with seven plus years related experience with VAX systems in PASCAL fluency required. Must be VMS internalist within I/O driver systems. Defense environment background a plus.

Reba McCarrell will give you more information regarding the following:

SOFTWARE ENGINEER

Responsible for design, coding, and testing of systems level software. Position requires minimum of BSCS or BSEE degree with at least two or more years experience with the VAX 11/750 or 780 and VMS operating systems. Experience in one or more of the following areas is desirable: MIL-Standard documentation, UYK series computers and real-time signal processing architecture.

BUSINESS PROGRAMMER ANALYST

Responsible for development and maintenance of on-line systems in an IBM OS/MVS IDMS CICS environment. Must have a college degree in Business, MIS or related field, and three to five years experience developing/maintaining on-line systems, supporting Accounting, Manufacturing or Purchasing/Inventory control.

DATA BASE ADMINISTRATOR

Responsible for the installation of IDMS in an IBM OS/MVS environment, for the design and maintenance of the data base and related data dictionary, and for the development and enforcement of standards and procedures for its usage. Requires a college degree and three to five years data base Design/Administration experience.

The Garland Division of E-Systems is impacting the future of electronics with exciting new projects that offer challenge and recognition. You can participate in an advanced human resources program which includes a flexible employee benefits package (FLEXCOMP), and a company-paid Employee Stock Ownership Plan. With Dallas recognized as being one of the most enjoyable and livable areas in the United States, the Garland Division of E-Systems can offer the senior engineering professional what is needed.

If joining E-Systems in Dallas means a move, E-Systems will offer you a personalized relocation program. We realize the difficulties of acclimating an individual or a family group to a different living situation. Our staff makes it a point to assist you and your family members after you have made the decision to join a company embarking on the most advanced programs in existence. Our dual assistance program is designed to ensure your move to E-Systems in Dallas will be a step forward in every area of your professional and personal life. For immediate consideration please write in confidence, to: Staffing Manager, E-Systems, Inc., Garland Division, P.O. Box 660023, Dept. 41, Dallas, Texas 75266-0023.

DIRECTOR OF MARKETING SUPPORT

Shape the office of tomorrow at RICOH today!

Ricoh, a $2 billion worldwide high technology company, is already changing the way people work around the globe. And in the U.S., we are among the top producers and marketers of a wide variety of office automation products, including state-of-the-art copiers and high-speed facsimile machines. To this product line, we are constantly adding new and more advanced products that give businesses a competitive edge.

Sales are up over 40% in North America, as a result. To manage growth of this magnitude and to plan for further growth, requires experienced senior executives. Currently, a position is available for a Director of Marketing Support with the ability to synthesize and coordinate diverse activities, work with a broad range of people, develop team spirit, and operate effectively in a fast-paced environment.

The position is responsible for directing the initiation, development, operation and MIS of the following sales support functions – training, sales promotion, new product launch, major account programs, supply sales, and establishing alternate channels of distribution.

Qualifications should include a Bachelor's degree in Marketing or Business Administration (the equivalent in actual experience is acceptable) and 10 or more years experience in the copier industry. Strong analytical, administrative, and marketing skills are a must. Office automation, data processing, and/or dealership experience is an asset.

If you'd like to play an important role in the future of office automation, consider joining Ricoh today! As you would expect, we offer a salary that is commensurate with your background and training and a comprehensive benefits package. For prompt, confidential consideration, forward your resume and salary history to:

SOFTWARE ENGINEERS

Northrop Electronics Division. A highly focused environment where Software Engineers design sophisticated technology to ensure the highest level of performance for some of the world's most advanced electronic projects.

Our Software organization is experiencing tremendous growth which results in outstanding opportunities for advancement. The following positions are immediately available:

VAX System Programmer

Responsible for systems operations and programming for a family of VAX 11/7xx computers. Will organize, plan and configure the computers for efficient utilization, and support users by troubleshooting and solving system problems. Requires detailed knowledge of VAX computer systems hardware and software specifically, extensive knowledge of VAX/VMS O/S and internals. Should be familiar with all VAX/VMS utility S/W as well as the algorithms and data structures used by the VMS O/S. Knowledge of VAX-11 Fortran and VAX-11 MACRO required. Candidate should have a minimum 2-3 years' experience in systems programming in a VAX/VMS environment.

Communications

Requires experience in developing computer communication networks using X.25 protocol and using Fortran 77 as a development language. Knowledge of HP-1000 and Gould SEL 32/87 computer systems or DS/1000, ACX-32, RTE-A or MPX-32 software systems is desired. Requires good verbal and written communication skills and familiarity with military requirements for software documentation, BS degree in Computer Science (or similar degree), and at least 5 years of experience in software development.

Software Development

We are designing and building a large, complex software system employing state-of-the-art techniques. This system is a type of "expert system" which will be used to automate testing and analysis functions now performed manually. It is an all new system being built from scratch. We need software engineering professionals to conceptualize, design, code, and test both application and system level modules.

Application Programmer

Design, code, integrate and document operational flight software for airborne navigation systems. Programming skills are required in both Assembly language and JOVIAL (J73) using principles of structured design in the development of software. Detailed knowledge of MIL-STD-1750A computer and VAX 11/780 with VMS operating system are required. Opportunity also exists for an Assembly Language Programmer to maintain existing code and incorporate modifications to meet changing mission requirements.

MPX Systems Software Specialists

Candidates must be knowledgeable in MPX and be experienced in system level routines and Assembly language. We are designing and building state-of-the-art systems employing Gould SEL 32/27, 77, 67, 87, and 97 computers. Our systems are custom designed: each one is different and we do not re-use old software.

Test & Integration

Will perform integration and test of navigation subsystems. Must be proficient in FORTRAN 77. VAX-11/730, 750, 780 MACRO ASSEMBLY preferred. Real-time applications experience essential.

Data Base Development

Perform detailed data base design and analysis. Should be familiar with developing a data dictionary, query optimizations and data access and control. Will code, test and develop software, including detailed documentation and review of all phases of the process in MIL-STD format (typically MIL-STD-483, 490, 1521A). Will review development and implementation of other engineers and senior engineers. Requires BS/BA degree preferably in Computer Science, Math or a related area; 7 years of experience, and data base and HP or SEL computer experience is desired.

Northrop provides our employees a competitive, comprehensive benefits package. Please send your resume to: [illegible] [illegible], Northrop Electronics Division, Professional Employment [illegible], Dept. CW 1-[illegible], 2301 W. 120th Street, Hawthorne, CA 90250.

PROOF OF U.S. CITIZENSHIP REQUIRED. Northrop is an Equal Opportunity Employer M/F/H/V.

POSITION ANNOUNCEMENTS

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if . . .

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work.
- You seek the opportunity to apply your knowledge.
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst — MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **Systems Software Analyst — MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.
- **Senior System Software Analyst — CICS**
  Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE.

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Central and South West Corporation
P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $3 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

At Control Data, success has many directions for . .

Systems Programmers

Control Data's headquarters are in the Twin Cities of Minnesota — the Midwestern hub of technology, education, finance and culture which is ahead of its time in providing residents with the "good life."

The COMSOURCE Division located at headquarters provides computer systems and services to meet internal and external customer requirements. To meet these requirements we are currently seeking the following expertise:

MVS SENIOR SYSTEMS PROGRAMMER

Major responsibilities include the installation and maintenance of MVS/SP and JES2 in an SMP/E environment, identifying tuning criteria and implementing adjustments, analyzing operating system dumps for problem resolution.

CICS SENIOR SYSTEMS PROGRAMMER

Major responsibilities include the installation and maintenance of CICS using SMP/E in an MVS/SP environment, implementing table changes and MRO in a Multi-CPU data center, assisting in VTAM/NCP problem diagnosis.

These positions require a BS degree or equivalent with minimum of 6 years systems programming to include current MVS/SP or CICS experience. ADABAS/AMAPS exposure desirable.

For immediate and confidential response please send resume to:

ATLANTA'S [illegible] BANK [illegible]

Don't trust us to keep your classified information secret

Every week, we deliver more of your target audience than anyone else. Over 600,000 computer-involved professionals. Including MIS/DP directors, systems analysts, programmers, and engineers — as well as corporate presidents, treasurers, and general managers.

And we deliver these readers for less. Compare costs and the people reached. You'll see that Computerworld is the number one medium for reaching MIS/DP professionals.

Our readers rely on Computerworld's classified section. In fact, 41% of our subscribers read the recruitment section every week. And 95% of our subscribers read this section regularly.

Readership like this means responses. Just ask some of the 4,000 organizations that ran more than 6,500 recruitment ads in Computerworld in 1984.

We make your ads work harder. Because we divide the classified section into logical categories: Position Announcements; Buy, Sell, Swap; Software For Sale; Time & Services; and The Bulletin Board. (Available on request: Software Wanted; Business Opportunities; and Real Estate).

So the people you want to reach will spend less time looking for your ad, and more time reading it.

We'll even typeset your ad at no extra charge. All you need to do is attach clean typewritten copy to your order. (Figure about 25 words per column inch, not including headlines). Or give us your order over the phone. We'll do the rest.

And since we're published weekly, we can offer you a fast turnaround from when you place your order to when your ad appears. As little as 10 days.

The next time you want results, advertise in Computerworld classified pages. Call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700. Call now.

MIS PROFESSIONALS

The Information Systems Division of HealthOne Corporation, a multi-hospital, diversified, health care delivery system, has the following key positions available for persons with appropriate experience and training.

Manager, Computer Operations, responsible for the management of HealthOne's two primary data centers through subordinate Data Center Supervisors. Will direct the efforts of approximately 30 Computer Operations, Production Control and Scheduling, and Customer Service personnel at two Twin Cities locations.

Physical environment includes IBM 4381 and 4341 host processors and numerous distributed Data General, Hewlett Packard, and Series 1 mini-computers. Current mainframe software includes VM, DOS/VSE with CICS, VTAM, VSAM, VOLLIE, LIBRARIAN, DYNAM-T, DYNAM-D, and ZEKE.

General requirements include a working knowledge of IBM medium to large scale systems operating under VM and DOS/VSE. Experience with MVS is highly desirable. Must have five to six years of operations experience with at least three years of management experience. A Bachelor's degree in a related field is desirable.

Manager, Patient Management Systems, responsible for management of in-house analysts and programming personnel, contract programmers, software vendors, and consultants in order to successfully manage the delivery of patient accounting systems to multiple hospitals. Application software is MEDIPAC Patient Accounting and ADT with additional systems planned for 1985 and beyond.

General requirements include experience with healthcare business office systems and IBM medium to large scale systems. Hands on experience with MEDIPAC is highly desirable. Candidates should have a minimum of five to six years of experience demonstrating substantial responsibility for management at the project level and above. A Bachelor's degree in a related field is desirable. An advanced degree would be a plus.

Senior Systems Analyst, Patient Management Systems, responsible for major systems development projects within the Patient Management Systems department of HealthOne's systems development group. Work with end user managers and end users to define business requirements. Perform analysis and design activities to support programmers with systems specifications. Evaluate vendor product offerings against requirements.

General requirements include experience with healthcare business systems and IBM medium to large scale systems. Hands-on experience with MEDIPAC is highly desirable. Candidates should have a minimum of four to five years of experience demonstrating two to three years systems analysis experience with a prior background in programming. A Bachelor's degree is preferred which may be offset by additional experience.

These positions will be attractive to persons whose qualifications match or exceed the requirements. We offer these positions in a challenging environment with competitive compensation and with an attractive benefit package.

To be considered for these positions, please submit your resume, with recent salary history to:

PRODUCTION SUPPORT REPRESENTATIVE

The state-of-the-art data processing center for our Fortune 500 financial services company is currently seeking a sharp individual with IBM operating systems experience. This challenging position will offer key production services support within an IBM 3081/4381-MVS/XA environment.

Responsibilities will include scheduling production batch processing under UCC 7; problem reporting/documentation/resolution under IBM Information Management Software; implementing and providing JCL support of new and existing batch applications; and maintaining Disaster Recovery procedures. Selected candidate will use UCC 7, UCC 1, UCC 11, and TSO/ISPF systems capable of 2000+ batch jobs.

A solid background in OS/JCL, in addition to UCC 7/11 or equivalent software experience, is required. Strong problem solving abilities are a must.

We provide excellent opportunities for advancement along with a competitive benefits package including relocation assistance. Interested candidates may send resumes with salary requirements to:

MARKETING ENGINEERS

The Industrial Computer and Communications Division is a leading manufacturer and supplier of Industrial Automation Controls and Decision Support Systems based on Industrial Computer and Industrial Communication equipment. The standard multivendor, broadband communication products and the Industrial Computers are based on the latest technology and provide our customers with high reliability, quality, and performance that is necessary to bridge the gap between the programmable devices and the plant computer.

WE NEED 5

PRODUCT APPLICATION ENGINEERS – Use your 3-5 years' experience as a Systems or Applications Engineer in broadband communication networking or computers to actively support our Sales and Marketing units by identifying the correct application of industrial communication and computer products. Using your experience with FORTRAN and "C" in the UNIX™ operating systems, you will provide application support for state-of-the-art communications and computer products. You will make presentations to customers, interface with product engineering and get involved with quotations for potential use. Experience in the specification, implementation, and testing of communication and/or computer systems is a must. Degrees include BSEE, BS in Computer Science or MS in Computer Science. Candidates should possess good verbal and technical skills.

If you feel you qualify for this exciting challenge, we should be talking to each other.

We can offer you a COMPETITIVE SALARY and an OUTSTANDING BENEFITS PACKAGE which includes: MEDICAL, DENTAL, VISION and LIFE, as well as THIRD PARTY RELOCATION ASSISTANCE.

Call Richard Jackson, Human Resources, 449-6700 or Toll Free 1-800-230-5627. In Ohio 1-800-237-5627.

REACH FOR A STAR

at
Metro Information Services, Inc.

METRO is a highly successful, and rapidly growing professional services firm that provides services such as systems analysis, design, and programming to its commercial clients, typically Fortune 1000 companies. Our offices and clients are located in several dynamic cities in the southeastern U.S.

METRO has received national recognition for its exceptional growth over the past six years. This recognition is directly attributable to the talented, dedicated professionals who make up our company. We attract and retain our staff with challenging assignments and an excellent compensation/benefit package, including profit sharing and company-paid relocation to the city of your choice.

METRO's growth is providing new career opportunities in the following areas:

MARKETING

Have successful recent experience in sales and marketing; preferably information system and/or professional services.

Enjoy helping people; clients, and Metro staff.

Assume heavy responsibility; be self motivated; an achiever; set the example.

TECHNICAL MANAGEMENT

Have over 8 years experience in analysis, design, and programming and over 2 years in management/leadership of computer systems implementation professionals.

Enjoy working with people and excel in staff and client development.

Be self-motivated, an achiever, and a leader.

Set standards of quality in all aspects of the profession.

TECHNICAL STAFF

Have 2 or more years of analysis, design, and/or programming experience in one or more of the following environments:

All Divisions
- IBM OS/MVS, DOS/VSE, PC
- IDMS ADS/O
- IMS DB/DC, DL/1

Attention: Patty Ezell

EDP PROFESSIONALS

Brockway, Inc. (NY), a Fortune 500 packaging company, is currently seeking experienced EDP professionals to assume key management positions at its headquarters located in northwestern Pennsylvania.

MANAGER OF THE CORPORATE DATA CENTER

With an annual operating budget of approximately four million and a staff of 25-30 people, you will be responsible for several critical areas of this multiple CPU Data Center including technical support, telecommunications and computer operations. Reporting to Corporate Director of MIS, you will plan and direct the implementation and maintenance of a systems management methodology for change control, availability reporting, capacity planning and hardware performance. Additionally, you will coordinate the activities of the Data Center across all divisions and serve as the primary corporate interface with hardware and systems software vendors.

To qualify, you must possess relevant data processing management experience with proven ability to plan, organize and direct a staff of systems professionals. Also required is a strong technical background in the "State-of-the-Art" MVS processing environments plus a B.S. degree or equivalent. An advanced degree is desirable.

MANAGER OF TECHNICAL SUPPORT

We will rely upon your management skills to direct a staff of systems programmers in maintaining a reliable, available mainframe computer and communications network for multiple manufacturing and sales locations. Responsibilities include developing short and long range hardware and software plans, preparation/monitoring of the section's budget, managing hardware and software implementation projects and establishment of capacity planning and disaster recovery systems. In addition you will develop organizational structures, education plans, policies and objectives to enhance the Data Center's service and the Technical Support section's capabilities.

To qualify, you must have extensive experience with IBM 4300, 308X, 303X or AMDAHL 580 using MVS, CICS and VTAM/NCP. To facilitate our conversion from DOS to the MVS operating environment, a working knowledge of VM, DOS/VSE, DL/1 and IDMS is desirable.

We offer a competitive salary, excellent fringe benefits and the opportunity to develop your professional and managerial skills.

For confidential consideration, please send your resume including salary requirements to:

PROGRAMMER ANALYSTS

The new Large Motor and Generator Division headquarters and manufacturing facility in Manatee County is currently seeking experienced Programmer Analysts.

The selected candidates should have a technical education with at least two years experience on IBM System 38 equipment, knowledge of MAPICS and RPG III programming experience. Knowledge of IBM 4300 series equipment, COBOL, MANTIS, teleprocessing, and systems software experience would be a plus. Responsibilities will include defining, maintaining and implementing manufacturing applications using MAPICS software.

We offer competitive compensation and benefits package. For prompt confidential consideration, send your resume and salary history to:

ACP/TPF CAREERS IN BRITAIN

Come home to your favourite airline

What's the point of earning a big salary when you can't afford a house or qualify for a credit card or your employer is hesitating over your green card? Whether you left Britain for a contract or to find the end of the rainbow, there's no place like home when it's time to settle down.

With new experience to your credit, British Airways wants to make you a very good offer to return and to play a key role in one of the many new projects now being planned in response to exceptional growth in demand for their systems. With one of the world's largest and strongest ACP units, BA can offer you an accelerated career path, better job security, the prospect of affordable housing and life without immigration problems. A number of important new positions have arisen for:
APPLICATIONS PROGRAMMERS · SYSTEMS PROFESSIONALS · TEAM LEADERS.

Regardless of your level or speciality, you will receive full relocation expenses to return, temporary accommodation, very interesting salaries and good opportunities for holiday travel.

Even if you are not a British Citizen and do not have a UK work permit, there is a possibility that contract or permanent positions could be available, so please contact us if you are interested in this unique opportunity.

If the sun seems to have gone out with your present employer or if you simply want to return to the land of culture and sanity which you know, send us your résumé. Your favourite airline wants to make you an interesting offer.

EDP AUDITOR

Reno, Nevada

Sierra Pacific Power Company, located in the dynamic, exciting little city of Reno, Nevada, currently has a highly visible opportunity for an experienced professional interested in maximizing professional growth while simultaneously enjoying the type of low congestion-outdoor family lifestyle found only in a Sierra Nevada recreational area like Reno. If that's not enough, we're only 45 minutes from the ski lifts and white sand beaches of world famous Lake Tahoe.

This is a newly created position which will involve developing, implementing and maintaining a company EDP audit program. Responsibilities will include identifying and prioritizing areas of analysis as well as selecting audit procedures.

The ideal candidate will be a skilled professional with EDP auditing experience and the ability to program in both COBOL and FORTRAN. Academic achievement in Accounting and/or Information Systems would be a definite plus. Our environment features two IBM 3031s and a 3083 under MVS and VM/CMS supporting corporate-wide applications in Engineering, Customer Support and General Accounting.

In addition to moving expenses and present mortgage payment assistance, we're offering a top salary and benefit package. If interested, please submit resume to:

PROFESSIONAL STAFFING

SIERRA PACIFIC POWER COMPANY
P.O. Box 10100 • Reno, Nevada 89520
An Equal Opportunity Employer M/F/H/V

Manager Systems Development

We are growing to a $1 billion company and seek an executive calibre individual to head our Systems Development Group. This high visibility position requires an energetic, seasoned professional with the business, technical, and interpersonal skills gained through:

- Significant exposure to one or more high technology manufacturing industries
- 8-10 years systems development experience including 3-5 years management responsibility
- Experience leading the conversion installation and maintenance of large scale engineering and manfacturing application systems
- Bachelor's degree; advanced degree preferred

Responsibilities will entail managing a staff of 60, planning & administration of budget, extensive interface with upper management & outside vendors, and facilitating a rapid & cost effective information flow throughout a fast growing business.

The position offers an attractive compensation & fringe benefit package including relocation assistance. Interested applicants are asked to submit a detailed resume including salary history & requirements in confidence to:

CW-B4684, Computerworld, Box 880, Framingham, MA 01701

An Equal Opportunity Employer M/F/H/V

Get your money's worth. Computerworld will lower your cost-per-hire.

When you're looking to fill MIS/DP positions, there's really only one place you need to advertise. Computerworld.

In every major market, Computerworld reaches more data-processing professionals than the local recruitment media. And we reach them for less.

Over 600,000 computer-involved professionals receive Computerworld every week. That's more than any other computer trade journal, business publication, or general-interest magazine.

Computerworld delivers quality readership, too. Fully 41% of our subscribers read Computerworld's recruitment section every week. And 95% of our subscribers read this section regularly.

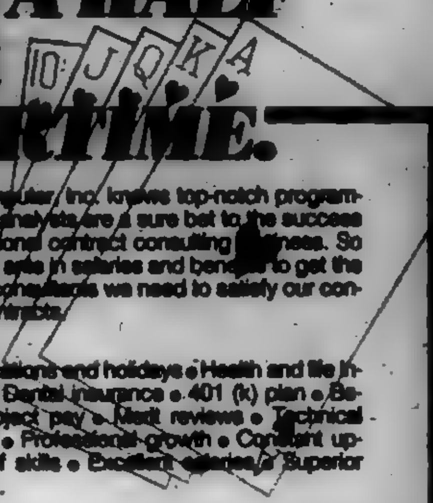
That's why over 4,000 organizations ran more than 6,500 recruitment ads in Computerworld in 1984. The openings they advertised for cover the whole gamut of MIS/DP positions -- including systems analysts, computer science & software engineers, directors of MIS/DP, programmers, sales managers, and systems managers.

As a matter of fact, recruitment advertising has made Computerworld the national leader in classified advertising among specialized business publications (according to *Business Marketing* magazine).

Compare costs and the people reached. You'll find that Computerworld is the number one medium for computer-related recruitment advertising.

Find out how we can lower your cost-per-hire. Get your copy of our "1985 Quick Reference Rate Card." Call toll-free (800) 343-6474. In Massachusetts call (617) 879-0700. Call now. We'll help you find the people you need.

WE'LL MATCH YOUR SALARY. RAISE IT. AND, GIVE YOU TIME AND A HALF FOR OVERTIME.



CGA Computer, Inc. knows top-notch programmers and analysts are a sure bet to the success of our national contract consulting business. So we up the ante in salaries and benefits to get the qualified consultants we need to satisfy our consulting contracts.

• Paid vacations and holidays • Health and life insurance • Dental insurance • 401 (k) plan • Between project pay • Merit reviews • Technical challenge • Professional growth • Constant upgrading of skills • Excellent salaries • Superior benefits ...

Don't gamble with your career. Deal yourself a winning hand with CGA. Call us collect today at 414-784-9402. (SUBCONTRACTORS WELCOME)

EQUAL OPPORTUNITY EMPLOYER M/F

SOFTWARE PROFESSIONALS

ROCHESTER GAS & ELECTRIC is a major, investor-owned utility located in the heart of western New York State's wine country and vast apple orchards. Here we enjoy endless recreational activities on the shores of Lake Ontario and in the nearby Finger Lakes area.

Our rapidly expanding data processing environment includes multiple IBM and Data General processors. Our state of the art IBM 308X installation includes the latest peripherals including the new 3480 tape units, 3380 DASD, 3725 controllers, and the new IBM 3820 laser printers. RG&E is committed to the future.

To help us shape this bright future, we are currently looking for:

- **CICS SENIOR SYSTEMS PROGRAMMER**

  The individual selected will have full charge responsibilities for CICS and its related products, including: installation, maintenance, enhancements, problem resolution, and performance analysis; development of CICS usage standards; coordination of CICS training; and provision of CICS technical consulting. A strong technical CICS background is required and knowledge of MRO, ISC, ACF/VTAM, NCP, and NCCF/NPDA is preferred.

- **MVS/XA SYSTEMS PROGRAMMER**

  The individual selected will become a key member of our MVS/XA systems team with responsibilities including: MVS, JES2, and program product installation and enhancements; design and implementation of user exits; development of a DASD management methodology; and provision of technical consulting. A solid understanding of MVS structure and logic, strong assembler language skills, and experience with the installation of MVS and/or related program products using SMP or preferably SMP/E is desired.

At RG&E we believe in our commitment to excellence and are dedicated to providing the ongoing technical training necessary to ensure this excellence.

We offer excellent starting salary, benefits, and relocation packages. Please send your resume to:

DATA BASE
ADMINISTRATOR/ANALYST

Regency Electronics is seeking a self-motivated, hands-on professional to direct a conversion from IDMS 5.7 to 10.0 and to install ADS-O, OLQ, and DC while performing normal support functions. The position requires a minimum of one year experience in data base design, recovery, reorganization, and tuning. DMS-1100 or other network data base experience can be substituted if candidate also has IBM OS experience.

Regency, at over $100 million internationally, is one of the largest manufacturers of scanners, cable TV converters, marine and handheld two way radios, and test equipment. We offer challenge, recognition, and excellent benefits program, and competitive salary based upon experience.

If qualified, please send your resume and salary requirements to: Annette Ward, Personnel Director, Regency Electronics, Inc., 7707 Records St., Indianapolis, IN 46226.

FORTRAN TO $45K

Fast growing Minneapolis based firm seeks all around systems professional with business applications and/or technical support experience. Requires 3 to 10 years FORTRAN. PRIME or DEC VAX a plus. Call Mark David or Tim Smith at (612) 339-9001.

3536 IDS Center
Minneapolis, MN 55402

How do you define the role of a Standards and Quality Assurance Analyst?

We define this new role in our organization as critical to the continued success of our Information Services Department. It requires a person who can instill the attitude of, "Let's do the job right the first time!"

We seek a person ready to accept a new challenge in developing, revising and implementing quality assurance measures within our corporate offices and assist in developing and implementing technical standards throughout our corporation.

To meet our challenge, we need a polished communicator who is assertive, self-motivated and creative with an extensive knowledge base gained in a large MVS environment. Other technical experience should include TSO, ROSCOE, JCL, and COBOL.

If you are ready for an exciting challenge, please send your resume and salary requirements to the Employee Relations department. Principals only.

As a full-service leasing company,
we don't fill you with empty promises.

A lot of leasing companies promise you everything. But, the fact is, if they're not full service, they don't have a leg to stand on. At Greyhound Capital Corporation, we can promise a lot, because we are a full-service leasing company.

That means you get the best advice, the best service, the best financing, and of course, the best equipment we have to offer. And you can only get this kind of complete service from a full-service leasing company.

At Greyhound Capital Corporation, we've been leasing, servicing, refurbishing, maintaining and providing financing for computers and other equipment for over 20 years. In other words, we can deliver the goods. Be it financing, maintenance or leasing terms.

So remember, if your leasing company isn't full service, then they're filling you with empty promises.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 461) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Tell Us About The **TIME & SERVICES** You Have To Offer...Here In COMPUTERWORLD's Classified Pages.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

INTRODUCE YOUR DATABASE TO INTELLIGENCE OF A HIGHER ORDER.

The intelligence we speak of isn't science fiction. It's science fact.

In fact, it's INFORMATION EXPERT.™ from Management Science America, Inc. The fourth generation technology that not only recognizes the limitations of database vendors but addresses them.

For example, Information Expert allows all your software systems to work in a completely new manner. Together. Whether it's with existing software or new software.

And whether you're an end user designing reports or a data processor using its fourth generation language for applications development, Information Expert is expert at both. What's more, there's even a data dictionary that helps you do in minutes what used to take you hours. Our system also allows borderless retrieval of information. So you can get all the information you need. Not all the information you don't need.

So if you want more intelligent software, go to a more intelligent software company. MSA. For more information, call Robert Carpenter at 1-404-239-2000.

MEMORANDUM

TO: Boss
FROM: Ron G. RG.
SUBJECT: Database & 4GL Research

Excellent!!
Approved
Sign me up too!

I have already spent many hours researching our 4GL software aquisition. Normally it would take 8 months for my department to make its recommendation. A great timesaver would be the National Database and Fourth Generation Language Symposium being held in Dallas and Boston. In 4 days we'll be able to accomplish 6 months of work.

Benefits we'll get from attending the Symposium are:

1. A one-day Data Management and 4th Generation Language Technologies Seminar.
2. A concurrent one-day Technical Concepts Seminar.
3. Three days of individual one-hour product presentations (60 in all) which will give us first hand information on key DBMS and 4th Generation Language products.
4. Product demonstrations which allow "hands on" experience.
5. Free consulting from Senior Staff members of Digital Consulting Associates, Inc.
6. The opportunity to network and learn from other attendees.
7. A panel discussion featuring industry experts answering questions from attendees.
8. A copy of the 500-page Proceedings of the Symposium which serves as a valuable reference long after attendance at the program.
9. Guest Speaker presentations by nationally known consultants and industry leaders providing us with valuable industry insight. I know that Fran Tarkenton will be giving a lecture too!!

I strongly recommend that a corporate decision making team of Tim, Mary and Kristin go to the Symposium as well as myself. By the way – the 4th registration is free!!

Please send information on:

☐ DALLAS Nov. 5-8 ☐ BOSTON Dec. 3-6 ☐ SYDNEY, AUSTRALIA Feb. 24-27

Demands and Costs Soar

The demand to get maximum mileage from the data center's mainframes has never been stronger. This time, however, hardware is not at issue; instead, the issue is the growing cost of systems software.

In the last few years, many data centers have turned to packaged software rather than developing software in house. More often than not, companies found it cheaper and faster to purchase utility software that had been tested, debugged and used successfully by other installations than to develop their own. This may no longer be the case if purchased software costs keep rising.

IBM MVS and VS users have seen their systems software prices more than quadruple since 1980. Estimates indicate that this year IBM 3090 mainframe users will spend about 12.5% of their total three-year major operating costs on systems software. In comparison, the 3033 user in 1980 paid out only 6.5% of his major operating costs for systems software.

The days of "free" systems software are long gone. When software and support charges were no longer included in hardware prices, the potential for cost escalation was introduced; now those charges are rising with a vengeance.

The software market is undeniably important to IBM: Estimated 1984 software revenues for IBM reached $3.2 billion. IBM has begun implementing different marketing and pricing tactics with some of its new products to provide greater pricing flexibility. One of these new tactics involves its new version of Unix. For the first time, IBM will charge a license fee dependent on the extent of the software's usage.

In a move that will stabilize and stimulate the market, IBM is also trying to strengthen its software credibility in its micro-end products. IBM's recently announced partnership with Microsoft to jointly develop future operating systems and systems software products was welcome news to most of the industry. Users and vendors alike were worried IBM would move away from DOS and adopt its own proprietary operating system that would lock systems and applications vendors out of IBM's product line at the same time it locked users in.

The U.S.Commerce Department has projected that the software industry will become a $55 billion market in 1987. This rapid growth will result in larger shares of the MIS budget being spent on systems software.

If it hasn't already, MIS needs to become aware of this escalating cost factor. Double-check your vendor's marketing agreements to make sure you understand all hidden or future costs. And, most of all, be aware that getting the most for your money in systems software is going to get harder.

Insider

From Data To Intelligence

By Damian Rinaldi

How does one measure the value of data or information? Is it good because it's new? Or is it good because it's accurate? What turns information into intelligence?

An old story relates how a youth searching for meaning and inspiration in his life hears of a great man and leaves his own city to find him. He travels for a dozen years or more, has many wonderful adventures and endures many hardships. But in each place he visits, he hears more of this great teacher who lives in a far-off land and moves on to find him. The young man, grown stronger in body and spirit after all his travels, finally finds himself near his home; he returns, only to discover that the teacher he sought was the old friend living right next door who had sent him on his quest.

Like all good stories, this story has many levels of meaning. But it does illustrate the value of the right intelligence at the right time. The person who finally became the young man's teacher might well have been known to him for all his life. Also, the young man may have been given good information and guidance by the people he encountered, but without the experience of his own efforts behind him, he could not recognize the teacher who lived right under his nose.

A complex challenge confronts those responsible for selecting the right vendors and products for your organizations. You have to develop a flexible strategy for information management and build upon it so that unanticipated requests can be met easily. Information from all parts of your organization must be made available in an appropriate form to people who need the competitive edge intelligence provides.

This challenge has two aspects: technical and organizational hurdles are presented by the partial solutions you have embraced, the hodge-podge of systems and products acquired by individual departments whose requirements you were unable or unwilling to satisfy and the resulting mess you now have responsibility for cleaning up. The problems are compounded by the very simple fact that they are not separable and need to be addressed at the same time they are evolving.

There is, however, a glimmer of reason. The major and most influential, vendors are not quite so insistent that theirs is the *only* acceptable solution and not so intolerant of the coexistence dictated by the flexibility you require. Most encouraging, a growing collection of upstarts have positioned themselves and their products to bridge the gaps between the discrete solutions already in place.

Which piece of information is the right one? Whose advice is best? What strategy is most likely to bring me closer to my goal?

As MIS managers or chief information officers, your obligation is not to provide to your end users the single piece of correct information or intelligence that results in their success or failure. It is your responsibility to provide the tools they need to find their own solutions. Some of those tools exist today. Typical of them are products like Linkware from Linkware Corp., Waltham, Mass. or Framework II from Ashton-Tate, Culver City, Calif. The benefits both products offer are similar, despite their differences in application. Each vendor has recognized that different, incompatible systems are in wide use and that the ability to move information from one strange environment to another creates the opportunity for the end user to turn raw data and unconnected, unrelated information into solid competitive intelligence.

Linkware's universal translation capabilities, as well as the vendor's flexible pricing strategy make it easy for users to experiment and then expand or not depending on their own experience. Framework II's import/export capabilities from industry standard packages and the ability to extend those capabilities as new standards emerge provide the flexibility of response users are and should be demanding.

The integration of user experience and information management technology into knowledge management and expert systems that can result in better intelligence will occur most easily where the barriers against flexibility are broken down.

Access to information and the knowledge that good information is an invaluble asset is spreading like wildfire. Like a wildfire though, it can be guided, and it can make room for new growth. As facilitators or as guides and teachers, information systems managers share the risk that, uncontrolled and unguided, the information management revolution, if not well guided, will burn past and bring down their companies.

■

Rinaldi is director, software and services information program, International Data Corp. in Framingham, Mass.

IT'S INEVITABLE. EVERY COMPANY WILL NEED A RELATIONAL DATA BASE TO COMPETE.

"Miss Elliot, it's inevitable every company will need a relational data base to compete. Can you please find out what a relational data base is?"

When corporate management needs information, the last thing they want are excuses. Or explanations, no matter how logical they may be.

But what else can you do when the data base you're using doesn't let you get to that information quickly. If you're lucky enough to get to it at all.

The solution, of course, is a relational data base. A data base that lets you give management the information they need, the way they need it, when they need it.

ADR/DATACOM/DB® is the only relational data base management system that lets you give management access to all the company information. Because the data base they use to manage the company is the same exact data base the company uses to operate. And ADR/DATACOM/DB does it without sacrificing performance.

ADR/DATACOM/DB lets managers use relational query languages like ADR/DATAQUERY,® decision support systems like ADR/EMPIRE® and, with ADR/PC DATACOM,® even their own personal computers to get the information they need themselves.

And programmers can use powerful productivity tools like ADR/IDEAL,® our 4th generation application development system, to create applications quickly and turn data into strategic information.

ADR/DATACOM/DB allows system changes to be made quickly and easily. So it gives your company the flexibility to compete in a changing business world.

And, most important of all, ADR/DATACOM/DB still delivers the performance production demands. In fact, it is the only relational data base management system being used for high volume production applications.

It's inevitable every company will need a relational data base because it removes the barriers that separate management from the information it needs.

And ADR/DATACOM/DB is the relational data base that does it best.

For more information about the inevitable, mail us the coupon. Or call 1-800-ADR-WARE.

WHEN THE CHAIRMAN EXPLODES OVER A SECURITY LEAK, WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

It doesn't matter who actually leaked it—if there's a failure in system security, it's *your* problem.

But now, at last, you have an ally. In VMCENTER.

VMCENTER puts you squarely in control of system resources—providing multiple levels of authorization, for maximum protection against security violations.

It also allows you to do a lot more. Change passwords in a flash, encrypt data through simple commands, and keep top management informed of potential problems through a variety of reports.

Best of all, VMCENTER makes *you* secure—knowing that problems are being taken care of *before* they happen, not after.

But there's more.

In addition to security problems, VMCENTER solves a lot of others, like disk and tape management, resource scheduling and accounting, even workload balancing. And it does it all in an integrated manner that's more effective than any possible collection of quick fixes.

VMCENTER. It's a survival tool—and then some. Once you use it, you'll wonder how you ever got along without it.

And the Chairman may even learn to feel the same way about you.

For more information on VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, Virginia 22180, telephone (703) 821-6886.

VM
SOFTWARE INC.

Manager's Corner

By Jim Young

Every time I think about systems software, I am reminded of a particularly applicable cartoon. It showed an automat where, in an attractive surrounding, customers were conveniently removing food from the compartments. On the other side of the device, an army of workers crawled over one another to stock the empty slots, fix the food and keep the equipment going. This may be a humorous and exaggerated criticism of automation, but it speaks truthfully for today's systems software environment and its dependence on people.

For years, operating systems were supposed to be getting more automated, more embedded intelligence, less tailoring, less intervention and better users of the hardware (which would do its part by increased use of microcode). And, in fact, much of this happened. Unfortunately, however, it did not result in a simple, people-free environment. Simultaneously, function and complexity have increased dramatically. Broader integration has become more necessary; performance has become more critical. People are still required — many more people than have been saved by selected improvements. The result is a situation with accelerated demands on the systems programmers and the telecommunications, software and data base analysts. As computer systems play a greater role in company operations, these people become increasingly important. To quote the sports writers, they are the "straw that stirs the drink." Creating a productive environment for these people is of paramount importance to today's data processing manager.

Technical decisions are not unimportant. Selection of operating system, utilities, performance tools, spooling packages, library management tools and so on is still an integral part of today's DP environment and can still have fatal repercussions. Fitting these selections into a long-term strategy, ensuring compatibility between various packages and controlling costs all can lead to many an ulcer or sleepless night. Nevertheless, the most critical factor for success in this environment is the people who maintain these products.

I am also not emphasising systems software people management and ignoring other DP professionals. It's just that most traditional organizations have come to understand the role played by computer operations, applications development and other people whose jobs can be directly related to products delivered to today's perceptive users. However, the role played by people managing systems software is still obscure. The old perception as backroom specialists dealing with arcane toys or as ugly ducklings intrigued by obscure technology still exists. You can almost see the thick glasses and white lab coats. The image may have some historic justification, but it cannot be allowed to continue without jeopardising the foundation on which today's applications rest and placing at risk company operations and future performance.

To allow systems software professionals to make strong contributions, a productive, supportive environment can be created in the following areas:

- **Salary:** While the laws of supply and demand more than correct any discrepancies in starting pay, it is a sin for people to have to change jobs continually to be fairly compensated. By permitting this situation to continue, companies are needlessly losing critical skills as well as proprietary knowledge. DP managers must ensure salary structures that allow improvements within an organization. Job hopping has somewhat abated, but an absence of good internal programs could cause it to become an epidemic again at the first rays of economic sunshine. These salary scales even today can be easily justified by the criticality of system software in company operations.
- **Careers:** Salary programs should be accompanied by a plan of upward mobility — additional job positions to reflect increasing responsibilities. Just offering more money for similar performance is treating systems software professionals as mercenaries, an attitude that breeds the fickle loyalty of all soldiers of fortune. True careers allow on-the-job training, which expands responsibilities and allows systems software people to improve and broaden their skills. Simultaneously, they will be increasing their contribution to an environment for which they will build a sense of ownership. A happy consequence is that as systems software environments evolve, the transitions are consistently controlled by these long-term employees.
- **Development:** To complement this upward mobility, skill development programs will be necessary to prepare people for the new jobs. Increased requirements for people skills, planning skills, budget management skills and so on are essential to eliminate the old stigma of technical mechanic and to integrate system software methods into the rhythm of the management process. These skills are more critical than ever in today's environment with long lead times, more complex far-reaching impacts and more intricate coordination for systems software.
- **Recognition:** Although positive recognition of the systems software staff is an essential first step, educating others is also necessary. Today's DP managers have almost exhausted their ability to flatter, cajole and motivate. Technical professionals know their role transcends internal DP issues and they are becoming insensitive to traditional blandishments. Others must also join in to emphasize the broad dependence on this technology. This includes key user managers, human resource management and, ultimately, company executives.
- **Involvement:** As job responsibilities and job skills expand, systems software professionals will be able to get involved as equal partners, not servants, on major company plans and programs. This is the level where all the previous groundwork pays off by having adequately rewarded, motivated, trained professionals that have developed their skills over a period of years and now understand both technical capabilities and the company's climate and ultimate direction. People with the right technical background and business perspective will appreciate the importance of the critical decisions made by DP. With their participation, those decisions can assure the right foundation for future growth and productivity. Ongoing implementation then becomes a natural extension of the process, a commitment and not a management mandate.

Maybe a company's heavy dependence on people with specialized skills to manage the technical environment will disappear eventually. Maybe technology will absorb their responsibilities or restructuring will spread out the dependence on systems software. Maybe. But in the meantime, a weak systems software staff is the sword of Damocles hanging over an unsuspecting company's future.

The job of today's manager is to prevent this danger by improving the environment of systems software professionals and turning them into a company strength.

■

Young is management information systems director and responsible for user technology at Wright Line, Inc., Worcester, Mass. He has worked in the industry for 15 years.

Q&A

Burt Rubinstein is vice-president of Research and Technology at Index Technology Corp. in Cambridge, Mass. He helped to develop Excelerator, an integrated workbench of tools for systems analysts and designers. Rubenstein shared with Computerworld Focus *his views on how workbench tools have changed and will continue to change the way traditional data processing professionals support companies' business needs.*

What systems development problems do workbench tools target?

Five or 10 years ago all the tools were programmers' tools — like compilers, editors and debuggers — even though the research at the time was really saying a lot of the payback could be improved if people did a better job up front. In the old days, it was 20% analysis and design, 80% code and debug. Realistically, now it is probably 40% analysis and design and 60% code and debug.

Did the percentage change because it had to change or because with new technology it could change?

A combination of the two. People were becoming more sophisticated. There was five to 10 times more work to do and more complex systems needed to be built, but there were only 10% to 20% more people. They were ripe for new techniques. But the new techniques were burdensome. People had to become much more formal in the way they did analysis and design. Because of that, the whole area of tools really opened up maybe three or four years ago.

Can you define these workbench tools?

There is a classical waterfall life cycle where you finish one step, have everything signed off by the user and you go on to the next step. An ideal workbench would be sitting down with the computer and talking to it about your requirements; then out the other end would come a system all fully coded and complete with user documentation. Obviously we're nowhere near that goal yet. Workbench products are attacking the front end with the intention of attacking more over time — how do you look at an existing real world system? How do you decide what is in it, and then how do you design a first cut at what the computer system is going to do with it? How do you integrate all that together? Over time, one would hope these workbenches would go more toward the real front end of feasibility and business needs and toward the far end of making a good strong link to the actual coding and debugging of the system.

Are you talking about a fifth generation beginning at the front end?

When the workbench tools really meet their potential, yes. When you do the whole thing it might be even beyond the fifth generation. Over time, the different categories of people building systems, like analysts and programmer/analysts and programmers and maintenance coders and systems programmers will really become two: the analyst/builder, who might actually be the user; and, at the other end, the people who provide the tools the analyst/builder uses. Hopefully, the number of tools providers will shrink so that all you have are analysts/builders who are actually the end users.

Will these products alter the makeup of the DP department?

Workbench products combined with techniques, methodologies and concepts of system design will. Good programmer/analysts who can work with users will become the analyst/builders, and really good systems programmers will become the tool providers. We hope to provide at least five or 10 times productivity improvements for the development life cycle. It has to drastically change the makeup of the DP organization.

Will people within the DP organization have an easy time adapting to these changes?

I don't want to sound elitist, but the

(Continued on Page 9)

Reports Cite Potential In Aftermarts

The microcomputer software industry might not be as bleak as the press makes out, according to separate reports issued by market research firms International Resource Development, Inc. (IRD) of Norwalk, Conn., and Venture Development Corp. (VDC) of Natick, Mass.

According to the IRD report, "Key Vertical Markets for Microcomputer Software — Financial, Legal and Real Estate Segments," the real profits in microcomputer software lie in the software aftermarket, which it defined as training, consulting, software enhancements and support and business forms and supplies. The report indicated that aftermarket sales are now shooting past initial software package sales revenues and by 1995 will account for fully 84% of total microcomputer software industry sales.

The report also noted that the number of small firms is rapidly shrinking in some industries such as banking, drying up a primary market for smaller software firms. Ironically, though the aftermarket is booming, many software vendors are ignoring the market, concentrating on initial sales. This is a strategy, the report pointed out, dangerous to these firms in the long term.

Both the IRD report and the VDC report entitled "Distribution of Microcomputers to OEMs and VARs: A Strategic Analysis," emphasized the strength of the microcomputer vertical software market.

"Whereas horizontal application packages automate specific tasks such as accounts receivable or inventory control," the VDC report stated, "vertical applications software can automate an entire small business." The report also predicted that vertical market micro software sales in the U.S. will reach nearly $2 billion by 1986.

Among the businesses the VDC report said would offer excellent growth opportunities for vertical software over the next five years were medical and dental practices, pharmacies, legal practices, contracting and construction firms, insurance agencies and wholesale/retail distribution. Vertical markets already represent, the VDC report noted, as much as 50% of the entire microcomputer marketplace.

For further information, contact International Resource Development, Inc., 6 Prowitt St., Norwalk, Conn. 06855 or Venture Development Corp., One Apple Hill, P.O. Box 9000, Natick, Mass. 01760-9904.

Ashton-Tate Stakes Claim To Multimate

The planned takeover of Multimate International Corp., East Hartford, Conn., by Ashton-Tate of Culver City, Calif., might provide Ashton-Tate with the extra guns it needs to become Number One in the beleaguered U.S. microcomputer software market.

First, the purchase of Multimate International will give Ashton-Tate combined revenues of over $100 million for fiscal 1985, second only to the $157 million in revenues registered by Lotus Development Corp. of Cambridge, Mass. It will also provide Ashton-Tate with another software product winner in Multimate, the successful word processing package, which Multimate International claims has captured from 30% to 35% of the U.S. market for WP software within corporate micro installations.

Multimate, in combination with Ashton-Tate's very successful Dbase III data base management system and its Framework integrated software package, give Ashton-Tate a strong triad of products going into the latter part of the decade. Multimates's solid Fortune 1000 customer base will also give Ashton-Tate a greater avenue into large corporations.

"What we are seeing is a further consolidation of software companies in the U.S. micro software market," explained George Colony, president of Forrester Research Inc., a Cambridge, Mass., market research firm. "Ashton-Tate is adding a strong WP package to its products, trying to preempt a move by Lotus (Development Corp.) into that same area."

Colony said he views the Ashton-Tate/Multimate acquisition as part of the final phase of what he termed the "closing-off" of the first-generation micro software marketplace. In Colony's estimate, the first-generation market, represented by the IBM Personal Computer, has been won by a few large software houses represented by Lotus (which recently purchased Software Arts, Inc. of Wellesley, Mass.), Ashton-Tate, Software Publishing Corp. of Mountain View, Calif., and Microsoft Corp. of Bellevue, Wash. According to Colony there is now little hope for new, innovative software companies to enter and survive in this market.

Where Colony did see hope, however, was in the budding second-generation micro market represented by the IBM AT,

The first DBMS designed for online systems from the start, finishes first.

Compared to any other DBMS, CCA's MODEL 204 software is faster in a VM, OS, or DOS environment.

And, its productivity stays ahead of the pack even as you add more and more users. Incredibly, the MODEL 204 can support any size network from 30 to 30,000 terminals.

Like the cheetah's speed compared to other animals, the MODEL 204 was designed to be fast from the start. Because instead of being designed for batch, then retrofitted, this DBMS was specifically designed for online systems right from the start.

Impressive as its speed, is capacity. It can handle a few hundred records, or as many as 513 billion! With no limit on each record's size.

Because of its fourth generation tools, tough applications are easy to create, test, or change without affecting the database. And unlike any other DBMS, as your business data tracking requirements change, you can add or change new or existing fields without unloading, recompiling and reloading the database. A dramatic savings of time and manpower.

Very quickly, let us tell you more about MODEL 204's speed and superiority. Send the coupon for more information fast. Or, call 1-800-258-4100.

Send more MODEL 204 DBMS facts fast.

FDR/COMPAKTOR/ABR
Innovation Data Processing, Incorporated

MANAGEMENT SUMMARY

FDR (formally known as Fast Dump Restore) is a dump and restore utility designed to reduce the time required to produce a dump and restore the data. FDR replaces all standard IBM dump/restore utilities, supports all VS1 and MVS (XA) environments, and can be used with most IBM and compatible disk devices.

FDR uses three method plans in attaining input/output efficiency: 1) the use of increased blocking factors, 2) the elimination of redundant and unnecessary data, and 3) the use of cylinder orientation to minimize delays due to physical rotation, arm movement, and so on. FDR also offers a performance option (BUFNO=MAX) that increases the number of buffers FDR uses during the dump operation, and is designed to decrease elapsed time and save system resources. FDR has a full-volume disk-to-disk feature.

FDR includes a *Stand-Alone Restore* (SAR) program. This program allows restoration of a full-disk volume when, due to the unavailability of a VS1 or MVS operating system, FDR cannot be run. SAR can also be used to restore partial volumes and to clip a volume. SAR also aids the operator by issuing prompting messages on the console and error messages on the console, printer or tape whenever a problem is encountered during the restore. SAR also permits the Restore of specific tracks.

Recent enhancements to SAR include support of stand-alone operations in MVS/XA mode, a standalone backup capability, and support of backup and restore functions under VM.

A no-charge option available to FDR users is the *Data Set Functions* (DSF) subsystem. DSF allows the user to dump and restore individual data sets on a pack and to dump and restore by absolute tracks. It can also be used to restore data sets from full-volume FDR backup tapes and allows the user to rename a data set when restoring it. Password protection is provided, and can be activated on either a volume or data set basis.

Compaktor (CPK), an extra-cost option, is a disk management utility used to reorganize direct-access volumes using the FDR methodology. It reduces space fragmentation, merges data set extents, aids in positioning data sets, and offers several other solutions to frequent disk pack organization problems.

Automatic Backup and Recovery (ABR) is another extra-cost option that manages disk space on direct-access volumes. Disk volume and data set backup can be automated based on the last reference date and update characteristics. Data sets that have not been used for a time period can be automatically archived, freeing the disk space for more productive use. Reports can be tailored to user specifications. A Data Set Not Found Exit permits the Automatic Restore of data sets that have been archived without user intervention. The vendor recently released extensive ABR panels for TSO users. The panels provide complete dataset and volume reporting, thus permitting end users more direct control over their datasets. ABR is designed to operate with both the DSF and Compaktor subsystems.

FDR provides enhanced support for VSAM files which are cataloged into an ICF catalog. These data sets are also relocatable with DSF and ABR.

COMPETITIVE POSITION

While the packages listed on page one of this report compete with the FDR/Compaktor/ABR products, the only competition for FDR itself is IBM's DF/DSS. FDR is more efficient than the IBM product. This, along with its reliability, account for FDR's very extensive user base.

The other products listed as competition are disk space management packages and thus compete with ABR. The main competition includes Cambridge's ASM2 and Sterling's DMS/OS. While both of these products were introduced several years before ABR, neither has as large a user base. In addition, they are both more expensive than ABR.

The FDR/Compaktor/ABR family of products holds a very strong market position that is likely to continue. The family provides outstanding performance and reliability, and the vendor has earned a reputation for quality control that is equalled by few in the industry.

ADVANTAGES AND RESTRICTIONS

FDR, as its name implies, is a fast method for dumping and restoring data. The package is faster and more efficient than similar IBM utilities, and achieves a high performance level, reducing elapsed time and saving system resources.

A major advantage is the Stand-Alone Restore program. The ability to backup and restore disk volumes without an available operating system is critical to disaster recovery. The automatic restore to unlike devices and the automatic restore of archived files are additional advantages.

Another major advantage is the outstanding reliability of both the product and the vendor, as attested to by the rating in Table 1 and the wealth of comments from users. Many consider FDR the most reliable software package they have ever used, with never a bug to be found. Another decided advantage of FDR is the free 90-day trial offering.

USER REACTION

Twenty-three users of FDR responded to an independent Datapro survey. The average age of installation was 4½ years. The utility was running on various IBM mainframes as well as on an Amdahl 5860 and three NAS models. All but one were running under MVS, MVS/SP, or MVS/XA. Not every respondent rated all categories. Six did not rate User education, explaining that none is available.

TABLE 1.	Excel.	Good	Fair	Poor	MAUR*	CA**
Reliability	23	0	0	0	4.00	1
Efficiency	19	4	0	0	3.83	1
Ease of installation	20	3	0	0	3.87	1
Ease of use	12	10	1	0	3.48	1
Troubleshooting	19	3	0	0	3.86	1
Documentation	10	9	3	1	3.22	1
User education	5	4	6	2	2.71	2
Vendor's maintenance	14	7	0	0	3.67	1
Overall satisfaction	17	5	0	0	3.77	1

*Mean Average User Rating, on a scale of 4.0 for Excellent.
**Cluster Analysis—the range of average user ratings attributed to each cluster for each category, where Cluster 1 is the highest and Cluster 4 is the lowest. (See Report [illegible] for individual category Cluster delineations.)

These users overwhelmingly stressed the advantages of FDR. All 23 said the package performed as promised by the vendor. Many comments were made regarding the outstanding reliability of the package, with long-time users saying that they have never had any problem with FDR. They consider IDP the most reliable software firm they have ever dealt with, with one commenting: "I wish some of the big name software folks took some lessons in quality assurance from Innovation." This is also reflected in the table above, with reliability receiving a very rare 4.00 rating.

Twenty users said FDR saves system resources, 18 said it saves staff time, 12 considered it inexpensive, and 16 said that using FDR resulted in financial savings for their companies. Fourteen considered the package simple to operate and 10 said it is flexible in its capabilities, allowing different device migration, archiving, single dataset restore, and global functionality.

Several users praised the vendor for providing excellent technical support. IDP is very responsive to problems or questions and the support staff is very well trained with thorough knowledge of the internals of FDR and MVS. In addition, IDP is quick to upgrade their product as soon as IBM announces any new hardware or system modifications. Furthermore, the vendor is continually improving and enhancing their products' capabilities.

Few restrictions were mentioned. Two users considered FDR complex and one said it is inflexible, while another said that the migration facility for data set movement to unlike devices is slow. One user said the documentation is poorly organized, while the user who rated documentation poor commented that there is no overall description of how all the components of the package fit together. As a result of this, much time is spent flipping through the manual to determine what is needed to carry out a requested function. A vendor spokesman explained that reorganization of the documentation is difficult because some users have only one component of the product. While there are no major plans for changing the documentation, the vendor is currently adding more examples of how to use the product. ☐

In the News

IBM AT compatibles, "the PC2 when it arrives" and all the Intel Corp. 80286 processor-based systems now appearing and offering multitasking, multiprocessing and windowing capabilities.

"There are great opportunities opening for networkable software and multitasking applications," Colony explained. "The 80286 is creating a whole new second-generation market for software entrepreneurs which the major players in the IBM PC market will not be able to get into [in force] for awhile. They have simply too much money and development tied to the old [IBM] PC market."

Neither Lotus nor Microsoft would comment on the Ashton-Tate/Multimate merger.

Software For Micros Now MIS Turf

If there were any doubts about management information systems (MIS) in large U.S. corporations taking in the reins of microcomputer software purchasing from end users, studies such as the one recently conducted by the Omni Group in New York, N.Y., set the record straight.

According to Milburn Smith, senior consultant with the Omni Group, decision-makers representing 304 of the top 4,000 U.S. manufacturing and service companies were asked if they had put in place approved purchasing lists for microcomputer software. Of those companies interviewed, 44% said they had put such lists in place and were enforcing them. Of those companies with lists already in place, fully 76% listed MIS as the most influential group in putting the approved purchasing lists together, 8% had office automation committees handle the lists, 6% used administrative services departments and a mere 4% had user departments draw up their own purchasing lists. "This study indicates," explained Smith, "that users play a much larger role in purchasing micro software in smaller companies."

A second study by the Omni Group asked these decision-makers which micro applications software fell short of fulfilling their goals. Smith said 51% of the respondents chose micro-to-mainframe software as the most disappointing, primarily due to the complexities and crudeness of data conversion and formatting. Another 11% had an axe to grind with data base management systems, 10% had it in for software communications with outside data bases, 8% took issue with word processing packages, and 3% said electronic spreadsheets still had a way to go. Only 18% had no complaints.

For further information, contact the Omni Group at 115 E. 57th St., New York, N.Y. 10022.

Data Transfer Hot Topic For NUA

Two growing areas of electronic data transfer are being addressed by the Network Users Association (NUA) of Alexandria, Va. NUA subcommittees are being established to deal with the separate issues of electronic data interchange (EDI) and electronic document exchange (EDE). NUA distinguishes between the two by saying that with electronic data interchange, users take and use the transferred information as is. With electronic document exchange, users intend to revise the transferred documents and place them into their own information systems for their own use.

Marvin Rahm, telecommunications consultant with Dow Chemical Co., Midland, Mich., and chairman of several of the NUA subcommittees, said a number of large U.S. companies are demanding true electronic data interchange, whereby invoices, purchase orders, inventory and other information is made available by vendors for customers.

"At Dow Chemical, we have pilot projects under way to exchange electronic purchase order, accounts payable and receivable information with General Motors Corp. and some of our other large customers and clients," Rahm said.

Rahm added that he hoped these pilot projects would reach the operations stage in three or four years. The company would first have to iron out several problems with the complex coding of the accounting systems. At the end of this period, however, Rahm expects the interchange operations to be "completely paperless," he said.

The big problem for Dow Chemical and other companies working on EDI is data security, an issue being addressed by an NUA subcommittee.

With electronic document exchange, the NUA is focusing on the issue of such standards as IBM's document interchange architecture (DIA), IBM's document content architecture (DCA) and its distributed office support system (Disoss).

"It's important to establish standards when you're dealing with voice, data, text, image and graphics," Rahm explained. "Users have to be able to utilize combinations of these, but without com-

application development report: MARK SERIES

FOURTH GENERATION PROGRAMMING TOOLS MOVE JOBS THROUGH PIPELINE QUICKER AT WASHINGTON NATURAL GAS

John Rowlands, Manager of Data Processing Applications at Washington Natural Gas Company in Seattle, feels that too many managers in data processing are waiting for future programming tools rather than making use of the excellent application generators already available.

"At Washington Natural, rather than waiting for predictions about fantastic future software tools to come true, we decided to realize the potential provided by fourth-generation productivity aids available now."

The tools chosen by Washington Natural were MARK IV® and MARK V®, Application Development Systems from Informatics General Corporation for generating batch and online applications, respectively.

When Washington Natural, the largest distributor of energy in Washington, wanted a new general ledger system, "We looked at a half-dozen different products, including packaged systems," Rowlands explains. "We then proposed to senior management that instead of buying a package we should buy MARK IV and develop a general ledger system in-house. We said we could do it with half the people, in half the time, using MARK IV rather than COBOL.

"Management said to go ahead, and we started training the information systems staff," Rowlands continues. "We had two programmers, together with a consultant from Informatics, working on the general ledger system — and during the next two months, I became quite concerned. They weren't doing anything the way a COBOL programmer/analyst would.

"They were designing output when a COBOL programmer would be flowcharting, and they were designing input when a regular programmer would be coding. They were designing processes when a regular programmer would still be coding. They started coding when a COBOL programmer would be recoding.

"Then came the big surprise," Rowlands adds. "They started printing reports when a COBOL programmer would be printing core dumps! The whole system worked, and they never had a single core dump. And management was shocked, because we came in on time, within budget."

Washington Natural Gas has also developed a personnel and payroll system, a sales prospect system, several resource management systems, and a contractor management system. Rowlands points out that these systems all utilize the very powerful file maintenance functions of MARK IV.

Of all the programs now in production at Washington Natural Gas, 44% are written in MARK IV. "We've trained most of our programming staff on MARK IV, and we recommend its use for new batch application development wherever possible," Rowlands says. "I feel that MARK IV significantly improves productivity. Our programmers tell me that it can cut development time by 60-90%.

"I also like the fact that MARK IV forces structure," he adds. "People with very little MARK IV training can easily follow the logic of complicated MARK IV programs. I've also found that MARK IV can be taught to non-data processing people — and it improves morale because programmers can finish a job and get on to the next one more quickly.

"MARK IV gives us the ability to preview, create, and change reports very quickly. It also improves testing. Creating test files and testing systems is done automatically — and because of this, programmers tend to really test their systems."

ONLINE APPLICATION DEVELOPMENT

In 1984, to meet a burgeoning demand for new online systems, Washington Natural Gas purchased MARK V for online application development in its CICS environment. The company uses an IBM 4381 mainframe running the DOS VSE/VM operating system. Their online network includes approximately 200 terminals, scattered throughout seven offices and three warehouses.

"I felt that online systems development should be done using nonprocedural languages," Rowlands explains, "and our success with MARK IV gave me a good deal of confidence in Informatics. Furthermore, MARK V is similar in many ways to MARK IV, and I felt that this should enhance the learning curve and acceptance of the product by our programmers.

"I particularly like the way MARK V allows you to easily prototype new systems — so that users can approve parts of the system as you develop it," Rowlands says.

"The prototyping we can do with MARK V lets us sit down with users at a terminal and show them exactly how a screen will look and how one screen flows into the next. And we can immediately change things they don't like. It's really joint development, done with the users in real time."

Rowlands cautions that adequate mainframe memory size is a "must" when using development tools like MARK V. However, he notes that "on a transaction-by-transaction basis, MARK V compares favorably with COBOL in its memory requirements.

"We are planning a conversion from DOS to MVS in the near future," he adds, "and I chuckle to myself every time I think how easy our conversion is going to be, compared to shops that are primarily oriented to COBOL and assembler programming.

"As a manager, I'm pleased with the way MARK IV and MARK V are improving our programmer productivity and raising department morale," Rowlands concluded.

MARK IV AND MARK V ARE REGISTERED TRADEMARKS OF INFORMATICS GENERAL CORPORATION

I would like to see how the MARK Series can help me with my CICS, IMS/DC and batch programming.

patibility, document exchange between equipment and systems from different manufacturers isn't guaranteed."

Joseph V. St. Amand, senior network architecture consultant at Wang Laboratories, Inc., Lowell, Mass., and also a member of some NUA subcommittees, said the problem for users is not data interchange as much as it is the gateways that connect the IBM Systems Network Architecture (SNA) mail systems. Amand explained that users are looking for a common definition or set of protocols for electronic data interchange that will provide an international foundation for store-and-forward messaging systems.

"On the bright side," Amand said, "a number of vendors who belong to the Computer Communications Industry Association have been meeting together and considering funding the joint development of the [International Organization for Standardization] Open Systems Architecture to IBM's Systems Network Architecture."

Q&A

(Continued from Page 5)

good people will. The good people were the first to hop into structured programming and structured design and the first to look at formal analysis techniques. The good people can work with the user and get the requirements out in a very succinct form. On the other hand, the average or below-average programmers who are just translating what has already been done will fall out or become enlightened.

Do you see this in an information center context?

Very much so. The concepts of understanding what the requirements are and being able to specify those interactively to a system are the same in a development center or information center. There seems to be a convergence on ideas bottom up from the development center and top down from the information center.

Are workbench tools revolutionary products?

A little bit of revolution and a lot of evolution. If we had the perfect solution right now, it would probably take five years until everybody embraced it. But it will grow in three areas: the breadth of what it does, the depth to which it goes and, finally, integration.

Will project time be shortened?

Project time can vary from one or two months for a very simple system to more than three years. After three years a project might be canceled because the needs changed before the system could be delivered. Workbench tools not only produce the systems more efficiently but more effectively in that they'll allow a system to be built that will actually have a very high chance of meeting the needs much more quickly. And as these tools develop, more users will be able to build the systems themselves. The users will become more systems-oriented, systems people will become more user-oriented and everybody will become less computer-oriented.

— *Lee White*

System/36 To Run Pick?

IBM watchers make a living predicting what the computer giant will do next. Some speculation now has IBM adopting the Pick operating system from Pick Systems, Inc., Irvine, Calif., for their System/36 computers. Rich Lauer, vice-president of marketing for Pick Systems, added fuel to the fire by stating that "we are waiting for a firm commitment from IBM on the System/36."

The fact that IBM might have Pick on its System/36s is not earth-shattering; Pick already runs on all IBM mainframes using the IBM VM operating system as well as the Series/1, the IBM PC, the IBM XT, and, scheduled for this October, the IBM AT. What would make porting the Pick operating system to the System/36 unique, however, would be the necessity of IBM exposing to Pick Systems the microcode and other proprietary features of what until now has been a very closed machine.

"Other IBM computers are not nearly so proprietary," Lauer explained. "IBM's microcomputer line was made purposefully open for vendors to produce add-ons. Same with the Series/1. The IBM 4300 series and the 30 series are not as proprietary because the VM operating system allows access to certain machine information. The System/36, however, has always been a closely-controlled architecture."

Frank Petyak, Pick Systems national sales manager, has stated that Pick Systems has been under pressure for some time to make their operating system compatible on the System/36.

"Even if IBM balks," Lauer said, "it's hardly the end of the world for Pick Systems. We have over 40,000 Pick installation sites around the world, and we've just delivered the latest version of Pick to the English market. It won't be a great disappointment."

VSAM
USERS

Gain Control
Over Your
VSAM
ENVIRONMENT

VSAM—ASSIST

Installed on over 600 systems to back up and restore VSAM files and catalogs quickly, efficiently, and safely. Dumps files to a variety of storage devices in only 10% of the time required by REPRO. Automatically adjusts for different track size when migrating from 3350 to 3375/3380 DSAD. ICF Support included. For all OS/VS systems.

QUICK—INDEX

Loads alternate indexes in one-fifth the time required by BLDIN BLDINDEX. Eliminates the need to establish VSAM sort work space. For all OS/VS and DOS/VS(E) systems.

VSAM SPACE MANAGER

VSAM SPACE MANAGER incorporates several functions which the VSAM user will find essential to his environment. While remaining totally transparent to the user, it offers a means to accommodate non-specific volume allocations of VSAM space by eliminating the requirement of identifying specific volumes by volume serial number (VOLSER) when allocating VSAM space. Also allows users to "place" clusters and catalogs by absolute track address minimizing arm movement on the volume. For MVS only.

VSAM I/O PLUS

VIO Plus is the newest addition to the proven family of VSAM tools offered by Softworks, Inc. VIO Plus improves performance in every sense of the word: jobs will perform fewer I/O operations (EXCPs). CPU time will be reduced and elapsed time will be drastically reduced. In short, you will see a very noticeable increase in throughout. For all OS/VS and DOS/VS (E) systems.

Getting spreadsheets, word processing, graphics, communications and the IBM PC to work together can be tough, too.

If you think solving the federal budget deficit poses a challenge, you haven't tried getting a company's personal computers under control.

When you do, you'll find that most users require different configurations to handle their various computing needs. And while there are plenty of hardware and software products that perform well, they don't necessarily perform together.

Enter DunsPlus. A combination PC product and service that brings a new level of integration and cooperation to the IBM PC, software, communications, user education and services.

DunsPlus offers you the choice of any IBM PC, already configured with proven software programs like 1-2-3 and MultiMate or DisplayWrite word processing. It also includes software tools for data integration, file management, micro/mainframe communications, and systems development.

Unlike static integrated products, DunsPlus has the flexibility you need to add software to its consistent, easy-to-use, menu-driven operating environment.

And it's backed up with comprehensive education programs and support services.

DunsPlus. Like NOMAD, now NOMAD2, the premier 4GL/DBMS, it's one in a continual evolution of computer software services from Dun & Bradstreet.

To assure that your PC products work together, write DunsPlus, 187 Danbury Road, Wilton, CT 06897 or call 800-DNB-PLUS.

DunsPlus

We make PC products work the way they should. Together.

DBMS Systems: How Will The Newcomers Fare?

A new kind of [illegible] both MIS and [illegible] help create data [illegible] a variety of programs [illegible] potential is still to be [illegible]

By Stan Kolodziej

Data base management systems (DBMS) are no longer entirely in the hands of programmers and data processing centers, but are beginning to appear as tools of middle management. A big catalyst for this change is the raft of fourth-generation languages that have appeared in the marketplace, trailing a string of development tools in their wake.

On the input side, these software tools give a user the means to create data dictionaries, to model data bases and even to analyze data bases. On the output side, fourth-generation [illegible] generators, one can create a host of customized query and report programs and decision support aids ranging from spreadsheets to multidimensional data analysis, goal-seeking and expert systems.

One such product is Sperry Corp.'s Mapper fourth-generation language, currently in its thirty-first enhancement and long part of this self-help movement toward end users. Sperry managers have themselves used the system for some time, sitting at their Sperry Personal Computers or terminals and creating their own data base programs to help [illegible] production and [illegible].

Dudley Smythe, Sperry's director of franchise marketing, explained that "Mapper was developed for users by users. We understand what they need." Using the Mapper Kit, a set of application tools, and the Mapper Tutor instruction package, non-DP employees can be up and creating customized data base programs in four hours, Smythe claimed. In fact, Sperry thinks Mapper is good enough to franchise. Smythe has been assigned to sell service bureau franchises that will offer the Sperry 1100 [illegible] microcomputer. Mapper [illegible] time-sharing basis.

Another veteran player in the fourth-generation arena is Software AG of North America, Inc., Reston, Va. Software AG has [illegible] Super Natural, which the company claims is a major improvement over Natural, its fourth-generation language [illegible] DBMS builder. "[illegible] Natural [illegible] to be [illegible] ," Chuck [illegible] product manager at [illegible] AG, said. "We've also [illegible] delivers a subset of Natural into the hands of IBM PC users." Riegal added that Super Natural can also be linked to micros.

The Waltham/Weston Hospital, located in Waltham, Mass., is a Natural user. In 1983, Don Cotton, the hospital's director of MIS, began looking for a DBMS and easy-to-use programming language to create a replacement for what he termed the hospital's inadequate Report Program Generator (RPG) system running on an IBM System/3. The MIS plan called for heavy user demand, according to Cotton, who was surprised to discover that many of the hospital's personnel, especially the nurses, expressed an interest in using the system to track patients' medical data and generate patient reports.

Software AG's Natural and Adabas (an acronym for A Data Base), were chosen primarily for their easy software maintenance, Cotton said. Various DBMS applications such as patient billing and medical history were soon produced. Though the applications were written by professionals in the MIS department, Cotton pointed out, input was culled from the eventual users about what they personally wished from the system. This information played an important roll in how the various DBMS were structured. Over 90 nurses are now on-line to the system, which resides in an IBM 4300 series mainframe, with plans that eventually include the 150 staff doctors.

Using Super Natural, a menu-driven, data base query system, nurses view updated patient files. They can then combine data from these files with data from other files and produce individual reports. Users communicate with the system through English-like commands and icons, Cotton said.

He added that the system's fourth-generation language tools make it easy for nurses and other staff members to develop their own programs.

Most fourth-generation software tools provide nonprocedural, display-driven interfaces to create and update a personal data base. Nonprocedural is one of those terms carrying just about everything but an easy definition. The definition given by Doug Mahugh, however, a Chicago-based writer and programmer, is a little more eloquent than most: "A nonprocedural language is a programming language that allows the programmer to state goals to be achieved, rather than the specific procedures necessary to accomplish them." In contrast, Mahugh said, third-generation languages such as C and Fortran allow the programmer to specify how the program will run, as well as what it will do.

Fourth-generation languages make it easier for end users to program in English-like statements. So-called English-like statements range from languages sounding like stilted English, to something more like machine code. Generally, the best of natural language interfaces use English-like statements that resemble everyday conversational English. Through such statements, fourth-generation languages are giving nontechnical users the ability to program and access their programs without abandoning their native tongue.

Oracle, a fourth-generation language produced by Oracle Corp., Menlo Park, Calif., is an example of the changing user interface. Oracle is based on IBM's Structured Query Language (SQL), a fourth-generation relational data base language. Oracle currently provides three levels of interfaces catering to the expertise (or lack of it) of Oracle users. One level, called Easy, features several Macintosh-like interfaces, such as a mouse and pop-up menus. The emphasis with Easy is on the use of icons to create simple data base query and report applications. A higher level, the SQL Interface, features programming through English-like syntax. At this level, nontechnical users are expected to be up and running quickly, creating some interesting relational data bases and applications dealing in English-like communications.

The third level, the Pro Interface, is for serious programmers who still want to write reams of programming code. Oracle, like other fourth-generation languages and tools (Focus from Information Builders, Inc., New York, N.Y., and Ramis II from Martin Marietta Data Systems, Inc., Greenbelt, Md. for example) began its commercial life on mainframes (in Oracle's case on Digital Equipment Corp. VAX minicomputers). Now, however, microcomputer-based versions of their software are offered at prices generally ranging from $1,000 to $3,000.

Despite the advances such fourth-generation tools bring to end-user involvement in DBMS, not everyone is a fan. "It used to be said that fourth-generation would be the way of bringing computing to the consumers," Norman Agin, vice-president of Martin Marietta Data Systems, Inc., explained. "My view is that fourth-generation languages are really ideal only for systems analysts, not end users. For one thing, the breadth of fourth-generation language features has grown enormously, so much so that it's not a simple tool anymore."

When Agin wears his other hat, he is president of Martin Marietta's IT-Software Division. This division has created a product called Keep-IT, a $450 relational DBMS tool that is the core module of a series of 10 IT software packages designed for IBM Personal Computers and IBM-compatibles. Agin described Keep-IT as "about as easy to use as any data base manager you'll find," emphasizing

There are several ways to simplify VM for your users...

and they're all called *MULTIPAK/VM*™

MULTIPAK/VM is a productivity aid designed by SKK, Inc. to enable your VM users to more easily perform daily tasks. MULTIPAK/VM is actually a collection of four seperate but related VM utilities that improve upon some existing facilities, while adding some powerful new capabilities for VM users under CMS.

MULTIPAK/VM was written to assist users at all levels of experience. The package offers a trove of features that will benefit the most experienced VM/CMS programmer as well as the non-technical, inexperienced VM user. In fact, we developed MULTIPAK/VM for our own use based upon our years of IBM and VM experience from our ACF2 product line. SKK is a leader in IBM mainframe software products, with over 1,800 user sites worldwide.

Here are just a few of the many ways that MULTIPAK/VM can help you:

1. SPOOL VIEWER

Spool Viewer gives users the ability to now display all spool files. This includes print and punch files, which were previously inaccessible. With Spool Viewer users are no longer limited by file size, because the entire spool file may be viewed regardless of size.

Spool Viewer offers user-tailorable screens, which may also be used to change the displayed data. The Display/Change feature enables users to change file attributes by simply keying-over the displayed data without using complex CMS commands.

2. SHORT CUT

Short Cut is a command shell which simplifies CMS by guiding users through a multilevel system of command panels. Short Cut is designed to reduce the CMS learning curve and to increase efficiency of experienced users by offering simpler, faster alternatives to existing facilities.

Managers may use Short Cut to restrict CMS command usage by specific groups of users or by individuals.

3. SCREEN PAINTER

Screen Painter enables users to construct full-screen application panels by laying out screens exactly as they are to appear. Screen Painter offers new levels of performance, while automatically validating all screens and allowing users to print screen hardcopies. These screens may be called from an assembler program, and EXEC, or a high-level language.

4. STRETCH EDIT

Stretch edit offers VM users new and enhanced XEDIT capabilities. MVS or VS1 datasets, or parts thereof, may be copied directly into CMS files without losing the current line displayed. Stretch Edit allows users to swap screens, rename files in one step, and enhance normal program function key usage.

5. FREE TRIAL

SKK can also give you a productive way to evaluate MULTIPAK/VM; a 30-day free trial. Simply mail in the completed coupon or call a MULTIPAK marketing representative at 312/635-1040.

What could be more productive? Your company...with MULTIPAK/VM.

the pop-up menus and Help screens and the fact that the system does not "allow" a user to put in an incorrect answer. "Keep-IT is a great product for end users to make and manage data bases," Agin claimed, "but about 80% of Keep-IT users use only about 20% of its features. That's probably the case for many fourth-generation software languages." Share-IT, a multiuser version of Keep-IT, has just been released by the company.

"Fourth-generation languages are driving DBMS today," said John McCarthy, research manager at Forrester Research, Inc. in Cambridge, Mass. "But those languages are not that easy to learn. You still have to be a bit of a techie to program." Other observers are just as reluctant to credit fourth-generation languages as meaningful programming tools at the large systems level. Though nearly every DBMS uses some kind of fourth-generation query language, the creation of DBMS with these same languages does not necessarily follow.

An English language capability will benefit amateur programmers in clerical and middle management more than mainframe programmers.

English language capability will benefit those amateur programmers in clerical and middle management areas more than it will mainframe programmers. If fourth-generation languages break down, it's in program documentation. Using English to write powerful mainframe-based programs could be just as complicated as describing those same programs in English. It is not unusual for programmers to use several pages of English to describe the operation of a single page of code.

If anyone is to gain from fourth-generation software tools in the short run, however, it will be DBMS end users. One company slating its product at just such users is Artificial Intelligence Corp. (AIC), the Waltham, Mass., producer of Intellect. Intellect is a natural language that Jane Eisenberg, AIC's director of OEM and product marketing, was quick to describe as a "fifth-generation language," in what has become a more frequent effort by companies to differentiate their products from others in a crowded market. Intellect was forged by AIC's president, Dr. Larry Harris at Dartmouth College, N.H., in the early 1970s. Harris improved Intellect over the years after he founded AIC in 1975. First brought to market in 1981, Intellect was developed for IBM mainframe computers, and a version for Digital Equipment Corp. VAX computers has just been released.

AIC spokesmen pointed out the stress Intellect places on its fourth-generation language interface with users. "Unlike many other language interfaces, Intellect is a true natural language; it's what the user speaks and writes naturally," Eisenberg said. One Intellect user is the Hartford Hospital in Hartford, Conn. Dick Edlund, director of data systems, has been using Intellect since 1981 to build data bases and data base applications ranging from medical histories to human resources and patient billing.

More than 100 users are now on the IBM 4300 series-driven system, most without previous DP experience. Sitting at their IBM terminals, Edlund said, users (many of whom are doctors and heads of hospital departments) can create their own relational data bases and reports using the Intellect Interactive Lexicon module. This module is a data dictionary that translates a user's individual programming terminology into a format usable by the software. The lexicon is immediately updated as the user writes more applications.

In tandem with Intellect/SX, a data base development tool, users have what Edlund described as a "forgiving" set of DBMS builders. This fact was instrumental in the hospital's selection of Intellect over IBM's SQL/DS relational data base language. Edlund said the hospital was simply not comfortable with the number of commands the IBM system required.

Large DBMS systems and tools will continue to be written in third-generation, procedural languages such as Cobol and Pascal, the stuff of old-line programming. Third-generation languages have a huge base of supporters that tend to regard anything fourth-generation with suspicion in relation to DBMS. Still, fourth-generation languages are making some headway in MIS as a quick way of satisfying a growing demand from corporate America's middle management for more end-user programming.

Fourth-generation software tools such as English from Mathematica, Inc., Princeton, N.J.; Clout and Clout2 from Microrim, Inc., Bellevue, Wash.; and Ramis II/PC from Martin Marietta Data Systems, Inc. are putting some DBMS power on micros and proving that DBMS don't always have to be spoon-fed from MIS. The success of such programs will continue to be a direct barometer of end-user involvement in DBMS.

E-A

Software AG Users
spell it out...Datapro™ survey
rates ADABAS

E-X-C-E-L-L

SOFTWARE AG
Where the future
comes as no surprise.

E-N-T!

ADABAS does it again—and we're not surprised!

The results are in! Datapro Research Corporation asked systems software users to rate their data base management systems. And, Software AG users rated ADABAS "Excellent!"

Exactly the same thing happened in an earlier survey when Data Decisions asked users what they thought. For the third year in a row, ADABAS went right to the top of the list as the highest ranked DBMS for the IBM mainframe. And NATURAL was a top contender for best fourth-generation language.

Together, ADABAS and NATURAL make an unbeatable team!

At Software AG we don't believe in surprises. We believe in providing our users with the most powerful software tools available anywhere. And that's the proper plan for the world leader in advanced systems software.

So, if you want the facts about systems software, just ask our users. For starters, send us the coupon below and we'll rush you the official Datapro DBMS report. Or call us at 1-800-336-3761. (In Virginia and Canada, call 1-703-860-5050.)

Rush me the facts.

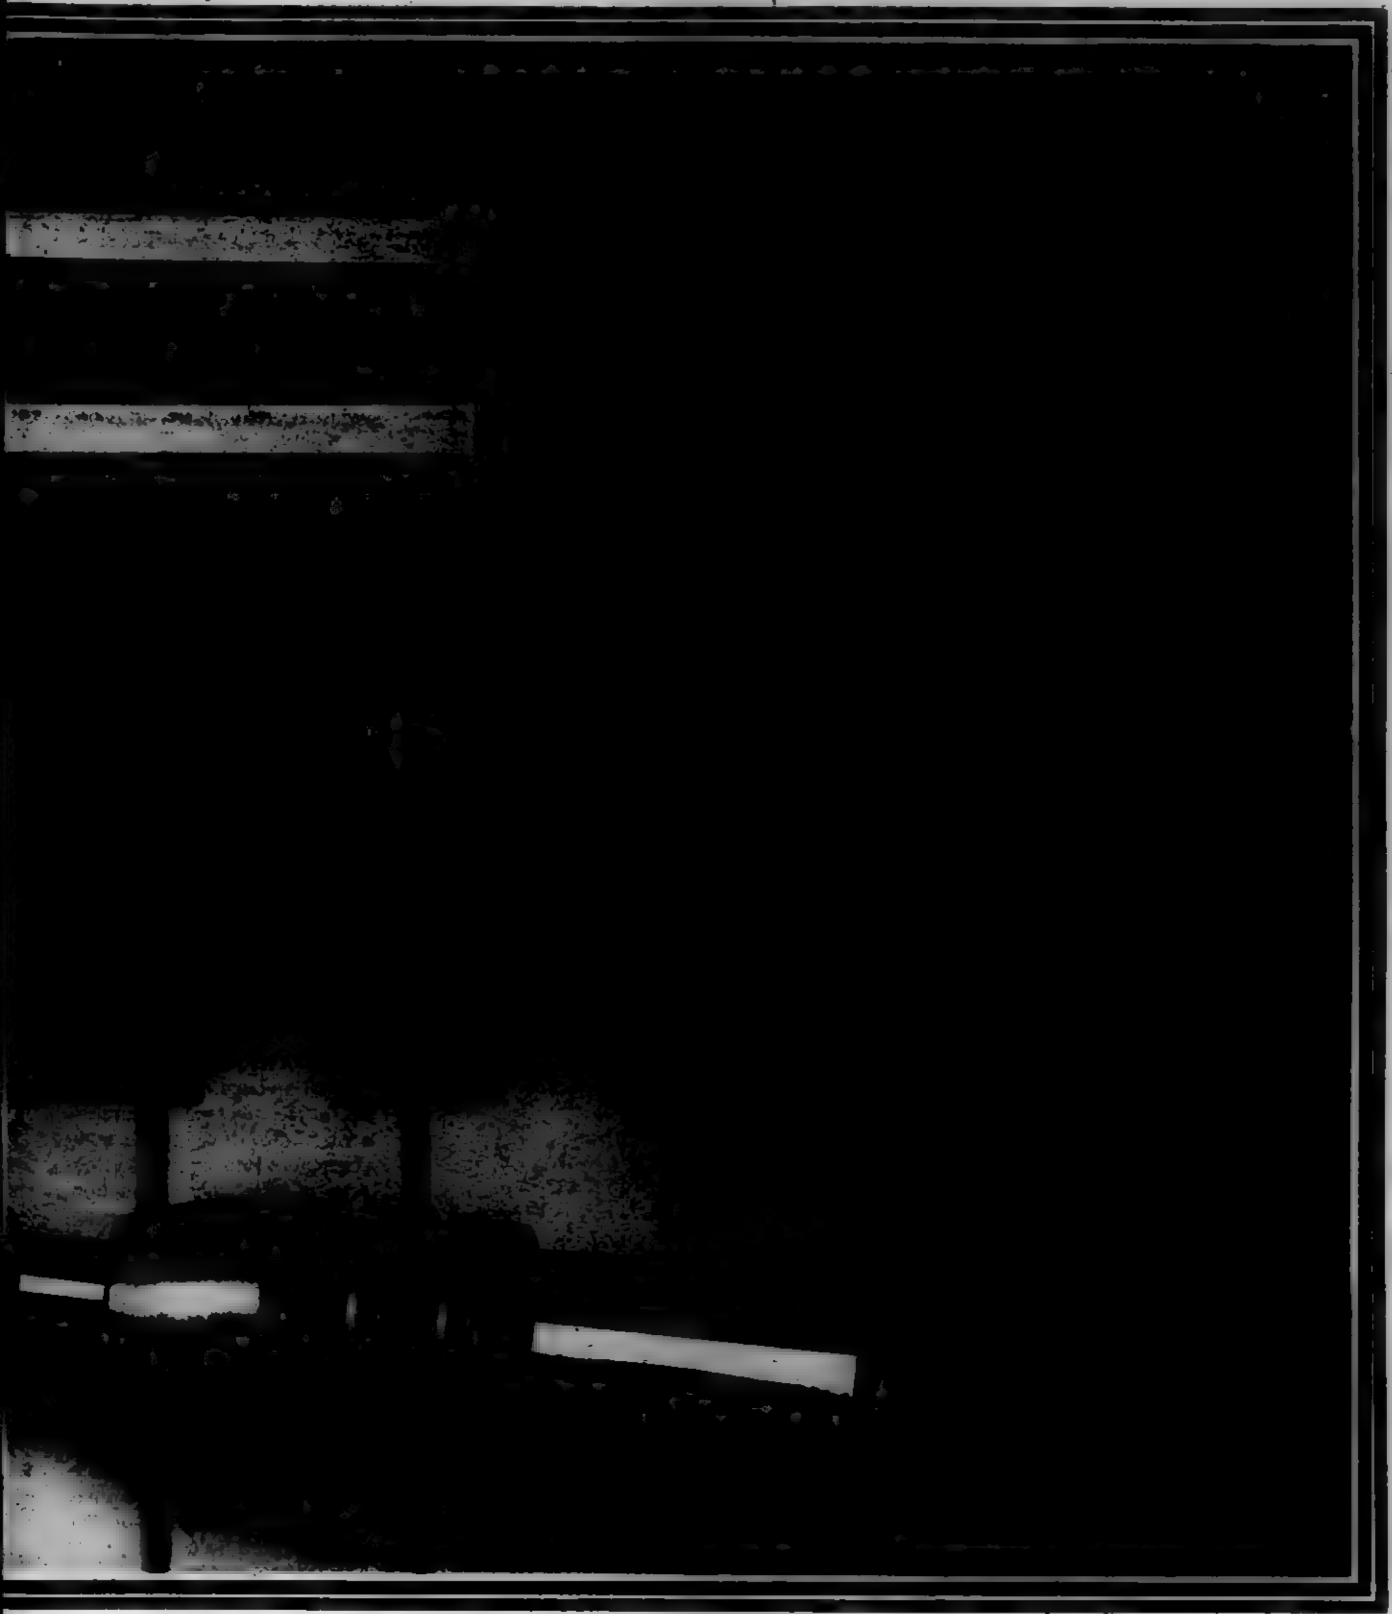
The Information Center And Productivity Tools: Working in Harmony

By Shaku Atre



The formal information center has celebrated its fifth birthday, and it can now be said that at least some of its promises have been kept. Because of the information center, users have, at least to some extent, become more self-sufficient. Their productivity, particularly in the area of decision making, has been bolstered. What have we learned in those five years? What should an information center offer if it is to increase users' productivity by making them more effective and efficient?

Information centers function within organizations as consulting and service facilities that enable departmental end users to access their data. Information is the analysis and synthesis of data, and company data is stored on hardware of many different shapes and forms. Mainframes, minicomputers and microcomputers all participate in making an information center a success, but the microcomputer is the major piece of hardware present in all information centers. Disguised as a personal computer, the long-sought-after multifunction workstation has arrived, and many experts are having trouble recognizing it. The workstation of today and tomorrow is not just an intelligent terminal — it is a brilliant one, and it will replace the dumb terminals in no time at all.

Meanwhile, however, the proliferation of 200 personal computer manufacturers, 800 models of personal computers and 30,000 software packages continues. For users, the old saying still holds true: "More is not necessarily better and less may sometimes be more." Today, three to four white-collar workers share one workstation, but by 1990, if predictions hold, the ratio of workstations to white-collar workers will be 1:1. In anticipation of that time, managers should make sure their information centers provide productivity tools in the form of hardware, software and applications to make workers more effective and then more efficient in their use of the workstation.

The many types of data processing that exist in organizations are there to make the organization more productive and, we hope, more profitable. Three levels of organizational support systems are depicted in Figure 1, Page 19. Today, the aggregate computing capacity of all personal computers now installed already exceeds by a wide margin the computing capacity of all installed IBM, Digital Equipment Corp., Burroughs Corp., Sperry Corp., Honeywell, Inc. and other mainframes. That statement, however, is only half the picture. Mainframes are used more than 90% of the 24-hour day, but most personal computers are used only discontinuously between the hours of nine to five. One simple way to increase return on investment is obvious: Promote sharing of partially idle personal computers.

Among the major productivity tools will be a mainframe-to-micro connection and, by the same token, the micro-to-micro connection. Software and communications (both remote and local) will provide more effectiveness and efficiency in addition to the powerful hardware at the workstation level. Remote communications, in the form of IBM's Systems Network Architecture (SNA) and X.25, will be an important ingredient, as will the local-area network. The compound electronic document of tomorrow will have as its major components data, text, image, graph and also voice.

With software and communications pulling in tandem to provide increased productivity, integrated software will become essential, and its key ingredients include financial software, word processing, record keeping, graphics, communications, educational programs and project management.

Why the need for software integration? How will it improve end users' productivity? In spite of the ever present talk about software integration, not everyone agrees on exactly what benefits are provided by integration. Three major areas of software integration stand out:

- Provision of a uniform user interface that makes the software easier to learn and use.
- Easier passage of data from one application to another so a minimum of redundant data needs to be stored and no cumbersome interruptions are necessary.
- Easier switching from one application to another (a poor person's parallel processing).

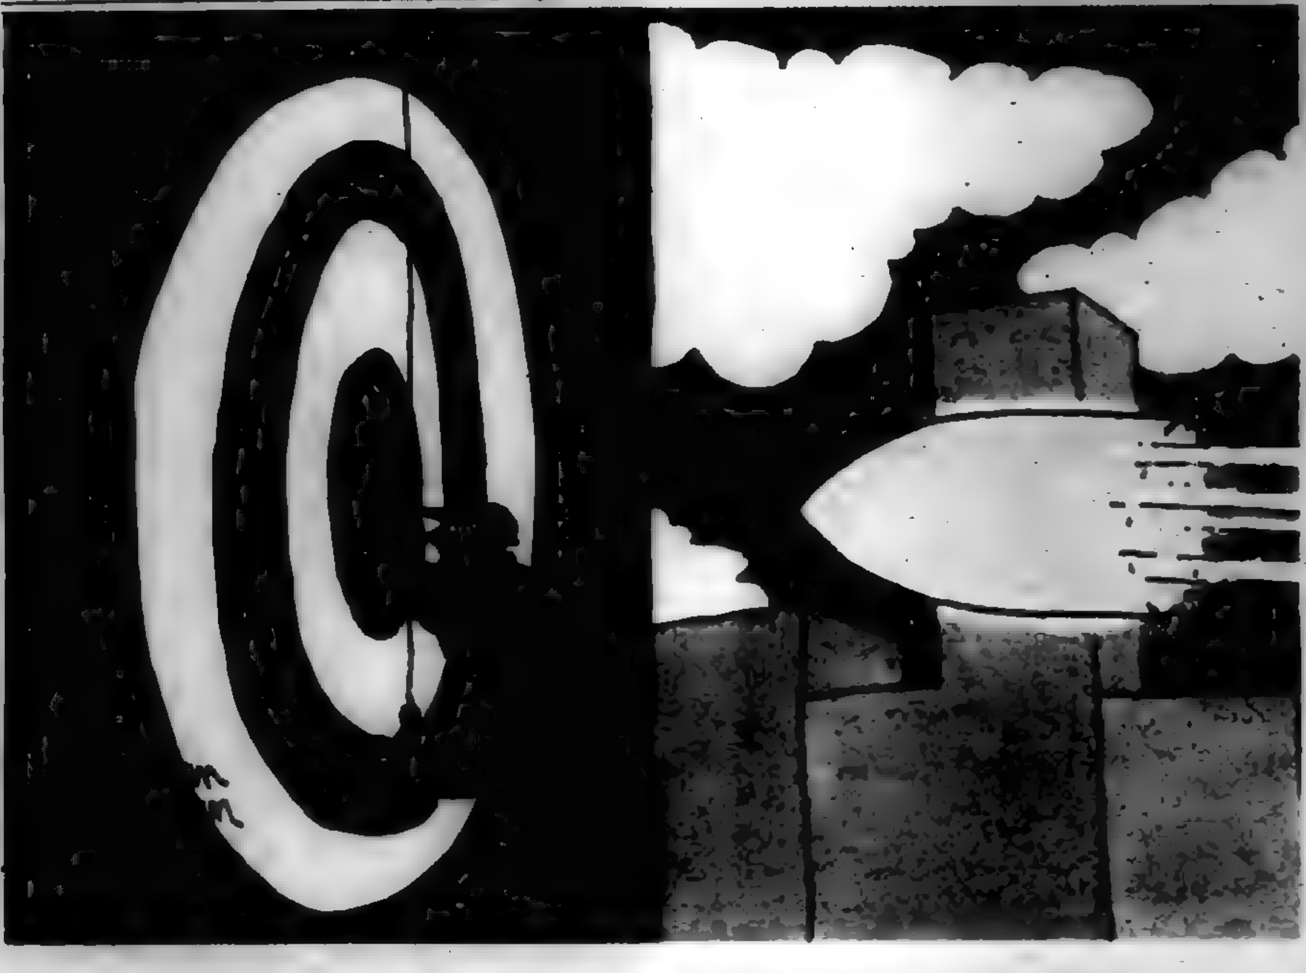
One simple way to increase ROI is obvious: Promote sharing of partially idle personal computers.

These communication powers will let an end user on one personal computer access data from another personal computer as well as from the mainframe. In future, personal computers are going to drive today's minicomputers into anonymity, obscurity and, finally, extinction. Data bases stored on mainframes and personal computers are competitive weapons for end-user productivity, if the data bases can be interrelated.

Data to be shared by various user groups should be stored in a data base, a collection of selected data about an enterprise with multiple users. The major theme of a data base management system (DBMS) is, then, the interrelatability of data. The question then becomes how the personal computers installed in an organisation can help the information center users gain access to interrelated data.

The architecture depicted in Figure 2 on Page 19 is one solution that can be implemented today. The customer master file (data base), which resides on the mainframe, could be managed by a mainframe DBMS, such as one of the following: Applied Data Research, Inc.'s Datacom/DB, Cincom Systems, Inc.'s TIS, Computer Corp. of America's Model-204, Cullinet Software, Inc.'s IDMS/R, IBM's IMS and DB2, Information Builders, Inc.'s Focus, Martin Marietta Data Systems, Inc.'s Ramis II and Software AG of North America, Inc.'s Adabas.

Extracts could be taken from the mainframe-based customer information file using the various data base vendors' corresponding products. The data



Some people just ask for trouble.

Isn't it amazing just how many people go around looking for trouble?

Why, we're willing to bet there are people in your DP department this very minute flirting with disaster.

They're running the risk of a JCL error, a network breakdown, or some other equally unpleasant catastrophe bringing the whole kit and caboodle to a screeching halt.

When all they have to do to keep things running smoothly is use one of our incredibly efficient software programs.

JCLCHECK™ software catches all JCL errors. And gives you complete, on-line validation and concise diagnostics. Plus full documentation on a job stream or entire production system, suitable for insertion in the run book.

The ProDict™ program puts time on your side. It's an automatic, on-line dictionary of all your production jobs, data sets and programs, that can save you the hours, days, even weeks now spent manually searching listings.

NetCheck™ software takes the stress out of taking control of your CICS network. It lets you organize your network into manageable groups with easy-to-remember names. It also lets you bring up the network in just minutes. And troubleshoot problems in seconds. So things get done faster, with you in control of your network—instead of the other way around.

All in all, our software programs offer a reliable, long-term solution for making life in the DP department a lot less troublesome.

Still, some people are destined to find these things out the hard way.

To that we can only add, better them than you.

Yes, I want to stop living dangerously. Send me details on:
☐ The JCLCHECK program.
☐ The ProDict program.
☐ The NetCheck program.
☐ Have a representative call me.

extracted from the file and downloaded from the mainframe can then be formatted for use within other personal computer products, such as Lotus Development Corp.'s 1-2-3 or Symphony. Users could then work with the data on their own personal computers, using products with which they are familiar.

Compatibility of the downloaded mainframe data with the personal computer products varies from vendor to vendor. The selection team from the information center will therefore have to be cautious in finding out whether any programming is needed to make the downloaded data compatible with spreadsheets and other types of software users have on the personal computer.

The promise of distributed DP made in the '70s can be delivered with today's personal computer architecture and the software made available for it in the organizational structure of the information center. User groups from finance, marketing, accounts receivable and accounts payable should be able to transfer data and applications between the mainframe and the personal computers without needing to know where their data is stored and how it is accessed.

One of the major concerns in the data base area is that redundantly stored data will have different updates on different personal computers. Triggered by IBM's certification that two types of DBMS (IMS for production and DB2 for end-user computing) are better than one, corporations have started exploring alternatives and/or supplements to their production DBMS. If no guidelines are set for duplication and access of data, the environment will come into disarray; data base, the productivity tool, will instead become data base, the menace.

The incompatibility of hardware and software on the levels of the mainframe and micro combined with the presence of multiple DBMS in a corporation means that environmental independence must be provided by some front-end facility. The front end to the various DBMS or different hardware systems should be designed to route requests — for data and responses — transparently between application programs. A single system image must be provided. Isn't that really a distributed data base environment? Which data base technology will provide all these capabilities?

Of all the DBMS tools, one type provides the most effectiveness: relational -

For a limited time 25% off regular price for ALL registered users of SSI's Emulator Transfer Utility (ETU). Call for details.

NEW for S/34-S/36 users

New there is a Practical Data Dictionary....

DATA DIALOGUE™ from **SOFTWARE SYSTEMS, INC.** (SSI) is a fast and easy way to get data from your IBM* S/34-S/36 into your PC-based spreadsheet or other PC application, and it works with SSI's Emulator Transfer Utility or IBM's file support utility.

DATA DIALOGUE™ is a powerful Data Dictionary Utility developed by **Software Systems, Inc.** that enables the IBM* S/34-S/36 to select and reformat data into ASCII, ASCII BASIC or DIF** formats for use in PC applications.

- **CONVENIENT** - select data items (fields) from S/34-S/36 files without the need for file names, types, access methods or record layouts.
- **POWERFUL** - Each Data Dictionary may contain data items from up to 10 files. An unlimited number of Data Dictionaries may be defined.
- **VERSATILE** - Access even the most complicated or non-standard S/34-S/36 files. Use it locally to select data input for custom applications or impromptu report programs.
- **FAST** - written in S/34-S/36 assembler for fast-execution with minimum overhead.
- **FLEXIBLE** - Alter data selection criteria at runtime with variables stored in the LDA or in procedure parameters.
- **PRACTICAL** - Requires only minimal amount of CPU resources and costs only $1250 for S/36 and $995 for S/34.

data base technology. Relational systems offer the most flexibility in responding to the unanticipated requests of end users as well as the capability of implementing the never-ending changes of the business world. The integrated tool that will provide the most productivity to the end user will consist of a number of technologies, as depicted in Figure 3.

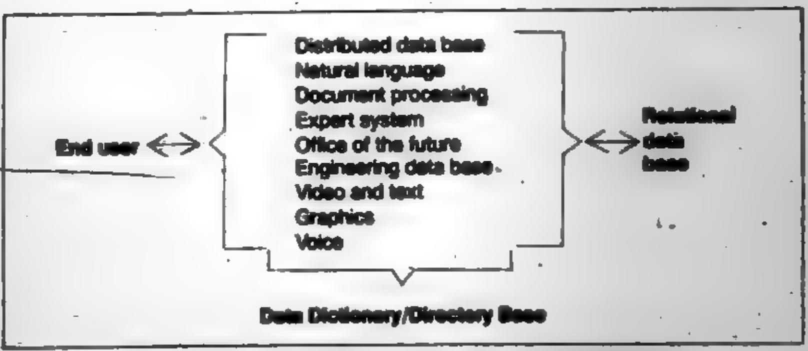

Figure 3. Integrated Productivity Tool For End Users

With the distributed data base technology to achieve the productivity gains to the fullest extent possible, the following guidelines should be established for mainframe-micro connection:

- Microcomputing is not a fad. It is here to stay. Establish guidelines for acquisition of microcomputer hardware, software and applications. An in-house computer store may not be cost-effective.
- Capacity planning for mainframes will be a losing game. Establish charging guidelines.
- Downloading and uploading of data is still in its infancy. Establish guidelines for volume of data to be transferred as well as the time frames for transfer.
- Establish backup, recovery and security guidelines for floppy diskettes as well as for downloading and uploading.
- Establish guidelines for providing integrity of data on mainframes if the downloaded data on microcomputers will be stored redundantly.
- Acquire workstations with communications in mind for mainframe-micro connection as well as micro-micro connection.

In summary, the types of productivity tools that should be provided in the information center are the following:

- A menu-driven professional office management tool that allows for sending and receiving notes; comparing, proofreading and distributing documents electronically; scheduling meetings with other users; accessing information center announcements; maintaining a personal calendar; and performing many other management activities.
- Analysis, design and validation tools for application development.
- A data dictionary directory supporting all phases — design, coding, testing and production.
- A full-screen editor integrating graphics and WP.
- Management tools for project planning, control and teaching.
- An on-line data base of software designs and programs.
- Multiuser support.
- Computer-based training with an attractive medium like interactive video disk.
- Prototyping capabilities.
- Spreadsheet software that puts checks in the results for validity and prepares documentation.
- Comfortable keyboards (some companies like Key Tronic Corp. and Wico, for example, have made more advanced keyboards).
- High-capacity hard disk (if the end user thinks 10M bytes is more than plenty on a PC-XT, just wait six more months).
- Charge-back software (not too complicated).
- Electric-surge preventer.
- Backup utility
- Correspondence quality and graphics capabilities in one printer
- Office desks (with personal computers in mind) with special construction for personal computers, hard disk and keyboard — and above all, designed with aesthetics in mind so that cluttered wires can be hidden.

One warning about purchasing these productivity tools: the software is advertised only with buzz words. Some industry buzz words that seem to be used for most microcomputer software are *integrated*, *user-friendly*, *relational*, *data base management system*, *menu-driven* and, of course, *PC-compatible*.

The explosion of personal computer technology will not only bring us application programming without application programmers, it will have another effect. We are all going to be application programmers — just as we have all become telephone operators. Firms developing information-based products must choose application development environments that satisfy conflicting demands of easily operated software for end users and application development power for programmers. DP professionals will do applications programming side by side with end users, but on micros instead of on mainframes.

The information center, which will be a utility facility, will be taken for granted, in the same way we now take for granted electric power and water.‡

With The
Introduction Of SUPRA™,
The Full Potential Of
Relational
DBMS Technology
Has Just Been
Delivered.

Relational

The potential of relational DBMS technology is enormous.

And as a software company that has invested lots of time and money into the development of relational technology, we take exception to those software vendors that are giving relational technology a bad name.

You know the ones.

They spend millions of dollars in advertising trying to tell you their systems are relational. In reality, they are nothing more than incomplete relational caps on old hierarchical, network or inverted list systems.

If you believe as we do, that the time has come for someone to deliver the full potential of relational technology, we have good news.

Someone has.

Advanced Relational

**The New Cincom Systems
Is Proud To Introduce The All New
SUPRA™, The Advanced Relational DBMS.**

Instead of putting our eggs into the advertising basket, we invested our millions into seven years of research and engineering.

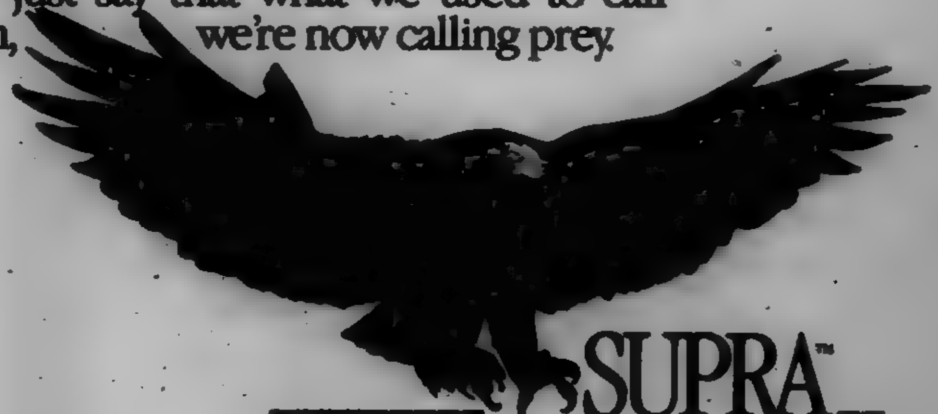
The result of our patience is the innovative *three-schema architecture.* This new approach to relational data management allows SUPRA to fly high above and go far beyond any other relational system now on the market.

SUPRA delivers simple, easy access. SUPRA delivers unsurpassed data integrity. SUPRA delivers implementation ease like you've never seen. And SUPRA is available now.

We invite you to compare SUPRA to any relational system, or so called relational system, you may now be considering.

Are we really that confident in SUPRA?

Well, let's just say that what we used to call competition, we're now calling prey.



SUPRA™

Attention: Marketing Services Dept.

Transforming The Data Center

Systems software is changing the data center's capabilities, just as the data center changed companies' information needs. The new role for the data center will help everyone.

By Russel M. Artzt

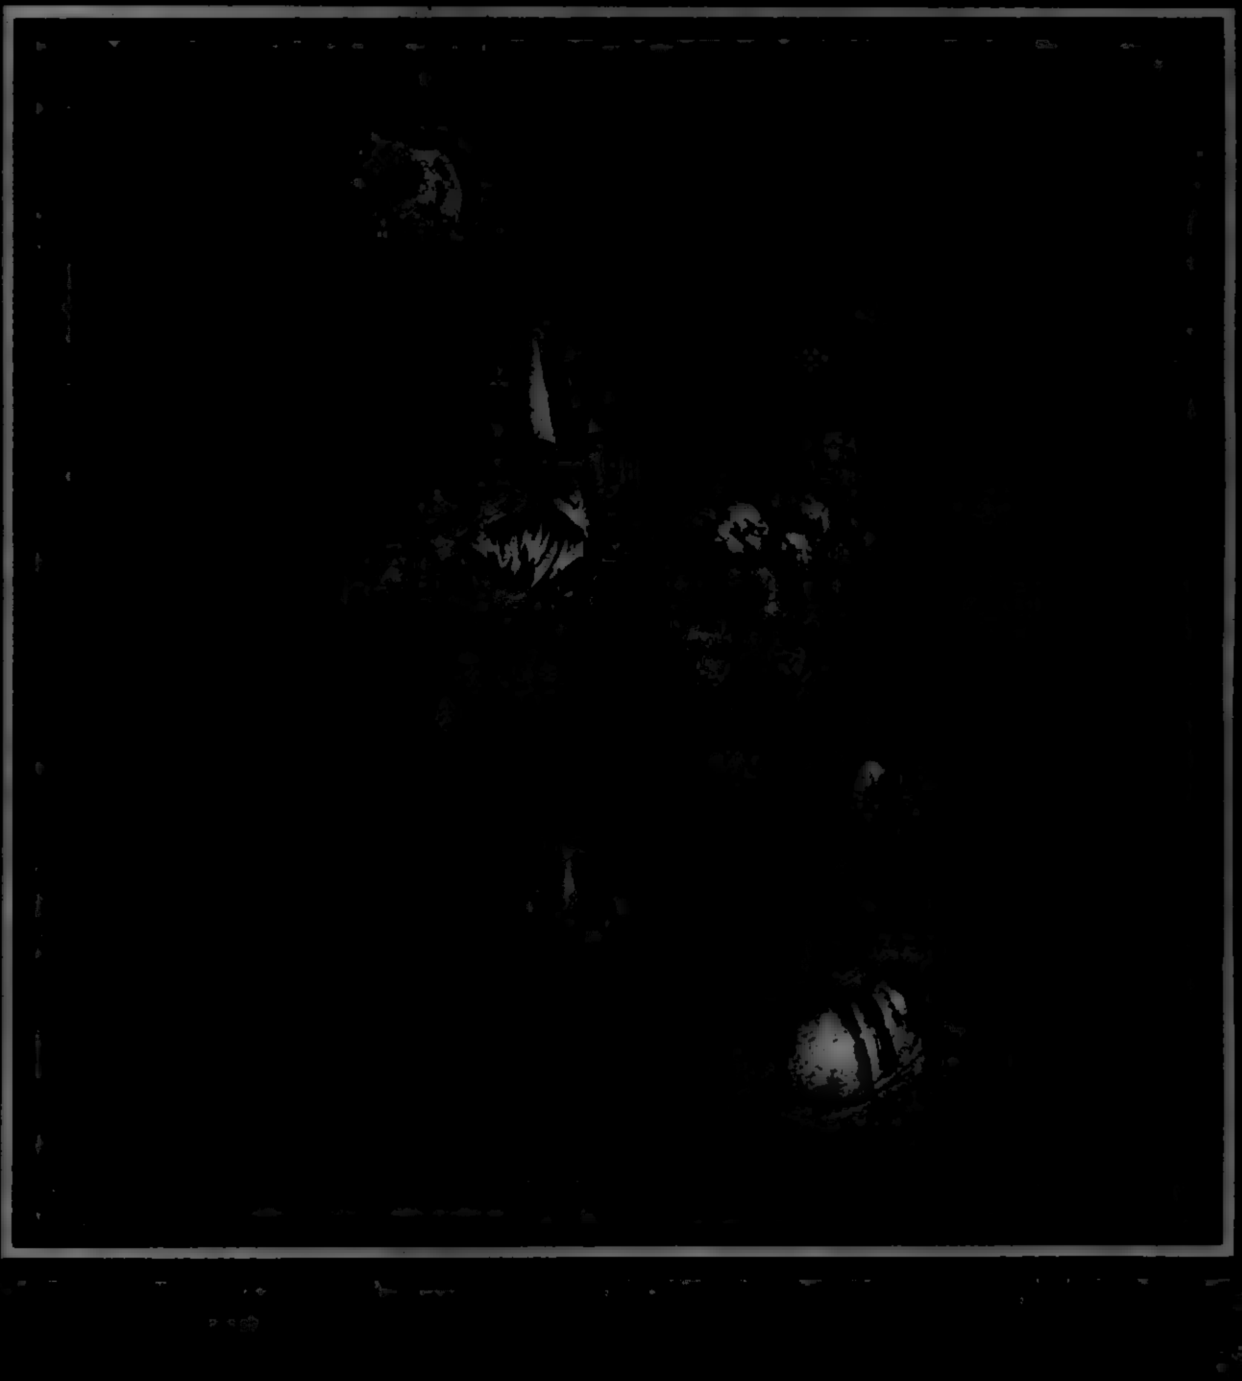
Get ready for another transformation. A movement is now under way to automate the data center and, if it's successful, it will transform the way the data center operates, just as the data center's automation of the corporation transformed the way companies do business. This time, however, the catalyst will be advanced systems software.

Although sophisticated software programs have been used to automate user departments, even the programming departments of many data centers have yet to adopt specialized software to improve their own operations. Jobs are initiated, scheduled and controlled manually from input to output, causing a tremendous loss of time and increasing the chance for errors. The data center's two most valuable resources — computers and people — are wasted.

Data center efficiency is an intrinsic part of the corporate competitive edge, and automation can sharpen that edge. The increasing complexity of data processing, economic constraints on the corporate DP investment and the corporation's own dependence on the data center require sophisticated management solutions and the technology to support those programs.

There was a time when management — and even the DP department — did not realize the importance of the DP function. That attitude was reflected in the way the data center operated. Today, however, data centers across the nation are responding to more advanced needs, both within the center and from the corporation. Today's systems software should meet those needs by offering the data center the same capabilities — streamlined service, support and training — that applications software offered to end users.

Although it has taken vendors many years to produce the right kind of systems software to automate the data center, the concept is not new. The first software for operations, in the mid-1960s, addressed questions such as: How do



we avoid wasting CPU time? Why must processing operations stop while the operator loads another tape? How do we avoid destroying vital data?

These questions gave birth to the concept of multiprogramming, designed to maximize machine usage. However, hardware vendors most often addressed this problem by adding more hardware at a time when mainframe hardware costs were extremely high. The systems software vendors did develop to provide the interface between man and machine came bundled with the hardware.

Independent vendors' existence depended on good software, and they helped users understand the additional freedom and power purchased systems software could give them in designing applications and streamlining the data center. When hardware vendors unbundled software from hardware pricing in 1969, the concept of automating the data center began to grow, as did independent systems software vendors.

On the applications side, independent vendors were successful in end-user departments because of the economies realized through using packaged software. Nevertheless, the data center was not viewed as a user department. The inital steps toward automating the data center took the form of filling the gaps left in the operating systems with systems software designed to solve immediate problems.

Software systems must be designed as one comprehensive package that would let data center managers anticipate and plan work loads.

Before the advent of packaged programs for these areas, data center managers' choices were limited: maintain the status quo and lose all opportunity to gain control of data; hire more people to execute these tasks manually; or develop software internally to manage these functions, a prospect that could take many staff years before it would be able to be fully operational.

The first software packages produced by independent vendors in the early 1970s addressed these problems individually and narrowly. The real impact on software development didn't occur until the mid- to late 1970s, when several events began the process of automating data center operations:

- Drive to maintain competitive positioning: Business needed a more immediate access method to enormous amounts of data to maintain a competitive position. When on-line processing was introduced, the problems of disk space availability and managing that space became important.
- Need for data security and management accountability: Federal laws and regulations made top management in companies directly accountable for the proper use of data, and data security measures then became critical needs.
- Growth of concern by senior management: Corporate management no longer regarded DP as magic. As executives became aware of the risk and impact of poor data center management on their businesses, they began to promote professional management techniques in the data center.

Several key technological events also contributed to the development of systems software, which puts the DP manager in control of data center resources. Introduction of on-line processing spurred growth of the permanent disk to hold current information. Corporations have recently expanded direct access storage device (DASD) capacity by more than 50% annually. Although managing DASD space has become a necessity, it is still handled manually, resulting in misused and wasted resources. In addition, transferring data from disk to tape for storage creates file management problems.

Software has been developed to provide efficient use of DASD and often helps to delay or avoid the unnecessary purchase of additional disk packs or conversion to larger hardware systems. Time formerly spent on manually allocating disk space can now be spent on more productive tasks, increasing operator efficiency. By integrating DASD management with tape library management, software allows data sets that aren't used frequently to be archived, providing better security and increasing usable DASD space. Among the benefits systems software packages brought to disk space and/or tape management systems are the following:

- Up to 30% of the disk space capacity in a disk-oriented installation has been freed, and tape processing throughput has been increased by as much as 30% in tape installations.
- Data files have been made more secure by protecting them against accidental loss of vital data and preventing unauthorized access to sensitive files.
- Management of peripheral resources has been improved by eliminating reruns, freeing up tape drives and increasing usable DASD space.
- The manual process of tape library and disk storage management has been replaced by fully automatic functions.

By providing the means to understand exactly how the DP resources have been and are being used, management can examine the performance of each hardware component that makes up the computer system and analyze the performance of all jobs being run.

Performance measurement tools promote greater control of hardware resources by providing historic data on computer use; providing an on-line computer job accounting facility and the ability to bill corporate departments for services rendered; serving as a diagnostic tool to see inside the computer to see how jobs compete with each other for resources; and enabling the user to diagnose the performance of an individual program. Other factors also influenced the creation of systems software to automate the data center. Corporate concern for disaster recovery spurred contingency planning by data center managers and software development to address this need. The DASD and tape/disk management facilities fill some requirements for disaster recovery by automatically ensuring that critical data files are backed up in a vault or off site.

Job documentation in advanced software should automate disaster recovery by creating vital operational documentation that would take hours by any other means. It should automate the process by centralizing job documentation and offer full support for disaster recovery plans.

Recent software developments not only provide an additional level of security in addition to the usual passwords and access codes to protect resources, they also audit access to them. These packages should allow a user to place any desired level of security on any of the data center resources, terminals, files or tape volumes.

Today, a single piece of software can plan and schedule the production work load automatically, forecasting potential bottlenecks and evaluating alternatives to use the resources better. Scheduling software that has been designed to communicate with other areas of the operation, such as disk space management, can play a role in preparing data needed for upcoming jobs.

When initially introduced, most of the systems described here were aimed largely at solving critical problems in a mutually exclusive way. The industry is now moving into an era where software systems must be designed as one comprehensive package that would give data center managers the means to anticipate and plan their work loads and achieve new levels of productivity.

A few intangible features are still required to complete today's state-of-the-art products. These features are automated service and support, more effective education and training techniques and closer ties to software vendors. Service and support constitute a very large issue for data center managers. Vendors in the business of providing to clients a product as important as information accessibility will find that service has to be a major component of the product mix. It is as important as any line of code.

Computers and software are obviously the effective way to track and maintain such an extensive service operation. Vendors will have to become more responsive and innovative in providing service and support, as corporate management increasingly recognizes the importance of the data center's role in total corporate performance.

Artzi is senior vice-president for development at Computer Associates International, a software firm in Jericho, N.Y.

Multitasking Operating Systems - Is The Contest Already Over?

The tug-of-war among vendors of multitasking operating systems seems to be reaching its end. Is Unix the big winner for the '80s? Perhaps the real question is: Is there a contest?

By Lee White

The tug of war taking place among operating systems and their various proponents may soon be at an end.

Not all operating systems are involved in the contest, of course. In the large mainframe/management information systems world, operating systems are defined by the vendor, with the user silently acquiescing. Examples of vendor-defined mainframe operating systems are IBM's VM and MVS and Digital Equipment Corp.'s VMS. In the stand-alone microcomputer arena, the now accepted standard is Microsoft Corp.'s MS-DOS. The third category is the networked microcomputer or supermicro. Its operating system, and the only battle left, really, is Unix.

What differentiates the third category from the other two is the fact that it is user-driven. According to Frank Zehna, president of AIM Technology, Inc. in Santa Clara, Calif., the driving forces behind the Unix standard are the scientific/engineering community, the federal government and the aerospace industry. Now that Unix has become a big player, bid specifications name Unix as the operating system. Vendors that cannot offer Unix-based hardware are effectively cut out of the bidding process, which most can ill afford.

Zehna even takes the Unix standard a step further; he insisted the Unix that will drive the marketplace will be AT&T's Unix System V. This would seem contrary to DEC's direction; DEC has released the revolutionary Microvax II, which runs Berkeley Unix (also known as 4.2). Zehna had high praise for the Microvax II but suggested DEC will probably change direction from the Berkeley version to System V. "DEC is in the same position every other supplier is in. In order to bid [on federal contracts], you have to bid what's compatible, and that's System V." In fact, the next release planned for System V (February 1986) will include most of the Berkeley enhancements, according to Zehna, which in his opinion further fosters the migration path toward one standard. "You can't fight that. You can try, but you're going to lose," Zehna explained.

Katie Klosterman, market research supervisor at International Data Corp./Yates, said that, from the pure Unix standpoint, there won't be any fight to lose. In many ways Unix is the answer to a maiden's dream. As far as vendors that sell products to the Unix environment, switching from machine to machine, even among different Unix systems, takes at most a day to port. "Although the marketplace is standardizing now on System V, it's kind of a moot point." Klosterman said. She cited Apollo Computer, Inc.'s Domain/IX workstation, which runs its own proprietary operating system, Berkeley 4.2 and System V alongside each other. "You can actually run a program that calls for commands in 4.2, then calls for commands in V, and it will recognize either one. If [the user] likes a couple of 4.2 commands but knows V intimately, [the user] can use those 4.2 commands and still work basically in V," Klosterman said.

Klosterman sees more compatibility down the road, but tempered her comments with some realities. Among her predictions was the demise of Berkeley Unix. Even California-based Sun Microsystems, Inc., whose Bill Joy is the father of Berkeley Unix, has come out in support of System V recently, she said. Sun is about to announce 4.3, which Klosterman has heard is not even compatible with the 4.2 version.

Mark Hatch, Unix product manager at Apollo, agreed that eventually System V will be *the* Unix, having borrowed more and more features from Berkeley 4.2.

He predicted that when AT&T comes out with the next release of System V, it will contain heterogeneous networking capabilities that will "leapfrog Berkeley." Hatch cautioned, however, that Berkeley is a large force in the engineering community, and its demise is unlikely in the short term.

The end will probably come because of AT&T's superior funding. "When that time comes, 4.2 will probably fade into the sunset," he said.

What is not expected to fade off into the sunset is Microsoft, Inc.'s Xenix, a Unix-like system that IBM has chosen as the multiuser, multitasking operating system for the IBM Personal Computer AT.

According to Bruce Steinberg, marketing communications manager for The Santa Cruz Operation in Santa Cruz, Calif., there are more Xenix installations worldwide than all the Unix installations together. Steinberg described Berkeley 4.2 as "a kind of utility. It's just there. It's been there for a long time; places that already have it will probably stay with it."

Giving Berkeley its due as a "niche" Unix, users are still left wondering whether the real tug of war, when and if it comes, will be between Unix System V and Xenix. Not a chance, according to Steinberg, who explained that

(Continued on Page 29)

. . . And In This Corner . . .

When Unix hit the streets, users rejoiced at the prospect that compatibility and portability might be, at least to some extent, just around the corner. It now appears, however, that instead of compatibility, vendors are modifying, refining, even reinventing the wheel. Most often the reasoning behind such actions is the creation of a better product.

Such was the case with Multi Solutions, Inc., of Lawrenceville, N.J., creators of the Unix-like S1 operating system. Brought to the market in early 1984, S1 claimed portability across 8-bit to 32-bit microprocessors, support for up to 256 parallel processors, the ability to read and write files to and from most microcomputer operating systems and machine independence.

S1 was written in a high-level language called SL, developed by Robert R. Knight, a former professor at Princeton University. According to Patricia McMahon, marketing support manager at Multi Solutions, Knight came from a heavy mainframe environment but did most of his consulting work on the Z80 microprocessor. Knight knew the Z80's days were numbered. He also wanted the mainframe functionality he was used to.

Knight began work on a language he hoped would lead to an operating system that would provide the advantages of the mainframe, the better facets of Unix and none of the disadvantages of existing microcomputer operating systems. "He took the ideas of C and refined it to what I think [the developers] were trying to make C," McMahon said.

Knight's SL made possible the creation of S1. In addition to the features of portability and compatibility, McMahon claimed that with S1, a system can be running on a totally new chip architecture within six months. Among the distinguishing features of S1 are the interfaces within the self-contained modules or subsystem which have no necessary interdependence upon each other. This is particularly important, McMahon said, to the computer hardware manufacturer interested not only in the business market, but also in the engineering/scientific and home computer communities.

Multi Solutions and other Unix-like development organizations must answer two questions that are much more interdependent than the subsystems within S1. The first question is just as important to Microsoft and AT&T as it is to Multi Solutions: Is Unix going to become the operating system of choice for more than the engineering and academic world?

The second question? In the face of standardization on System V, which seems a fait accompli, is there a place for the maverick multitasking, multiuser operating system?

In November 1984, Multi Solutions entered into an exclusive five-year agreement with Computer Engineering and Consulting Ltd. of Tokyo to license and distribute the S1 operating system to Japanese companies. This agreement will guarantee Multi Solutions a minimum of $40 million over the life of the agreement.

The same month, Multi Solutions announced it had signed a licensing and distribution agreement with Entronix AB, a Swedish company and member of the Ventronic Venture Electronic AB group. Under this three-year agreement, Entronix B would market the S1 operating system with its line of VME Bus 68000 computers worldwide. However, to date, no major computer hardware companies in the U.S. have adopted the S1 operating system.

McMahon is sure that Multi Solutions and its S1 operating system have a long and profitable future. She cited its superiority to Unix as the key to its success. "Unix doesn't have the real-time capability in any one system and it doesn't have the networking capabilities that are necessary, either," she insisted.

Management at Multi Solutions has taken its confidence a step further and has formed a company that will write applications software for S1.

Whether the upbeat mood at Multi Solutions continues depends to a great extent on whether true Unix itself becomes a standard operating system. If so, specialized Unix clones, even incompatible ones, might find their niche markets.

ROUTING SLIP
TO: Programmers & Word Processors
For your attention and action!

Programmers and Word Processors like and use the Print Position Aid®
because it helps them in their work.

Check (✓) These Print Position Aid® Features:
- ✓ The PPA® consists of 6 transparent grid overlays which meet programming and word processing needs.
- ✓ These overlays cover the needs for printing 6 or 8 lines per vertical inch.
- ✓ The 15 inch wide grids of the PPA® help in locating either 10 - 12 - 15 characters per horizontal inch. Pica spacing is also included.
- ✓ In addition print location finders for Word Processors are provided. Matrix printing space lines for 5 - 6 - 8.3 - 16.7 - 17.1 - and 20 characters per inch are included.
- ✓ Because the PPA is useful to Programmers and Word Processors it has been called the "All In One" Print Position Aid®.
- ✓ The template overlays are arranged in a manner which allows the user to locate print positions against a soft yellow background to help reduce eyestrain.
- ✓ The cost of this totally self-contained unit is $49.95.

Now with this PRINT POSITION AID®
Programmers and Word Processors can locate their
print position more quickly and easily.

$49.95

bringing a Unix-like system on board involves two steps: certification and verification. If a piece of software is multiuser and multitasking and has all the functionality of System V, it fits the System V verification definition. Certification, on the other hand, means that an operating system is true Unix. Within a month, Steinberg said, Xenix is going to be System V.

Steinberg sees a coming together of the Unix/Xenix camps. Xenix, which was based on Unix System III, is merely a refinement of the original, he said. If there was confusion, it had to do with the fact that AT&T put large amounts of money into advertising System V, while not acknowledging that Xenix ran on its own 6300, he added.

The phrase Unix war is a concept to be avoided at the risk of alienating users, according to Steinberg. "It was more like a crusade which was not exactly circumvented by the approach to the market taken by AT&T and Microsoft and a whole bunch of other vendors that were still trying to find a market niche for their own systems. Historically, the lack of definition tended to fragment the market."

But is the glorious visual of AT&T and IBM locked in passionate embrace enough to give microcomputer users everywhere that warm and toasty feeling? Hardly. Some very hard questions still remain unanswered.

The first question has to do with Lotus Development Corp.'s 1-2-3. There are millions of Lotus files out there in corporate America, happily residing on floppy and hard disks on IBM PCs, PC XTs, PC ATs and PC-compatibles running MS- or PC-DOS 2.0 through 3.1. What happens to all these Lotus files with a new operating system?

A high-level manager at an organization whose mission is to develop Unix applications stated that his group is well aware that Lotus drives the micro market right now. "The issue is not whether you're dealing with Lotus 1-2-3 but whether you're dealing with 1-2-3 functionality, whether you're dealing with systems that can read 1-2-3 files, whether you're dealing with a system that has exactly the same interface as 1-2-3. That issue is fully acknowledged, but it's a little sensitive right now."

The second question is whether marketers in Unix-land can overcome objections to Unix as an unfriendly operating system. Steinberg sees this objection as a smoke screen, stating only people who came up through the system really care about operating systems, anyway. DOS was seen as a friendly system only because it was accompanied by a lot of friendly applications, he said. Unix "has allowed itself to wallow in its reputation of being a very deep and arcane system. A good operating system will be invisible to the user and will be very friendly to the application," concluded Steinberg.

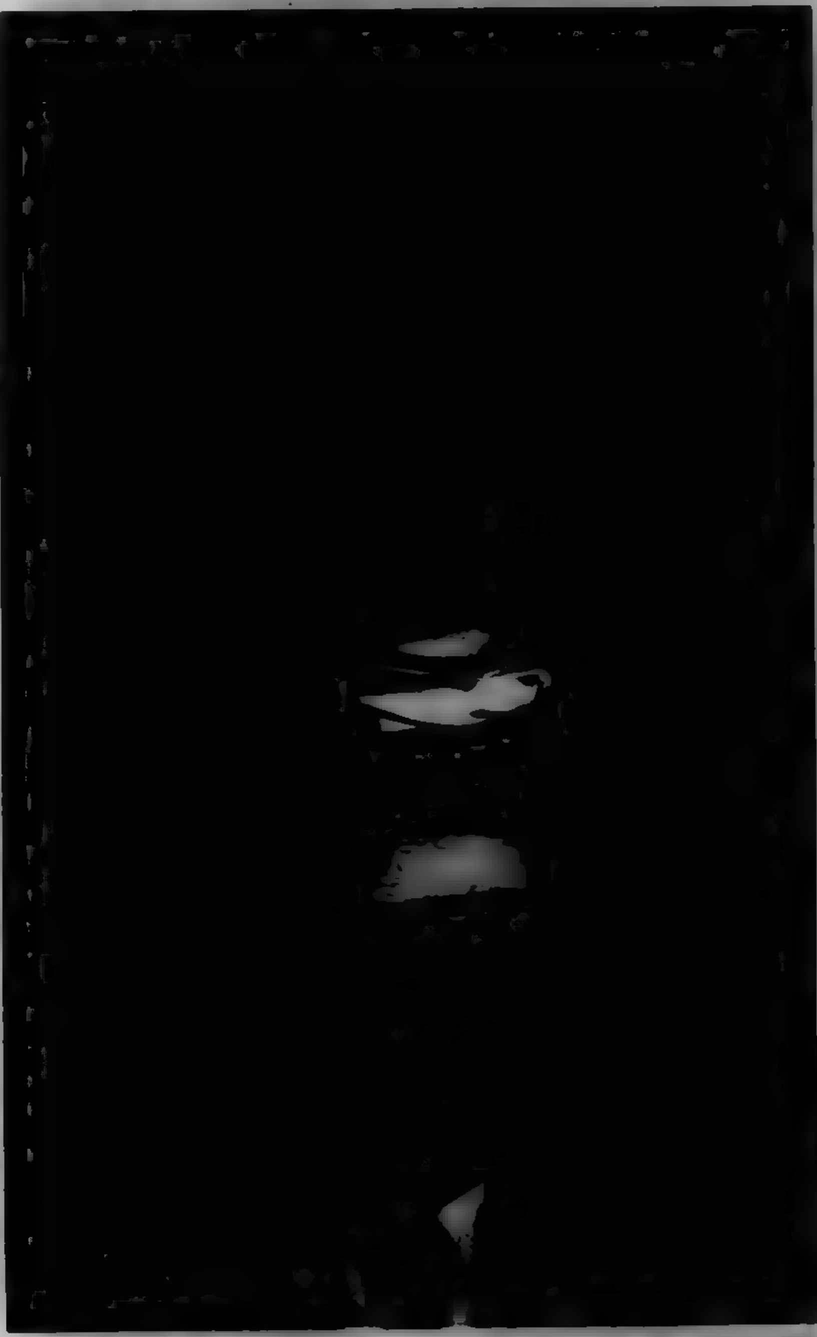
The third and final question, and one in the mind of most MIS professionals, may be the most important of all. What, in the near- and long-term, will Unix contribute to making computing easier and better, resulting in a bottom line strategic and competitive edge? If a Unix or Unix-like operating system will allow MIS departments to switch hardware on a ad hoc basis; decrease the amount of programming time necessary to develop and refine applications; and at the same time allow the micro-, mini- and mainframe computers to function as a unit in a true networked environment, then Unix will indeed succeed.

It would seem that Microsoft and AT&T's mission would be to listen to the user community and respond to that group's needs. Things really aren't too bad on the end-user computing front right now. Applications software houses have been responsive and the grumblings have quieted. Users will have to be convinced Unix will give them something they really need. If this is not done, the Unix crusade will be more like, "What if they gave a war and nobody came."

■

White is a senior writer at Computerworld Focus.

Looking for the first CICS applications development tool that's as versatile as you are?



As a data processing manager, you wear a lot of different hats. Constantly balancing programmer resources, machine resources and time demands to get your different jobs done.

That's why you need CONSENSUS™ from Martin Marietta Data Systems. The first on-line applications development tool to let you develop applications three different ways and in whatever operating environment you choose.

With CONSENSUS, you can develop applications in COBOL and in 4GL procedural and non-procedural languages. CONSENSUS accesses almost every popular database and lets you develop in CICS, CMS, VM/PC or batch environments. And, most importantly, all CONSENSUS components are compatible with one another and with existing applications.

CONSENSUS is truly a breakthrough product. One which can change the way you develop CICS applications. It's another of Martin Marietta's Natural Selection© products—an interrelated family of products that work with an extraordinary variety of machines, environments, applications needs and degree of user sophistication.

If you thought you'd never find an applications development tool that's as versatile as you are, you're in for a nice surprise.

It's ready now.

Call 1-800-257-6171 today!

MARTIN MARIETTA

Martin Marietta's CONSENSUS. We're ready now.

With over 100,000 boards already in place, few would argue that IRMA™ has become the standard in micro-to-mainframe communication links in the 3270 environment.

Especially since IRMA's grown into a family of compatible hardware and software products.

Now IRMA's family is about to grow once again. Introducing IRMAlink/Windows™.

IRMAlink/Windows is an inexpensive and easy-to-use software product that gives the PC user the ability to display a single host session and a PC session on the screen at the very same

Now IRMA even does windows.

time. No flipping back and forth between the PC and the host sessions.

With DCA's host-based software speed you'll be able to transfer files from the mainframe in background mode while working in PC mode. Which will help you increase your productivity.

Find out more about IRMAlink/Windows.
Just call 1-800-241-IRMA. Telex 261375 DCA UR.

Remember when it used to take days to get your message across, and, when it finally did get there you were never sure if it ever got read?

SoftMail® is the complete electronic mail system for your IBM mainframe that will tie up all these loose ends in a neat package. SoftMail® operates under CICS, DOS/VSE, VS1 and MVS. Just look at all these features:

- ➢ Completely Menu Driven
- ➢ Urgent Priority Messages
- ➢ Powerful Text Editor
- ➢ Annotate Documents
- ➢ File Folders
- ➢ Personal Diary
- ➢ Meeting Scheduler
- ➢ Print Messages
- ➢ Extensive On-line Help Facility
- ➢ Mail Notification
- ➢ Archiving
- ➢ Extensive Security
- ➢ Distribution Lists
- ➢ General and Daily Notepad
- ➢ Unavailability Log
- ➢ Multi-language Support

and many more useful features.

To see SoftMail® in action call 1-800-FOR-DEMO or mail the coupon today. We will rush you an interactive demonstration diskette.

Other H&M Software products include: SoftMenu – menu driver, SoftScript – intelligent word processor, SoftPlan – electronic spreadsheet, KEYFAST – the most advanced data entry, DATAPACKER – line compression, MFAST – screen definition, CFAST – query system, VBOMP – DBOMP-compatible data base.

☐ Send Demo Diskette for IBM/PC

☐ Send Info ☐ Have Salesperson call

Topview — Marvel or Mishap?

IBM's Topview has not turned out to be what users were led to expect. What's wrong with this much-touted software? Can Topview be made viable, or is it just a Big Blue mistake?

By Morton Rosenthal

Integrated software packages have not prevailed on the personal computer because they're not the true answer to integration. By trying to be all things to all people, most integrated packages offer a set of compromises that fail to meet the needs of most users who run more than a single application on the personal computer.

What these users really need is an integrating environment that will allow them to combine their favorite stand-alone programs into a single integrated system. The ideal integrating environment would let multiple-application personal computer users start a program, quit the program and start another without losing their place, transfer data among programs and even have programs run concurrently.

Sensing this need in the marketplace, IBM recently introduced Topview to do all the things an integrating environment should do. And nobody likes it.

Most people who have tried Topview have concluded the product is virtually unusable in its present form. What's wrong with Topview? Let us count the ways in which IBM went wrong.

Topview requires too much memory. It won't run most programs in background. Even when it can run a program in background, it can't drive a printer from background. It doesn't handle bit-mapped graphics. It allows file transfer among programs only if the receiving program has been written to be compatible with this feature. It requires the user to set up a

Program Information File for each program it runs, but the user may or may not have the information to do so. It doesn't run DOS batch files, and it's slow.

In spite of all its problems, however, Topview makes a lot of sense. Pretend for a minute that Topview does what it's supposed to do. After selecting the best of the stand-alone programs, you could use Topview to integrate them into a single system. Topview would let you run a program by opening a window on the display, and you could switch to a new program merely by opening a second window. You could return to an application at exactly the point where you left off, or you could let the application run in the background until you returned to it. The foreground program could occupy the full screen, or you could simultaneously look at multiple programs running in multiple windows.

These capabilities are powerful and IBM is certainly on the right track in thinking that any software that can effectively provide such capabilities is sure to be a hit in the marketplace.

What, then, can IBM do to make Topview viable? Or is Topview's future beyond IBM's control?

The next generation of hardware and software will solve Topview's memory problem. Huge amounts of random-access memory will be available at a reasonable cost and, of course, a new version of the PC operating system will allow the PC to address memory in far greater amounts than the present limit of 640K bytes. All in all, it should be a simple matter for IBM to modify Topview to work with a large memory system.

The slow operating speed can also be corrected by IBM in an enhanced version of the product. The change is necessary and IBM will make it if it wants Topview to get off the ground.

Topview's lack of graphics capability is a more serious problem. Although creating a graphics-oriented user interface is easy enough, integrating graphics programs is a horse of a different color. It's not difficult to store text when switching from one program to another, but storing an elaborate graphics display is far more challenging because so much more information is involved. Still, this is a problem IBM can solve in future versions of Topview.

A few of Topview's problems, however, cannot be so readily solved because they involve issues of compatibility between Topview and the applications programs running under it. By and large, the solutions to these problems aren't under IBM's control.

A few of Topview's problems cannot be so readily solved because they involve issues of compatibility between Topview and the applications programs running under it.

A major problem is background processing. For Topview to allow a program to run in the background, the program must use all standard PC-DOS conventions. Because handling input/output (I/O) operations through PC-DOS slows down a program considerably — especially when writing to the screen — most popular PC programs bypass PC-DOS and make direct hardware calls. The solution to this problem is complex, but a safe prediction is that, with few exceptions, the only programs that will ever run in Topview's background are those that have been designed by their developers to be compatible with Topview I/O conventions.

File transfer is another problem. Applications programs must be designed (or redesigned) to accommodate Topview's file-transfer buffer if they are to be able to receive files from other programs.

Designing an applications program to work with Topview is obviously the job of the software developer. Most developers are hesitant to adapt their software to Topview because they're not sure Topview will become popular. After all, if Topview fails to catch on, why waste development time to support it?

Moreover, a few developers are avoiding Topview compatibility for quite a different reason: They're scared to death IBM's entry into the software arena will put them out of business. Although they'd like to see an integrating environment standard emerge, they'd rather have that standard set by a company other than IBM.

And another company is, in fact, in a position to establish the standard. Microsoft Corp. recently released Windows, a multitasking integrating environment many think will pose a real challenge to Topview. Unlike Topview, Windows has bit-mapped graphics and its own screen interface; like Topview, however, Windows requires that applications programs be written to take advantage of its special capabilities.

Although Windows is not yet available at retail (only the OEM version has been released), it has a fighting chance of becoming the integrating environment standard. Microsoft's relations with OEM and developers are excellent; after all, Microsoft is the company that developed the MS-DOS standard. In fact, if Windows or its successor started to catch on, it wouldn't be surprising if IBM acquired the rights to it and offered it as its own. If that happened, we'd have a real standard.

A third contender for establishing the integrating environment standard is Digital Research, Inc., which sells GEM Desktop, a windowing program that provides an interface like that of the Apple Computer, Inc. Macintosh. The product does not provide multitasking, however, and most observers doubt it will ever be taken seriously as an integrator — at least in the business market.

Nevertheless, one group of users may latch on to GEM Desktop. The product has a definite appeal to executives and other light-duty users who want an easy-to-use, icon-oriented interface, but who don't want to buy a Macintosh. The size of this group is probably not sufficient to establish GEM Desktop as any kind of standard.

Some industry observers think IBM's recent Topview giveaway (a free copy with each hard-disk XT sold to dealers) was a ploy to get Topview into greater circulation and thus increase its chances for becoming the standard. If this was IBM's strategy, it won't work. It will take more than high circulation to establish a product that few people use more than once.

In the meantime, what are users to do while waiting for the standard to emerge? How will we ever juggle all those high-powered programs we'd like to run all at once?

Do nothing. Let Microsoft twist the developers' arms to write software for Windows while it twists its programmers' arms to complete the retail version of Windows. Watch IBM use its marketing muscle to get its enhanced Topview into the hands of every PC user it can. Then, when your favorite programs become available in special versions for a particular integrating environment, you can assume that environment has been established as a standard — and you should give it a try.

But don't hold your breath waiting. Using an integrating environment to integrate stand-alone programs on the PC is an excellent concept, but for the experienced PC user the concept has a long way to go. In the meantime, just relax and continue using your software the old-fashioned way. You aren't missing a thing.

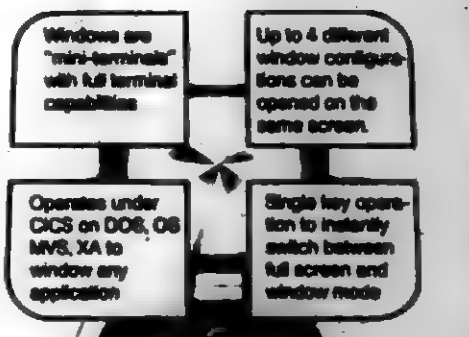
WINDOWS ON YOUR MAINFRAME TERMINAL
CICS—WINDOWS™

SAVE YOUR HARDWARE $$$



Windows are "mini-terminals" with full terminal capabilities
Up to 4 different window configurations can be opened on the same screen.
Operates under CICS on DOS, OS MVS, XA to window any application
Single key operation to instantly switch between full screen and window mode

- Window facilities on every 327X terminal without any changes to your hardware or software
- Work with 2, 3, even 4 transactions simultaneously without losing valuable time switching back and forth between applications
- Increase productivity by having needed information instantly available on the same screen including: other applications, menus, help screens, prior transactions, editors, notepads, etc.

FOR MORE INFORMATION OR FREE TRIAL OFFER CALL OR WRITE TODAY

So You've Chosen Your 4GL – Now Can You Cost Justify It?

By Gary G. Rossell

Selecting the right fourth-generation language is difficult enough; cost justifying the choice is another problem altogether. In 1984, as vice-president of data processing in charge of support services for Meridian Bancorp, Inc., I headed a team that began a search for an information center tool for corporatewide use. Meridian Bancorp is a $5.6 billion financial institution, the fifth largest bank holding company in Pennsylvania and a Fortune 500 company.

Only after we had made our decision, documented our reasons for the selection and obtained management approval did we begin the process of cost justification. We intentionally separated selection from justification to ensure that we had the right information center tool before we figured out how to justify the expense. Our tool was Nomad 2, a fourth-generation language data base management system (DBMS) developed and marketed by D&B Computing Services.

We always separate selection from justification to ensure that we do not come up with a system that, although it fits a budget, might be merely the best choice of a group of second-rate products or one that does not have all the necessary features for our organization's needs. Any other kind of planning would be a bit like deciding you could afford to spend only $6,000 on a new automobile before deciding that you really needed a passenger van that could hold eight people in relative comfort. We do not ignore the amount that we plan to spend on a new product, but we do separate selection from justification.

Naturally, if we could not cost justify our choice, we would have to turn to the three R's: regroup, reassess and, possibly, reselect. The inability to cost justify would definitely makes us reexamine our selection decision in depth.

Cost justification is taken seriously at Meridian Bancorp. We have learned to talk business English to management rather than computerese. We communicate in terms of return on investment (ROI), cost reduction and avoidance and efficient operations — not in acronyms.

We commit to short-term deliverables and make the believer/leader sponsor responsible for its implementation. We also commit the selection/justification team to deliver the product. This same sense of commitment conveyed in the proposal to management is built into the entire process of selecting and evaluating any significant new system.

That is, we make sure at every stage of these processes that we can prove to our own satisfaction that we have rigorously and thoroughly examined all the alternatives, that our choices are logical and that they can be explained in business terms. This examination and explanation is expressed in terms of what is best for the company, the business and the users rather than what will serve the primary interests of management information systems.

Even thus prepared, cost justification — after screening, evaluation and selection — is an important exercise, especially if you are in charge of it and getting ready to say to senior management: "I believe in it. I commit to it. I will deliver it for the company. You can hold me accountable."

Naturally, the justification is related to the selection criteria for a new system and to our initial goals. In the case of an information center tool, we were primarily interested in an information center tool for end-user computing.

Cost justification of a system requires a completely different mental set and different procedures from those required for merely identifying criteria and goals. But cost justifying is much easier after you have become familiar with the product's features and capabilities.

We decided not to limit the scope of our cost-justification efforts and expanded them to the following:

- Reduced applications development costs.
- Hard-dollar and soft-dollar savings.
- New business opportunities.

≡ Maintenance Changes
≡ Prototype Possible

Figure 1

The identification of reduced application development costs required an analysis of the programming process. Figure 1 lists the major tasks that represent the program coding process.

Our analysis indicated that the basic tasks require 80% of the coding time, while the development of unique logic for a specific application takes the other 20%. As a result of this analysis, we identified the following cost savings for applications development using a fourth-generation/language DBMS:

- Less coding time than with Cobol.
- Less training time than with Cobol.
- Faster start-up by entry-level programmers.
- Lower average salaries for trainees.
- Decreased testing because of canned and debugged standard functions.
- Reduction of programming errors also because of the same canned functions.
- Reduced effort in maintaining changes.

In addition to identifying development savings, our analysis confirmed that a fourth-generation language could simplify basic coding tasks and make it possible for end users to accomplish them easily with a minimum of training.

We identified the following obtainable cost savings:

- Reduction or elimination of time-sharing services.
- Assumption of jobs being handled by service bureaus.
- Avoiding the hiring of contract programmers.
- Avoiding the purchase of minis and micros.
- Eliminating one report writer software package.
- Avoiding the purchase of an add-on option of a new software package.

With the concurrence of one of our users, we were also able to identify one new short-term business opportunity through the application of the fourth-generation language/DBMS to an existing manual system. The following other, less tangible opportunities were also identified:

- Reducing the invisible backlog of jobs that are never requested because users have given up trying.
- Tackling jobs with less obvious savings or benefits that have been put off due to low priorities in DP.
- Meeting the accelerating demand of personal computer end users who are outgrowing their personal computers and/or need data from the mainframe.

Later, we also plan to look at the possibility of doing a portion of the forms preparation work of large numbers of people in the corporation.

After exploring all these factors, we were able to provide two separate cost-justification estimates — either of which proved the ability of the system to pay for itself.

We are currently developing the new business opportunity option using the package's procedural and nonprocedural language-handling facilities for one of Meridian Bancorp's major departments. ■

Rossell is vice-president, data processing, in charge of DP support services for Meridian Bancorp, Inc. in Reading, Pa.

Software Package Contracts - What Non-Lawyers Should Know

By Lawrence Szczech

Let's assume you are the financial or operations manager of a large organization that is about to bring in some new software. What will you advise? Have you given enough thought to this area to offer your company some protection? Without trying to impersonate a legal expert (and this article does not give legal advice), I've put together some pointers that may prove helpful in negotiating software package contracts. These guidelines are drawn from my firm's experiences as vendor and user.

The first point to remember when negotiating software contracts is that users don't buy software packages; they lease them. Because a lease carries with it no inherent rights of ownership, the only rights the organization has are those outlined in the leasing agreement or contract. The organization that wants to ensure that its software objectives will be satisfied will do so before signing on the dotted line.

When the purchase is a micro software package, the terms of the license agreement are cut-and-dried. They're usually printed on the carton containing the magnetic cartridge or diskette. In some states — Louisiana, for example — removing the shrink wrapper means agreeing to the terms.

Most IBM System 34/36/38 software package vendors will also have a prepared agreement, albeit one more open to negotiation. The professionalism of vendors goes a long way in determining their willingness to negotiate. Some vendors that are more open to an individual firm's needs will allow the addition of clauses that address legitimate business objectives. Almost all vendors, however, will require that the standard terms remain unchanged.

The first and last step an organization must take in leasing software is to have a lawyer look at the agreement. Lawyers are no protection from the burdens that may have to be carried later. Ultimately, your shoulders will bear the success or failure of any software contract. As the financial or operations manager, you should carefully review the contract's coverage of the following four areas: performance, pricing, timetable and add-ons.

In the following discussion of these areas, a one buyer/one vendor relationship is assumed. If the software package has been purchased from one vendor, that in turn uses another company to install and/or modify the package, make sure all parties and their roles are tied together in the same agreement.

Performance: The lack of standards in the software industry increases the need for defining what a package is supposed to do for its user (for example, how it should perform in your environment). Many users would no doubt like to attach their request for proposal to the contract and have it function as the performance criteria. No software package vendor would agree to such an arrangement. Placing personalised demands on a product designed (as all packages are) to offer standard functions would give the vendor no room to perform. Performance measures have to be geared to what the vendor says the unmodified package will do, not what a user would ideally like it to do.

What then is a fair measure of performance? One common example or statement of performance is that the software will function as outlined in the user documentation. A user could also ask to have the contract stipulate the software must pass certain postinstallation performance tests. It might also be wise to define acceptance of the package as occurring on the day performance tests are met.

Another option is to have a fixed trial period serve as the performance measure; when a large-scale system is being installed and tested, however, 30 or 60 days will hardly be ample time.

A key question could change both the vendor's and the user's perspectives in terms of performance warranties: Are you getting the source code? If you don't have the source code, you will be at the mercy of the software vendor if you ever want to make changes, integrate the package with another system, upgrade hardware or just if you come across a bug or lose some object code. Because you will not have the ability to change anything, performance criteria such as warranties will become ever more crucial.

When a user buys software with the source code, the software comes "as is." The vendor's contract is sure to revoke liabilities or warranties because the vendor would be a fool not to do so. By giving a user the source code, the vendor also gives the user the ability to modify the way the software performs. As a result, the vendor will therefore no longer want to sign a contract ensuring that the end result of that operation will meet certain levels. Buying software "as is" has no drawbacks — if you do your homework. That means seeing a demonstration in an actual client environment rather than in a controlled situation like the software vendor's office. Talking to a client actually using the software is the best way to measure software performance regardless of what the software is.

When a package is purchased without the source code, a user should make sure two points have been covered. First, does the contract stipulate how future versions of the software will be installed, how much they will cost and who will pay for them? Does a yearly maintenance or license fee include personnel costs of installation? Don't rely on future enhancements to increase the payback on your software investment. Most follow-up releases deal with solving what was wrong with the earlier version — for example, removing bugs or improving usage — not with expanding operational capabilities presently available. If enhancements are announced, the vendor will offer them under a separate module at a new price — you don't get software for free.

Never, never pay for everything up front — even for a discount. You'll lose your prime bargaining chip — withholding payment.

Second, make sure the vendor has placed the source code in escrow and has defined what happens if the vendor goes out of business. Do you get a copy of the source code? Does the holding firm become its owner and therefore your landlord? These are legal questions you must discuss with your lawyer.

Pricing: The contract states the price. Just make sure it also matches payments to vendor performance. If you're buying software, receiving the source code and having modifications done, a sample payment schedule might be the following: 50% of the package price when the agreement is signed; 50% of the package price upon installation; and modification charges to be billed to you only after you've signed off on work time sheets and/or reviewed progress in some type of regularly scheduled status meetings. A user buying a package without source code could tie part of the payment to installation and part of the payment to satisfactory completion of performance criteria (for example, postinstallation tests). Never, never pay for everything up front — even for a discount. You'll lose your prime bargaining chip — withholding payment.

The contract should also grant rights to future purchases at premium rates. A normal software package license entitles usage on only one CPU (but usually includes maintaining a backup copy for archival purposes). An organization that can foresee the need for duplicate copies or permission to download/migrate programs in a distributed/local network

Before VM Magic, embarking on a migration from one disk type to another was a formidable undertaking.

At last, an effortless path for DASD migration.

Now you can migrate to the new, faster disk device types in only the time it takes to copy your files—a matter of hours, instead of months or years consumed by program and job control conversions.

VM MAGIC bridges the distance between incompatible disk device types and guest operating systems running under IBM's Virtual Machine Facility (VM) without conversions or program modifications. That's right. VM MAGIC enables your system to store and retrieve data from any type of disk device, regardless of operating system, access method or software.

Get greater economy and performance without waiting.

With VM MAGIC you save more than the manpower expense of a long, labor-intensive conversion effort. You also reduce hardware and energy expenses, because with VM MAGIC you can respond to any of the disk device requirements of guest operating systems using any DASD. Save thousands of dollars in disk rental, maintenance and operating costs by eliminating outmoded or unnecessary disk device types.

Expand your options under VM.

VM MAGIC also lets you:
- increase system performance by migrating to, and taking advantage of, new technology disk hardware.
- select disaster recovery and backup sites without regard for disk configuration.
- prolong the life of your current software by eliminating its dependence on a specific disk environment.
- make decisions about hardware upgrades, program modifications and conversion efforts in a logical, orderly way.

For more information on the time and money-saving applications of VM MAGIC in your installation, call SDI at (415) 572-1200.

SDI®

SDI, 1700 SOUTH EL CAMINO REAL, SAN MATEO, CALIFORNIA 94402, TELEPHONE (415) 572-1200

should realize that now's the time to establish the associated costs. Secretly producing such copies could invite a lawsuit from the vendor, and legal costs for copy-infringement defenses usually exceed package costs.

Establish the price for the remaining modules if you are buying one or two modules of an integrated system (for example, the company needs order entry and inventory now; maybe later manufacturing control and purchasing will be necessary).

This agreement might involve a set time frame or series of cutoff dates whereby the follow-up modules are available at a set price or increase at a set percentage that would allow for inflation and enhancements.

Timetable: A word is missing here — *realistic*. It is important that the timetable be realistic for both user and vendor. If you don't already have one, work out an installation action plan with the vendor to ensure a smooth transition from the present system.

Add-ons: The user who buys a software package is getting a lot more than the named entity usually stated in the beginning of the contract. What you're really getting, whether you realize it or not, is a new way of operating a portion of your business. Have you considered all that this entails? Do you want user training? Do you want user manuals in addition to system documentation? Is the cost included or extra?

Most software licenses start out by saying: "This agreement supercedes any previous verbal or written claims." If the organization wants the documentation included in the price of the software, get it in writing in the contract. Most vendors offer training on a billable basis. If you expect free training, get it in the contract. Such contractual dealings take time. Any software procurement timetable should reflect the need for this discussion period right from the outset.

Of course, even a well-written contract can't guarantee results. Some of today's software contracts go so far as to outline a means for settling disagreements that might arise. A prevalent example is arbitration, which allows the user to resolve disagreements while avoiding the excessive delays and costs of taking the vendor to court. Be careful, though. Recent precedents have given arbitrators not bound by stipulations within the agreement a free hand in deciding the outcome.

If disagreements do arise, another alternative is negotiating disputes. For example, assume the software has been installed. Response time is slow. A file won't accept any more records. Operators keep keying in the wrong data because the order form doesn't match the entry screen. Are these problems caused by hardware, or do you have a legitimate gripe about the software vendor's package? Identifying the culprit will require a computer expert. You have two choices: assign a senior programmer/analyst on staff or retain the services of a consulting firm.

If after clearly defining the issues and reviewing pertinent agreements you feel a legitimate claim exists, delineate this claim in a letter, detailing subsequent demands, and mail it to the vendor with copies to appropriate senior management. This action puts you on record (which will be valuable in the eyes of the court) and shows the vendor you're serious.

In the software industry, reputations go a long way in making sales, and most vendors willingly negotiate disputes, especially if the user hammered out a solid contract in the first place. Finally, negotiations should end with an agreement outlining the vendor's actions.

MISunderstanding.

Users and MIS people see information systems from different viewpoints. And they talk about them in different ways. To build effective information systems, applications users and applications developers need to share a clear understanding of what those applications will do—both now and in the future.

TIP™ is a technology for successful information system planning and development that lets users and MIS people "talk the same language" by using diagrams, not words, to define business systems and their information needs. TIP takes full advantage of interactive graphics software as a communications tool and provides automatic consistency, verification, and validation checking. It lets you "do it right the first time" and reduce future maintenance costs. The integrated TIP modules support: ■ business and system analysis ■ requirements gathering and definition ■ strategic planning and database planning ■ data analysis and data modeling ■ application development

TIP eliminates misunderstanding. For information or to attend a Free Seminar call Technology Information Products Corporation at (617) 273-5818.

ONCE FAIRCHILD REPUBLIC CHOSE AT&T, ALL SYSTEMS WERE GO.

The people at Fairchild Republic are experts at designing and developing custom flight systems for air and space travel. When they needed a custom system of their own to manage their communications and information here on earth, they turned to another expert—AT&T.

The problem was to link seventeen different plant and office buildings spread out over eighty acres, and provide them with fast, cost-efficient voice and data communications.

AT&T had the answer. Our Premises Distribution System, AT&T's unique universal wiring scheme, serves as the link. It can unite not only our own communications systems, local area networks, and computers, but also those of other major vendors.

The communications system they chose is AT&T System 85, equipped with a wealth of features to speed and improve the voice and data flow throughout plant and office.

Beyond fulfilling all of Fairchild Republic's needs today, this fully integrated system is packed with capabilities waiting to be tapped as they continue to grow in the future.

What does the future hold for Fairchild Republic? In their business, not even the sky's the limit. AT&T has the technology, products, service and support to see them through.

To find out why AT&T is the right choice to help your business meet its long-term needs and goals, call your Information Systems Account Executive or 1 800 247-1212, Ext. 536.

AT&T
The right choice.

Prototyping – New Tools For Cutting Through The Applications Backlog

By Carol A. Kaniper

Many data processing departments are faced with application backlogs measured in years. And, although users are threatening to hold their collective breath until they turn blue, there seems to be little management information systems managers can do to crank out applications faster.

Application backlogs exist because the complexity of many DP systems has grown beyond human control. MIS managers have to spend too much time pigeonholing application systems into the organization's data base — verifying relationships here, creating new data bases there. As these procedures eat up time, the backlog grows, users get angry and applications — critical to a company's success — become obsolete before they are completed.

These problems are not new. Computer departments have had trouble meeting user demands for applications since the dawn of DP. A number of companies offer products that attempt to relieve the pressure of application system development. Known variously as fourth-generation languages, application generators and/or systems development tools, these products offer ways to streamline application development and better manage data base resources. Some of the systems and their makers include Dbase from Ashton-Tate; Ideal from Applied Data Research, Inc.; Linc II from Burroughs Corp.; Mantis from Cincom Systems, Inc.; SQL from IBM; and Ramis II from Martin Marietta Data Systems, Inc.

One of the most important capabilities these systems provide is application prototyping. Prototyping gets users involved in application development. They get to help engineer their applications, not simply test drive them. A prototype is the forerunner of a live system. It is a working model that gives users a better feel of how the system will work and allows users to determine if the initial design is correct. Among the benefits provided by the prototyping approach to application development are the following:

- **Happier users:** Fourth-generation prototyping involves the end user to higher degree than traditional application development. This increased involvement lets the user make changes to the application system at an earlier point in the process. Prototyping provides the user with a physical model to examine, test, evaluate and comment upon, rather than an intangible stack of specifications. There is a greater chance users will be pleased with the live system

When the data monster strikes, strike back.

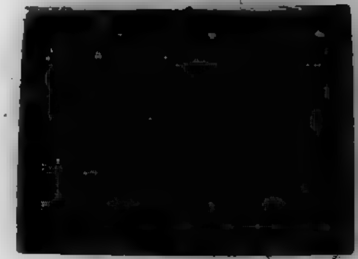
Raw data can do a number on you.

So what you need is a way to bring it under control.

RS/1.™ From BBN Software Products.

If you get lost, this is the way out.

With RS/1, you can enter scientific and engineering data on DEC and IBM micros, minis or mainframes.



And then you can run statistical analyses. Fit functions to your data. Even turn tables into complex models, so you can run a series of "what if" scenarios.

Meanwhile, you can make scatter plots, line graphs, histograms, 3-D plots, pie charts, control charts and bar charts. So anyone can make sense of it.

And you can accomplish all of the above with English-like commands, HELP and menus. So you'll be up and running in hours instead of days. And getting work done in minutes instead of hours.

RS/1 is the most powerful data analysis software, yet it's easy to use. And it's fully documented and comes with our support and maintenance.

Call us at 1-800-251-1717 (in Massachusetts 617-864-1780) to find out how thousands of scientists and engineers are using RS/1 to understand their data better. Or better yet, ask us for a demonstration.

Because anyone who knows how to create a monster should also know how to tame it.

when it is finally delivered because they have played an important role in developing it.

In his book *Application Prototyping: A Requirements Definition Strategy for the 80s*, Bernard H. Boar describes the benefit of increased user participation in application development. "Users must be actively involved to ensure the functionality and acceptability of the system. In conventional prespecification, users may or may not find reading the documents and attending the walk-throughs exciting. They may sign off after a careful analysis of the proposal or simply sign off to get rid of it.

"Users can't wait to see a prototype. Their eyes light up and the ideas swirl as they experience the imperfect model. The users actively participate because they have a meaningful and comfortable medium to participate through. The problem becomes one of sorting out all the ideas and suggestions for tryout rather than an absence of innovative suggestions," Boar notes.

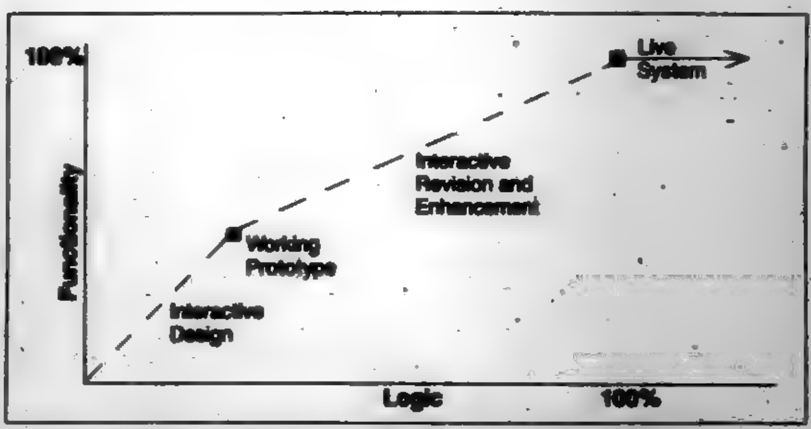

Figure 1. Evolving Applications Through Prototyping

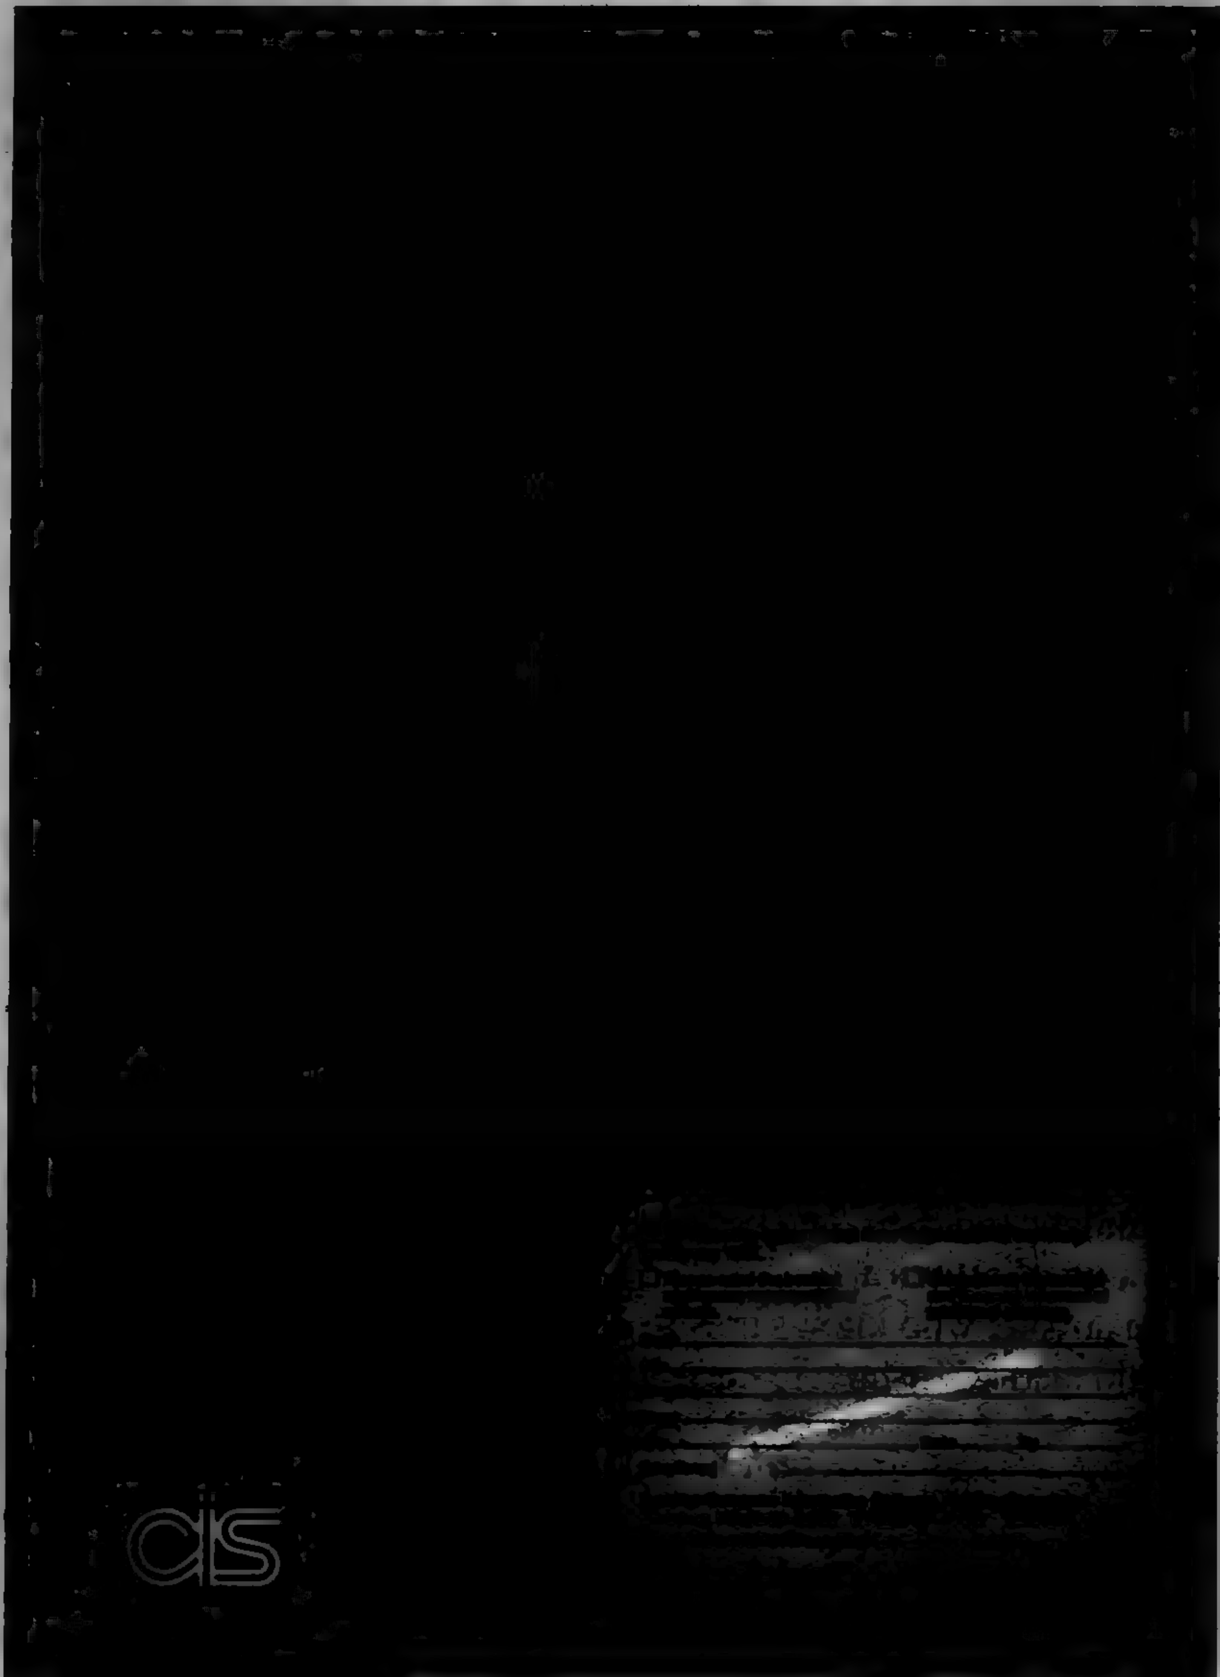
- **Improved DP productivity:** In a 1983 study of six companies using a fourth-generation system, Dr. Eberhard Rudolph of the University of Auckland, New Zealand, found fourth-generation systems can improve programmer/analyst productivity by 1,000% to 2,000%. One main reason for improved productivity is the prototyping capability provided by most fourth-generation systems.
- **Improved business responsiveness:** Prototyping with a fourth-generation system not only improves the productivity of the DP staff, it has a major impact on end-user productivity. Users get tailored solutions more quickly than previously possible, which may allow better use of clerical personnel, cost savings through more timely and accurate information and better decision-making ability.

The ability to produce application systems faster also allows an organization to accommodate new business more quickly, which enhances its market position. In addition, improved productivity may provide a competitive edge in a new business area (such as customer service) or automation of new business growth targets.

- **Reduced development risk:** According to Boar, many large software development projects never result in an operational system or do so only after significant modifications. "Medium- to large-scale application development is a high-risk undertaking. To minimize risk, models must be used to test the ideas. Only when the risk level has been negated by consensus acceptability of the model, are major resources expended to build the full system."
- **Reduced user training time:** It naturally follows that if users are involved in developing their own applications, training time will be significantly reduced. Users know the system because they helped develop it. In addition, once a definitive working prototype is developed, it can be used to train other users.
- **Simplified project management:** Boar points out that as a result of the iterative nature of developing an application through prototyping, it is unnecessary to create a formal control system such as Gantt or Pert diagrams. Because revised prototype systems can be created quickly, usually in a matter of a few weeks, a status report can be an actual demonstration of the revised working prototype.

Developing an application system based on prototyping closely parallels traditional application development in its early stages. In both approaches, a thorough systems analysis is conducted of the user's department and proposed application.

After systems analysis, however, the two approaches diverge. In a traditional development process, the systems analysis team then creates an extensive set of system specifications. The specifications are often an analyst's interpretation of the user's requirements as well as specifications such as how the new application will interact with the company data base — something in which the user has no interest. Yet the user is expected to review and approve the specifications. After the specifications have been approved, one or more programmer/analysts code the application system.



Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

After the coding, however, changes and revisions become difficult, and user input characteristically is no longer sought. At this point, careful attention must be paid to the entire program structure and its data base. A simple field change in a screen typically ripples throughout the entire program.

By means of the prototype approach, a more compact proposal is drawn up. Little mention is made of the interaction between the user's application and the corporate data base because many fourth-generation systems manage this activity automatically. When the general concepts for the application are agreed upon, the systems analyst or programmer creates a working model of the application (see Figure 1, Page 44).

The prototype or application model is a working framework. Usually in a matter of days or weeks, working screens rather than vast sets of specifications are produced and presented to the user, who is encouraged to make constant comments and updates. Almost any aspect of an application can be prototyped and tested by the user to make sure it meets application requirements. Logic can be tested for transaction processing, reports or batch processing. Though not fully featured with all the required functions and logic, this working prototype allows the user to review the basic application design before the system programs are generated.

As shown in Figure 1, the user and developer interactively revise and enhance the working model as it moves toward full production capability. More and more logic and functions are defined as the model moves closer and closer to the ideal system.

When the user and analyst agree that the model contains all the desired elements, a live system is generated. Some fourth-generation systems using the elements defined by the prototype will generate everything necessary for a live production system, including data communication links, the data base structure and the necessary Cobol programs.

What about the down side? If it's so easy to create application systems using prototyping, won't users request new systems more frequently? Won't users want every available bell and whistle included in their systems? Because programmer/analysts know bugs can always be fixed later, won't preliminary designs get sloppier and sloppier?

Certainly, prototyping is not a cure for bad design habits. A bad driver's driving techniques won't suddenly improve when he gets behind the wheel of a grand prix race car. If a DP department's application development practices are poor before a fourth-generation system is installed, the new system may not help much.

It is possible users will want to add more functions to their applications using the prototyping method than they might using a traditional approach. This is not necessarily bad, especially if the user feels the functions are necessary. If the user comes away with a system that has a few extra features, it won't, in most cases, add significantly to development time; it may help the user do the job and, therefore, probably will result in a happier user. If requests for progressively more functions get out of control, one approach is to point out the added cost and delay for creating each additional feature.

"We don't develop application systems anymore, we evolve them with the user's help," said Morris Ayres, DP manager for Universal Rundle, a plumbing fixture manufacturer in New Castle, Pa. "We work with the user to move the system from a concept to a full-blown system. Users become more comfortable through the evolution process — the process becomes a training ground," he added.

"In most cases, a systems analyst will work in a department and use the old system for a period of time. The analyst documents the old system for review purposes," Ayres explained. "Once we work out the conceptual design, we design new screens, get them to run and that system becomes the basis of development."

Ayres said that before converting to a fourth-generation system, Universal Rundle faced a three-year backlog of application requests. "We tried many different ways of simulating the proposed application. We used overhead projectors and showed users what the screen would look like before and after it changed," Ayres said. "No matter how hard we tried, we always seemed to come up short.

"Now we're getting systems in place faster. We've reduced our backlog to six months," he said. "Management knows it will get its application in place in a reasonable time frame; that's what it expects from us. We experienced a 60% increase in programmer productivity — just a sheer reduction in the number of lines of code we have to generate. We've reinvested the time we've saved on improving the quality of the applications we deliver."

Prototyping is but one aspect of currently available fourth-generation application system generators. Used properly, the prototyping approach to application development can help chop backlogs and give everyone — from DP personnel to top management — a little breathing room.

Kaniper is program development manager for Burroughs Corp. in Detroit, Mich.

Compuware Case #4

(You and)
CICS
Abend-AID
vs.
The Dump

Exhibit A.
The Irate Boss.

You need a better defense against transaction abends.
Would you rather face an irate boss who is aggravated because of programming problems, or one who's all smiles because "all systems are go?" Thanks to CICS Abend-AID, from Compuware, debugging is no longer a problem, and what boss wouldn't appreciate that? This powerful software tool works hard solving transaction abends, so you can devote more time developing applications instead of debugging them.
Compuware CICS Abend-AID supplies the proof.
It's like having your very own full-time problem solver to analyze the cause of transaction abends and let you know immediately: what happened, why it happened and where it happened—all in plain English. And it even tells you how to correct the problem as simply as possible.

Put the advantages of Compuware CICS Abend-AID into practice immediately.
Haven't you lost enough production down time? And wouldn't you like to spend more of your time developing programs? That's the profitable way to do business and keep the boss smiling.
You be the judge.
Give Compuware CICS Abend-AID a fair trial for 30 days, free of charge, and discover its immediate time-and-money-savings benefit—not to mention a happier boss!
Call 1-313-540-0400 today, and Compuware will take it from there.
With Compuware CICS Abend-AID defending your case, you'll win the boss over every time.

KEN RANEY

Bringing DSS Into Focus

Decision support systems are finally coming into their own. The technology is available today and their capabilities are just being discovered. Some organizations are already making DSS a reality.

By Stan Kolodziej

Every day, Steve Anderson sits at his terminal at the Atchison, Topeka & Santa Fe Railway Co. offices in Topeka, Kan. He types in his password and logs onto the railroad company's operations expeditor (OX) software system, developed in-house. As Anderson plugs in a set of commands he is soon enmeshed in OX's railroad car tracking subsystem. Very quickly Anderson sees which freight cars are scheduled to be used that day at various locations across the country. He also sees which cars are lying idle and what empty cars are being hauled to other areas.

Typing in a few more commands, Anderson leans back and watches as the computer flashes the effects of moving some freight cars from Clovis, N.M. to Barstow, Calif. The screen indicates the cars would be better used in Topeka. The OX system has just answered Anderson's what-if question and, perhaps, saved thousands of dollars in the bargain.

At Genrad, Inc.; a Waltham, Mass., electronics firm, Donald Sundue, corporate director of management information systems (MIS), looks at the massive monthly operations report sitting beside him. Instead of picking it up, he punches instructions into his terminal. Sundue's screen quickly displays a condensed electronic version of the report, presented by means of the Command Center, a decision support system (DSS) from Pilot Executive Software, Inc. of Boston, Mass. A few more keystrokes and Sundue has gleaned, consolidated and printed what he wanted from the report without flipping through any pages.

Both the above sketches represent real uses of DSS. At the Atchison, Topeka & Santa Fe Railway, the company's OX system has been touted in some circles as the most extensive user-developed computer system in the U.S., if not the world. OX also represents what DSS is supposed to be all about: putting computing power in the hands of users.

Steve Anderson, the railway's senior special assistant to the vice-president of the Information Systems Department, explained that the system was produced over the past decade almost exclusively by non-data processing personnel such as himself. OX was written with the help of the fourth-generation Mapper language and application tools provided by Sperry Corp. of Blue Bell, Pa. The system's grass roots user involvement began when the Atchison, Topeka & Santa Fe's industrial engineering teams were called in to try and improve the manual billing system and failed. A Sperry representative then entered and convinced Anderson that the railway really didn't need a DP department to handle automated billing. He was right. Within a mere four months, Anderson and three other railway employees without computer training had put both a billing system and a piggyback car-loading system in place.

"We've never had to go outside to get [the OX system] done," Anderson said. "We have our own expert systems people right here. The people using the system know the business, and they should be the ones who put it together."

OX is a decision-making tool in a very real sense, but it is not used by those making the most important corporate decisions at the Atchison, Topeka & Santa Fe. This has been a big dilemma for vendors of DSS since they first began appearing more than a decade ago. Aimed at corporate decision makers, today's DSS offerings are still used almost entirely by middle management and, ironically, these people are not corporate America's major decision makers. Executive hands have remained for the most part clean from the touch of computers and computer terminals. When executives do some decision making, they put pen to paper and use intuition, not keyboards and spreadsheets.

With executives looking the other way, DSS were quickly assimilated into corporate data centers, where programmers used them to pump financial data to financial analysts, accountants and other middle managers. These people, in turn, have since used DSS to produce the finished reports executives read and use as a base for some of their decision making.

"DSS has had trouble reaching executives because those who rise to the top of corporations also seem to rise above the data," explained Paul Cubbage, senior industry analyst at Dataquest, Inc., a San Jose, Calif. consulting firm. "Most of the time they don't even use data to solve problems."

The DSS concept got its start early with financial applications and has deviated little from this financial touchstone. Early mainframe-based DSS products such as Interactive Financial Planning System (IFPS) from Execucom Systems Corp., Austin, Texas; Focus from Information Builders, Inc., N.Y.; and System W from Comshare, Inc., Ann Arbor, Mich., were the inspiration for a number of large, financially driven DSS products that, until the arrival of the IBM Personal Computer, had a stranglehold on the DSS concept. Financial DSS programs are extremely data-driven and their supporters look askance at some of the more intuitive, abstract input to many decision-making programs now on the market for personal computers.

The IBM Personal Computer has had a twofold effect on DSS. First, it has done much to take DSS out of the old grasp of the DP department and into the lap of the user. Almost every DSS vendor now offers a micro version of its mainframe DSS product. Second, by downloading data from the mainframe onto a microcomputer and merging the data with programs such as Lotus Development Corp.'s 1-2-3, the user can create more open-ended, personalized DSS applications than is possible when tied to a mainframe.

An example can be found at the F.W. Woolworth Co. in New York, where the retailer's MIS department is working with users in its information center to migrate mainframe IFPS applications to IBM PCs. Using Execucom's Dataspan conversion software, programs written in Cobol and other non-Execucom languages can be converted to IFPS format without the use of programmers. Barry Putt, F.W. Woolworth's manager of corporate business applications, said divisional managers are using IBM PCs to create personal financial modeling projects using such cryptic tools as variance analysis, return on investment trees and profit center scenarios.

"IFPS command structure is easy enough to lead our people through any models they want to develop," Putt explained, adding that he welcomes the ease of transferring IFPS to a PC environment because he and his MIS colleagues are busy with other perhaps more important corporate work.

Putt's praise of the IFPS command structure is important, for the command structure is the way the DSS product and user communicate. "Overall, DSS has been uninteresting because of the interface problems," said office automation consultant Amy Wohl, president of Advanced Office Concepts Corp., Bala Cynwyd, Pa. "Most systems still require users to be experts. Artificial intelligence has been making ground, but not enough in improving the interface to DSS."

One of the bright spots Wohl mentioned, however, is Metaphor, from Metaphor Computer Systems, Inc. in Mountain View, Calif. Metaphor is an information retrieval and analysis system that is far from PC-oriented, costing between $8,000 and $10,000 per user. It employs the company's own workstations, shared file servers, data base servers and mainframe communications servers — all tied to a Xerox Corp. Ethernet local-area network. David Liddle, Metaphor's chief executive officer, said the ideal user of Metaphor would be a large company that requires "a lot of data and a lot of ad hoc decision making."

The Metaphor application capsules allow users to take the symbolic icons through windows on the workstation screen and to create their own DSS applications. Applications are not written in the traditional sense, and no code is used. Instead, applications are made by interconnecting the icons by arrows, linking each command in a long chain. Liddle said more than 90% of all Metaphor user applications (mainly financial querying

SUCCEED

Continue UCCEL On Its WINNING Course and Contribute To Its Unsurpassed Growth!

Winning has entered the Corporate arena. Companies compete head to head to be the best. Even on the individual level, personal best takes on new meaning. UCCEL, and the professionals who make this company the nation's leading independent supplier of software products and services exemplify better than anyone the new interpretation of winning. Help us to continue on our winning course by joining our **Systems Software Division** as

SYSTEMS SOFTWARE PRODUCT CONSULTANTS

In this Dallas-based position, you will provide UCC System Software product-related consulting services which include planning, implementation and installation, project management and project related support to our customer base. Additionally, you will be involved in developing productivity tools, standards and procedures along with nonproduct related consulting services such as data center check-ups.

The qualified candidate must have a minimum of 6 years diversified data processing experience to include project management, systems analysis and design, good communication and presentation skills. **DOS to OS conversion experience with involvement from initial planning to actual implementation of the conversion is a plus. Must also have UCC System Software product knowledge.** A college degree and/or equivalent experience is required. 50% plus travel is involved.

UCCEL offers an excellent salary, a unique benefits plan, relocation assistance, and the opportunity to make an immediate impact with a winning company. For consideration, please submit résumé, including salary requirements to:

Figure 1. Sampling of Decision Support Systems

and reporting) are produced this way by the actual users.

The often complicated command structure of most DSS products has been another stumbling block in getting executives to use the systems. Even the physical interface itself can cause resistance. "Executives have a psychological barrier about keyboards. Executives do not type," said David Friend, president of Pilot Executive Software, Inc., which is the producer of Command Center. Taking this observation into account, Friend has made sure the basic interface for Command Center is the electrical device called a mouse. Most other companies offering DSS systems are also starting to offer a mouse interface.

Many data bases used in DSS products are written in third-generation languages such as PL/I and C. The command interfaces between these data bases and the user are now being written in fourth-generation languages, however, which is a boon to users. These fourth-generation languages stress English-like commands and less emphasis on rigid procedures for users. With a more natural interface, DSS — especially those that run on micros — promise to gradually pry themselves from the traditional middle management base while offloading much of the DSS burden currently carried by MIS.

Texas Instruments, Inc. in Dallas, Texas, for instance, has been using Information Builder's Focus, a popular DSS fourth-generation language, to build personal DSS applications on a large part of the company's massive network of 14,000 personal computers. According to Bart Benne, Texas Instruments' manager of end-user computing, users can range from lab technicians and engineers to white-collar administrative staff. "Ninety percent of all applications on the data base query side are written by the users themselves, " Benne explained. "In the past, programmers would often have been too busy to do the job for them." Benne added that Focus training and programming seminars at information centers scattered throughout Texas Instruments operations has offloaded much of the overtime MIS processing work.

To be sure, the micro has spawned a whole new generation of smaller financial DSS products such as Easyplanner and Supercalc, both from Computer Associates Sorcim/IUS, San Jose, Calif.; DSS Workbench from Lloyd Bush Software Products, Inc., New York, N.Y.; and Esca-DSS from Esca, Inc., Chicago, Ill. However, the much lower costs and personalized touches associated with microcomputers have allowed new vendors of DSS products to explore niche areas and vertical markets with products based at least in part on abstractions founded on mathematics, psychology and intuition. Although many might lack the cachet of financial data, what they lack in business gravity, they compensate for in fun.

One of the oldest of these new open-ended DSS products is Expert Choice, which finds its inspiration in the analytical hierarchy process (AHP), a set of equations taken from the recesses of university research. Expert Choice uses an inverted tree-like "configuration analysis" procedure that measures pairs of options on the way to a predetermined goal.

According to Mary Ann Selley, president of Decision Support Software, Inc., the McLean, Va. producer of Expert Choice, "Expert Choice uses matrix arithmetic based on icons to lead the user to make gut decisions from a combination of qualitative and quantitative data. It's arriving at a strategy, and strategy is more than just juggling financial spreadsheets." Others seem to agree. Selley pointed out that current users of Expert Choice include bankers determining which countries to invest in, oil companies trying to find the best way of getting more dollars out of old oil wells, and U.S. Department of Defense officials who use the package to conduct nuclear attack, first-strike scenarios.

Other such DSS packages are increasingly becoming part of a melting pot classification known as "mindware." Maxthink from Maxthink, Inc., Piedmont, Calif.; Lightyear from Lightyear, Inc., Santa Clara, Calif.; and Trigger from Thoughtware, Inc., Miami, Fla., are examples of DSS mindware packages trying to ease themselves into business psyches — and pocketbooks.

Lightyear's chairman, Terry Garnett, described Lightyear as "a framework for organizing, analyzing and evaluating different alternatives." Thoughtware recently issued a letter of intent to purchase Lightyear, Inc. Jack Levine, president of Thoughtware, classified Trigger as a product "that automatically triggers actions based on exceptions to established guidelines" while hopefully increasing profit for corporate users. These products are targeted toward the business market, but their vendors would argue decision support is only as limited as the imagination of those using the packages. Trigger, for example, is being used by a police department to monitor the efficiency of squads supervised by a police lieutenant.

The future of DSS is tied to fourth-generation languages and the ability to make the communication between user and system as natural and easy as possible. David Tory, senior vice-president of planning at Computer Associates, Inc., the Jericho, N.Y. producers of CA-Financial Planner, a mainframe-based DSS, offered an explanation: "The whole orientation of DSS is toward languages users understand. DSS people are finally beginning to use the tools to make software a function of the computing environment, not the computer system itself."

Kolodziej is a senior writer at Computerworld Focus.

The office of the future arrives in October by mail.

Few things are changing as fast as the office work place. What with things like word processing and electronic mail and telecommunications, it's tough keeping up with what's available today. Let alone what's coming tomorrow.

But that's exactly what we're going to do in our October 16th Office Automation issue of *Computerworld Focus*. And that gives you an ideal forum to sell just about any computer-related office product you have. Because you can surround your advertising with hot, relevant editorial.

We'll start by taking a look at the needs of the end user. And how today's technologies and MIS/DP departments are—or aren't—handling the problems.

Then we'll discuss today's trends and where they seem to be taking us. Trends like top-to-bottom computer architectures. Standardized communications protocols and operating systems. Integrated software. Fiber optics. Cellular radios and phones. Just about every new twist for the office of the future.

So if you've got a product or service that belongs in the automated office, it also belongs here. The **October 16th** issue of *Computerworld Focus*. But hurry, closing is **September 6th** (materials due one week later).

For more information, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*, 375 Cochituate Rd., Framingham, MA 01701 at (617) 879-0700. Or call your local sales office.

MIT's Project Athena: A Meeting of the Minds

By Lee White

IBM and Digital Equipment Corp. have gone back to school at Massachusetts Institute of Technology in Cambridge, Mass. This time, though, IBM, DEC and MIT are all learning something new.

MIT needed a solution to a serious problem on its campus: There were computers dotting the terrain, and along with the various pieces of hardware were diverse operating systems, programs, protocols and networks, mostly centered around research activities. A student moving from one computational environment to another, even within the same department, met time and programming barriers that seemed hardly worth the effort to overcome.

As far back as 1979 The MIT Ad Hoc Committee on Future Computational Needs and Resources recommended networking the entire campus and distributing several thousand personal computers by 1989. But it was not until 1982 that the long-range planning efforts of the School of Engineering identified the need for computing resources in each department.

At about the same time, three other developments occurred: the advent of the 32-bit personal computer, which put the power of mainframe computing on the desktop; advances in networking technology; and vendor-awareness of the importance of the educational market.

Professors in the School of Engineering began discussions with major computer manufacturers in late 1982. As negotiations progressed, MIT decided that more than one vendor's participation would ideally simulate the true multivendor environment. In May of 1983, MIT signed a $70-million agreement with Digital Equipment

Announcing Masterpiece:™ A Powerful Mainframe Application Software Product Built Upon A Simple Idea Called Intelligent Architecture.™

What do you call a mainframe application software product designed with such patient attention to detail that it will register the effects of one transaction on every other business transaction in a company?

What do you call software architecture so artfully conceived it will someday enable a person using an application to move from one database management system to another, or from one teleprocessing monitor to another, without a single change in his work style?

What do you call query and reporting tools so simply and powerfully rendered that even a novice will find them no more difficult to work with than a personal computer spreadsheet?

Only one name fits…

Introducing Masterpiece.

The Masterpiece series is a family of mainframe business software products—a classification and a category which may lead you to conclude that it is like other mainframe software products.

Don't leap to that conclusion.

The Masterpiece design is so clean and uncluttered that it makes current and future applications efficient to develop and easy to use. Masterpiece comes with none of the excess baggage, inherent short-comings or system limitations that have traditionally plagued the people who need business information and the people who manage it.

Masterpiece is, in every aspect, a new family of software products.

And, in every aspect, an *improvement* over the software packages you may be used to.

Or are, in fact, now using.

Intelligent Architecture Design: The Fundamental Difference.

Previous software designs have been developed to better utilize the power of the computer.

Masterpiece was designed to mirror the methods and styles of the work place and to anticipate the *inadequacies* of the computer.

Masterpiece design is called Intelligent Architecture. It's a new term. And a new way to build software. Now, Intelligent Architecture brings new meaning to concepts like "modularity," "borderless integration" and "event-oriented processing."

Only application-specific code is contained in the application…other coding (system code, interfaces, code common to multiple applications) is separated out and coordinated by the Intelligent Architecture itself.

This means that ultimately a user can adopt a new database management system without the slightest change in either his way of working or in the application code itself.

Only software built in this manner, is software that will endure.

The Intelligent Architecture design means that all menus and screen prompts become common to all Masterpiece applications. It means that the way users interact with an application will be the same from application to application—a significant factor contributing to greater ease-of-learning and ease-of-use.

It is this capacity, present now in the Masterpiece Intelligent Architecture design, that lifts Masterpiece beyond the promise of other software products in its class.

And *that* is the fundamental difference.

Masterpiece is a trademark of Software International Corporation. Intelligent Architecture is a trademark of Software International Corporation. MasterQuery is a trademark of Software International Corporation. MasterSecurity is a trademark of Software International Corporation.

Masterpiece: Common Functions.

The reason Masterpiece works so well is because each of its pieces work so well together.

And apart.

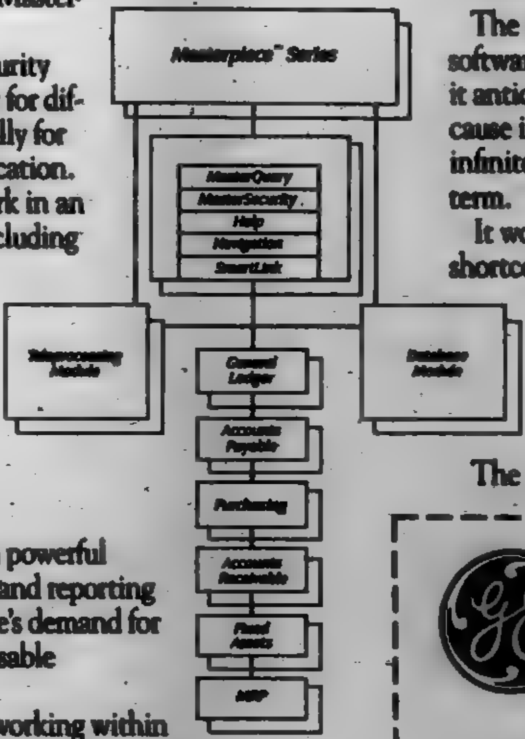
The MasterSecurity™ system, Online Help and Navigation features work across (and are common to) all Masterpiece applications.

But because they are separate from all applications, Online Help, for example, can be custom modified or even translated into different languages.

The Navigation feature lets you move from screen to screen with direct access from one Masterpiece application to another.

Levels within the MasterSecurity system can be determined not only for different applications but set specifically for transactions within the same application.

Everything is designed to work in an intelligent and modular fashion including what may now be the industry's most advanced query tool… MasterQuery.™



MasterQuery System.

The MasterQuery system is a powerful fourth generation borderless query and reporting tool designed to satisfy an executive's demand for instantly accessible and instantly usable information.

MasterQuery gives a person working within one application the ability to access information from another (accounts payable while working on general ledger, for instance) and to merge information from separate applications in a single report.

It also gives that person the ability to arrange his information in whatever form, format, or fashion he chooses. In whatever sequence or order. With whatever computations or projections he wants to make. With only the barest bit of computer know-how.

Masterpiece Integrated Applications.

The Masterpiece series will include these fully integrated, functionally rich business applications: General Ledger, Accounts Payable, Purchasing, Accounts Receivable, Fixed Asset Accounting, and MRP software products.

Masterpiece: The Promise The Future Holds.

The Masterpiece series is truly "built from the ground up" software. Because its architecture is so well thought through it anticipates future enhancements and applications. Because it's a product designed to be completely modular and infinitely *improveable* it represents a real value over the long term.

It won't, in short, fall prey to technological or design shortcomings. Won't dead-end at some point. Won't fail to perform as your needs expand.

For a Masterpiece demonstration, clip the coupon below or call toll free 1-800-343-4133 (in Massachusetts, call 1-800-322-0491) and arrange to attend a Masterpiece executive briefing.

The sooner you call, the further ahead you'll be.

Corp. and IBM, and Project Athena was born.

Project Athena, named for the Greek goddess of wisdom, differed in many ways from outwardly similar agreements inked by computer manufacturers and universities. For the most part, other pacts involved vendors' donating equipment to educational institutions with the hope that students would become accustomed to particular hardware during their campus days. Those students would influence the purchase of the same equipment after they graduated and entered the work force, vendors gambled.

Project Athena was the first time two big players signed on together for a long-term, side-by-side venture that involved much more than donating hardware. This venture meant the physical presence in adjoining work spaces of IBM and DEC engineers for three years and five years, respectively.

Steven R. Lerman, professor of civil engineering and director of Project Athena, was quick to point out that, although the five DEC and five IBM people talk to each other and have adjacent offices, the relationship between IBM and DEC exists only in the context of a shared relationship with MIT. "In many cases they are working on projects toward common ends — MIT's common ends — but there is no contractual relationship between IBM and DEC, none at all," Lerman explained, adding that their contractual relationship has fairly comparable conditions.

Lerman did, however, comment that each corporation just might have something to gain. "Athena matches some corporate end, but that end is very, very abstract."

For MIT, the end was not at all abstract. Making sense out of the impossible-to-quantify numbers of computers from myriad vendors, most operating in little more than a vacuum, was just one goal. Faculty members who served on the initial task force for Athena were also looking for new ways to teach. The educational environment of the '80s really differed very little from that of 100 years before: Students learned by listening to teachers' presentations of new concepts; by reading books and journals; by working problems and receiving feedback; and by observation, trial and error in the laboratory.

MIT's primary goal, then, was to devise imaginative ways to use computers to enhance and perhaps revolutionize the learning experience. Of the $70 million cost estimate for Project Athena, $25 million each would come from DEC and IBM and $20 million was to be raised by MIT. Most of that $20 million was earmarked for curriculum innovation and design. This money would allow faculty members time to work intensively on their projects. To date, $12.5 million has been raised. At a point less than halfway through the five-year program, more than 70 projects have been funded.

Project Athena was the first time two big players signed on together for a long-term, side-by-side venture that involved much more than donating hardware. IBM and DEC engineers share adjoining work spaces for three years and five years, respectively.

Although a preponderance of the courses deal with various engineering disciplines, a surprising number have originated within the schools of architecture and humanities, with a great deal of input from the Sloan School of Management.

According to Lerman, most of the interesting uses of computers in higher education do not involve using computers as substitute teachers or even as part of direct classroom teaching. Lerman explained that at MIT the average student spends only 12 to 15 hours each week in the classroom, but labors 40 additional hours outside the classroom reading, working in the library, writing papers and working in the laboratory.

As an example of how computers serve as an out-of-classroom aid, Lerman cited a professor who teaches a course in quantitative physiology. Part of the coursework involves teaching mathematical models of the heart-lung system; particular variables include heart rate, pressure in the aorta and oxygen transport across the artery. A standard mathematical model that is traditionally used produces six coupled differential equations. Most students understand the equations at some level but, because the equations are tightly interlinked, have no intuition of how the system really works.

"What the professor has done," Lerman explained, "is to build a software package with graphics. Students can exercise the model system and experiment to see what happens if a drug is administered that decreases the venal pressure or what happens if a drug accelerates the heart beat. They're actually performing 'what-if' experiments on this complicated mathematical formulation. We hope this method will help them develop intuition."

That professors in one of the most distinguished universities in the world could formulate novel methods for educational computing is not surprising. The more complex part of the project, creating a common environment so that these new educational methods are available to the entire MIT community, was something for which MIT sought outside help. In Athena's original planning phase, specifications were written for a long-term environment based upon networked high-performance advanced workstations with graphics capabilities. At the time, neither IBM nor DEC had built such a device, and it was decided that Phase 1 would revolve around existing hardware to build approximations of the future environment.

Unfortunately, asynchronization has been the order of the day for the hardware side of the project. DEC has announced and is shipping its Microvax II and, with a high-end display, the Microvax II matches MIT's specifications. IBM, on the other hand, has not announced an appropriate advanced workstation. Phase 1 has therefore consisted of lightly loaded VAX machines on the DEC side. The IBM side, after a number of design changes, uses Personal Computer ATs and XTs on a network with a uniform software environment and graphics displays. At present, the equipment includes about 53 VAX units, 160 PC ATs and a few Microvaxes for experimentation.

The single integrated network that ties the hardware together serves about seven or eight local-area networks. This network is two-tiered, with local Ethernets and a backbone network that links them together with a gateway between. The gateway, which is transparent to the user, operates with a single protocol.

With incompatibility looming large in the industry, MIT may well be blazing new trails for the coherence it hopes to attain. Lerman called this coherence "a fairly grandiose objective," admitting that MIT will not necessarily be able to drive the industry. "Neither IBM nor DEC nor any other manufacturer is obligated to follow the way we're headed, but we hope to demonstrate the value of that sort of environment," he said. If the project is as successful as the Athena committee expects, the results will demonstrate that hardware from different vendors can be integrated in a manner that exploits the relative advantages of

Take your 3480 space savings one step further.

Introducing EDP's 3480 Tape Cartridge Storage System...an economical unit that makes the most of your space, time and money.

The innovative system's increased density allows for more efficient use of floor space...enabling three rows of EDP storage racks to fit comfortably in the same amount of space that holds only two of most others. It's completely assembled, so there's no time spent in set-up. And a versatile Twenty-Pack lets you retrofit existing units.

each, while passing on the benefits of a uniform computing environment to programmers and users.

> **"We're talking about a university environment that is heavily oriented toward people and activities that are research-, teaching- or learning-oriented. To the extent these attributes can be generalized, then they can be transferred to other environments."**
>
> *Robert V. Mazza, IBM*

The heart of Project Athena, however, is not hardware but software. The two workstations presently run different software operating systems: the VAX machines run Berkeley Unix and the PC ATs (and XTs) run PC-DOS 3.0. The data communications protocols are written so that files can be moved freely between the two systems. Nevertheless, the team is headed toward a higher plane of compatibility. "We have prototype software that allows a VAX to provide disk space to a PC AT or PC XT. The PC issues an order to spin up the disk over the network. The VAX is hooked to the same network, and it recognizes the name of the person using the disk and accepts a password access. In effect, you have another PC disk, an E disk. You have the total illusion of having another hard disk, except that it really exists over the network and the VAX is providing it," Lerman explained.

DEC seems to be running ahead of IBM at this time, with its workstations and software actually driving the project, but Lerman hopes that gap will narrow soon.

At the beginning, DEC had its VAX units running Berkeley Unix, but lacked a high-performance workstation. IBM, with its PC AT, had a reasonable workstation, but could not run Berkeley Unix. In Phase 2, when common features of workstations will include a 32-bit processor, a high-resolution bit-mapped display and a local-area network, the theory is that both these problems will be resolved. Much of the uncertainty that exists now is due to IBM's slowness in coming up with a product.

Lerman would not comment officially on IBM's plans for an advanced workstation running Unix, stating instead that discussions are ongoing. He also said the Athena group and IBM were talking about the possibility of experimenting with an unannounced product. "The discussions are quite clear and moving in a certain direction. Part of the [antitrust agreement] issues were that [IBM] was restricted to only announcing things to which they were committed absolutely. So they're very conservative," Lerman said.

With $50 million riding on the project, IBM and DEC might be suspected of having underlying motives that go beyond sheer altruism and the quest for new ways to learn. Jack McCready, manager of External Research Programs for DEC, explained in the best corporate manner that DEC has a long-standing tradition of interaction with universities; he cited approximately 200 DEC-sponsored projects at more than 75 universities in recent years. McCready admitted, however, that Project Athena is certainly the largest project DEC has sponsored, and a first for its coinvolvement with IBM.

McCready's background lends itself well to his job. Prior to joining DEC in September 1984, he spent five years as president of Educom, a nonprofit consortium of 500 universities dedicated to looking at how colleges and universities use computing.

Before Educom, he was vice-provost for computing at Carnegie-Mellon University in Pittsburgh. While at Carnegie-Mellon in 1976, he negotiated a large three-year pact with DEC.

McCready stated that DEC has the best program of university involvement in the industry. "It's a long-standing commitment going back many years and a general success story in that we believe that working with research organizations in higher education is an excellent way to learn about computer information processing-related technology." Regarding Athena in particular, McCready stated that he thought the project could give birth to a new model of computing that might very well take over entire education and commercial accounts over the next few years.

This commercial applicability of Project Athena was not lost on McCready.

CA-FINANCIAL PLANNER®.
[illegible]

CA-FINANCIAL PLANNER, a powerful financial planning and modeling system, greatly extends the power of Lotus 1-2-3,™ SuperCalc³ or any other spreadsheet. Now, with incredible ease, you can:

- Perform market simulation and forecasting on any number of variables or formulas.
- Do complex profitability, cash flow, and goal-seeking analyses.
- Handle unlimited amounts of data.
- Automatically prepare boardroom-ready financial reports.
- Generate accurate, auditable financial models.
- Perform periodic and ad hoc multi-level consolidations. Maintain an audit trail of consolidation entries.
- [illegible] and make it available to corporate PC users.

It is the most cost-effective, resource-efficient mainframe software solution to financial planning and modeling that you will ever [illegible]

Although predicting potential marketability of basic research is difficult, the educational community itself is a huge customer base for DEC, he explained, and accounts for several hundred million dollars each year. This dollar figure will increase as the price of the technology drops and the individual student and faculty workstation becomes a viable alternative to center-based computing.

> **"We will be able to learn a tremendous amount about the use of our products in a very large networking case, not hundreds of machines but thousands of machines. That has a direct commercial spinoff for us."**
>
> *Jack McCready, Digital Equipment Corp.*

In addition, DEC sees itself as a networking company, and networking is what Project Athena is all about. "[Athena] is probably going to be one of the biggest experimental utilizations. We will be able to learn a tremendous amount about the use of our products in a very large networking case, not hundreds of machines but thousands of machines. That has a direct commercial spinoff for us," McCready said.

Whether this spinoff is in the back of IBM's mind is a subject Robert V. Massa, director of development for Academic Information Systems at IBM was less inclined to discuss. "Clearly, we're talking about a university environment that is heavily oriented toward people and activities that are research-, teaching- or learning-oriented. To the extent these attributes can be generalized, then they can be transferred to other environments."

But Massa expressed doubt that much would be gleaned from Athena that would be relevant outside the groves of academe. He characterized the IBM/DEC activity at MIT as a system interconnect and programming architecture and a user and application interface defined by that environment. "It isn't as though we're bringing in our architectures, nor is DEC bringing in its architectures," explained Massa. He added that he didn't think the goals of Project Athena had anything to do with evolving communications, programs or applications interface standards. If such standards were a byproduct of Athena, Massa concluded, "it would be highly surprising to me and would certainly be an unexpected benefit."

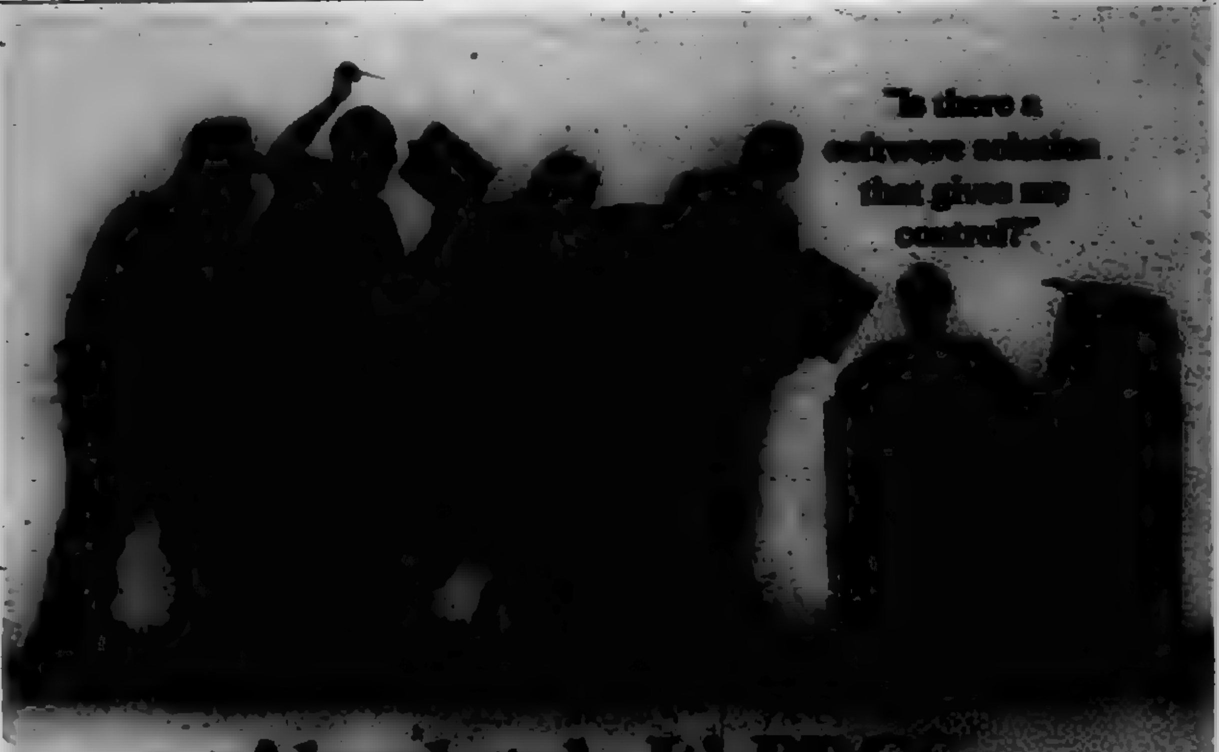
IBM's view notwithstanding, perhaps the most important result will be that of the DEC/IBM connectivity. When Number One and Number Two join forces, the potential market value of the results could be staggering. "We see environments out there where DEC and IBM systems have got to work together smoothly and that is the whole notion of coherence at MIT. IBM systems and DEC systems, networks of them, lots of them all working in a common environment," understated DEC's McCready.

Although present installations including both DEC and IBM systems stand to reap great benefits from a coherent technological breakthrough, the question of further narrowing the hardware vendor field would seem to be more probability than possibility. McCready insisted that the open environment of Athena would have broadening rather than narrowing results, but one would expect that IBM and DEC will have a substantial head start on commercial applications.

MIT's Lerman explained that any and all results of the Athena project will be owned solely by the university and they will be disseminated free of charge to other universities.

However, IBM and DEC don't have to worry about being left out in the cold. "The principle we're working on, although it's not embedded in contractual language, is what I would call the most-favored-nation principle. We will not make deals with third parties other than DEC or IBM that are better than we would make with DEC and IBM. We would like to create it at MIT and then convince [IBM and DEC] to build it as products. We're not in the support or the maintenance business; that really should be the realm of computer vendors and software houses. Our hope is that they come to us and say, 'Gee, that worked very well and we want to license all this stuff from you and build it.' "

White is a senior writer at Computerworld Focus.



"Is there a software solution that gives me control?"

Absolutely. It's BPCS.

Business Planning and Control System

BPCS is the solution. It gives your company firm control of its entire manufacturing/distribution operation. From inventory management and order entry to shop floor control and full financial reporting, BPCS coordinates every operational function... with ease!

BPCS is written in native code to maximize IBM's System/38 architecture. So with BPCS you get the power to take control of your entire operation today. And the flexibility you'll need to grow along with your business tomorrow.

Local BPCS affiliates provide technical support for easy installation and implementation. The affiliate network, composed of 43 professional consulting organizations in 20 countries worldwide, guarantees you a trusted partner in the search for a real solution.

BPCS is indeed that real solution. It's designed to accommodate the broadest scope of business operations but can be tailored to meet each individual user's needs. BPCS affirms your control in the most demanding situations.

Over 700 worldwide users attest to BPCS quality. Get the complete software solution designed to coordinate all your information needs. Get BPCS.

BPCS...Absolute Control For Your System/38.

Products

WESTBORO, Mass. — **Data General Corp.** has introduced two products designed to strengthen the company's networking offerings.

According to DG, the intelligent broadband controller (IBC) enables the company's Eclipse MV/ Family of computers to be connected with Net/One broadband local-area networks from Ungermann-Bass, Inc., Santa Clara, Calif. DG said the IBC is an IEEE 802.3 standard network interface designed to perform protocol handling and other communications tasks to reduce central processing overhead and improve system performance. The single 15-in. board includes 256K bytes of random-access memory, a Microeclipse processor, a data channel interface and a serial I/O section.

DG also introduced the CEO Document Exchange Architecture (DXA), the company's interface with the IBM Document Interchange Architecture (DIA) and Document Content Architecture (DCA). The company said it is implementing the interface to DIA/DCA in phases. The initial phase lets users send and receive mail through an IBM distributed office support system (Disoss) network while appearing to the network as a Displaywriter-like node. The second phase will allow the Eclipse MV/ Family system to emulate an IBM System/36 node.

The IBC is priced at $6,500. The CEO DXA software is priced from $1,500 to $6,500 depending on the type of Eclipse MV/Family system used.

For further information, contact Data General Corp., Information Systems Division, 4400 Computer Drive, Westboro, Mass. 01581.

CHICAGO — ARX, a software product that allows personal computer users to back up and restore disk files to the mainframe, was recently announced by **Chicago-Soft, Ltd.** ARX communicates through CICS (OS/DOS), VM/CMS or TSO. Operation can be in attended or unattended mode. A standard job may be set up on the personal computer to back up files regularly at off-peak hours reducing transmission times and leveling the system load. Directory management and reporting facilities are also provided, the vendor said.

Several techniques for data compression reduce the amount of transmitted and stored data, according to the vendor. In addition, data encryption techniques may be employed and private or public directories may be created to allow the sharing of program or data files.

The cost of ARX varies depending upon the mainframe operating system. For DOS/VSE, the price is $5,000 for five personal computers plus $1,000 for each additional 10; for VM/CMS, $10,000 for 10 personal computers plus $1,000 for each additional 10; and for MVS, $15,000 for 15 personal computers plus $1,000 for each additional 10. For more information, contact Chicago-Soft, 738 N. LaSalle St., Suite 2, Chicago, Ill. 60610.

LAFAYETTE, Calif. — **Theos Software Corp.** has introduced Theos, a multiuser operating system for Intel Corp.'s 80286 microprocessor.

Theos, an acronym for The Operating System, has four components: The system administrator, which handles user accounting and system security; the resource manager, which takes and prioritizes requests from the system administrator; the development workshop, which provides for software development; and the application grid, an application interface with operating system programs.

The company said the Theos system offers a help function and is complemented by the Basic, C, Macro Assembler and Executive Job Control programming languages.

The Theos operating system sells for $895, and for $1,295 bundled with Basic. The Theos development package sells for $1,695 and comes bundled with the operating system and the Basic, C and Macro Assembler languages.

Theos is at Suite 100, 201 Lafayette Circle, Lafayette, Calif. 94549.

Informix — ESQL/

PALO ALTO, Calif. — **Relational Database Systems, Inc.** has announced Informix—ESQL/, a product based on IBM's structured query language (SQL).

According to the company, Informix-ESQL/C is designed for use by applications developers who program in the C language. The company said the product enables users to embed dynamic and fixed SQL queries within their C programs, and reduce application time.

The price of Informix-ESQL/C running on PC-DOS or MS-DOS machines is $595. A Xenix version is also available for $749.

More information is available from Relational Database Systems, Suite 600,2471 E. Bayshore Road, Palo Alto, Calif. 94303.

PRINCETON, N.J. — **Martin Marietta Data Systems, Inc.** has introduced three products, Smartedit, PC/Reporter and Cobol/XE.

Smartedit is described by the company as an intelligent editor designed for the development and maintenance of programs written in Ramis II, Martin Marietta's fourth-generation language.

PC/Reporter is a PC-DOS version of the Ramis II language reporter. According to the company, PC/Reporter enables users with any sequential or comma-delimited Ascii files to generate customized reports using Ramis II's English-like syntax.

Cobol/XE is a Cobol-based customer information control system (CICS) application development system that supports Cobol programming in the CICS/VS, VM/CMS and VM/PC environments.

Prices for Smartedit range from $2,250 to $4,500. PC/Reporter lists for $795. Cobol/XE is priced at $15,000 for the VM/CMS version, $24,000 for the disk operating system (DOS) CICS version and $33,000 for the operating system (OS) CICS version.

For further information, contact Martin Marietta Telesales, P.O. Box 2392, Princeton, N.J. 08540.

SAN JOSE, Calif. — **Computer Associates Sorcim/IUS, Inc.** has announced Easyplus 1.1, a window manager, and the Easyplus Network Manager, a product that allows users to run windows on a network.

According to the company, Easyplus 1.1 integrates Computer Associates' Easybusiness Systems Plus series of accounting, word processing, data management and financial modeling packages, as well as other popular software packages such as Lotus Development Corp.'s 1-2-3 and Micropro International Corp.'s Wordstar.

The Easyplus Network Manager is designed, the company said, to give all the Plus Series programs operating under Easyplus full local-area network capabilities, providing data integrity.

Easyplus 1.1 sells for $149. The Easyplus Network Manager is priced at $395 each for units of four and $595 for units of eight.

More information is available from Computer Associates Sorcim/IUS, Inc., 2195 Fortune Drive, San Jose, Calif. 95131.

DEC AI Vaxstation

HUDSON, Mass. — **Digital Equipment Corp.** has introduced the AI Vaxstation, a workstation which the company said is the first to use artificial intelligence fully. According to the company, the AI Vaxstation combines the performance of the DEC Microvax II computer system with multitasking, multiwindowing and high-resolution graphics. The company added that the workstation's functions are integrated into DEC's VAX Lisp artificial intelligence programming environment.

Priced at $48,690, the AI Vaxstation has a 5M-byte Microvax II processor, a 71M-byte Winchester disk drive, a 95M-byte tape subsystem and a Decnet/Ethernet local-area network interface.

At the same time, DEC introduced

Challenge DADS.

CICS Initialization

- Allocates all user and transient data files
- Eliminates CICS downtime if files can't be allocated
- Supports all CICS startup options
- Requires no modifications to CICS

CICS Real Time

- Allocates/deallocates user and transient data files
- Allocates/deallocates files by groups
- Automatically opens and closes files
- Automatically enables/disables transactions and programs
- Provides security exit and audit trail

Advanced Features

- Automatic time-initiated allocation/deallocation
- Batch interface
- O/S core manager

Products

three services for broadband networks; Physical design consulting, physical installation management and ongoing maintenance. The company said the services will support customers' broadband networks as well as Digital's broadband Ethernet products.

Costs for the services start at $1,000 per diem. More information is available from DEC, Maynard, Mass. 01754.

IRVINE, Calif. — **AST Research, Inc.** has announced Knight Data Security Manager, a software package the company said is designed to ensure data security, simplify the DOS command structure and add time management and messaging capabilities to microcomputers using hard disks.

Knight Data Security Manager

Running on the IBM XT, IBM AT and IBM compatibles, the Knight software employs user-defined passwords to protect data files and application programs. According to the company, the Knight program ensures data privacy by building "walls" around personal files and project areas, instead of using an encryption procedure.

The Knight Data Security Manager is priced at $295. For more information, contact AST Research, Inc., 2121 Alton Ave., Irvine, Calif. 92714.

BLUE BELL, Pa. — **Sperry Corp.** has introduced its Knowledge System workstation, the first of a planned Sperry product line of artificial intelligence/expert systems.

The Knowledge System is based on Explorer, a 32-bit workstation developed at MIT, Cambridge, Mass., under the auspices of Texas Instruments, Inc., Dallas, Texas. The Knowledge System will be marketed with Knowledge Engineering Environment (KEE) software, developed by Intellicorp, Menlo Park, Calif. Sperry said KEE enables rapid prototyping which gives an expert the ability to see quickly, with the aid of diagrams, the value of a knowledge-based system.

According to Sperry, The Knowledge System workstation can address up to 128M bytes of virtual memory, and contains a Texas Instruments high-speed processor designed to run Lisp, an artificial intelligence programming language.

The Knowledge System workstation is priced at $50,000. Copies of the KEE software systems are $60,000 each.

More information is available from Sperry, Information Systems Group, P.O. Box 500, Blue Bell, Pa. 19424.

FORT LEE, N.J. — **On-Line Software International, Inc.** has introduced Verify, a testing control system for IBM customer information control system (CICS) application programs. The company said that Verify's regression testing ensures that an application package will function properly in production.

Among Verify's other features listed were automatic testing which, according to the company, eliminates the need of repetitive operator input, and automatic logical verification, which eliminates the need to visually compare application screens and files.

Verify runs under the IBM DOS/VSE operating system or any operating system with CICS Release 1.5, or greater. It is priced at $25,000 for the DOS license and $35,000 for the OS license.

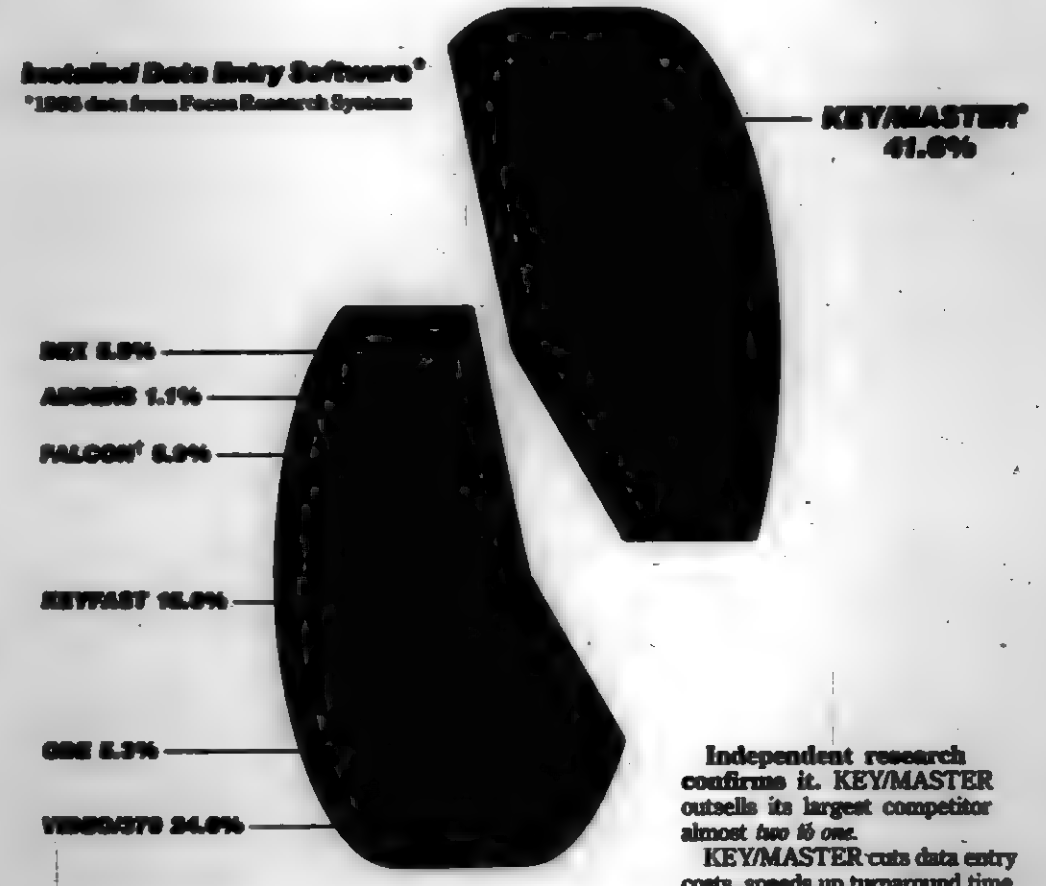
More information is available from On-Line Software International,Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

CAMBRIDGE, Mass. — **Index Technology Corp.** has introduced version 1.5 of its Excelerator software for systems analysts working with IBM Personal Computers. According to the company, version 1.5 offers graphics support for additional structured programming techniques, project data-sharing tools for controlling large projects with multiple Excelerator users, and expanded cross-referencing and analysis tools.

Excelerator Version 1.5

Excelerator version 1.5 is priced at $8,400 for single quantities, $7,900 each for quantities up to five and $7,400 each for quantities up to ten.

More IBM Sites Have Installed KEY/MASTER® For Distributed Data Entry Than Any Other Software System



Independent research confirms it. KEY/MASTER outsells its largest competitor almost *two to one.*

KEY/MASTER cuts data entry costs, speeds up turnaround time and reduces errors — all without applications programming.

KEY/MASTER is continually chosen over all other data entry software for one simple reason: *"Perhaps KEY/MASTER is one of those products whose design level so closely approximates user requirements that it is virtually faultless."**

Not convinced? Find out for yourself why KEY/MASTER tops all the rest in distributed data entry software. Call 1-800-227-3800, ext. 7005, and ask for the facts about KEY/MASTER. Or, write directly to the Data Entry Experts: TSI International, Dept. #213, 295 Westport Avenue, Norwalk, CT 06856.

More information is available from Index Technology, Five Cambridge Center, Cambridge, Mass. 02142.

WOBURN, Mass. — **Systems Designers Software, Inc.** has announced Envisage, an expert system environmental shell which the company said enables a systems designer to create a variety of applications using such artificial intelligence techniques as traditional logic, Bayesian Inference and "fuzzy logic."

According to the company, Envisage frees the systems designer from "reinventing the wheel" each time a new expert system is developed, using subroutines and inherent techniques to allow the creation of a system specified by end-users.

Envisage runs on Digital Equipment Corp. VAX computers and is priced at $20,000. More information is available from Systems Designers Software, Suite 407, 444 Washington St., Woburn, Mass. 01801.

PROVIDENCE, R.I. — **Cadre Technologies, Inc.** has announced Teamwork/SA, a series of software development tools designed to enable a project team to capture systems requirements, organize them into models and maintain them in an integrated environment.

According to the company, Teamwork/SA is based on an Apollo Computer Corp. DN300 workstation, Apollo's Domain distributed network architecture, and Cadre's proprietary software. Among Teamwork/SA features that Cadre mentioned are a project library which serves as a central data base for everyone working on a specific project, an editing system with mouse interface and a model configuration management function which allows data flow diagrams to be collected into leveled sets.

Teamwork/SA

The single version Teamwork/SA system is priced at $34,900, and the software-only price for a single-user version is $9,800. The multiuser Teamwork/SA system is $41,900 per network node, and the multiuser software price is $17,500.

More information is available from Cadre Technologies, 222 Richmond St., Providence, R.I. 02903.

PRINCETON, N.J. — **TTSoftware**, a division of Martin Marietta Data Systems, Inc., has announced Runit, a disk operating system (DOS) shell program, and Mailit, a document conversion and transfer program.

According to the company, Runit provides a uniform interface to all IBM Personal Computer routines and simplifies program selection, use of DOS utilities, and mainframe log on. The program runs on the IBM PC, the IBM XT, the IBM AT and IBM compatible computers.

Mailit runs with IBM's Script and professional office system (Profs) word processing environments. The company said Mailit works with documents prepared with an IBM PC-based word processor, transferring the documents from Ascii format into the Profs and Script text formats.

Runit and Mailit are respectively priced at $100 and $300. For more information, contact Martin Marietta Data Systems, P.O. Box 2392, Princeton, N.J. 08540.

JERICHO, N.Y. — **Computer Associates International, Inc.** has announced CA-Unicenter, a software-based system for the management of corporate data centers using IBM and IBM-compatible mainframe computers. CA-Unicenter has three components: Data center management software for increasing programmer and operational efficiency; CA-Uniservice, a microcomputer and mainframe-based client service, support and training system; and CA-Activator, an on-line system for automating product installation and maintenance.

The CA-Unicenter is priced at $144,000 for a three-year lease. The company said a perpetual license is also available for $180,000.

For further information, contact Computer Associates International, 125 Jericho Turnpike, Jericho, N.Y. 11753.

FARMINGDALE, N.Y. — **Iskra Software International, Inc.**, a division of Iskra Electronics, Inc., has introduced Formatix, an applications generator for Digital Equipment Corp. VAX and PDP-11 computers.

The company said that Formatix can develop an application for immediate review, enabling the user to chain programs to produce applications. The company added that by using Formatix's menu function, programs generated by Formatix as well as those programs written in Cobol, Pascal or any other language, can be combined.

Formatix prices range from $1,700 for the DEC Microvax to $9,800 for the DEC VAX-11/782 computer.

More information is available from Iskra Software International, 222 Sherwood Ave., Farmingdale, N.Y. 11735.

Reach 66,000 Danish computer professionals.

Advertise in CW Communications' Danish publications and sell your products directly to Denmark's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, total data processing expenditures in Denmark for 1985 are expected to reach $1.8 billion. CW Communications covers the Danish market with three publications; *Computerworld Danmark*, *PC World Danmark* and *Run*.

Computerworld/Danmark serves 20,000 key EDP decision-makers throughout the Danish computer community. Each week *Computerworld/Danmark* covers new products and services, current applications and industry trends.

PC World Danmark is the monthly magazine that targets 12,000 IBM PC and compatible users and supplies them with first-hand information on the Danish PC market.

Run reaches 34,000 Commodore owners and potential owners in Denmark. Commodore is expected to grow at 40% per year through 1989. *Run* addresses the Commodore market with timely updates on hardware, software, and programs.

CW International Marketing Services makes advertising your products in Denmark, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

VSAM Users: Challenge VSUM to design and manage your VSAM files.

Modeling VSAM Files
- Recommends data set parameters
- Calculates efficient CI sizes and free space
- Generates IDCAMS define parameters
- Determines storage requirements by device type

Managing VSAM Catalogs
- Provides extensive catalog search and list capabilities
- Provides statistical archival for trend evaluation
- Supports ICF catalogs

Managing VSAM Datasets
- Provides proven VSAM performance recommendations
- Provides accurate space utilization and record statistics
- Provides backup of keyed VSAM data sets during analysis
- Provides user selectable reports: DATASET, CONTROL AREA GRAPH, KEY RANGE, CONTROL INTERVAL

Subaru. Over 150,000 a year are sold even before they reach the U.S.

And long before they're off the ships, they're on the Sperry MAPPER™ System. Allocated to distributors. Assigned to dealers. Complete with work orders.

Working off a Sperry computer, 300 MAPPER terminals provide a total communications system between Subaru of America and the distributor network.

Distributors get the information they need with less than a 3-second response time. No DP skills are needed. No tech people are needed. All data is visible in report format so anyone can read it.

And commands are given in plain English, giving users the capability of tailoring runs to their own individual business needs.

Locating parts, a major problem for most car manufacturers, is no problem for Subaru. Stocks of 28,000 parts are inventoried and controlled on the MAPPER System. Punch it in and you can see instantly where the parts are and how many of each is available.

Don Finello, Vice President of Data Processing at Subaru of America states, "At Subaru, MAPPER isn't just a report generator. Management, Accounting, Sales, Parts, Advertising—all departments use it."

MAPPER has made the user self-sufficient. Control of the information is back in the hands of the people responsible for getting the job done. The people who know the job best.

And it's a system geared for growth. An important thing when you're moving as fast as Subaru.

For more information or to arrange a demonstration of the MAPPER system at the Sperry Productivity Center nearest you, call toll free, **1-800-547-8362 (ext. 100).** Or write, Sperry Corporation, Box 500, Blue Bell, PA 19424-0024.

Dear Fellow Professional:

One of the most pressing issues facing data processing today is the threat of professional obsolescence. How can you possibly keep up with all the changes in software and hardware?

Ongoing technical education is the answer, and Digital Consulting Associates, Inc. (DCAI) is the source. We are the acknowledged world leaders in professional education in Data Management Technologies. Our current seminar offerings include:

- 4th Generation Data Management Software
- Structured Systems Development with 4GLs
- NEW • Information Systems Architecture
- NEW • Relational Database Management Systems for Commercial Applications
- Database Administration and Data Resource Development by Ronald G. Ross
- Database Implementation by Shaku Atre
- IMS and DB2: Database Strategies for the IBM World
- NEW • Distributed Database Architectures
- Information Centers: End User Computing
- Micro-Mainframe Links
- Data Communications: Network Design, Integration and Applications
- NEW • The PC as a Programmer's Workstation
- NEW • Applications Prototyping: A Key To Systems Development

Our seminars can keep you abreast of the changes in high technology that you need to understand. By simply taking a few minutes to ready through our catalog you can gain a valuable sense of what's happening in the industry today. To recieve our free catalog and learn more about our seminars, please call **617/470-3880.**

Sincerely,

J. Schussel

Mac add-ons unveiled as Jobs departs

By Steve [illegible]

CUPERTINO, Calif. — Anticipated fanfare surrounding Apple Computer, Inc.'s introduction of its long-awaited 20M-byte hard disk and additional software and peripherals for the Macintosh computer was muffled last week when Chairman Steven Jobs angrily resigned from the firm he cofounded and helped to lead the microcomputer revolution.

Jobs resigned last week amid charges that he raided the company of five key employees with whom he planned to start an educational computer firm. When it was reported that Apple's board of directors was contemplating taking action against Chairman Jobs, Jobs insisted the board accept his resignation.

The resignation letter, which Jobs made immediately available to several newspapers, said the board of directors had taken a "hostile posture" toward him as a result of the new venture. In addition, he said, "The company's recent reorganization left me with no work to do and no access even to regular management reports."

News of the Jobs departure overshadowed last week's introduction of several key new Apple products. Among them was a 20M-byte, 3½-in. Winchester hard disk drive for which Macintosh business users have long been clamoring and which is seen as one of the peripherals the Macintosh needs to be considered a serious business tool.

"It's unfortunate the announcement has become so clouded with this soap opera," said Jan Lewis, an analyst with the Palo Alto Research Group in California. Apple's introduction of the hard disk drive was long overdue, Lewis said. "Apple had to come out with it. It couldn't go after the business market

Washington eases AT&T computer sales strictures

Permission conditional on revenues disclosure

By Bryan Wilkins

WASHINGTON, D.C. — In the most significant deregulatory move since the divestiture of AT&T, the Federal Communications Commission last week conditionally approved AT&T's request to market its telephone and computer equipment lines together with its regulated transmission services.

The FCC said it will drop the present requirement that AT&T sell telephone and computer equipment separately through its Information Systems subsidiary. Still in effect, however, is a requirement to maintain a separate sales operation for enhanced telecommunications services like electronic mail.

As a result, AT&T will no longer be forced to maintain duplicate marketing forces in its Informations Systems and Communications subsidiaries, allowing the company to integrate its bids for large-volume corporate customers. Since deregulation, these customers have often complained about AT&T's lack of coordination when dealing with its clients.

AT&T Executive Vice-President Charles Marshall alluded to these complaints in reacting to the FCC decision. "For our customers, it will mean better service," Marshall said in a prepared statement. "Various parts of our business will be in a position to work together to offer customers a fully integrated approach to their equipment and network service needs and, where desirable, one point of contact with the company."

Marshall said 10 corporate or government accounts will be selected for service by an integrated marketing team, which

TOP OF THE NEWS

Score another one for Lotus' campaign against unauthorized reproduction of micro software. The latest company to come clean was Computerknowledge, a Dallas-based software training organization, which late last week disclosed that it had uncovered and halted widespread illegal copying of Lotus 1-2-3 among its employees. Computerknowledge had an existing written policy prohibiting unauthorized software duplication by employees and is a member of the Association of Data Processing Service Organizations, the professional organization that has taken the lead in combatting illegal software reproduction.

■

Cray Research, manufacturers of some of the largest computers known to man, just released an upgrade of its X-MP line offering more memory than ever before. But users are still clamoring for storage space. "We have very large memory requirements and could use any memory Cray makes available," said Steven Walworth, planning analyst at the National Aeronautics and Space Administration's Ames Research Center

Productivity key concern at Software/Expo

By John Desmond
and John Gallant

ANALYSIS

Despite all that is new in the computer industry, users at last week's Software/Expo in Dallas seemed most concerned with issues and technologies they have wrestled with for some time.

Underscoring them all, however, was a concern regarding productivity in U.S. business and the computer software industry's failure to cope effectively with this matter.

Regarding other concerns, users appeared to be still wrestling with some mundane, unglamorous issues such as controlling the massive influx of personal computers, paring the applications backlog and implementing core products like data base management systems and micro-mainframe links.

The first to address the productivity issue was keynote speaker Tom Nies, chief executive officer of Cincom Systems, Inc., the sole vendor to use the show as a springboard for a major product introduction (see story below). Nies declared that the current computer industry recession was the result of a declining rate of productivity improvement across all industries. The Cincom Systems executive placed blame for faltering productivity squarely on the shoulders of software vendors — IBM and the independents.

"The computer industry recession is primarily caused by the software vendors' old-fashioned approach to software," Nies said. "That approach makes it impossible for customers to consume new computers. It inhibits the forward movement of the computer industry."

Crediting hardware vendors with great advances, Nies said those gains have largely been negated by the software industry's evolutionary, almost snail-paced advances. "The idea of software generations is a hoax," he said. "There have been no revolutionary periods of change. There have been no great leaps and bounds."

With the failure of software to use the full potential of hardware, "we, as DP professionals, will not be able to satisfy the hoped-for revolution in DP. We won't be able to support, for example, distributed processing, real end-user computing

CDC losses kill bond offer

Divesting assets seen likely to stem losses, boost rating

By Clinton Wilder

MINNEAPOLIS — Control Data Corp. is facing steep losses and a potentially severe fiscal crisis in the wake of last week's 11th-hour cancellation of a $300 million public offering of bonds and preferred stock.

That is the opinion of analysts and company observers who have watched the U.S.'s fourth largest computer company flounder in a sea of unsuccessful diversification and devastated margins in the computer peripherals market. Most analysts said they believe CDC's No. 1 priority must be the continued sale of its corporate assets to raise cash for the preservation of credit arrangements with its banks.

The company had intended to use the proceeds of the offering to pay off debt issues. In recent weeks, the company announced it has fallen into technical default on covenants contained in those issues.

CDC's Commercial Credit Co. subsidiary, whose current profitability has offset some of the firm's losses in the computer business, appears to be the most likely candidate for divestiture, either as a whole or in parts. The proposed sale of the business to Security Pacific Co. was canceled in June, but Commercial Credit has restructured since then and is projected to more than triple its $25.2 million first-half profit for the full year.

By contrast, CDC's information services and products business unit, which comprises mainframes, supercomputers, peripherals and data processing and other automated services, lost $32.7 million in the first six months of 1985. Some estimates project the full-year loss for the computer unit at as high as $100 million.

"By selling off assets, it buys [the company] time to get operations under control. There are some very attractive assets within Commercial Credit," said Michael Geran of E. F. Hutton & Co.

CDC's current volatile situation was sparked Sept. 17, when underwriter Goldman, Sachs & Co. announced it would not authorize CDC's sale of $100 million in shares of depositary preferred stock and $200 million in subordinated debentures or bonds.

In addition to forcing the company to seek alternative short-term financing to replace the offering, the news rocked Wall Street's confidence in CDC's financial future. Within hours, Standard & Poor's Corp. lowered its credit ratings on the senior debt, preferred stock and commercial paper of CDC and Commercial Credit.

"If Goldman Sachs, with its reputation for integrity and thoroughness, rejected the offering, there's a lot more to CDC's situation than has been reported before," said William Shaffer, president of the Minneapolis consulting firm of Shaffer & Associates, Inc. and a veteran CDC observer. "When you add up all the indicators, it's a very serious situation."

Shaffer said customer confidence may be shaken in the company. "The scientific user community is very dependent on support. It's hard to sell in that environment without confidence in that support."

E. F. Hutton's Geran predicted CDC will pay particular attention to support to prevent further erosion of its customer base. He said the company's biggest financial drains are its peripherals and DP services businesses.

Analyst Jonathan Fram of Paine Webber, Inc. compared CDC's experience in peripherals to battered semiconductor vendors in the dynamic random-access memory chip market. Excess capacity and a wave of Japanese imports have turned the stagnated peripheral market into a cutthroat battle for market share, often regardless of price. "CDC seems to be holding its own in pricing, but the peripheral business is nothing to write home about," he said.

The investment community consensus is that CDC must accelerate its recent pattern of consolidation and divestiture to retain a fighting chance at keeping its financial ship afloat. "I think they are trying to do that," Fram said. "The sense of urgency is there."

Washington eases AT&T computer sales structures

will be used to determine general marketing policy. He said AT&T hopes the FCC will continue removing its structural separation conditions from other parts of AT&T's business, citing in particular its enhanced service offerings, which will continue to be marketed through AT&T Information Systems.

There will be no immediate "radical reorganization, nor do we anticipate any significant new downsizing of our force because of this action," Marshall said.

Daniel J. Harrold, a Washington, D.C., attorney and spokesman for the International Communications Association (ICA), which represents large telecommunications users, reacted to the FCC's move by saying the association wants to see details of AT&T's accounting plan before making a judgment. "This is the key to lifting the separation requirements. There is obviously going to be some subsidy [of equipment sales and transmission], but the question is how much and to what degree."

In a separate move, the FCC denied AT&T Communications' request for permission to proceed with an optional discount pricing plan, Pro-America, which would have awarded users a 15% discount on all direct-dial long-distance calls for a flat $25 monthly fee. The requested tarriff was not supported by demand figures supplied by AT&T, the FCC ruled.

The FCC conditioned its permission allowing AT&T to drop the separate subsidiary requirement for the marketing of terminal and computer equipment — the heart of its Second Computer Inquiry decision policy — on AT&T moves to establish accounting procedures and network disclosure policies. The FCC will have to approve these plans before the new policy can go into effect.

First, AT&T will have an obligation to disclose to its competitors changes in technical interconnection standards to its core network at the time it is ready to make a make/buy decision. Competing equipment organizations will have to sign a nondisclosure clause if they are seeking to bid for one of AT&T's contracts. If they do not sign, AT&T must publicly disclose its planned network changes at least six months before they are to go into effect.

Second, the FCC is requiring that AT&T establish an order placement structure to prevent discrimination in the servicing of new orders coming into AT&T for connections to its dominant long-distance network and to ensure that all customers receive the same treatment. The FCC will require monthly reports on installations in this regard.

Third, the FCC will require AT&T Communications to disclose proprietary information on its customers' telecommunications installations if directed by the customer to do so. This gives the customer some power over the selection of a carrier and equipment, the ICA's Harrold said.

The fourth and final condition will require AT&T to set up a cost accounting system to track joint and common costs shared between the equipment arm and the transmission portion for AT&T's combined marketing, research and development and sales efforts.

WITH ADR'S DATA BASE YOU CAN USE 50 OF THE BEST APPLICATIONS PACKAGES EVER WRITTEN. AND NONE OF THEM ARE OURS.

"I couldn't help overhearing, Mr. Thompson, but a relational data base with open architecture offers a solid foundation for all your company's applications thereby helping your company respond to a turbulent business world. Mom, can I go out and play?"

One-stop shopping, buying all your applications from the same company that sells you your data base management system (DBMS), is a very appealing idea. Especially to the company that's trying to sell them to you.

But it doesn't make sense. Because no one company has a lock on all applications. One company's manufacturing package may be perfect for you, but you may need a distribution package from another company.

At ADR®, we understand this. And that's why ADR/DATACOM/DB®, our high performance relational DBMS, helps you use the applications packages that satisfy your company's needs best, From a variety of sources.

With ADR/DATACOM/DB you can choose from the best applications packages available today. And tomorrow. The best in banking, finance, manufacturing and other areas. All from the best applications vendors.

That's because we've worked with the best applications vendors and helped them develop and support applications especially for ADR/DATACOM/DB.

Applications Vendors Supported by ADR/DATACOM/DB.

The advantages of having an application built by a company that specializes in applications are obvious. After all, they're the experts. They can build applications that are rich with features. And they are committed to keeping them current. Simply because that's their business. Which are the same obvious reasons for having a DBMS built by a DBMS specialist.

Or to put it another way, maybe one of the reasons why ADR/DATACOM/DB is such a good DBMS to buy is because we're not trying to sell you something else.

Cray doubles memory on X-MP line

By James Connolly

MINNEAPOLIS — Responding to what users described as an insatiable demand for more memory, Cray Research, Inc. last week upgraded available CPU memory on its X-MP line of supercomputers.

Cray introduced four expanded-memory X-MP models, cut the price on an existing model, discontinued another model and announced I/O products. The product line now consists of nine models, featuring various memory capacities in uniprocessor, dual-processor and four-processor versions.

The X-MP line now stretches from the previous 1M-word (using 64K-bit words) uniprocessor X-MP/11 to the new high-end X-MP model, the four-processor, 16M-word X-MP/416 that costs $16 million. While the X-MP/416 is priced just $1.6 million below the top-end Cray system — the 264M-word Cray-2 announced earlier this year — the machines are not competitors, Cray Executive Vice-President Marcelo Gumucio noted.

> **”**
>
> *'We can use all of the memory we can get.'*
>
> — **John E. Ranelletti**
> **Lawrence Livermore**
> **National Laboratory**

"The Cray-2 and the X-MP are really two different machines. The Cray-2 has a [264M-word] memory but is a new machine about which we are still learning the total capability. It was designed to solve larger computational problems that can be comprehended in main memory. The X-MP is a multitasking, multiprogramming machine for which there are a lot of application packages available," Gumucio said.

Supercomputer consultant Sid Fernbach of San Jose, Calif., noted that the four-processor X-MP "is just as good a machine as the Cray-2" and that the software for the Cray-2, the second of which is scheduled for delivery to a [National Aeronautics and Space Administration] location next month, "isn't too good."

Managers interviewed last week at X-MP installations, while unfamiliar with the details of the Cray announcements, welcomed news of the memory enhancements.

"For our applications at [the Nasa Ames Research Center] we have very large memory requirements and could use any memory Cray makes available," commented Steven Walworth, planning analyst for Nasa Ames at Moffett Field, Calif.

John E. Ranelletti, head of the computation department for Lawrence Livermore National Laboratory in Livermore, Calif., added, "I'm not personally familiar with the announcement, but we can use all of the memory we can get."

The X-MP/416 moves ahead of the existing four-processor, 8M-word X-MP/48 at the top of the X-MP line. Both systems use emitter-coupled, bipolar memory technology.

The dual-processor systems announced are the X-MP/216 with a 16M-word memory and the 8M-word X-MP/28.

Cray also said it is cutting the price on the 4M-word X-MP/24 from $10.5 million to $8.5 million and discontinued a 2M-word version. The fourth new processor is the X-MP/18, featuring 8M words of memory.

Cray said all dual processors and uniprocessors now will use static MOS memory technology.

The company announced that several features previously available only on the largest Cray X-MPs have been extended to all models. The features include gather/scatter and compressed index vector instructions, which allow for vectorized processing of randomly organized data, and a 1G-byte channel for connecting a Cray Solid-State Storage Device.

Cray also introduced its DD-39 1.2G-byte disk storage device, featuring a 5.9M byte/sec. transfer rate, and announced an IBM Data Streaming Interface with a 3M-byte bandwidth for data access from IBM storage devices.

Delivery for the new uniprocessor models reportedly is scheduled for the second quarter of 1986, for the new dual processors in the third quarter of 1986 and for the new four-processor models in the fourth quarter of 1986.

The X-MP/416 costs $16 million; the X-MP/216 costs $11.5 million; the X-MP/28 costs $9.5 million; and the X-MP/18 costs $8 million.

Field upgrades from uniprocessors to dual processors and from dual systems to four-processor systems are unavailable. However, memory upgrades within those systems are available for the price of the difference between models.

IBM rolls out PC Network products

IBM last week announced products for its PC Network and enhancements to its microcomputer software introduced last summer.

The PC Network Analysis Program monitors activities and identifies problem conditions on a network. The program can sample, analyze and present network operation information at user-selected levels. It monitors conditions at individual adapters and tracks traffic for specific periods of time.

The software maintains a program-created directory of powered-on adapters.

The package costs $1,295 and will be available in December.

The company also added the IBM Business Management Series Local-Area Network Access Edition. The program works with the Business Management Series, a six-package series of general ledger and accounting packages, and enables the programs to operate on the PC Network.

With the package, five concurrent users, consisting of a network server and up to four remote users, can access one of the six business packages. Users can share logs, programs and data files. The Business Management Series Local-Area Network Access Edition's applications job monitor tracks which IBM Personal Computer on a network is running the program, monitors reserved files and manages locked application files.

The software costs $245.

The IBM Local-Area Network Printmanager enables users of an IBM PC Network or a Corvus Systems, Inc. Omninet to share an IBM 3820 page printer equipped with a Synchronous Data Link Control card. A user can choose from up to 55 fonts.

The Data and Words modules of the IBM Personal Decision Series also have been enhanced. Words now includes a facility that converts documents so they can be used by IBM's Displaywrite 1, 2 or 3. A second change improves the package's interface to Word Proof spelling checker. The Data module now supports the installation of Displaywrite 1, 2 or 3.

The firm also introduced a C compiler that runs under IBM's PC-DOS 3.1. The compiler features include selectable-memory-model support.

The compiler sells for $495.

Computerworld is a member of the CW Communications/Inc. group, the world's largest publisher of computer-related information. The group publishes 55 computer publications in more than 20 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's Computerworld/Argentina; Asia's The Asian Computerworld; Australia's Computerworld Australia, Australian PC World and Macworld; Brazil's DataNews, MicroMundo, and PC Mundo; China's China Computerworld; Denmark's Computerworld/Danmark, PC World and Run (Commodore); Finland's Mikro; France's Le Monde Informatique, Golden (Apple), OPC (IBM) and Distributique; Germany's Computerwoche, Microcomputerwelt, PC Welt, Softwaremarkt, CW Edition/Seminar, Computer Business, Run and Apple's; Italy's Computerworld Italia and PC Magazine; Japan's Computerworld Japan; Mexico's Computerworld/Mexico and CompuMundo; The Netherland's Computerworld Benelux and PC World Benelux; Norway's Computerworld Norge and PC Mikrodata; Saudi Arabia's Saudi Computerworld; Spain's Computerworld España, PC World and Commodore World; Sweden's ComputerSweden, Mikrodatorn, and Svenska PC; the UK's Computer Management, Computer News, PC Business World, and Computer Business Europe; Venezuela's Computerworld Venezuela; the U.S. Computerworld, Hot CoCo, inCider, Infoworld, MacWorld, Micro Marketworld, PC World, Run, 73 Magazine, 80 Micro, Focus Publications and On Communications.

QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our supersonic systems.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not* go directly to jail. But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT). First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

• **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

• **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevant records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination, headings and dates • Can often produce simple reports in one day rather then, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

SYBACK • SYNCSORT CMS • SYBACK • SYNCSORT CMS • VM

Macintosh add-on products unveiled as Jobs departs

without having a hard disk drive," according to Lewis.

Hard Disk 20 fits underneath and connects to the back of the Macintosh and can be used with any Mac with 512K bytes of memory. It is the second hard disk drive to be introduced for the Macintosh in recent months. General Computers, Inc. of Cambridge, Mass., introduced a 20M-byte hard disk for the Macintosh last month in Boston.

Scheduled for limited availability in November, the Hard Disk 20 can operate twice as fast as a floppy disk drive, a spokesman said. Hard Disk 20 comes with a hierarchical filing system, and the software uses the Macintosh's file folder icons for grouping together related files, a spokesman said.

The product costs $1,499.

Apple also introduced a version of its dot matrix printer: Imagewriter II, priced at $595, can operate at up to 250 char./sec. and gives users access to three printing modes.

The printer is said to include an expansion slot for a range of interface boards.

For the Apple II line of computers, the company introduced a 3½-in. floppy disk drive that can store up to 800K bytes of information. Available immediately, Unidisk 3.5 includes systems software utilities for formatting and duplicating diskettes and for copying and deleting files on a diskette.

It is designed to bridge the gap between Apple's low-end, 143K-byte floppy disk drives and its 10M-byte Profile hard disk. The Unidisk 3.5 costs $499.

Other products introduced by Apple include the following:

- The Apple Personal Modem, a Hayes Microcomputer Products, Inc.-compatible 300/1,200 bit/sec. modem. Currently available, the modem operates at 1,200 bit/sec., 110 bit/sec. or 300 bit/sec. for compatibility with other networks that require lower speeds.

The modem also uses the Hayes Smartmodem Command Set and can be connected to any personal computer with a standard RS-232C serial port. The Apple Personal Modem costs $399.

- Switcher, a utility that allows Macintosh 512K and Macintosh XL users to store up to eight applications in memory at the same time. Switcher also allows users to transfer data between Macintosh applications.

For example, users can copy a graphic from a Macdraw onto a Macwrite word processing document.

Early versions of Switcher were made available in April to Compuserve, Inc.'s Micro-Networked Apple User Group and to several software developers, including Microsoft Corp., which included the utility in its Excel spreadsheet product.

Individual copies of Switcher are priced at $19.95, the vendor said.

Two commercial Unix users stand by their systems

By Charles Babcock

NEW YORK — Two large users of AT&T Unix operating systems in commercial settings told attendees at the Unix Expo conference that they think they have made the right choice.

Both said, however, that they have had difficulty building a professional staff experienced in Unix.

Steven Stamps, director of development at J. J. Kenney Co., said his firm was trying to download 70% of the transaction processing currently handled by six Perkin-Elmer Corp. superminis onto 150 individual workstations.

J. J. Kenney is a broker of municipal securities for other brokerage houses. Many of the transactions that its computers must process are read-only or informational messages for its traders, and downloading them to AT&T Unix PCs would eliminate the need to expand its central data processing center, according to Stamps. The firm built a prototype system, and it is being used by six traders, but J. J. Kenney ran into difficulties.

"We found we did have a performance problem. The system became spongy at 10 terminal users. We had thought we could run 24," he said.

The development staff has had to reconfigure the system to get better response times, Stamps said.

George Grant, director of marketing for Quotron Systems, Inc., Los Angeles, said his firm spent five years preparing to market a Unix stock quotation and office automation system to brokerage houses.

One year to convert

According to Grant, Quotron's 80-member development staff spent from 1980 to 1983 building software development tools, including screen managers, window managers, a data base management system and forms manager.

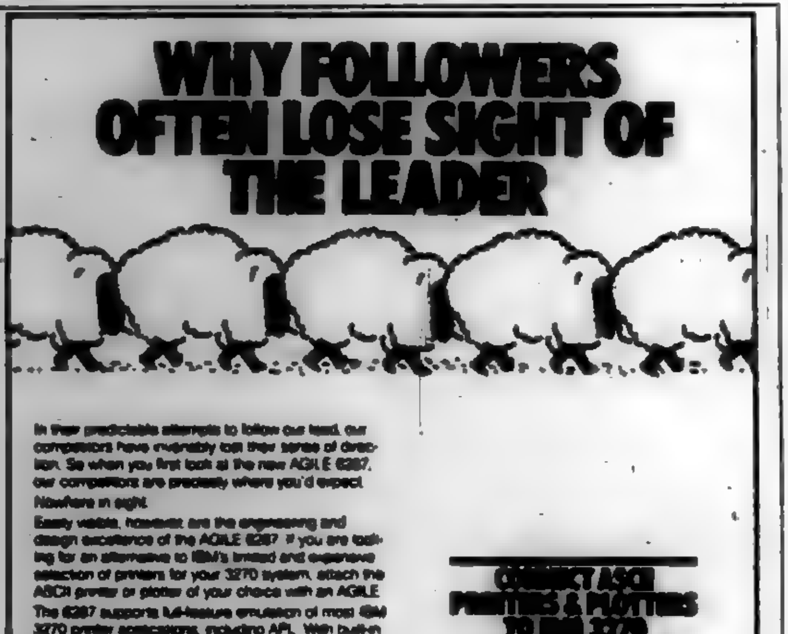
Once the tools were assembled, the staff was able to convert Quotron's stock quote service into the C language in a year.

"It is the Unix system with the tool set that makes productive application development possible," Grant told conferencegoers, many of whom said they were interested in using Unix in their business offices.

Unlike Quotron, J. J. Kenney was able to buy many of the system utilities and the data base management system it needed rather than develop them itself. Availability of those products indicates how the market for Unix has changed in the last five years, Stamps said.

He and Grant both complained that it is difficult to find experienced Unix programmers and that such programmers were commanding top salaries. A programmer with five years' experience in Unix and 10 years' experience in data processing can earn $50,000, he said.

Stamps also said commercial users worry about the "polarization" between System V, which AT&T is promoting as a standard, and University of California at Berkeley's Version 4.2, which some users view as offering a wider selection of enhancements.



WHY FOLLOWERS OFTEN LOSE SIGHT OF THE LEADER

In their predictable attempts to follow our lead, our competitors have invariably lost their sense of direction. So when you first look at the new AGILE 6287, our competitors are precisely where you'd expect.

Nowhere in sight.

Easily visible, however, are the engineering and design excellence of the AGILE 6287. If you are looking for an alternative to IBM's limited and expensive selection of printers for your 3270 system, attach the ASCII printer or plotter of your choice with an AGILE.

The 6287 supports full-feature emulation of most IBM 3270 printer applications, including APL. With built-in diagnostics, internal power supply and fan cooling, the 6287 is backed by a full two-year warranty.

For plotters, laser printers, dot matrix, daisy wheel or high speed printers, the reasons to choose the AGILE 6287 are clear.

But if by chance you do look at our competitors, tell them we said hello.

We haven't seen them in years.

Major software firms most probable bidders

By Maura McEnaney

SAN FRANCISCO — Walker Interactive Products, Inc. is for sale and could be sold within the next several weeks, according to industry sources and analysts.

But mum is the official word from the vendor of financial applications packages, once touted for its applications development tools and line of business financial software. Vendors rumored to be interested in the firm declined to comment.

Industry analysts said they heard of the Walker rumor as early as last April, and the software industry's leading vendors are quick to confirm the possibility of a sale. One vendor source said a sale to Management Science America, Inc. (MSA) was imminent, but another said any sale will take some time to finalize.

Potential buyers for the $20 million company include the industry's largest software vendors, among them MSA, McCormack & Dodge Corp., Cullinet Software, Inc. and IBM. Analysts have their own theories on the potential sale of the company, which has been troubled with poor sales and steep liabilities during the past several months.

William Shattuck, analyst with Montgomery Securities, put his bet on Cullinet as the most likely buyer of Walker. "It would make a lot of sense for Cullinet," Shattuck said, particularly in light of Cullinet's legal dispute with McCormack & Dodge over the international marketing rights for Cullinet's General Ledger package, originally purchased from McCormack & Dodge. One source, formerly associated with Walker, said MSA is the likely buyer, a view held by one of MSA's chief competitors.

Shattuck downplayed the MSA interest. "It seems to me [buying Walker] would make more sense for a company that is trying to get into the applications market rather than a company that has pretty much covered all the bases, like an MSA."

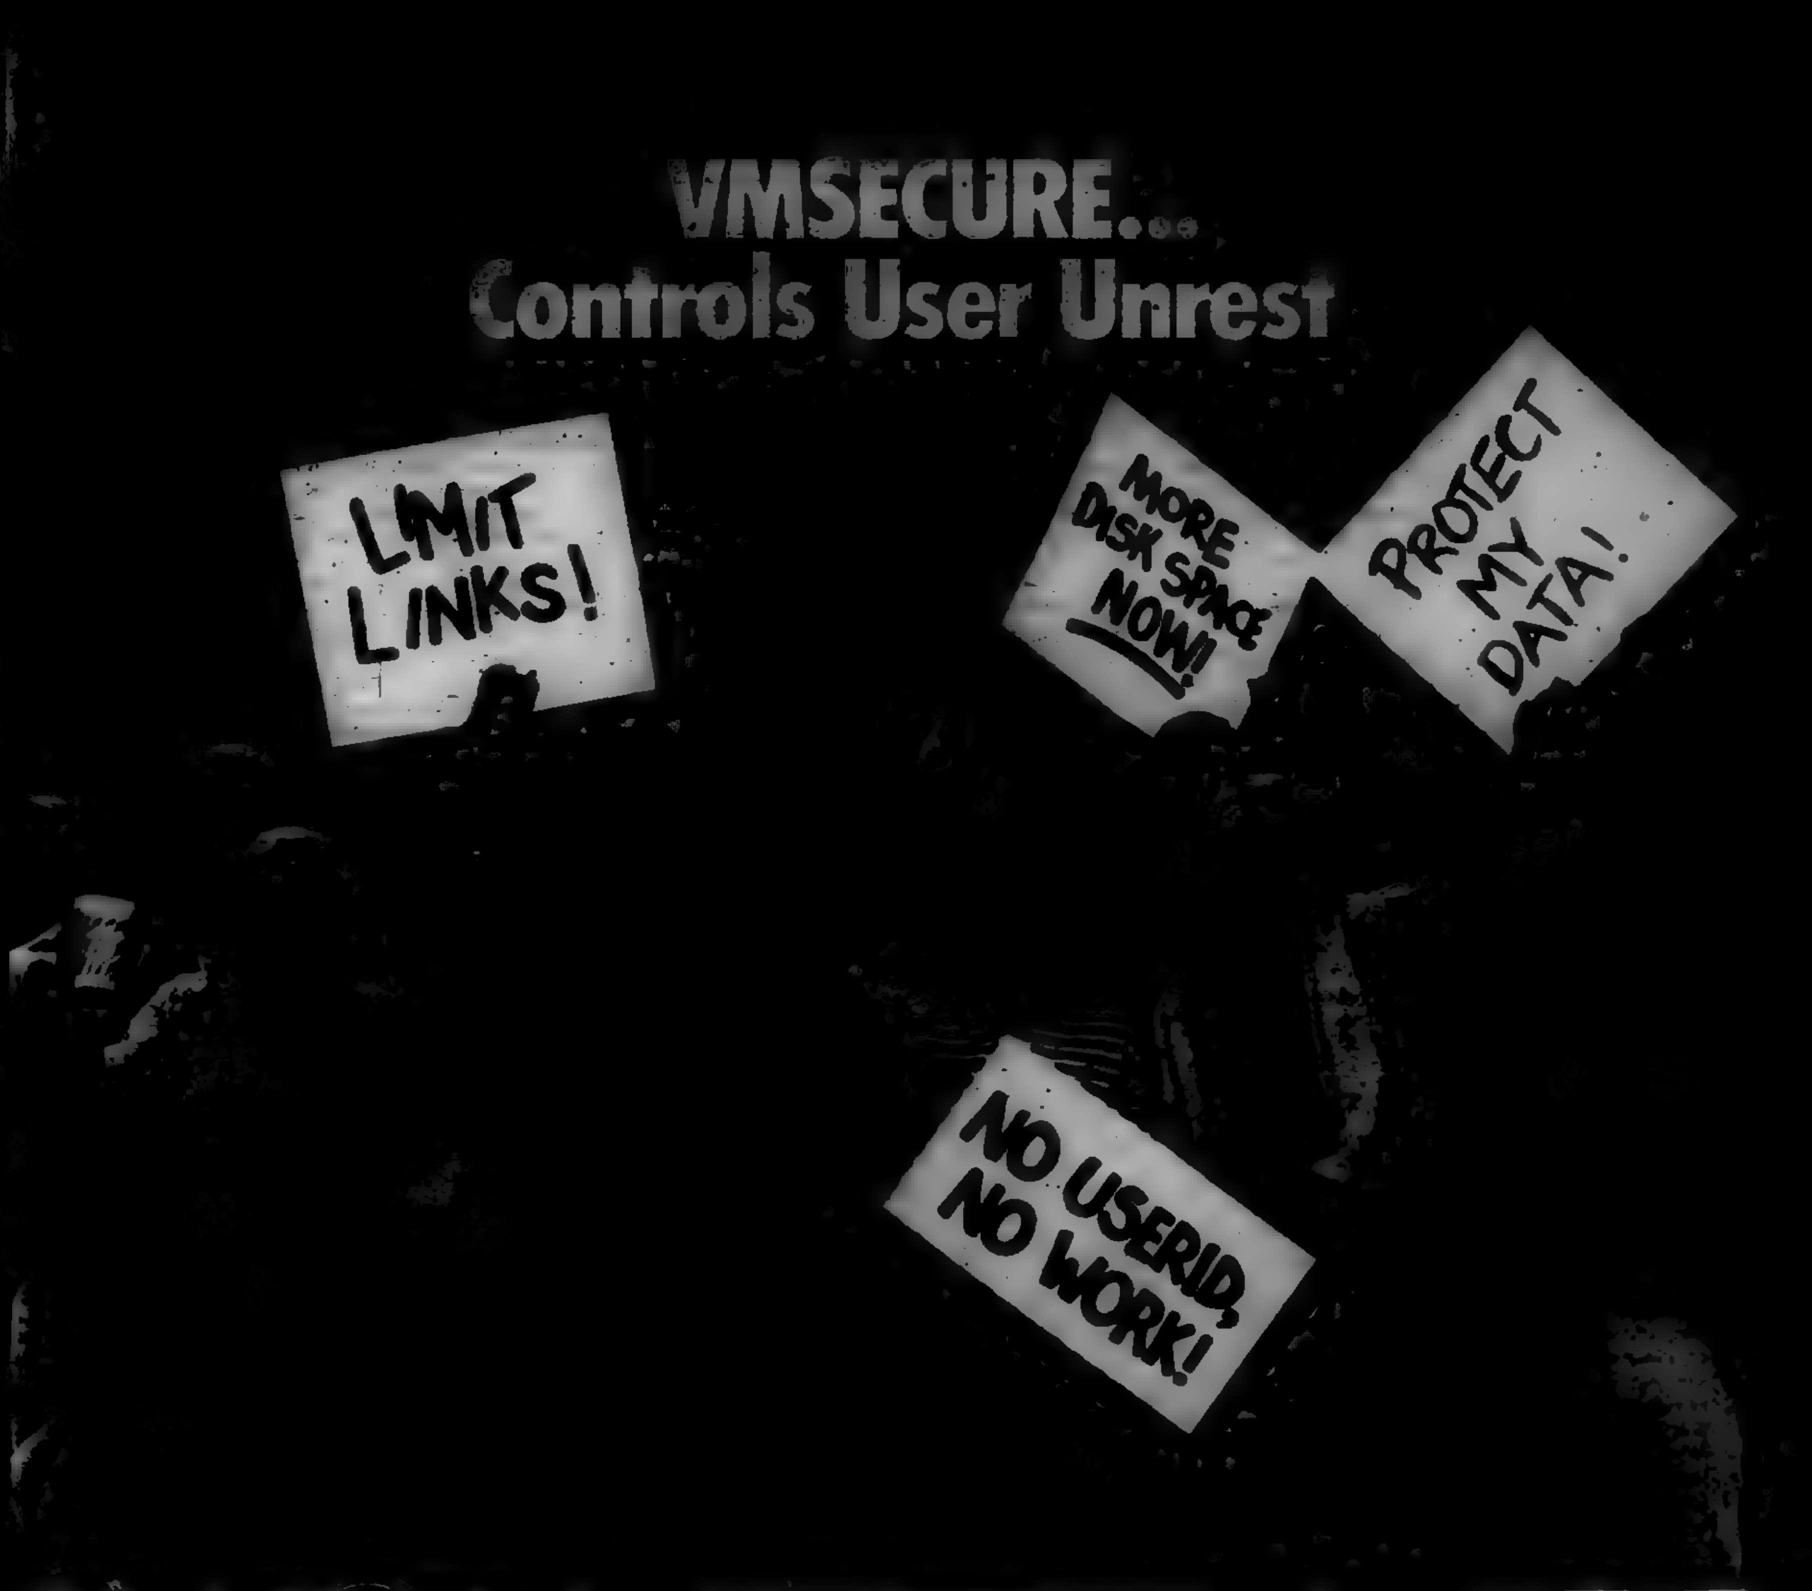
Brian Muttert, a software analyst with Robertson, Colman & Stephens, an investment banking firm here, would not comment on the pending sale of Walker, because of what he said was his firm's financial involvement with Walker Interactive.

Several years ago, Muttert said, Walker was viewed as a fast-track company that developed a solid reputation for its interactive software applications.

Launched as a consulting company by Jeffrey Walker in the mid-1970s, Walker garnered investments from venture capitalists and was reborn in 1980 as Walker Interactive Products. Shortly thereafter, the company recorded 200% annual sales growth on the strength of sales of its Integrated Interactive Financial Systems.

Computerworld *staff writer John Desmond also contributed to this report.*

VMSECURE...
Controls User Unrest



LIMIT LINKS!
MORE DISK SPACE NOW!
PROTECT MY DATA!
NO USERID, NO WORK!

True security in VM requires a unique approach.

Sometimes it doesn't seem fair. On one hand, users insist on tight security for their own data... but on the other, they want almost complete access to everyone else's.

Obviously, access control in a VM data center is a challenging task. And thankless as well.

True Security Starts with Control of the Directory

In VM, effective security must start with control of the source directory. That's where access is initially defined, and VMSECURE lets you create a hierarchy of access authorizations, with the most efficient directory management system available.

But VMSECURE hands you control well beyond the directory with a database of installation defined access rules.

User Freedom

Let's face it...end users are often the best judges of their own specific security needs within their own areas. VMSECURE capitalizes on this simple fact by allowing end users to participate in making their own security rules.

But You're Still the Boss

All the user rules can, of course, be overridden by data center management, therefore maintaining centralized control of overall system security.

In other words, VMSECURE allows the end users to set specific rules...but gives the data center the muscle to enforce and override them.

Identify Offenders Now

With VMSECURE, you can set specific access criteria, control password construction, enforce password change intervals, encrypt data, and prevent users from accessing resources and data for which they are not authorized. When violations occur, VMSECURE is quick to respond. If a rule or password violation is detected, the system immediately executes your own predetermined sequence of responses including access denial...or complete disablement of the terminal. Automatically.

Fast and Efficient

VMSECURE also offers you the most efficient directory management system available for VM, performing maintenance functions up to 100 times faster than traditional methods, saving personnel time and CPU resources.

VMSECURE directory management facilities are also extremely flexible. The nuisance tasks of directory updates and changes are distributed to group managers and greatly simplified with full screen menus.

Take Total Control

VMSECURE is available individually or as one of the components of VMCENTER, the most comprehensive data center management system for the VM environment.

A Free 30-day Demonstration

To find out how well VMSECURE can solve your security problems...and to discover the advantages of a system that was designed specifically for the VM environment, call the toll-free number below for a 30-day free trial. See for yourself the difference that VMSECURE can make.

Productivity key concern at Software/Expo conference

and applications development without programmers. We are simply selling old technology repackaged."

DP and MIS managers interviewed at the Software/Expo last week expressed concerns about improving productivity, and many said they plan to do it with personal computer software ranging from decision support to graphics packages.

Jim Grayson, MIS manager with Standard Meat Co. of Fort Worth, Texas, said he was looking for a package offering good graphics on a personal computer to free up demand on the mainframe. "Graphics is a big CPU hog," he said.

Decision support software was being sought by Steve Chaney, information center manager for Standard Meat. The company's information center has worked well for middle management, "and now I want something easier to use for upper level executives," Chaney said. "At the executive level, they need more of a presentation system than something to develop applications with."

Controlling the proliferation of personal computers is a chief concern of Michael Friedkin, technical services manager in the Louisiana State Department of Labor, Baton Rouge. "Management has said to go out and buy personal computers. My unit has to coordinate all that and try to provide micro-mainframe links and support," he said. "One thing I want to look at is the information center concept to see if we can slow the need for links" and prolong the useful life of his mainframes, he said.

George Connor, systems analyst at the Sandia National Laboratories, Kirtland Air Force Base, Albuquerque, N.M., said he wants to quicken the pace of application development by having users do more on their own. "Our financial systems are all implemented, but the users want more," he said, pointing out his backlog. Recent research at the laboratory, which has a development and support staff of 169, showed that half of the staff's time is spent maintaining business applications.

Gene Gotland, finance systems manager for Boeing Aerospace Co. of Seattle, said he hoped to find products that will help him distribute applications to end users and allow users to write ad hoc applications. "We are trying to do this with personal computers and fourth-generation languages," he said.

Not surprisingly, users made their way to Dallas' Infomart to learn more about fourth-generation languages, relational data base management systems and other products lumped under the banner of productivity tools. DBMS was born more than a decade ago, but it remains a basic concern of users who must integrate applications developed over a span of three decades. Software/Expo sessions seemed to offer just what these users were looking for: They focused primarily on day-to-day issues such as development, maintenance, DP management and the optimum use of productivity tools like DBMS and fourth-generation languages.

Cincom announces relational DBMS for IBM mainframes

for IBM mainframes.

In the previous decade, Cincom took the early lead in the DBMS race with its Total product. But in recent years, the Cincinnati-based vendor has fallen behind such rivals as Cullinet Software, Inc. and Applied Data Research, Inc. (ADR) in the independent DBMS market. (IBM still maintains control over the DBMS market, but Cullinet and ADR have lately boasted impressive gains over Big Blue.) Cincom is hoping to turn that around with the debut of its Superior Relational Architecture (Supra) "advanced" relational DBMS.

According to Cincom President Dennis Yablonsky, the advanced aspect of the product is that it implements the American National Standards Institute's ideal DBMS model. Although the model drafted by the institute's Standards Planning and Requirements Committee — which was made up of representatives of major hardware and software vendors and some of the largest U.S. companies — is more than a decade old, Yablonsky said Cincom has become the first vendor to implement it fully in a commercially available relational system. Yablonsky hosted the company's multimedia press unveiling of Supra during the Software/Expo conference held in the Infomart facility.

Yablonsky said Supra meets the committee's requirement that a relational DBMS incorporates a three-schema architecture. That means the system maintains three independent definitions (schemas) of data: an external or user view; a conceptual view that organizes data in a relational table format; and an internal or physical view of how data is managed and stored. He said most relational DBMS, including Cullinet's IDMS/R, ADR's Datacom/DB and Cincom's existing TIS product, currently only support a two-schema architecture.

In addition to leading Cincom's renewed attack on the DBMS market, Supra has also become the flagship of the company's newly focused product line. Under the banner of TIS/XA, Supra joins Ultra, the company's Digital Equipment Corp. VAX-based DBMS; its Mantis applications development system; its Control series of manufacturing and financial applications; and its Net/Master and PC/Contact network management systems.

"TIS/XA is intended to automate the automation process," Yablonsky said. "Supra shows that we are in the DBMS market to stay. We intend to take back our rightful place through aggressive development and marketing."

The three-schema design, Yablonsky said, automates a variety of functions, relieving programmers and data base administrators from writing teleprocessing monitor and data base navigation and derivation logic and data integrity code. By separating the conceptual data view from the physical view, he said, Supra eliminates data redundancy, allows for the enforcement of data integrity constraints and enables users to restructure the physical data base without modifying existing applications.

Supra consists of five components. The Spectra information retrieval and application development system, which customers got a sneak peek at during Cincom's recent Directions '85 conference, enables end users to access data through nonprocedural commands. The Normal data base administration tool automates logical and physical data base design through a set of tools that assist the data base administator.

According to Yablonsky, the Relational Data Manager component supports the three components of the relational data model: relational structure, manipulation and integrity. Manipulations include the SELECT, PROJECT and JOIN commands that must be supported in a true relational DBMS. Supra's Physical Data Manager supports all data structuring techniques such as indexing, chaining, sequential and flat file. Yablonsky said the component was designed to reduce physical I/Os and ensure high performance. He said the data manager also supports on-line dynamic file allocations or deallocations for nonstop processing. Supra integrates data in the data manager and native IBM Vsam files, providing users access to data in existing Vsam-based applications.

The final component, the In-Line Directory, controls data access, security and applications development. It maintains information about users, programs, views and data definitions and integrates all Supra components.

Supra, available now, costs $145,000 for IBM DOS/VSE and $215,000 for MVS or MVS/XA.

Infomart, site of this year's Software/Expo

Limited product debuts seen at Software/Expo

DALLAS — With the introduction of its Superior Relational Architecture relational data base management system, Cincom Systems, Inc. of Cincinnati led the rather slim pack of software vendors unveiling products at last week's Software/Expo conference.

While not introducing a software offering, Vienna, Va.-based Boeing Computer Services Co. announced site licensing options for all of its microcomputer software products and for some of its mainframe tools. At an Infomart press briefing, the company said it will offer unlimited right-to-copy licenses for one company site or for a group of sites to provide more purchasing flexibility for its customers.

Citing the recent controversy over software copying, Boeing said it wanted to take a firm stand and address larger organizations' need to overcome copy protection limitations. As an example of how the pricing schemes would reduce costs, a spokesman said a buyer could save more than 90% on the single-copy price of the Boeing Calc package, depending on the pricing plan chosen. Boeing will provide reproducible diskettes and camera-ready copies of documentation.

Forecasting Planning Associates and Systemware, Inc., both of Dallas, jointly announced Data Center Manager/1. The product, designed to run on an IBM Personal Computer, aids DP professionals in the management of computer equipment, software and supplies. Data Center Manager/1 offers an inventory data base that supports disaster recovery planning, budgeting and forecasting, configuration management and component failure impact analysis.

The package consists of separately priced basic inventory, budgeting, configuration and maintenance modules. Basic inventory is available now for a one-year license fee of $4,995. Other modules are scheduled to be available later in the year at prices to be announced.

Austin, Texas-based Data Interface Systems Corp. unwrapped its DI-3270/L product for IBM 3270 Personal Computer-terminal emulation. A spokesman said the products use local-area network technology to support micro-to-micro communications and that one or more micros in the network serve as gateways to a host system, acting as an IBM 3274 controller. All micros in the network act as 3278 terminals and 3287 printer controllers, with up to four logical units supported at each node.

A stand-alone implementation of the system is also available. Currently available for bisynchronous systems, DI-3270/L will reportedly support IBM's Systems Network Architecture in 1986. Pricing ranges from $650 to $950 per node. Stand-alone version pricing starts at $300.

Arlington, Texas-based Southwest Software Services, Inc. introduced Version 3 of its Zeke — The Controller automated scheduling and dispatching system for batch jobs under IBM's DOS/VSE and MVS operating systems. Enhancements enable automatic replies to job messages to be defined to the system along with the reply Zeke is to use. Dates and critical run parameters can be cataloged, checked, verified and automatically entered by Zeke when a specified program requests the information.

In addition, an on-line security system has been added, and multisystems support enables the Zeke data base to be shared between DOS/VSE, MVS and CMS. The DOS/VSE version of Zeke costs $11,500, and the MVS version costs $19,500.

Al Lee & Associates, Inc. of Dallas announced enhancements to its Magec on-line applications development system for IBM OS and DOS users. A utility function has been added to generate data item definitions automatically from existing Cobol copy book definitions. The system's access method transparency feature has been expanded to support IBM's Vsam, Isam and Bdam and Applied Data Research, Inc.'s Datacom/DB.

Magec costs between $28,000 and $72,000, depending on configuration and operating system.

Learn how information can become a strategic corporate asset.

With a comprehensive database management system and appropriate tools, you can assure that data processing becomes a competitive advantage—not corporate overhead.

Learn how to satisfy the requirements of every department in your organization with advanced database technology, in combination with complete Information Center tools and applications rich in functionality, whose underlying architecture is built on, and takes full advantage of, that same advanced database technology.

Plan to attend one of Cullinet's seminars in Database Management, Manufacturing, Financial Management, Human Resource Management or Information Center Management. Call soon to reserve spaces for yourself and your colleagues.

To enroll in a Cullinet Seminar, call 1-800-225-9930. In Massachusetts, phone 617-329-7700.

All seminars through December 31 are listed below. Call for information on later seminars.

Cobol 85 standard wins Ansi approval

By John Gallant

Cobol 85 is a U.S. standard at last. The American National Standards Institute (Ansi) gave its final approval to the proposed language upgrade less than one month after receiving the Cobol 85 standard document from its drafters.

In a sooner-than-expected move that surprised even insiders [CW, Sept. 16], Ansi's Board of Standards Review approved the Cobol 85 standard through letter balloting that ended Sept. 10. According to Dorothy Hogan, vice-president of communications for Ansi, 11 members of the 12-member review board voted to approve the standard; one ballot was not returned.

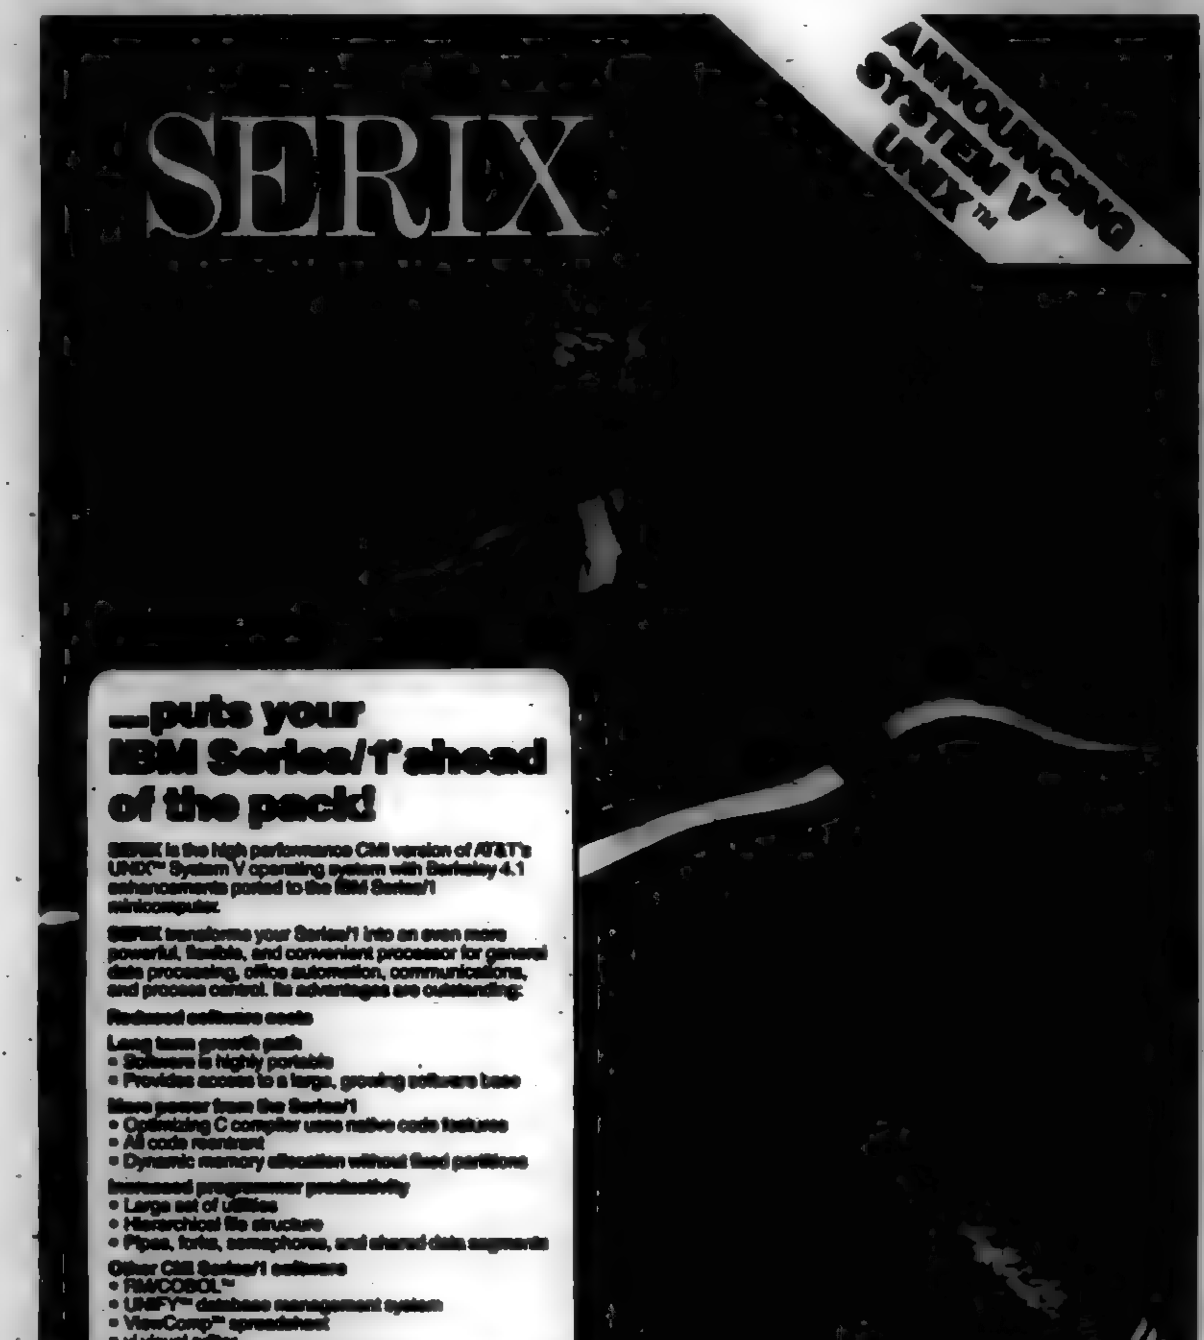
The Board of Standards Review received the Cobol 85 draft standard from Ansi's X3 committee — primary drafters of the upgraded language — in late August. X3 committee members told *Computerworld* at that time they were not expecting a final vote on the document until later in the year.

Committee members received no special notification of final approval and only learned of the vote through a periodically distributed Ansi publication.

"It's great news that we now have an American standard," said Jerome Garfunkel, a member of the Ansi X3J4 Cobol subcommittee and founder of Jerome Garfunkel Associates, Inc. "But the news comes as something of a surprise. It points out one of my greatest disappointments with the whole standards procedure. Even as a member of the Cobol committee, it has been very difficult to find out what stage the document was at and when it was to be approved."

According to Ansi's Hogan, the Board of Standards Review's vote set in motion a 30-day period during which people can appeal the approval. But, she said, no objections have yet been received.

The Cobol 85 standard now awaits only final International Standards Organization approval, a step expected before year's end.



SERIX

ANNOUNCING SYSTEM V UNIX™

...puts your IBM Series/1® ahead of the pack!

SERIX is the high performance CMI version of AT&T's UNIX™ System V operating system with Berkeley 4.1 enhancements ported to the IBM Series/1 minicomputer.

SERIX transforms your Series/1 into an even more powerful, flexible, and convenient processor for general data processing, office automation, communications, and process control. Its advantages are outstanding:

Reduced software costs

Long term growth path
- Software is highly portable
- Provides access to a large, growing software base

More power from the Series/1
- Optimizing C compiler uses native code features
- All code reentrant
- Dynamic memory allocation without fixed partitions

Increased programmer productivity
- Large set of utilities
- Hierarchical file structure
- Pipes, forks, semaphores, and shared data segments

Other CMI Series/1 software
- RM/COBOL™
- UNIFY™ database management system
- ViewComp™ spreadsheet
- vi visual editor
- EDX™- to -SERIX™ conversion kit

CMI Corporation is a Master Value-added Remarketer of IBM Series/1 equipment. Leasing and other financial arrangements are available.

at Moffett Field, Calif. **For more on the Cray X-MP, see page 4.**

■

Ranks of IBM Personal Computer AT clones can soon swell with an entry from Hewlett-Packard, a machine currently code-named Viceroy. The system, which could debut in the next few days, is said to be priced lower than the AT and to offer a floppy-disk controller and up to 640K bytes of memory. HP will also toss in its line of specialized graphics cards and monitors, making Viceroy suitable for computer-aided design and manufacturing tasks.

■

The saga of the IBM PCjr continues. Last week the company told its employees that they could purchase the erstwhile Peanut, complete with color monitor, disk drive and three software programs for a bargain-basement price of $450. The original price tag for the PCjr was in the $1,200 neighborhood. To reduce inventories further, currently estimated to be well in excess of 100,000 units, IBM is expected to flood retail outlets with PCjrs just in time for Christmas shopping and with a base price of about $600. Last Christmas they cost approximately $750.

■

A couple of weeks after Apple Computer Marketing Vice-President William Campbell pronounced the demise of the Macintosh Office concept ("We don't have the products to sell the Mac Office") at the Macworld Expo in Boston, Apple pops up on the CBS network presentation of *Death of a Salesman* advertising . . . Mac Office. Actually, there is a nice counterpoint between the two seemingly clashing episodes: Picture beleaguered salesman Campbell as a high-tech Willy Loman and Mac Office as a system that is liked but not *well liked*. **For more on Mac and Apple, see page 1.**

■

Ulric Weil, principal at Morgan Stanley & Co. and experienced IBM watcher, said that IBM booked $6 billion in orders for its 3090 mainframe line in the second quarter of 1985. These orders were so significant in and of themselves, Weil said, that the computer industry as a whole was able to post a 13% increase over 1984's second quarter.

■

It was a busy week for bicoastal data base ballyhoo. On the East Coast, the principals in a new company called Ansa Software — President Steve Dow and venture capital angel Ben Rosen — visited prospective corporate clients, dealers and trade press reporters to beat the drums for their Lotus Development Corp. 1-2-3-compatible micro data base management system Paradox. And out west, Symantec Corp. — headed by former Lotus and Microsoft Corp. executive Vern Raburn — finally released its integrated Q&A package, which includes a data base function and a natural-language front end. **More on both products, page 12.**

IBM software targets 4700 system, mainframe Unix

By John Gallant

IBM last week unleashed software that brought its 4700 financial system into the Office Systems architecture and provided an array of applications and development tools for its mainframe Unix operating system.

IBM's introductions brought yet another processor — the 4700 Personal Computer — into its strategic DIA and Distributed Office Support System (Disoss) linked family of products. In addition, the products for the IX/370, IBM's VM-hosted implementation of AT&T's Unix System V, seemed to signal an intention on IBM's part to make IX/370 a more viable operating system alternative.

An IBM spokesman said the announcement of 4700 Personal Computer Office Systems support provides "an initial offering of access to DIA distribution services for users in a 4700 system environment." He said that through compatibility of IBM Personal Computer products, including Personal Services/PC, on the 4700 Personal Computer, "a broad base is established for continuing IBM 4700 Office Systems support" — a statement that paves the way for other 4700 financial system products to be brought into the Office Systems fold in the future.

With Personal Services/PC running on a 4700 Personal Computer or a Personal Computer attached to a 4700 Controller, users gain access to DIA distribution services to and from Disoss on a host processor. Distribution services refers to the sending and receiving of messages, documents and Personal Computer files.

Text documents created on the 4700 Personal Computer running Displaywrite 2 or 3 and Personal Services/PC can also use Disoss for distribution. Office Systems support will be available when the previously introduced RM4700CTLR package for the 4709 controller and 4700 Personal Computer Application Services package become available later this month. Pricing is based on individual product prices.

IBM's nine IX/370-related announcements included the following:

■ IX Cobol ($6,000), a version of Austec, Inc.'s ACE Cobol modified to operate under IX/370. It supports record and file locking and is based on American National Standards Institute's (Ansi) Cobol 74 standard.

■ IX Basic ($3,500), an Ansi Minimal Basic standard compiler and interpreter.

> *With Personal Services/PC running on a 4700 Personal Computer or a Personal Computer attached to a 4700 Controller, users gain access to DIA distribution services to and from Disoss on a host processor.*

■ IX Pascal compiler ($4,800), a Unix implementation of Pascal that allows users to compile and execute Pascal programs under IX/370.

■ IX Prochart ($16,000), a version of Visual Engineering, Inc.'s Visual:Prochart. It allows users to create business graphics and is based on the Ansi Graphics Kernel Standard.

■ IX Integrated Word/Math ($12,000), integrated office automation software that was previously announced for the IBM Personal Computer.

■ IX Ultracalc ($10,000), developed by Olympus Software, Inc. It is a financial planning and modeling package with business graphics.

■ IX Informix ($14,000), an implementation of Relational Database Systems, Inc.'s Informix relational data base management system.

In conjunction with IX Informix, IBM also introduced the IX Informix Embedded Query Facility for Cobol ($9,000), which allows users to build custom data base applications under IX Cobol; and IX Informix Embedded Query Facility for C ($9,000), which supports the use of query language statements to access data bases from C programs and allows users to call C functions and use C library routines while using the IX Informix product.

Learn how to manage application development... from the people who know how to manage.

As the demand for applications accelerates, you face many challenges. How do you increase the productivity of I/S development resources while maintaining a high level of quality in the results? How do you design the data base that's best for you? What techniques can be used to involve end users in the development process?

To learn how your company might accelerate its application development process, consider attending the following courses at the IBM Information Systems Management Institute:

—Accelerating Application Development
—Application Maintenance Management
—Application Program Testing
—Data Base Administration and Design
—Data Resource Planning
—Initiating Quality Data Processing
—Inspections: Formal Application Walkthroughs
—Top-Down Requirements Analysis
—Top-Down Software Design

For 19 years the IBM Information Systems Management Institute has offered low-cost classroom courses to help customers plan for growth, develop management processes and increase the productivity of their information systems.

The Institute's 36 courses are grouped into six areas considered to be critical success factors for information systems operations: Information Systems Planning; Application Development; Service Management; Information Asset Protection; End-User and Personal Computing; and Professional and Management Development.

Experienced instructors teach the same techniques that IBM itself uses. What's more, classes are conveniently offered in over 20 cities.

To help you find out more about the Institute's curriculum and each specific course, we have recorded complete descriptions on audiotape.

To listen to these tapes, to order a course catalog or to enroll—call the number below.

Ansa offers Paradox IBM-compatible relational DBMS

By Donna Raimondi

A microcomputer data base management package from Ansa Software with the ability to import Lotus Development Corp.'s 1-2-3 data directly into its data table was scheduled for release and shipment today.

The Paradox relational data base management package for IBM and compatible microcomputers is the first product from Ansa, a company backed by venture capital firms Kleiner, Perkins, Caulfield & Byers and Sevin Rosen Management. The latter is a principal backer of Lotus and Compaq Computer Corp.

Paradox uses machine reasoning features to evaluate user requests and to write programs that seek the fastest route to an answer, according to Stephen M. Dow, president of the company and a partner on leave of absence from Sevin Rosen. In an interview last week, Dow said the package will be shipped through dealer channels immediately and will sell for $695. The company does not plan any direct sales, he said.

Lotus 1-2-3 similarity called a benefit

Paradox's similarity to 1-2-3 is a major benefit to users, according to beta test site user Lesley Pollitt, director of software management at Micromentor, Inc. in Cambridge, Mass. It allows 1-2-3 users to learn Paradox easily, she said.

Paradox is said to handle information management problems through query by example, program synthesis and heuristic query optimization techniques.

Data from a variety of sources can be integrated into Paradox, the vendor said.

The software's built-in programming language, PAL, is said to enable users and programmers to develop turnkey applications that meet their specific needs.

Paradox uses tables to display information in rows and columns. The columns hold categories of information while the rows show individual records. Each table or file can contain up to 260 million characters — formatted in 65,000 rows and 255 columns, with 4,000 char./row and 255 char./col.

A form is used to display data when working with information about one record. Any change made in the form is reflected immediately in the table. Forms can have borders, boxes and annotations on the screen.

Query forms on the screen enable users to retrieve, select or perform calculations on information in the tables. Users question their data by checking off columns and selecting rows.

Reports can be user designed or employ the Paradox program's standard reports.

Symantec package out

By Jeffry Beeler

PALO ALTO, Calif. — A closely watched four-year-old software company last week released its first product, an integrated data base, word processing and report generator package that will use a natural-language interface, according to its developer, Symantec Corp.

The Cupertino, Calif.-based vendor's Q&A product will reportedly unite its data base, word processing and report generator functions to allow users of IBM or IBM-compatible micros to produce documents that derive their contents from two or more sources.

To perform tasks such as writing memos or updating data bases, a user summons a high-level menu that lists Q&A's constituent modules — the File data base, Report format generator and Write word processor. The user then simply selects the menu heading for the desired module.

Q&A uses its natural language interface to create and update data bases without moving to other programs or swapping disks, the company said.

Q&A's natural language capability resides in the product's "intelligent assistant," which enables users to create, populate, edit and update data bases with English language commands rather than with a formal query language.

According to beta user Jay Yamada, who serves on the board of directors for KQED, San Francisco's public television station, the station has used Q&A for about two months.

"I would typically spend two to three days creating [Ashton-Tate, Inc.] Dbase III screens and prompts for KQED's data base," Yamada said during a private interview. With Q&A he was able to perform the same tasks in about 10 minutes.

Q&A's systems prerequisites include 512K bytes of random-access memory and a choice of either two floppy disk units or one floppy and a hard disk module.

For users who already have 512K-byte IBM-compatible micros, the Symantec package sells for $299. When Q&A is bundled with a 256K-byte expansion board, the purchase price rises to $349.

Lotus to deliver remedy for Symphony 1.1 defect

CAMBRIDGE, Mass. — The latest version of Symphony needs some fine-tuning to correct a bug that may cause data to be lost, Lotus Development Corp. revealed last week.

The company said it will send existing users two replacement disks next month to correct the problem.

The bug in Release 1.1 can cause data losses when the user is inserting or deleting rows and columns and moving ranges. The bug was discovered by "quality assurance people and a couple of customers," a spokesman said. Release 1.1 began shipping July 22.

Lotus President Jim Manzi said the company was receiving about 10 complaints a day from Symphony users. Appearing at a press conference to kick off formally the company's Signal product [CW, Sept. 16], Manzi declined to say how many copies of the program had been shipped with the bug in it, although all those copies sold since the version was released contained it, he said.

According to Manzi, not every user of Symphony would have experienced the defect, although it may occur during use of common spreadsheet functions, including inserting and deleting data or transferring numbers between sections.

Stephen J. Crummey, vice-president of sales and service, downplayed the problem, calling it "not a big deal." The fix for the Symphony version that came out on July 22 is not totally resolved, he said. The company will probably swap two of the six diskettes in the Symphony package. The solution will be out in early October at no cost to registered users, Crummey added. An updated version of Release 1.1 will be shipped to dealers within the next week.

In the meantime, users can minimize the risk of losing data if they save their worksheets before using the INSERT, DELETE or MOVE commands, a spokesman said.

One user told *Computerworld* that Symphony has an additional problem with its color features. Release 1.1 is supposed to show both text and graphs in color, according to Russell Baris, project analyst at Pfizer, Inc. of New York who has had the version for about three weeks. When used with an IBM Personal Computer AT or a Compaq Computer Corp. Deskpro 286, the color does not come through on text, he said, adding that Release 1 did color the text. Baris said he told Lotus about the problem and was informed a fix would be sent when available.

A spokesman admitted that Release 1.1, when used with IBM's color card and a color monitor, can produce black and white text for some users. That glitch, along with other bugs that have been reported by users since the package was released, will be corrected in the forthcoming fix.

TCA crowd in buying mood

By Paul Korzeniowski

SAN DIEGO — There was little evidence of a slump at the Telecommunications Association 1985 conference last week where crowded aisles made it difficult to walk around, and users said they were in a buying mood.

The show attracted 250 vendors, up from 230 in 1984, and the association predicted attendance would total 14,000 people, up from 12,700 last year.

The audience seemed to be equally divided into users and vendors, with large contingents from MCI Communications Corp., AT&T and Pacific Bell.

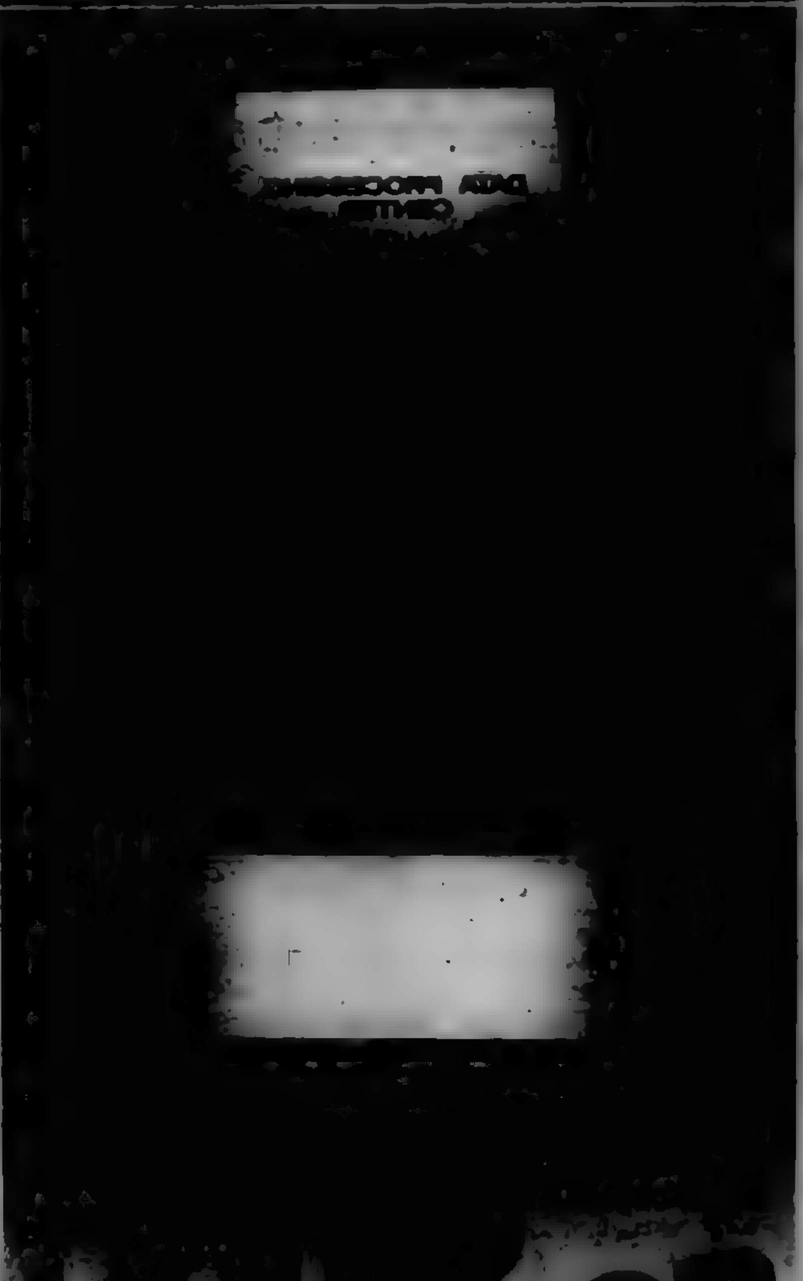
Users interviewed by *Computerworld* were in a buying rather than a browsing mood. Most were evaluating products that had been previously introduced. Only one product announced at the show was mentioned by a user as a probable purchase. J. P. D'Amico of the Los Angeles Police Department expressed an interest in T-Bar, Inc.'s 2001 matrix switch. He was not interested in a similar offering IBM unveiled a week before the show. "We are staunch supporters of [Digital Equipment Corp.] equipment," D'Amico stated.

Richard P. Schoettger Jr., a programmer analyst at Guild Mortgage Co. in San Diego, was evaluating all the items necessary to link his company's IBM System/38 to remote offices. His shopping list included modems, multiplexers and common-carrier services. "I was surprised that satellite equipment had progressed so much," he noted. "The satellite companies seem to have solved the problems of voice delay."

Nick Cook, vice-president of telecommunications at First Nationwide Corp. in San Francisco, was checking to make sure that he didn't overlook any item necessary when his company installs its first T1 line next month. "My best advice has come from other users whom I met during lunch," he said.

Other managers were interested in products that would enable them to squeeze more performance out of existing equipment. John G. Gacek Jr., director of telecommunications operations at the Chicago Board Options Exchange bought a private branch exchange in 1983. At the show, he was searching for a call management software package that would enable him to determine how that private branch exchange is used. Call management packages store data from local and long-distance calls and produce a number of reports that help managers determine if telephone lines are needed or telephone services could be eliminated.

Network management packages supply the same type of capabilities to companies with data networks, and Keith Felton, communications systems manager at California Casualty Management Co. in San Mateo, Calif., was inspecting these offerings. "The network diagnostic products included more features than I would have expected," he said.



LIQUID TERROR

You're alone, working late. Trying to get the last batch run put to bed. Suddenly, everything goes dead: your system, your memory, your career. Another victim done in by an undetected water leak.

But it doesn't have to end like that. Because we've created the TraceTek® 100 Leak Sensing and Locating System. It's the only system that simultaneously detects water, sounds an alarm *and* pinpoints the leak source for fast action.

So stop worrying. And start filling out the coupon below and send it to us. Or call us today at (415) 361-4602. We'll show you how to protect yourself from water leaks. Before they turn into . . . liquid terror.

The alternative is alarming.

IBM expands net strategy with protocol converters

By John Dix

RYE BROOK, N.Y. — Driven by the need to mesh support of Personal Computers and minicomputer equipment into its mainstream networking strategy, IBM last week announced two protocol conversion devices.

The announcement involved the 3708 network conversion unit and an eight-port communications adapter for a previously announced network controller. Both devices convert asynchronous Ascii data streams into IBM's Synchronous Data Link Control (SDLC), the protocol of its Systems Network Architecture (SNA), and provide full screen 3270 data format emulation.

These announcements come one year after the unveiling of IBM's first two major products in this area, the 7171 Ascii Device Attachment Control Unit and the 3710 Network Controller.

Analysts said IBM has little choice but to broaden its support of asynchronous Ascii communications because that is the natural protocol of its widely used Personal Computer. It also opens the door to the synchronous Ebcdic realm of IBM for users of typical minicomputer peripherals such as asynchronous Ascii terminals, printers and plotters.

Ten-port device

The new 3708 network conversion unit is a 10-port device that can be configured with one or two host links, leaving, respectively, nine or eight ports to support asynchronous Ascii devices. Besides performing the Ascii-to-SDLC conversion, the $4,500 unit provides full screen 3270 emulation.

Ascii devices, which can be located up to 4,000 ft from the 3708, are supported at speeds up to 19.2K bit/sec. through RS-232C interfaces. Remote devices can be supported with modems. When the 3708 is configured with two host links, one running to an IBM processor and the other to an Ascii host, terminal users can select the desired host through a menu. The 3708 is scheduled to be available next month.

The concurrently announced eight-port communications adapter provides the same protocol conversion functions as the 3708 but as an internal card option for the previously announced 3710 Network Controller. The 3710 concentrates three types of protocols — SDLC, IBM's Binary Synchronous Communications protocol and selected asynchronous protocols — over one SDLC or X.25 communications link.

While the 3710 previously supported asynchronous data streams, it did not provide protocol conversion. The 3710 can be outfitted with seven of the new $3,900 communications adapters — slated for delivery in the first quarter of 1986 — to provide up to 56 Ascii ports. From the host side, the Ascii devices look like 3270 devices attached to a Physical Unit Type 2 3274 cluster controller.

"IBM has to support Ascii because of the [Personal Computer] and the need to coexist in multivendor shops," according to Dave Moschella, director of computer market planning services at International Data Corp., a market research firm in Framingham, Mass.

Besides Personal Computers, the mainframe maker has turned to asynchronous Ascii communications with its System/36, said Peter Lowber, director of information systems with the Yankee Group, a Boston-based consultancy. "It might make sense to use Ascii locally in these environments," Lowber noted, "and 3270 to access the corporate data base."

IBM's intentions are not so benevolent in the view of Dale Kutnick, an independent consultant in Wayland, Mass.

"IBM wants to push SNA as a standard further down into corporations. That means it is going to have to support asynchronous Ascii, non-IBM devices to a much greater extent," he said.

Justice pushes stronger computer crime law package

By Mitch Betts

WASHINGTON, D.C. — The U.S. Department of Justice last week offered anew its computer crime legislation, as part of a package of eight bills attacking white-collar crime and contract fraud.

The computer crime legislation is virtually the same as the administration bill offered last year (S. 2940). U.S. Attorney General Edwin Meese III said the Federal Computer Systems Protection Act of 1985 would repeal and replace the "incomplete and flawed" computer crime legislation enacted by Congress last year.

The Justice Department's bill would make it a federal felony to engage in computer fraud or theft or to damage computer hardware or data when the offense involves computers used by the U.S. government, federally insured financial institutions or private businesses engaged in interstate or foreign commerce.

The Justice Department repeatedly has attacked the Computer Fraud and Abuse Act of 1984 enacted by Congress — and drafted mostly by the House Subcommittee on Crime — for technical and drafting flaws. The statute outlaws unauthorized access to data stored in federal government computers [CW, Oct. 11, 1984].

Sen. Strom Thurmond (R-S.C.) and Rep. Hamilton Fish Jr. (R-N.Y.) are expected to introduce the package for consideration by Congress' judiciary committees.

Meanwhile, Sen. Patrick J. Leahy (D-Vt.) is on the verge of introducing the Electronic Communications Privacy Act [CW, Aug. 12], according to an aide.

In a recent speech to the Electronic Mail Association, Leahy said the bill provides civil and criminal penalties for unauthorized access to the computers of a communications system — if data is obtained or altered — and provides civil remedies for the unauthorized disclosure of the contents of an electronic message.

IBM blasts apartheid

By Donna Raimondi

ARMONK, N.Y. — Escalating civil unrest and the economic uncertainties of doing business in South Africa prompted IBM last week to issue a strong statement demanding that the South African government address the problems of apartheid.

The statement harshly criticized the unbending policies of apartheid that, the company said, are undermining the business climate there. "We have stated that we believe economic activity can facilitate positive social change," IBM said. "We are following this principle when we say we intend to remain in South Africa as long as we can maintain an economically sound business and as long as there is a chance that we — together with others — can contribute to peaceful change."

But IBM said it is "very discouraged by the current political situation and the resulting business environment in South Africa, which are reducing the chances of meeting those objectives."

IBM also said the government there has not shown progress in dealing with its problems. "The rapidly deteriorating situation is having a significant impact on IBM's South African business as well as business in general in South Africa," IBM said. "It is imperative that the South African government address the problems of apartheid with the compelling and urgent attention they deserve."

The statement goes beyond previous IBM pronouncements on apartheid and, according to IBM spokesman Michael Dutton, was prompted by business instability caused by customers taking their business to foreign competitors in fear of U.S. policy restrictions.

The computer did it

A month ago we reported that a faulty computer modeling program was possibly to blame for Union Carbide Corp.'s failure to warn adequately neighbors of its Institute, W. Va., plant that a cloud of toxic gas had escaped. [CW, Aug.19].

According to these initial reports, a computer modeling program from Safety Emergency Systems, Inc. incorrectly predicted the gas cloud would remain over the plant. The vendor denied its program was at fault and contended that incorrect data was fed into the model. Union Carbide acknowledged that substitute data was used for the chemical that was thought to have escaped.

Plant supervisors first thought toxic aldicarb oxime gas was released. Data was prepared for the model on only three chemicals, and aldicarb oxime was not one of them. So an operator made the closest approximation and entered data on that chemical.

In the confused, emotion-charged (remember Bhopal, India?) aftermath, it seemed logical to leap to the conclusion that the modeling program made the wrong prediction on the speed and direction the gas cloud would travel because the wrong data was entered. "Garbage in, garbage out," said Gary Gelinas, president of Safety Emergency Systems.

Or in the catchphrase solution to so many modern technological mysteries: "The computer did it."

We are quick to blame the bloodless, lifeless, carefully constructed interpreters of ones and zeros when lives are endangered or lost. A similar incident occurred recently when a glitch developed in a space shuttle launch. According to reports, faulty computers would have shut off the shuttle's engines and prevented the craft from ascending into high orbit had not human operators intervened and kept the shuttle climbing. The image was of computers run amok sending the astronauts plummeting helplessly back to Earth. But this time, the humans prevailed.

Computers haven't taken over yet. They're not smart enough. And, we need to examine our tendencies to give them more credit and more blame than they deserve.

For instance, we learned in a follow-up call to Union Carbide that a broken steam pipe may actually have caused the leak disaster. Runaway vented steam heated up a tank containing two chemicals, changing the state of the chemicals and increasing pressure in the tank. The operator could not identify the leaking chemical because he apparently had no idea that the chemicals had changed into different states in the tank. For want of a thermostat, perhaps, 135 people were hospitalized.

It may be good news that these recent press reports were initially off the mark. It is not encouraging, however, to recall how quickly and easily assumptions of guilt were made in the first place.

In reality, the Union Carbide incident demonstrated the seeming impossibility of programming for the unpredictable. It's like building the perpetual motion machine. Those in the computer community must take the lead in educating society that computers are limited to the assumptions built into their programs, just as Union Carbide's model was limited by the predictable.

LETTERS TO THE EDITOR

Bulletin board abusers don't rate protection of First Amendment

I must take exception to the editorial,"Hands off," [CW, Aug. 26]. In it, you expressed the opinion that computer bulletin boards should have First Amendment protection.

The computer system that I have responsibility for is currently under attack by a group of people accessing it via a public packet-switched network. The access attempts have come from all over the country, and the hackers have tried to sign on using standard vendor maintenance accounts. It is clear that the information about these accounts is on an underground bulletin board being used for criminal purposes.

Although we intend to prosecute the perpetrators when the Federal Bureau of Investigation catches them, I would have been happier if the problem had never existed. I am not at all amused by these "cute little bit bangers," and I will support any and all efforts to force them to behave lawfully, even if their instincts direct otherwise. The removal of temptations presented on bulletin boards seems to be a good start toward this goal.

Stephen M. Rush
San Francisco

■

The editorial, "Hands Off" [CW, Aug. 26], missed the point: Abuse of privacy and property by placing private information on computer bulletin boards is not a fantasy but a very real problem and one that did not exist before computer technology made private codes so critical and so easily and destructively disseminated.

Your position, which stated that because freedoms are often abused by some that the best policy is to ignore them, is surely not meant to be taken seriously. Legislators are hardly characterized fairly as "busybodies ... poking around" when they hold as extensive hearings as are being held in California on issues on the public's agenda.

These abuses do happen. The Data Processing Management Association (DPMA) is concerned about them, and your newsweekly regularly reports them.

The bill that Sen. John Doolittle (R-Calif.) introduced in California does not limit any of the rights protected by the First Amendment. On the contrary, those rights are enhanced by being protected in a computer environment as they are in traditional media. There is no First Amendment right to invade another's privacy nor to encourage another to do so by publishing the access codes that would accomplish it.

Doolittle's bill addresses this concern and so does the DPMA proposal. The means differ, but the intent is the same.

Donald G. Ingraham
Alameda, Calif.

Manager defends function of memos to organize long-term group projects

Walter Cuirle's viewpoints expressed in "Minimizing the flow of managerial memos" [CW, Aug. 12] are interesting but need a different perspective.

There are several valid reasons for written memos. New ideas are easy to say and to listen to, but later on when action may be required, it is much better to refer to written notes than it is to trust one's memory. Status reports often contain a number of specific points of information such as solutions to past problems, changes in completion dates and so on.

I would certainly argue with some of the numbers that Cuirle uses to justify his recommendations. Two hours to prepare a one-page memo seems very excessive.

The thought of managing 10 people for one month on a project without written memos scares me. I can't always remember all the details of what I did last week let alone all the ideas encountered in a project of one month's duration.

As a manager, I can read, study and act on written memos and reports much more easily and quickly. Meetings are for questions, discussions and planning. At the end, a written summary of points raised and answered can be referred to for review, study and implementation at a later time.

I certainly can appreciate Cuirle's concern for the reduction in paperwork and managerial time. However, the particular examples and recommendations he gave could only encourage less than adequate control that in turn would result in less than satisfactorily completed projects.

Ruminations on communications

LECHT ON SCIENCE
Charles P. Lecht

Let me begin by stating that I've always thought of AT&T as being extremely fair in its practices, and I was against its dismemberment and still feel it to be one of the finest companies in the U.S. or anywhere else.

Nevertheless, one cannot overlook the rising cost of communications at a time when competition is supposed to be bringing it down. Consider the cheery human voice that ends long-distance noncredit card calls with "Thank you for using AT&T." Although I confess to not knowing the real number of these messages, I'll go out on a limb and state that they number at least a million a day — the U.S. has more than 150 million telephones so I feel safe in my guess. At no less than three seconds and sometimes as much as five seconds for each "Thank you for using AT&T," the suggestion that these consume at least four million seconds of valuable telephone time daily is unquestionably conservative.

Supposedly you can use one of the alternative services that make you dial another number before you dial the one you want or others that make you dial so many numbers for one call that you deserve a medal for doing it right the first time. But these are too demanding as far as I'm concerned: 10 numbers is as many as anyone I know can handle without having to redialing after getting someone in Zambia by mistake.

No, friends, I'm not going to file a petition to remove the "thank yous" from our telephones — courtesies are hard enough to come by these days, sincere or not.

A maze of menus designed by a robot

What I am concerned about is what's next. And not only from AT&T. Already MCI Mail insists on giving the day's headlines and a lot of advertising when I sign on, and then takes me through a maze of menus that must have been designed by a robot for a robot with part of the former's circuitry missing — all this in my office in Japan while I'm trying to send a simple message to New York.

> ”
>
> *It's hard to swallow the promises of those that resell AT&T's service; AT&T still makes and sells it best. Why else would virtually all of the U.S. be on it?*

The headlines and advertising take 12 seconds. Whether or not this is directly billed to me is never clear, but I'm old enough to know that, as the saying goes,"You don't get anything for nothing in this world." Someone's paying for the creation and transmission of the headlines, the urgings to send a telex or two and the sales pitch for Dow Jones — all of which preceeds the question of why I signed on to the system in the first place.

On weekends, I get announcements of specials. You know, the kind that we expect to find on the windows of our local deli, but in this case, I'm paying the rent of the window space.

I could go on to mention other systems that insist that I spend my bucks on similar stuff, but it might just bring watchdog lawyers out of their kennels to bark up a storm of indignation based on their arguments on humanity's moral right to switch services if one or another doesn't suit them. Of course, the fact that there's still nowhere to switch to, especially if you want to cross a state's boundary that isn't in our national telecommunications network — a euphemism for AT&T's core business long-lines facilities — is hardly noticed.

It's hard to swallow the promises of those that resell AT&T's service; AT&T still makes and sells it best. Why else would virtually all of the U.S. be on it, including IBM? From my perspective, the pushing of advertising and news on the non-AT&T networks signals that there are still no non-AT&T networks — that is, competition — in our communications industry. How else could our alternative network services purveyors get away with it?

The lessons we learned in the mainframe computer industry wherein others tried to compete directly with IBM by piggybacking on the things IBM did best, namely making IBM computers, cannot be forgotten. Sure, we saved a buck or two by buying the alternatives, but when the whole picture was put together, unless we really knew what we were doing — for example, buying an Amdahl Corp. mainframe to add processing power to an otherwise IBM system — we were bound to lose out on the deal. The ex-customers of RCA Corp. and Univac can attest to this.

Buy away, my friends. But if the system thanks you too much for doing so or gives you news you've already read at breakfast, watch out. You are paying for it.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specialising in computer and communications technologies.

Squeezing CPU power: Is the effort worth the return?

THE DATA CENTER
John P. Murray

No matter how well the technical support group does its work in monitoring and fine-tuning information processing hardware resources, and no matter how extensive the factual basis for providing justification to move to a larger mainframe, it can still be difficult to convince senior management of the need to do so.

The facts supporting the need can be marshaled and presented in the most businesslike manner possible, and yet senior management will deny the request. It is likely that the denial will be accompanied by directions to squeeze more out of the installed hardware.

In some instances it is possible, even after a considerable amount of fine-tuning has already been done, to obtain a bit more processing capacity from a heavily loaded mainframe.

An important question should be raised in such a circumstance — notwithstanding management's directive to do more with the current hardware: What is the real cost of attempting to gain that probably minor benefit?

Provided that the system is indeed well tuned and that it is operating at a high level of efficiency, significant gains in throughput in a particular area are probably going to be obtained at the expense of some other area. On a net basis, the difficulty or inconvenience experienced in one area may be more than offset by the gains produced in another area.

> ”
>
> *Although there may be some political benefit to being able to inform senior management that the instructions to squeeze more out of the system are being followed, the use of a cost-return ratio might demonstrate that the actual value of the effort is questionable.*

If the issue of fine-tuning the hardware resource is appropriately addressed, a considerable portion of the total gain to be realized can be obtained early with a rather limited effort. Given the proper advanced planning and analysis, 20% of the total effort can produce 80% of the total return.

This is the case because much of the total benefit will often be found in major areas; if these areas are addressed first, the gains can be substantial.

Getting results from other areas

Once the more prominent problem areas have been addressed, getting results from other areas will take a great deal of time and effort. And the potential results are going to be questionable in terms of the return on that effort.

Although there may be some political benefit to being able to inform senior management that the instructions to squeeze more out of the system are being followed, the use of a cost-return ratio might demonstrate that the actual value of the effort is questionable.

If such fine-tuning impedes or reduces a particular department's productivity, the value of any gains realized after the initial 80% or so would have to be questioned.

For example, an adjustment may be made to provide more resources for batch processing. In a heavily loaded system, this probably means that on-line processing receives fewer resources.

Although the net effect may seem, and may indeed be, rather small, spread over a large active network, the result in terms of lost productivity and lowered morale may be significant. It may well be that the adjustment, while speeding up some of the batch processing, will reduce overall throughput.

Minor increase put to better use?

One must ask if the time spent in obtaining this rather minor increase in hardware efficiency could be put to better use somewhere else. The net return on the investment of this time might be much greater if it was devoted to other areas.

The decline in the cost of raw processing power continues. Given that continuing decline, the issue may not be whether there is unused processing power, but whether the potential return is worth the effort expended to harness it.

If, indeed, a 20% effort will produce an 80% return, can an additional 30% or so effort be justified to produce another 5% return? Every installation must make its own decision, but the answer is clear.

Murray is director of management and information services for American Breeders Service, a DeForest, Wis., division of W. R. Grace & Co. and is the author of Management Information Systems as a Corporate Resource.

Apprenticeship in DP shops guarantees high quality

READER'S PLATFORM
Bo Sanden

A certain basic structure is taken for granted in most DP organizations: On the one hand, there are managers who are not really supposed to be involved in technical matters other than to receive reports and so on from the technical staff.

There may be reports of technical solutions as well as progress reports, but the manager is not expected to solve technical problems, only to understand the issues when they are presented. The manager works with administrative tools such as assignment of people, adjustments of plans, budgets and so on.

The technical staff, on the other hand, is supposed to concentrate on the purely technical issues and not to manage. Sometimes, a dual career is implemented whereby technicians can be promoted to technical positions on a par with management positions but notably as system experts. This normally implies a high degree of specialization in particular systems or techniques.

The type of organization where this occurs is probably based on traditional manufacturing where the main objective is to control large-scale production that is not very complicated. The main issue is to manage large groups of people, to motivate them and to provide career paths.

By contrast, I like to see the approach in the time-honored tradition of creative crafts, which is very appropriate because there is always an important creative element in software design.

The traditional organization in these trades is based on masters and apprentices, often with certain steps in between. The master is the manager but also the technical authority and the instructor.

Unlike that of a technical expert, the important characteristic of the master is not in-depth knowledge of a given system. That sort of necessary expertise can be delegated. Rather, it is general design experience and acquired skill, which are more generally applicable.

There are several advantages with this approach: First, it is highly motivating. To the young apprentice with a technical interest rather than administrative ambitions, the master is a professional guide as well as a role model. To the senior technician, it is a way to continue working wih the technique while eschewing the boring details.

Over the years, the distance to the actual development terminal increases as does the distance to the program code. This prevents burnout. The master is not a chief programmer but is in charge of delegating the details.

Second, it guarantees quality. The master can assume the responsibility for the conceptual integrity of the large system. The approach economizes the scarce resource of senior technical talent. Just as important, it makes quality a central issue.

Today, quality is often the concern of a separate quality department rather than of the line or project organization. As the technician sees it, quality is rewarded with prizes and pats on the back, and promotion is based on completely different criteria. The career of the master, however, is built solely on professional skill.

Communicate and clarify questions

An integral part of this skill is the ability to communicate and clarify technical questions. The existence of a master promotes the discussion of technical issues within the development group.

Contrary to the common belief that programmers are loners who prefer not to share a solution with anyone until it is finally coded, in actuality even the most reticent programmers love to discuss technical problems.

The real reason why technical problems are not discussed is that nobody wants to listen. Colleagues are busy with their own problems, and the administrative manager is neither competent nor interested. The true master, however, will welcome the opportunity to provide guidance, mildly enforce relevant standards or concepts or simpy tackle an interesting problem.

Another advantage is that technicians will receive competent feedback. However well intentioned, the administrative manager will base judgment on the word of others or on the compliance with plans and may easily overestimate a mediocre job in a critical project. At the same time, the manager may let an outstanding effort in a smoothly running project go unnoticed, simply because the work is so well done that the project never becomes critical and, therefore, never draws attention to itself.

The master, on the other hand, would hopefully be knowledgeable enough to judge each task on its own merits and be able to distinguish the difficult ones from the easy ones.

Sanden is in charge of a distributed systems project at Philips Data Systems in Monterrey, Mexico.

WHAT IF YOUR TRANSACTION RATE DOUBLES?

WHAT IF YOU INSTALL A NEW CPU?

WHAT IF YOU USE MORE DASD?

MAP Amdahl's Modeling and Analysis Package, is a fast, powerful, and economical way to answer your "What if...?" questions.

You may use MAP to

- model an entire computer system and its various workloads.
- forecast the effects of workload growth, upgrades, and configuration changes on system performance.
- predict response time and device utilizations, as well as residence times, queue lengths, memory utilization, paging and swapping activity, and I/O path contention.
- automatically process SMF/RMF data to generate models for MVS/XA and MVS/370 environments by using OBTAIN, a built-in data reduction utility.

With MAP, you can make informed choices as you plan and manage the growth of your computer systems.

WHAT IF YOU NEED TO ADD OR MODIFY APPLICATIONS IN IMS?

Here the tool to use is Amdahl's SURF/IMS (System Utilization Reporting Facility/IMS).

Rather than building a mathematical model, as MAP does, SURF/IMS constructs a synthetic application program and runs it like a real production application. You can observe the impact of various configurations as the program runs.

SURF/IMS helps you manage an entire IMS/VS environment.

For more information about MAP or SURF/IMS, complete and mail the coupon below, or call 800-227-1817, extension 44.

Please send me information about software productivity tools from Amdahl.
I'd like information on ☐ MAP ☐ SURF/IMS ☐ both products.

With The Introduction Of SUPRA™, The Full Potential Of Relational DBMS Technology Has Just Been Delivered.

Relational

The potential of relational DBMS technology is enormous.

And as a software company that has invested lots of time and money into the development of relational technology, we take exception to those software vendors that are giving relational technology a bad name.

You know the ones.

They spend millions of dollars in advertising trying to tell you their systems are relational. In reality, they are nothing more than incomplete relational caps on old hierarchical, network or inverted list systems.

If you believe as we do, that the time has come for someone to deliver the full potential of relational technology, we have good news.

Someone has.

Advanced Relational

**The New Cincom Systems
Is Proud To Introduce The All New
SUPRA™, The Advanced Relational DBMS.**

Instead of putting our eggs into the advertising basket, we invested our millions into seven years of research and engineering.

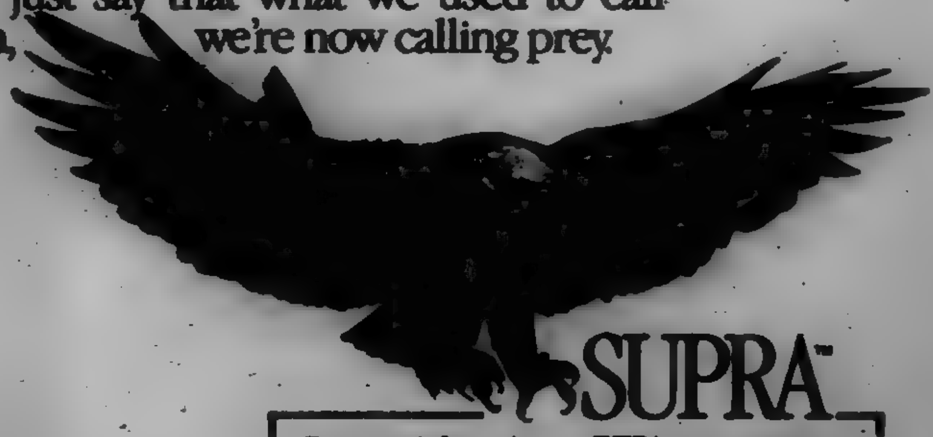
The result of our patience is the innovative *three-schema architecture.* This new approach to relational data management allows SUPRA to fly high above and go far beyond any other relational system now on the market.

SUPRA delivers simple, easy access. SUPRA delivers unsurpassed data integrity. SUPRA delivers implementation ease like you've never seen. And SUPRA is available now.

We invite you to compare SUPRA to any relational system, or so called relational system, you may now be considering.

Are we really that confident in SUPRA?

Well, let's just say that what we used to call competition, we're now calling prey.



SUPRA™

For more information on SUPRA, or to arrange a personal demonstration, simply return this reply coupon, or call us direct. 1-800-543-3010

Microprocessor comparison misleading with Mips figures

The article, "Chip vendor representatives wield claims at NCC session" [CW, July 29], in which technically well-qualified panelists at a technical session representing four major microprocessor manufacturers described and compared their products, is incomplete in a way that makes it seriously misleading.

The reader finishes it believing that the panelists presented their microprocessors mainly in terms of million instructions per second (Mips), a simplistic, would-be measure of processing power, and made emphatic — if not belligerent — claims of superiority based on it.

In fact, the panelists, all of whom were apparently involved in the design of their products, spent by far the greater portion of their time on the technical features of their CPUs and the associated coprocessors and instruction sets.

Computerworld's audience needs timely information about advances in the art of microprocessor design and about how those designs are evaluated. Information regarding the inadequacy of widely touted Mips figures, particularly when designers themselves publicly deemphasize Mips evaluations, deserves to be noted.

Two-vendor shop provides no guaranteed solution

The article, "Choosing and using consultants," [CW, Sept. 2] was amusing and sad. It stated that an IBM representative decided that a particular shop needed to become a two-vendor shop. I cannot think of a single problem that is solved just by becoming a two-vendor shop.

The sad part is that a company would hire someone from IBM to come into a non-IBM shop to make recommendations. Do they really believe the representative is not going to recommend changing to IBM hardware? That is like going to a Ford dealer to help you choose between a Ford and a Chevrolet.

DP apprenticeships guarantee high quality

All these requirements of the master may seem like a large order, and obviously, the master's tasks are not easy ones. Masters are not just any people who have been around for a while. They must certainly have a genuine technical interest and an urge to continue developing technically.

Given that, the other qualities can be acquired. There is a very natural path leading from the hands-on design of small programs to bigger programs to the design of large systems by means of specifications or other abstract tools, with the details delegated to others.

The ability to communicate technical issues develops in parallel, beginning with the reviews or presentations of one's first programs, if supported by the organizational culture. Finally, a growing interest in working with other people in delegating tasks is part of human maturation.

The master-apprentice organization does have a certain patronizing character, and one might think that this would be resented by apprentices. My experience, however, is that it will not, because of the technical authority of the master as well as the difference in work experience that will normally exist. People with a technical interest will respect a person who can provide concrete advice and suggest viable solutions to technical problems.

A different situation often exists today. Because of the rapid technological changes, many technicians who are fresh from school suddenly find themselves supreme authorities of some part of the technology, especially in small organizations where nobody has had the time to master the latest novelties. This may be challenging to a highly talented individual, flattering perhaps to others, but in general, it is not very healthy.

Inventing devices to cope

The young individuals will have to invent their own devices to cope with the technique. There will be no role model, and the only nonadministrative career presenting itself is extreme specialization in the particular technique, which may not always be a very attractive prospect.

Masters exist in many places. Perhaps we do not hear very much about them simply because good results are produced without much ado. Also, perhaps managers count themselves fortunate having a talented and experienced individual in the organization and do not realize that mastership can be cultivated. There is no lack of potential masters and young talent in need only of the right kind of support and guidance.

Maybe masters are particularly common in the academic world, which probably attracts more technically oriented and less career-oriented individuals than industry. Probably the existing management philosophy of industry hinders the development of masters. It may, however, be necessary to change the paradigms and recognize software development as a creative craft, not only to improve dramatically the general quality of software but also to create a more motivating environment and thus solve the problems of excessive manpower turnover.

IF YOU WANT TO SELL BUSINESS SOFTWARE TO THIS COMPANY, YOU BETTER HAVE THE NEWEST GENERATION.

PepsiCo, Inc. was one of the first companies to see that borderless business software was the wave of the future. Their choice: The company that invented it, McCormack & Dodge. We created Millennium, a family of financial and human resources applications that aren't just borderless in name, but in fact.

Millennium eliminates boundaries between applications, letting you search through large data bases and effortlessly pursue information trails across systems. Millennium applications are on-line, real-time, integrated with all major data bases. The complete Millennium family includes an interactive PC link and systems development tool.

We are about to deliver PepsiCo's second Millennium version, Millennium 2.0. Even more advanced than the original. With it we send our thanks for believing in Millennium the first time around.

Employment figures reflect trend toward efficiency

By Clinton Wilder

Employment levels of most major mainframe and minicomputer vendors declined or grew only modestly in the first half of 1985, reflecting both this year's industry slump and a trend toward more efficient manufacturing.

The worldwide work force at Control Data Corp. is at its lowest level in nearly eight years, having shrunk by 3,720 positions since Jan. 1 and by more than 10,000 jobs since 1981. Burroughs Corp. has been the year's other big job loser among the Bunch companies, with more than 2,000 employees laid off, chiefly in administration and production, in accordance with Chairman W. Michael Blumenthal's long-term consolidation plan.

At financially troubled CDC, the sale of subsidiary Magnetic Peripherals, Inc. production facilities in Minnesota, Texas and Kentucky slashed 900 positions, the largest single component of a domestic work force reduction of 3,400 since Jan. 1. CDC's worldwide employee population of 60,400 as of June 30 was its lowest since the end of 1977. Most of the cuts have taken place in production jobs, and CDC is not adding employees in other areas, according to spokeswoman Susan Bush.

IBM work force

At the other end of the spectrum, the work force continues to grow normally at IBM, the world's second largest industrial employer behind General Motors Corp. With 402,000 employees worldwide as of June 30, Big Blue grew by 7,000 employees in the first two quarters, consistent with its annual employee growth rate of 10,000 to 15,000 during the last several years.

The U.S. work force increased by 3,000 employees in the period, also a normal IBM growth rate, for a total of 242,000. "Hiring is proceeding across the board," spokeswoman Maxine Yee said. "Even though our profits have been lower than in past years, that hasn't connected to our employment figures."

The profit margins of Digital Equipment Corp. have also held up reasonably well during the current slump, but DEC has slowed its domestic hiring to a trickle and has reduced its manufacturing force. The U.S. work force expanded by 6,600 in the final nine months of 1984 but remained level between Jan. 1 and July 1 of this year.

Like Burroughs, DEC is in the midst of a long-term job reduction plan, but DEC's plan focuses specifically on the production area. Planning for smaller machines and more efficient, automated production lines, DEC has trimmed 3,000 manufacturing positions since the beginning of 1984. Another 2,000 cuts are planned in the next one to two years to reduce production employment to 25,000 worldwide from a high of 30,000 two years ago.

"As our computers get smaller and more powerful, they need fewer people to build them," said DEC spokesman Jeff Gibson. "Fewer materials means fewer people to move the materials and fewer people to schedule them. When someone leaves the company in production, we're often revamping the process instead of filling the position."

The same type of elimination by attrition has hit large vendors' middle management jobs in the current downturn, according to one leading executive headhunter. "The middle management ranks have been severely hurt in this retrenchment, and I think those jobs are gone forever," said William Tholke, managing partner of the Korn/Ferry International executive search firm in Palo Alto, Calif. "Companies have identified a lot of duplication and are finding they can do without many of those positions."

Employment levels in so-called revenue-generating positions — direct sales, service and support, for example — have generally been spared the layoff axe. "But

Ada gets Nasa nod for space station use

By Mitch Betts

Ada, the programming language of choice with the U.S. military, recently gained another convert. The National Aeronautics and Space Administration will use Ada in the on-board flight systems of the manned space station project scheduled for launch in 1992.

Nasa is the first nonmilitary U.S. agency to use Ada, the high-order language developed for the U.S. Department of Defense, according to U.S. Air Force Maj. Allan H. Kopp, a deputy director of the Pentagon's Ada Joint Program Office, which monitors Ada developments.

The advanced language may also be used in the operating systems and applications of an advanced air traffic control project that is being designed for the Federal Aviation Administration (FAA), *Computerworld* has learned.

Nasa's Space Station Project Office at the Johnson Space Center in Houston selected Ada as the language for flight subsystem applications programs on the space station. Furthermore, officials said Ada is a candidate for the space station's ground control computers as well.

Liana Burke, a software manager at the Johnson Space Center, said Ada was selected because it is the most robust and modern language, because Ada compilers have been developed in the private sector, and because the Pentagon's support for Ada "gives us a degree of confidence in its long-term viability."

Commenting on the selection, Kopp said, "I think it clearly indicates that Ada is moving outside the realm of the Department of Defense into other government applications."

Kopp added that the Nasa action will have "ripple effects" on the computer industry. "It will mean that contractors doing business with Nasa will have to know Ada. It will mean the vendors who support those contractors with computer hardware and software will have to have Ada capability," he said.

Meanwhile, the Ada programming language is a leading candidate for use in advanced air traffic control software at the FAA, according to government and industry sources.

The firms competing for the FAA's Advanced Automation System contract, IBM and Hughes Aircraft Co., are both using Ada design tools in the early stages of the design process, a well-placed government source confirmed. Moreover, Ada is a strong candidate for use in the actual operating systems and applications software, if a mature compiler and trained personnel can be found to implement it, the source added.

In addition to Ada's reputation for modularity and low-cost maintenance, Ada makes a good choice for the FAA because of its error-free code and high reliability — important features for collision-avoidance systems, government and industry sources said.

Last year, the government awarded contracts totaling $246.7 million to IBM and Hughes for a three-year competition to design the advanced air traffic control system [CW, Sept. 3, 1984]. The contractor with the best design will get the production contract, with delivery beginning in 1989.

Ada already is the standard language for critical military computers at the DOD. The North Atlantic Treaty Organization recently announced it will implement the Ada language in all military systems, beginning in January 1986, according to Maj. Kenneth Schoonover, Ada project officer for the Air Force Systems Command, who spoke at the recent Federal Computer Conference in Washington, D.C.

However, the U.S. Postal Service (USPS), which last year planned to use Ada software for mail-sorting equipment at two bulk mail centers [CW, Aug. 20, 1984], ultimately did not use Ada.

According to Frank A. Amoroso, a USPS program engineer, those plans went awry when contractors, claiming that adequate Ada hardware and software were not available in time, substituted software products operating under AT&T's Unix system, which uses the C language.

From page 24

Employment figures show efficiency trend

that has been curtailed — we're hiring, but it's not wide open," DEC's Gibson said.

Overall, DEC added 400 employees between Jan. 1 and July 1, all of them overseas, for a worldwide employment total of 89,000. The U.S. work force remained relatively stable, falling by 300 for a total of 59,300.

More than two-thirds of Prime Computer, Inc.'s 8% work force increase since Jan. 1 has been in sales and research and development positions. The Natick, Mass., minicomputer maker expanded by 680 jobs for worldwide employment of 8,100 as of Aug. 25.

Hewlett-Packard Co. has seen increases of 1,000 domestic and 2,000 overseas employees in 1985, with no particular concentration in specific job functions.

Two Bunch mainframe companies, Sperry Corp. and Honeywell, Inc., have experienced a modest decrease in employment since the beginning of the year. Honeywell's worldwide job total fell by 650 positions to 93,621 as of June 30.

At Sperry Corp.'s Information Systems Group, a slight increase in domestic employees in the first seven months of 1985 offset most of the loss of 600 laid-off production employees at the Sperry terminal and communications equipment facility in Salt Lake City, for a total of 36,800 employees worldwide and 27,800 in the U.S. as of July 31.

If your IMS and TSO response time is not picture perfect...

Then try PMO FREE for 30 days. Your system can be tuned by using PMO and the Tuning Guide that is provided with your trial. PMO (Program Management Optimizer) improves IMS and TSO response time in MVS and MVS/XA environments. It automatically reduces PDS directory searches by keeping in memory a dynamically managed software cache of the active directory entries. PMO reduces I/O activity and results in lower CPU overhead and faster IMS and TSO response time. It installs in less than 15 minutes without an IPL. The PMO Tuning Guide helps you specify the various PMO user options which optimize the performance of IMS and TSO.

For your FREE 30-day PMO trial and Tuning Guide call: 800-323-2600.

Martin urges MIS managers to automate operations

By Charles Babcock

NEW YORK — Management information systems managers need to put more automation into their operations with engineering-style techniques, according to James Martin, the noted author and commentator on information management.

In a recent address to Cadre, Applied Data Research, Inc.'s users group, Martin described how information engineering will bring about a leaner, more end-user-driven corporation in the 1990s.

Martin said the modern corporation will be structured on a knowledge base composed of all data and rules pertaining to the business. The chief resource of the knowledge base will be an encyclopedia in which integrated models of data, the enterprise and the processes that run it are stored and cross-referenced.

> ”
>
> *The modern firm will be structured on a knowledge base composed of all data and rules pertaining to the business.*

The emerging techniques of artificial intelligence, when applied to the knowledge base, will be able to correlate the information and use the rules in many stages of decision making, he said.

To get to this point, however, MIS managers will need to use more disciplined techniques that lend themselves to manipulation by computer logic. Many MIS professionals worry that automation in their field could jeopardize their careers, but they should not, Martin noted.

"It's much more fun to work with power tools than hand tools," he said.

To move toward automation, MIS managers must minimize some current careless practices, such as incorporating the imprecise communications of English language specifications into program designs.

Much of Martin's talk addressed diagramming program specifications, a topic that has occupied his recent attention and is the subject of a forthcoming book.

"Diagrams have got to have the precision of a computer language. They are a computer language," he maintained. Precision diagrams will allow automated conversion of data flow diagrams into data navigation diagrams, decomposition diagrams and more, he said.

Bit-mapped personal computers like the IBM Personal Computer AT allow much more precise diagramming and give software developers a tool that yields a much quicker response time than a terminal, he noted.

Building a prototype early in the application development process would yield greater productivity, according to Martin. "I have never seen an example of a prototype being given to end users without end users changing it. So if you build a system without a prototype, you are probably going to build it wrong," he said.

Martin urged his listeners not to underestimate the role that artificial intelligence will play. AI is no "genie coming out of the bottle," he said, but its ability to apply a set of rules to a large body of data will make it a valuable component of the firm of the future.

That cannot happen while AI is the subject of a kind of cult following that needs specialized computers to run its programs, according to Martin. "You want to lift it out of its subculture and anchor it in the world of IBM and MIS," he said.

Information engineering, he concluded, will push MIS away from manual techniques and toward automated techniques. "This makes so much sense that every efficient corporation will do this" by the 1990s, despite massive migration problems, he said.

THE ONLY
SYSTEM IN
THE OFFICE
WE CAN'T
ACCESS.

You don't have to put *every* system in your office, factory or lab on a network.

Just most of them.

And the more kinds of equipment you have, the more you need Bridge.

We network more systems from more vendors than anybody.

Our CS/1-SNA Communications Server lets async terminals talk to IBM® hosts by making them look like 3278s.

Our CS/1-HSM lets you get into a VAX™ minicomputer without a whole lot of cards and cables.

Thanks to EtherTerm,™ we can turn IBM® PCs into async terminals and link you up to any device on your network.

And our Gateway Servers hook up all your networks. X.25, broadband and Ethernet. Across town or across the country.

We even have Management Servers to help you configure, control and monitor your entire network from any terminal.

But don't take our

IBM's Opel calls for competition in foreign telecom nets

By Jeffry Beeler

SAN FRANCISCO — IBM Chairman John Opel last week called for foreign governments to open telecommunications networks to the free-market dynamics that have fostered advances in the U.S. information processing industry.

"Competition must increasingly govern . . . an industry segment with which information processing is converging — telecommunications," Opel said during the eighth quadrennial International Industrial Conference.

"Historically the telecommunications networks of the world have existed under noncompetitive arrangements — as franchised monopolies owned or tightly regulated by government," Opel said during the conference luncheon address.

Within the last few years, however, governments have begun to retreat somewhat from their traditional monopolies and to push their telecommunications industries steadily toward deregulation. The process is already nearly complete in the U.S. and appears to be gathering momentum in several other countries as well.

"Britain has liberalized its policy," Opel told some 500 conference audience members representing more than 60 nationalities. "So have Canada and, to some extent, Ireland. Japan has passed legislation ending its traditional monopoly system with the intention of opening the telecommunications market to competition. Other countries are actively debating similar changes."

The worldwide movement toward deregulated telecommunications promises to yield significant benefits, Opel maintained. "Competition not only will continue to propel the growth of information processing," he said, "it also will power new growth in telecommunications. And it will bring both industry segments together in a flourishing $2 trillion marketplace before this century ends."

IBM Chairman John Opel called for worldwide deregulation of telecommunications.

In information processing, free enterprise has already fostered dramatic price/performance improvements and has otherwise fueled breathtaking technological advances, Opel said.

To underscore his point, he contrasted the recent histories of the information processing and telecommunications sectors. Since 1955, the execution rates for general-purpose processors have grown by a factor of 938, while the associated costs have dropped by a factor of 234.

In the telecommunications field, by contrast, a Tokyo-to-San Francisco telephone call that cost $17 in 1968 carries a $7 price tag today. "That difference in performance [between the information processing and telecommunications industries] reflects the price exacted by regulation, which, among other things, inhibits the abandonment of obsolete equipment for new [equipment]," Opel said.

Competition in the information processing industry has also "made an anachronism of artificial national regulatory barriers," promoted the development of international standards and blurred the distinction between what should and should not be regulated, he said. Similar changes are expected to accompany the ongoing deregulation of telecommunications networks.

word for it. Ask us to demonstrate it for you.

And while you're at it, let us bring you up to speed on our performance.

Our Communications Servers transfer over 200 packets a second. Our Gateway Servers do over 350 packets a second.

Your wish is our command.

Our user interface works just the way you'd expect it to work.

It's easy, logical, complete.

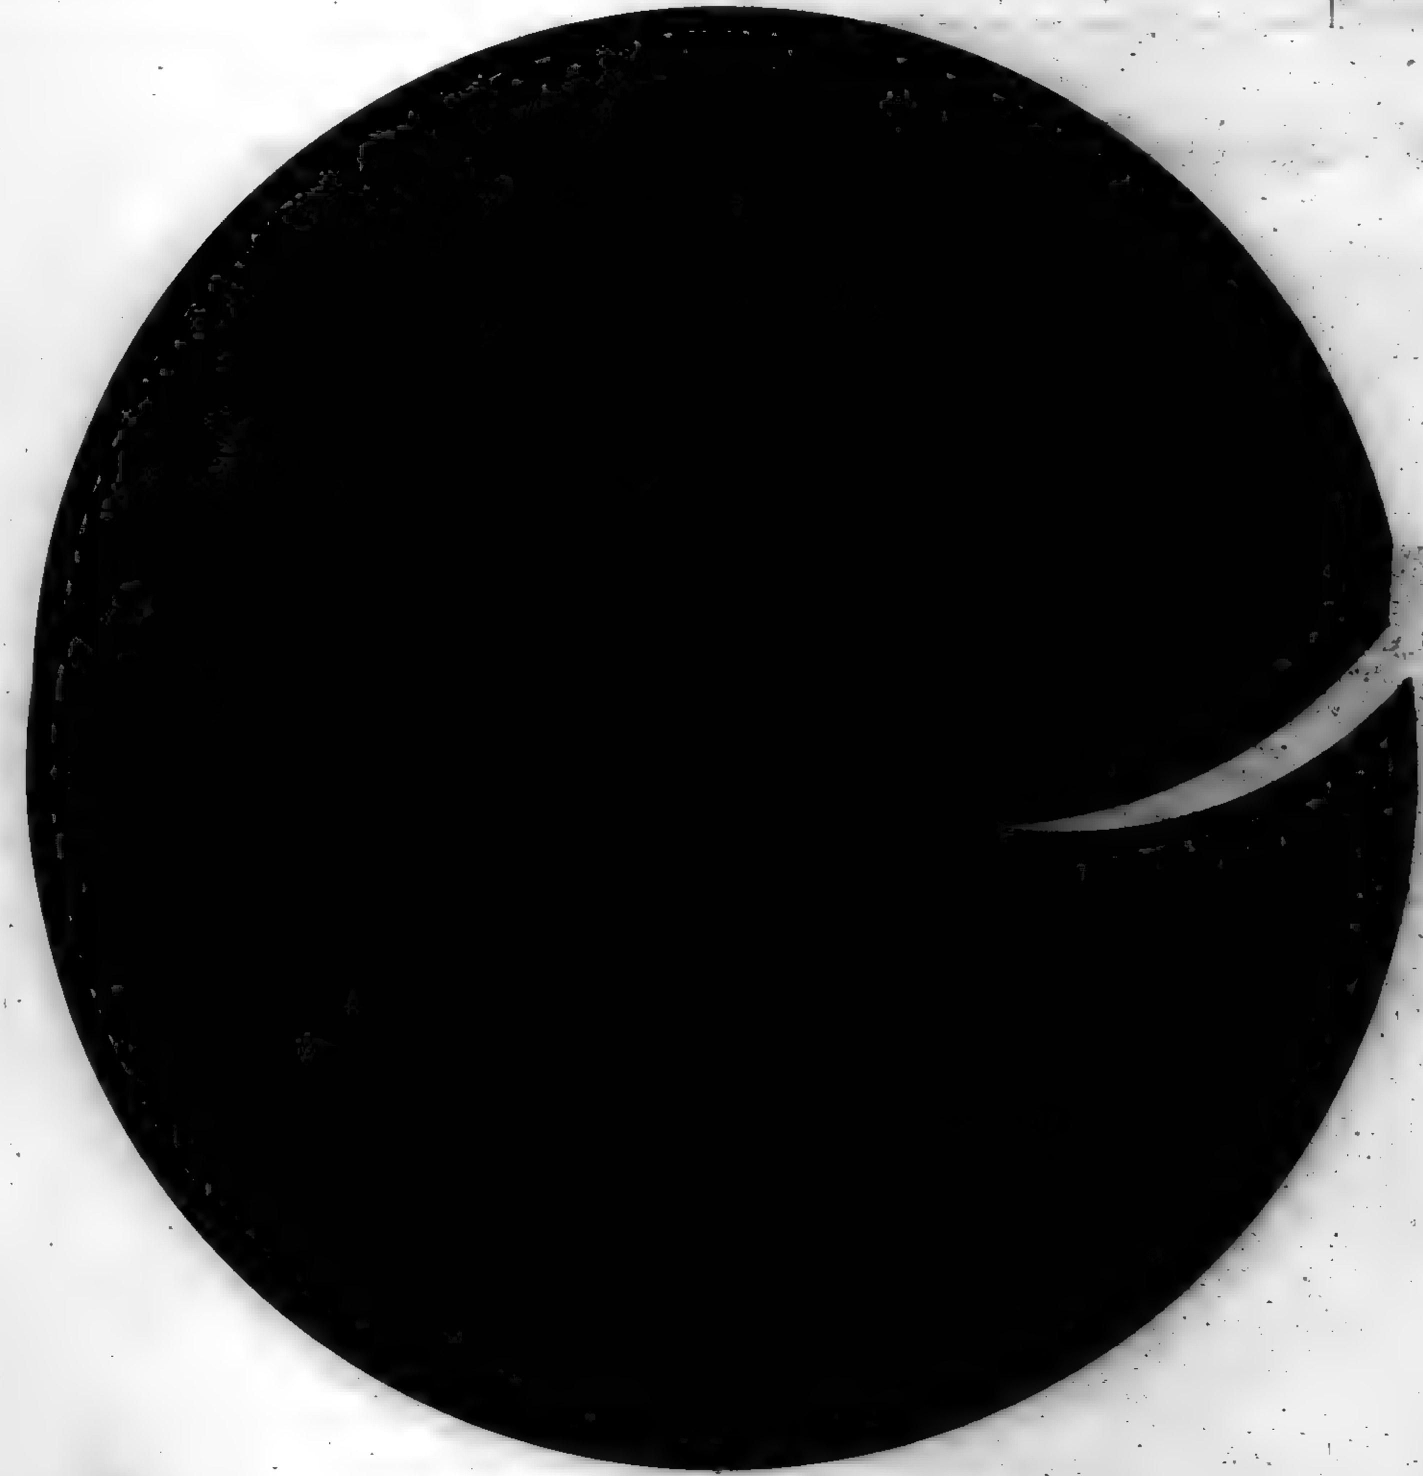
It's simple to change parameters, display statistics, execute command macros, broadcast messages anywhere on your network. Anytime.

And if you ever get into trouble, a single keystroke gets you "Help." Over a hundred commands will come to your rescue.

If you're looking for one network that can handle virtually every connection in your plans, call us at 415-969-4400. Or write Bridge Communications, 1345 Shorebird Way, Mountain View, CA 94043.

We'll show you how to keep all the equipment in your office on tap.

Bridge COMMUNICATIONS INC.



It's why.

Interviews with thousands of COMPAQ® Computer owners show that over 97 percent are satisfied with their COMPAQ Personal Computers. That's a percentage envied by the industry. And it's also one of the reasons why COMPAQ Computers win so many awards from top industry trade journals. They include "Favorite Compatible," one of the Top Ten Computer Products of 1984, and "Portable Computer of the Year."*

The reason is clear. COMPAQ Computers simply work better.

For example:

- Our monitors display both high-resolution text *and* graphics—not one or the other.
- Our exclusive internal tape back-up system can protect Megabytes of data in minutes instead of hours.
- Our disk drives are protected by shock mounts, so a bump won't bump off your data.
- Our unparalleled expandability means your COMPAQ can grow as your needs grow.
- And our computers run the largest library of business software on earth.

So you see, we keep our customers satisfied by offering computers with uncompromising quality and performance. Which makes it easy to recognize COMPAQ Computer owners. They're the ones with the big smiles.

For a free brochure or the location of your nearest Authorized COMPAQ Dealer, call toll-free 1-800-231-0900 (in Canada 416-449-8741) and ask for operator 9.

It simply works better.

WASHINGTON UPDATE
CW Washington Bureau

U.S. representative assails nine-digit Zip code program

WASHINGTON, D.C. — U.S. Rep. Glenn English (D-Okla.), a critic of the U.S. Postal Service's (USPS) nine-digit Zip code program, recently said the USPS should place more reliance on new optical character recognition (OCR) and bar-code equipment for mail sorting.

English, chairing a Sept. 13 hearing by the U.S. House of Representatives Subcommittee on Government Information, Justice and Agriculture, told USPS officials, "The focus should be on automation" rather than on the Zip + 4 program to reduce mail-sorting costs at the quasi-governmental agency.

The USPS recently announced it will begin testing multiline OCR equipment that can read the entire address on an envelope and print a bar code on the lower part of the envelope. At the same time, the USPS announced it will increase the discount that business mailers get for using the nine-digit Zip code [CW, Aug. 19].

English said the new equipment will make Zip + 4 obsolete, but USPS representatives disagreed. "This move toward multiline readers does not in any way lessen our commitment to Zip + 4," testified Jerry K. Lee Sr., senior assistant postmaster general.

"Deployment of the multiline readers over the next several years will enable the Postal Service to increase near-term automation-related savings while Zip + 4 volume continues to build," Lee said. "In the long run, the Zip + 4 code, coupled with multiline equipment, promises to provide the highest productivity gains for the Postal Service."

English said he has long urged the USPS to implement an automation program first, then consider a longer Zip code if that is cost effective. English charged that the Zip + 4 program has been mismanaged and that further discounts to mailers are an unnecessary subsidy.

NBS announces development of data dictionary standard

GAITHERSBURG, Md. — The National Bureau of Standards (NBS) recently announced that it will publish a standard for data dictionaries used in information systems of the U.S. government.

The announcement said the NBS will make the proposed Ansi standard on information resource dictionary systems a new Federal Information Processing Standard to promote portability of data among government users.

A preliminary cost-benefit analysis estimated that the U.S. government would be able to save more than $120 million, in constant 1983 dollars, by the early 1990s by using a standard data dictionary, according to the NBS.

In addition, the NBS announcement reported that a set of automated validation tests is currently under development.

DOD encourages ATM banking at military bases

WASHINGTON, D.C. — The U.S. Department of Defense recently proposed new regulations that encourage banks and other private financial services to open facilities — including automated teller machines — at DOD bases for military personnel.

The proposal stated that, although branch offices of banks, savings and loan associations and credit unions are preferred, ATM kiosks are permitted when full-scale financial services cannot be provided.

"In acquiring [ATM] services," DOD added, "preference shall be given to proposals that offer shared-access ATMs."

Public comments on the proposed rules are due Oct. 23.

Joint venture to offer packet network service

SAN DIEGO — A gaggle of unlikely partners has joined forces with the intention offering a packet-switching service later this year, it was announced at the Telecommunications Association 1985 show last week.

At the conference, MCI Communications Corp., Amdahl Corp., Pacific Bell, Security Pacific Data Transmission Corp. and Dow Jones News/Retrieval service demonstrated a service capability that may be ready as early as this winter.

While traditional packet-switching carriers such as GTE Telenet Communications Corp. and McDonnell Douglas Automation Co. supply users with end-to-end services, this joint effort will have different companies providing network link segments and components.

In the demonstration, Pacific Bell and Security Pacific provided local-exchange packet connections to Dow Jones over an MCI long-distance link. Amdahl provided the network management processors, network concentrators and other components needed to access the packet net.

The joint venture plans to build networks for private customers using local-exchange packet nets interconnected with packet links from MCI.

TRY IT

TRY THE ANALYST TOOLKIT™ FOR THIRTY DAYS.

Automate the process of systems analysis with the ANALYST TOOLKIT™, the first truly cost efficient PC-based graphic tool for systems development.

Try it on your projects. See how you can effectively use structured techniques on real-world projects. For a nominal charge of $500, applied towards the purchase, you'll receive the complete working software package with documentation and customer support, yours to use for 30 days. No demo disks—the real thing!

Only a limited number of evaluation systems are available. To find out how you can get the TOOLKIT up and running in your shop, call us at (800) 223-2452. In New York, (212) 391-2828.

Try the ANALYST TOOLKIT.™ See how we're changing the way systems are developed... again.

COMPUTER FAT.

HOW TO AVOID IT, FROM THE LEADER
IN ON-LINE TRANSACTION PROCESSING.

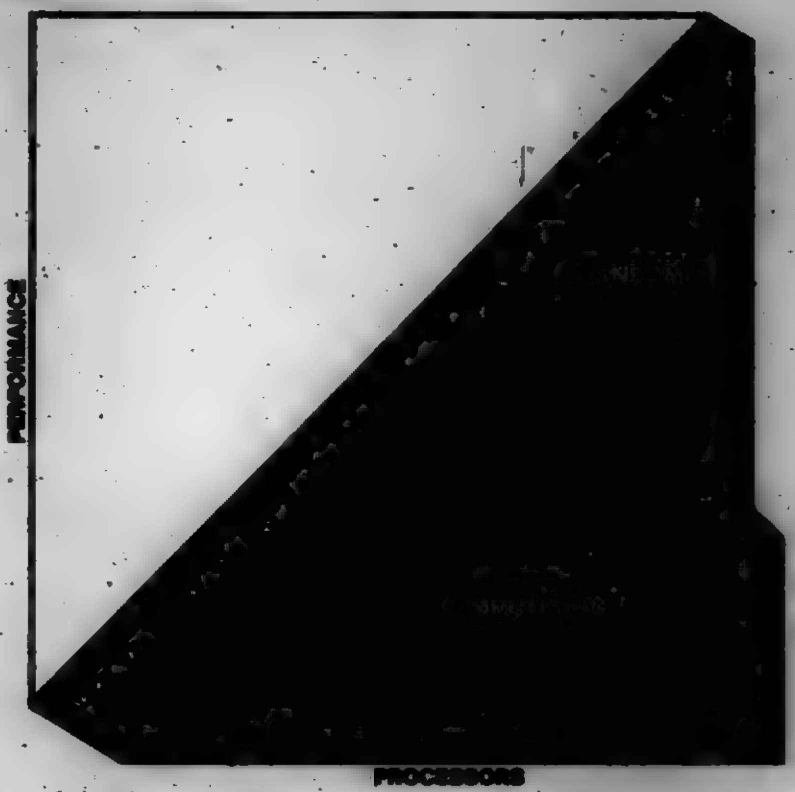
WHAT COMPUTER FAT IS.

Computer fat is created when you buy more computer than you need. With conventional computer architecture, you have no other choice. You buy the closest fit available and "grow into it."

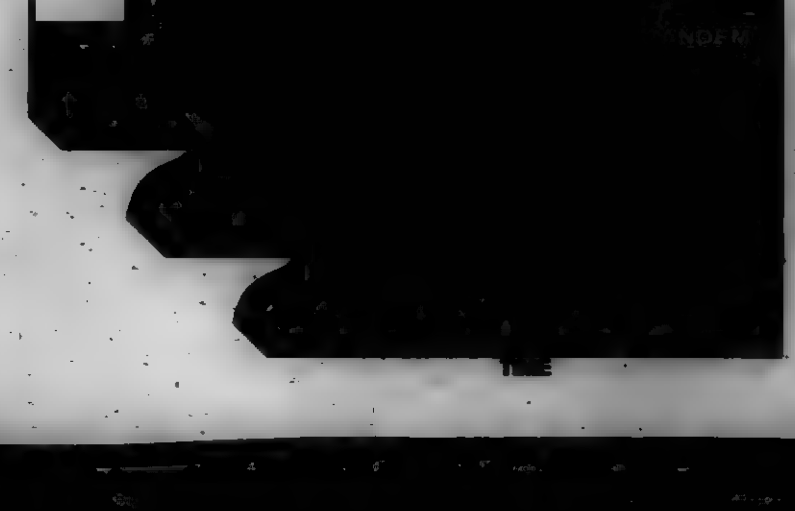
So there is always waste and inefficiency. And you pay dearly for it.

WHAT IT COSTS.

The performance cost. With conventional computer architecture, doubling your processors does not double your performance. With Tandem, each incremental increase in processing power provides matching performance.



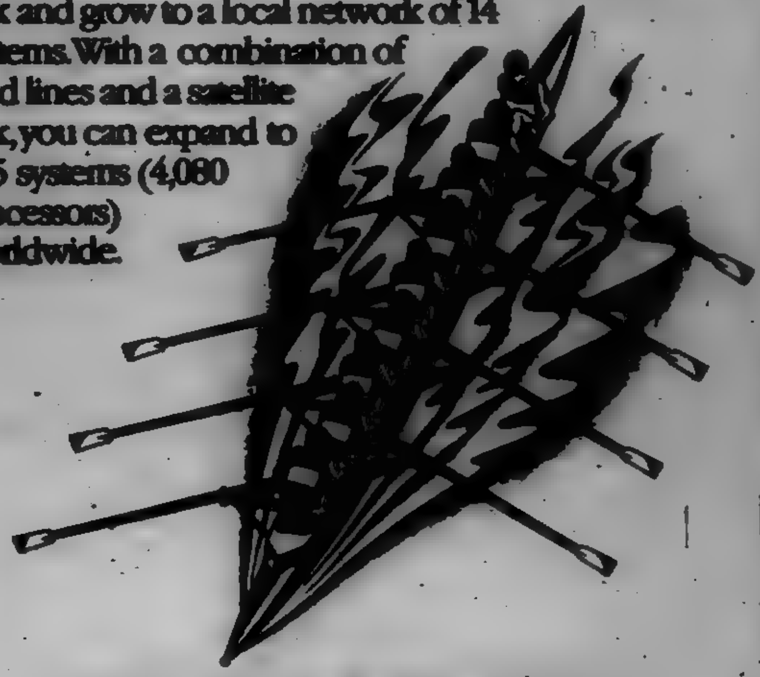
The dollar cost. With conventional computer architecture, growth is convulsive. You must continually over-invest to assure sufficient processing power. With Tandem, growth matches need. You never invest more than you have to.



TANDEM'S NON-FAT ARCHITECTURE.

Tandem Computers has developed the ultimate system for on-line transaction processing. It is the fault-tolerant system that can grow as your needs grow, expanding at any increment you choose.

You can start with two processors and grow to 16 processors in a system. You can put in a fiber-optic link and grow to a local network of 14 systems. With a combination of land lines and a satellite link, you can expand to 255 systems (4,080 processors) worldwide.



In a Tandem system, there are no idle backup components. They all share the workload.

With Tandem, your software expands, too. All systems work like one system, and you'll never have to rewrite a line of applications code.

The Tandem NonStop™ system is also enhanced by a high-performance, relational data base that can be geographically distributed to wherever it's needed. And no single component failure can shut you down.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the U.S. Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

TANDEMCOMPUTERS

Federal historians alarmed at loss of computerized data

By Mitch Betts

WASHINGTON, D.C. — Government historians and records managers, upset by the loss of computerized government data, vowed at a recent meeting to take a more aggressive role in shaping information management policy.

The meeting, hosted by the Society for History in the Federal Government, featured complaints from records managers and archivists at federal agencies:

■ Information systems are rarely designed with any input from records managers and archivists, who must retrieve historically important information 30 or more years after it is stored.

■ Records managers in the government are placed far below DP managers in the information management hierarchy and get little respect or resources.

■ The U.S. Congress has given an alphabet soup list of agencies that have the authority to manage federal records, but strong policy direction is lacking.

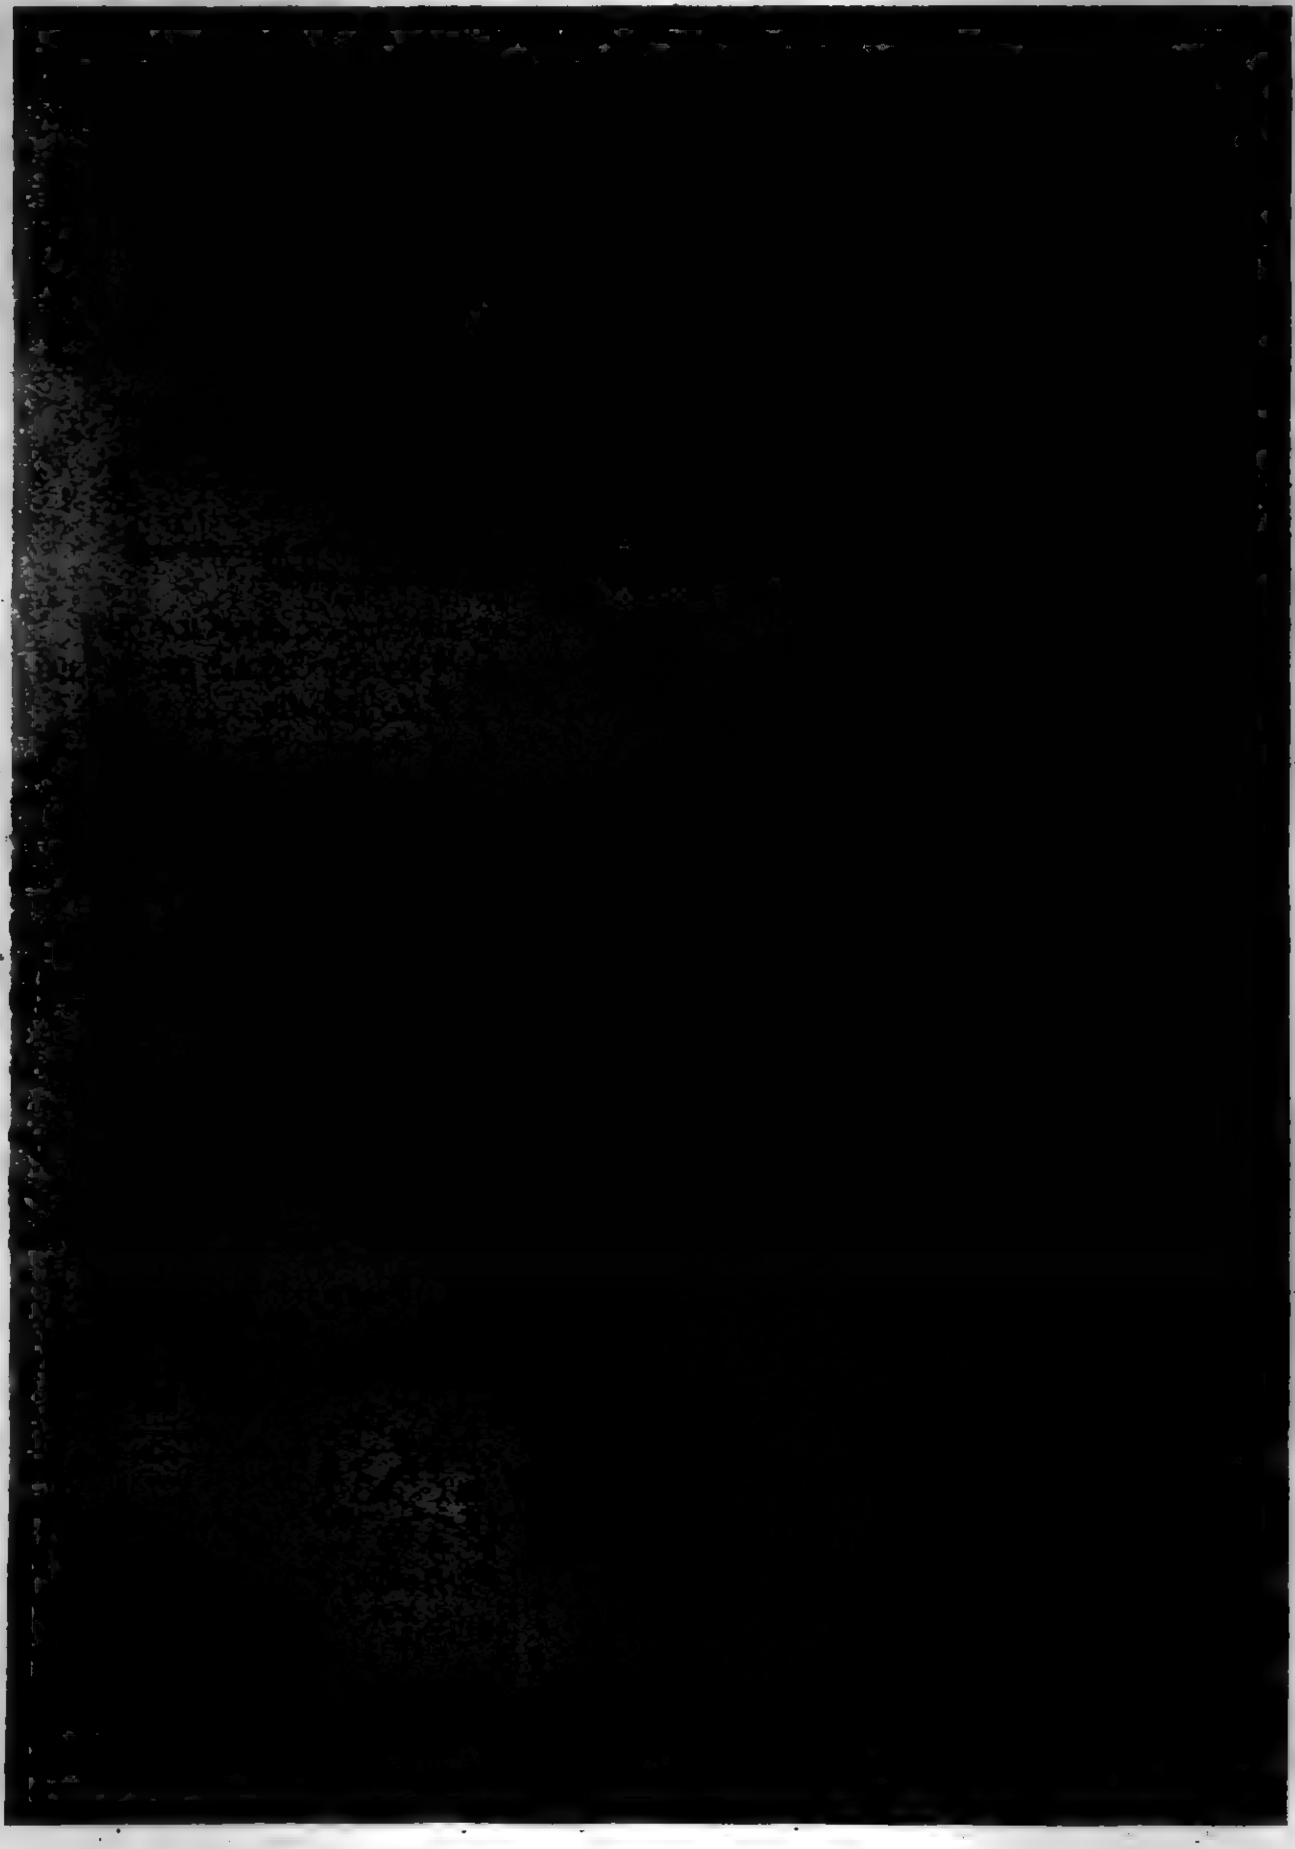
Generally, records managers and archivists need to retrieve and store certain types of government information, such as analytical reports, precedent-setting agency policies and directives, minutes of board meetings, legal opinions and comments on legislation.

According to a blue-ribbon panel called the Committee on the Records of Government, the computerization of government records has caused several problems, including the deletion, caused by word processing software, of historically significant first drafts of policy documents.

Consequently, "the U.S. is in danger of losing its memory," the committee's recent report said. Because of erasures of electronic records, future historians may know less about the 1985 arms control talks than about the 1972 Strategic Arms Limitation Talks, it said.

Furthermore, the growing use of electronic mail makes it less likely that important government memos will be preserved, the report said.

Frustrated with these problems, participants at the meeting said a government agency or committee is needed to set information policy. Anna Nelson, who was project director of the committee report, said a high-level records council is needed to coordinate policy along with the National Archives and Records Administration.



WORLD DIGEST

CW International News Network

MANILA — As part of a sweeping effort to computerize government offices, the Philippine's President Ferdinand Marcos has eliminated the country's $50,000 ceiling on the importation of computer equipment, reduced tariffs on those products and established a cabinet subcommittee to review the status of computerization.

The subcommittee, headed by Prime Minister Cesar Virata, is responsible for formulating a plan to boost technological development in the Philippines. Acting as consultants to the committee are technical experts from the government and private sector. Key government ministries and agencies reportedly have been assigned to lead the automation project and will be the first to acquire equipment.

VIENNA — Philips Data GesmbH announced a microcomputer named Yes. Yes is equipped with an Intel Corp. 80186 processor, DOS-Plus operating system and 64K bytes of read-only memory from Digital Research, Inc. Production of the system will take place in Austria, Philips said. For marketing and sales within Austria, Philips said it hopes to line up 100 distribution partners before the end of 1985.

So the CEO said: "If we could automate all our key departments and tie them into our SNA network, we'd knock the competition off the map."

And we said...

“Ready for action.”

Information. It's one of the best weapons companies have to knock the competition off the map.

When all the key players in your organization have instant access to the facts they need to make decisions, you have the best chance for top performance and enhanced customer satisfaction.

And that's where Honeywell comes in.

COMPATIBLE DEPARTMENTAL SYSTEMS

Our DPS 6 family of fully compatible computers make excellent departmental systems that can help win the battle on three fronts.

First, we tie headquarters into the action through Honeywell's DSA network architecture or through SNA architecture compatible with IBM hosts. That lets the brass on the corporate level keep track of major developments in the field. We also support another state-of-the-art network, the Local Area Network. Extremely modular, cost-effective and simply connected, Honeywell LANs tie together processors and devices such as PCs, terminals, and computers to fill many basic communications needs.

Next, we give departments the tools they need to plan and execute winning strategies. It's easy because DPS 6 systems are versatile. So your sales and marketing offices can have just the systems and applications they need while accounting and purchasing have theirs. All able to communicate instantly. Honeywell gives you all this without breaking the bank, because all our systems are designed to provide you with a clear growth path that evolves with your needs.

Finally, Honeywell gives the people in the trenches, the end-users, the friendly kinds of software that make the DPS 6 system easily accessible to everyone.

SERVICE AND SUPPORT

When it comes to service, you'll be backed by Honeywell's worldwide TotalCare™ customer service program that is capable of supporting even intercontinental networks. Uptime, after all, is everything, and TotalCare provides everything you need in programs and services that can be tailored to help meet your requirements.

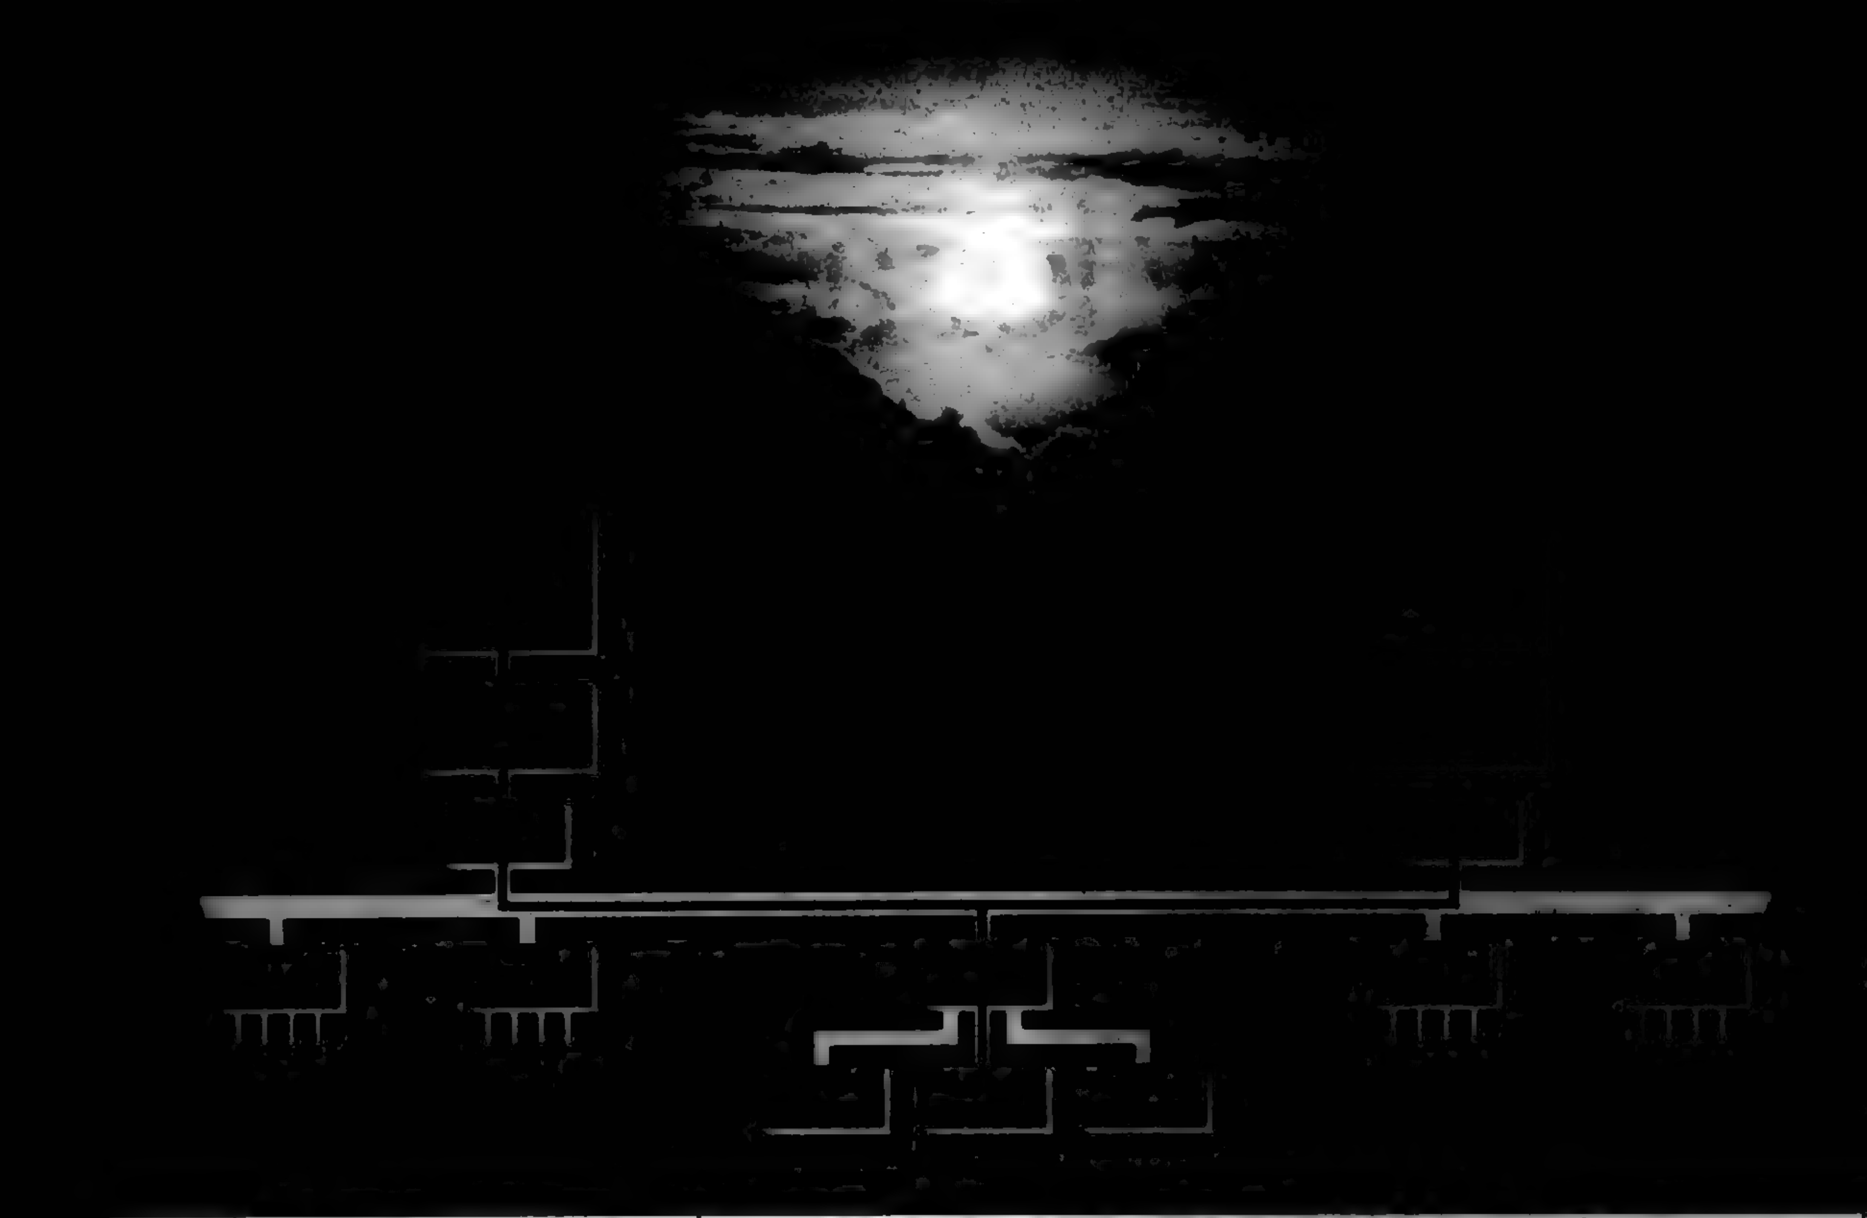
THE SMARTER CHOICE

Helping customers beat the competition is nothing new to us. We're veterans. For more information on Honeywell's departmental system, call 1-800-328-5111, Ext. 2790, or write Honeywell Information Systems, 200 Smith Street, MS440, Waltham, MA 02154.

Honeywell
100
Years

Together, we can find the answers.

Honeywell



Now, fly from host to host without changing terminals.

INTRODUCING THE NET/ONE IBM MAINFRAME CONNECTION.

Our new NIU-74 and NIU-78 Network Interface Units are the link you've been waiting for between your IBM® Information System and the Net/One® local area network. Now you can switch applications without switching terminals or chairs. You can move people without the costly hassle of recabling and reconfiguring systems.

In multi-system installations, you can get more applications out to more users with fewer terminals and printers, without adding more remote controllers. With the NIU 74/78's port rotoring capability, one IBM 3274 can serve more devices. And you'll get locally-attached performance even for devices miles away on large broadband systems.

The connections are made from your IBM 3274 controllers to Net/One through the NIU-74s, and from IBM 3270 type devices through the NIU-78s. The devices are plugged in, using standard connections, a standard Net/One CONFIGURE program is run to define the logical network, and you're on your way. From any terminal on the network, to any mainframe, any controller, any application.

And since Net/One is vendor-independent and supports all major LAN technologies and standards, it's the one network broad enough in scope to handle virtually every connection in your plans.

You get the additional capability you're looking for, without compromising your existing system in any way. In fact, Net/One enhances the value of the investment you have in your existing system.

Both the NIU-74 and NIU-78 are available now. And, like any Net/One product, they come with continuing support from our experienced field service personnel. Give us a call, and let us help you get going host to host without going from terminal to terminal. Ungermann-Bass, Inc., 2560 Mission College Blvd., Santa Clara, CA 95050, (408) 496-0111.

Micro statistics tool helps General Foods track tastes

Cuts division's $6,000 monthly CPU costs

WHITE PLAINS, N.Y. — You can't tell a book by its cover, and you can't judge a cereal by the design of its box. Nevertheless, said a spokesman for General Foods Corp., maker of the Post brand breakfast cereals, research shows that such factors as package shape or color can translate into millions of dollars of sales — lost or gained — for the company.

So it was with appropriate thoroughness and care that the General Foods' food division headquarters in this New York suburb went about selecting a microcomputer statistical analysis package to help determine the likely affects of product packaging and other variables on consumers' buying decisions. The headquarters supports six food divisions, which make and market products such as Minute Rice, Maxwell House Coffee, Oscar Mayer bologna and Post Raisin Bran.

According to Stephen Rood, a group marketing information associate at General Foods, members of the company's data research department will survey hundreds — sometimes thousands — of consumers to gather information about their purchasing habits. General Foods researchers collect demographic data as well as information about test subjects' reactions to a product or a package design.

The data sets that contain information from the surveys are large, Rood said. "It would be typical to find someone looking at, say, 30 variables and 1,000 cases from the interview data."

Until recently, the market research group relied on mainframe software packages, mostly SAS Institute, Inc.'s SAS, to perform regression analyses and other statistical operations on the information that had been collected. To access the software, which runs on a 16M-byte IBM 3033 at General Foods' corporate headquarters in Rye Brook, N.Y., the group had to pay up to $6,000 per month for CPU time.

"What was happening," Rood continued, "was that a number of people were coming in and saying, 'Well, gee, if I could download the data to a micro, it could substantially cut those costs.' "

Last summer, Rood, who is responsible for finding tools for market analysts to use in their work, obtained a copy of SPSS, Inc.'s SPSS/PC and installed it on an IBM Personal Computer XT. Since then, he and seven other micro users have been performing statistical analyses on micros using the SPSS package.

To access survey data, users dial into either the 3033 or one of 10 Prime Computer, Inc. 2250s General Foods maintains for data storage. They download the information to SPSS/PC using error-checking communications protocols in Temple, Barker & Sloane, Inc.'s Addata data base software. Portions of Addata run both on the 3033 and on the personal computers that run SPSS/PC.

For operations that the micro package does not support, such as discriminate analyses, and for analysis of data sets with more variables than the micro package can handle, users still rely on mainframe software. Rood said applications involving both micro and mainframe analyses at different stages are common.

Since the micro software has been installed, however, analysts have used it for as many projects as possible, Rood said, because of the cost savings it represents.

Besides performing regression, variance and factor analysis procedures on market research data, the analysts use the software to examine consumer trends and warehouse figures on product turnover. They also use it to prepare data for procedures like graphics display that are available in other software packages.

Application: Microcomputer statistical analysis package

Business: Packaged food

User: General Foods Corp.

Rood said most analysts learned to use SPSS/PC within a week because they had been exposed to SPSS mainframe software at college and had no problem understanding the micro version's documentation. The short learning cycle translated into lower costs and higher efficiency.

"We need a situation where we're not going to have analysts spending a great deal of time learning a new program," he said. "This package lets them get into their analysis and use a variety of statistical procedures on their data right away and with relatively little help."

Rood said he expects about 100 employees at General Foods to use the micro statistical analysis software eventually. The firm does not impose any top-down restrictions on microcomputer hardware and software. Users who can justify a purchase to their superiors are free to buy whatever they think will meet their needs. The company maintains an information center to guide users in their choices.

THE MONITOR FOR CICS

MORE THAN A REPORT WRITER!

- Detail Data Collection
- Data Summarization
- Costing/Accounting
- Independent of CMF
- Unlimited Report Control Breaks
- Summarizes EM Tasks
- Realtime Monitoring
- Task Cancel
- VSAM Split Information
- CICS Storage Analysis

FINALLY! AN ALTERNATIVE TO PAII AND CICSPARS

Data Management

Summarize and compress application and systems data into a cumulative file. Long range reporting via user-defined control fields and double word capacity. One job execution for reporting and historical management of all systems.

- Automatic monthly history extraction
- User defined history control fields
- Tape and disk support for all operating systems
- Capacity planning and trend analysis reports

Data Collection

Comprehensive record of transaction performance. System overhead in five categories. Each day's environmental and performance history maintained for online access.

- User defined file controls
- Space saving data compression
- Supports UFO™, MANTIS™, GENR/OL™, NATURAL™, and DMS™
- Automatic file repositioning and file wrap around option
- User friendly clocks, counters, and online exits
- High performance VSAM RRDS

Reporting and Accounting

Custom hardcopy reports assist in performance and trend analysis, capacity planning, transaction accounting, and problem determination. Select, edit, and report date via the report writer. Charges based on resource fields, total cost or actual consumption.

- CICS overhead, user clocks, and counter reports
- User exits and daily total page
- Report tables and automatic field spacing
- Variable page length and width
- Data selection and exclusion

Online Features

Online features utilize "user friendly" techniques. Supertune for application tuning. Menu driven system. Graphic realtime, task, storage, and file monitoring systems.

- Automatic problem alerts
- Track and tune CICS storage
- Daily performance replay
- Online historic data review
- Shows CICS file and DL/I database performance

6.1

CALENDAR

WEEK OF OCTOBER 20

OCTOBER 21-22, LOS ANGELES — **Direct Response Marketing for Financial Institutions: Telemarketing, Direct Mail & Sales Training.** Contact: Alice Gibons, Inter-Financial Association, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925.

OCTOBER 21-23, BOSTON — **Hammer Forum '85: Shaping the Second Revolution in End-User Computing.** Contact: Hammer and Co., Hammer Forum, 5 Cambridge Center, Cambridge, Mass. 02142.

OCTOBER 21-23, SAN FRANCISCO — **Lamond on IBM.** Contact: Reggi Veatch, National Marketing, Suite E-1A, Standard Court E., 9160 Red Branch Road, Columbia, Md. 21045. Also being held Oct. 29-31 in Dallas and Nov. 4-6 in Boston.

OCTOBER 21-23, WASHINGTON, D.C. — **Controlling Software Projects: Management, Measurement and Estimation.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held Dec. 9-11 in Dallas.

OCTOBER 21-24, CHICAGO — **Systems & Applied Technology Conference & Exhibition (Satech '85).** Contact: Satech '85, 2472 Eastman Ave., No. 34, Ventura, Calif. 93003.

OCTOBER 21-24, PITTSBURGH — **Work Measurement Techniques Workshop Series.** Contact: Institute of Industrial Engineers, Registrar, 25 Technology Park/Atlanta, Norcross, Ga. 30092.

OCTOBER 21-25, BOSTON — **Analysis Workshop.** Contact: Judy Trelogan, Arthur Young & Co., 1950 Roland Clarke Place, Reston, Va. 22091.

OCTOBER 21-25, CHICAGO — **CICS Macro-Level Programming.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 21-25, NEW YORK — **Comprehensive Course in Data Communications.** Contact: *Data Communications*, Special Projects Conference Management Center, c/o Information-Breakthroughs, Inc., 445 W. Main St., Wyckoff, N.J. 07481. Also being held Nov. 18-22 in Lake Buena Vista, Fla.

OCTOBER 21-25, NEW YORK — **Structured Systems Design Workshop.** Contact: Elise Rabelais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop West, Houston, Texas 77092.

OCTOBER 21-25, WASHINGTON, D.C. — **Ada Software Engineering Workshop.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held Oct. 28 to Nov. 1 in Los Angeles.

OCTOBER 22-23, BOSTON — **Developing End-of-Arm Tooling for Industrial Robots.** Contact: Robotics International of the Society of Manufacturing Engineers (SME), P.O. Box 930, One SME Drive, Dearborn, Mich. 48121.

OCTOBER 22-25, DENVER — **Data Base: A Builder's Guide.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also set for Nov. 12-15 in Dallas and Dec. 3-6 in Washington, D.C.

OCTOBER 22-25, SAN FRANCISCO — **Worldcom '85 — World Communications and Computers: 1985-2000 Conference and Exhibit.** Contact: International Council for Planning and Innovation, P.O. Box 17392, Washington, D.C. 20041.

OCTOBER 22-26, SAN FRANCISCO — **Fifth Multinational Conference on World Communications and Computers.** Contact: International Council for Planning, P.O. Box 17392, Washington, D.C. 20041.

OCTOBER 23-26, NEW YORK — **Strategies for Office Automation.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held March 11-13 in Boston.

OCTOBER 24, NEW YORK — **DOS/VSE for Systems Programmers.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 24-26, LOS ANGELES — **Local-Area Networks: Selection and Implementation.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01810.

OCTOBER 24-25, SAN FRANCISCO — **Lamond — The IBM PC.** Contact: Reggi Veatch, National Marketing, Suite E-1A, Standard Court E., 9160 Red Branch Road, Columbia, Md. 21045. Also being held Nov. 7-8 in Boston.

OCTOBER 24-25, SAN FRANCISCO — **PC as a Programmer/Analyst Workstation.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01810. Also being held Nov. 21-22 in Washington, D.C. and Dec. 12-13 in Boston.

WHO SAYS WORDSTAR® 2000 IS SO GREAT?

"Move over MultiMate, MicroPro's back on top."
—*Business Software*

"The new package is packed with virtually dozens of features everybody wants…Even in a dedicated machine, word processing has never been more plushly self contained and comprehensive."
—*Personal Computing*

"Three early users of WordStar 2000 gave the program high marks for its overall design, mnemonic command set and intelligent use of function keys."
—*ComputerWorld*

"I've become addicted to some of the features such as undo, windows, and automatic reformatting."
—*Popular Computing*

"Include WordStar 2000 on your shopping list—it's competitive with anything now on the market."
—*Computers and Electronics*

WORDSTAR® 2000

Now there are no limits.™

MicroPro.

Three more firsts from the people who invented the wheel.
Printer

XEROX

From day one, Xerox and Diablo have been known as the two best names in daisywheel printers. And now there are three more in the Xerox line to choose from.

The Xerox Advantage D-25 Diablo printer turns out letter quality [illegible] speed and quality. And it does all that for the price of [illegible] printer. [illegible] At 80 cps, the D-80IF is the fastest daisywheel printer ever made by Xerox. It has built-in [illegible]

And [illegible]

Each of these [illegible] compatible [illegible] easy to use.

They're also [illegible]

AT™ Pfantasies for your PC or XT.™

Want better speed and memory on your PC or XT without buying an AT?

You've got it!

Phoenix's new Pfaster™286 co-processor board turns your PC or XT into a high-speed engine 60 percent faster than an AT. Three times faster than an XT. It even supports PCs with third-party hard disks. But that's only the beginning.

You can handle spreadsheets and programs you never thought possible. Set up RAM disks in both 8088 and 80286 memory for linkage editor overlays or super-high-speed disk caching. All with Pfaster286's 1mb of standard RAM, expandable to 2mb, and dual-mode design.

You can develop 8086/186/286 software on your XT faster. Execute 95 percent of the application packages that run on the AT, excluding those that require fancy I/O capabilities your PC or XT hardware just isn't designed to handle. Queue multi-copy, multi-format print jobs for spooling. Or, switch to native 8088 mode to handle hardware-dependent programs and back again without rebooting. All with Pfaster286's compatible ROM software. And, Pfaster286 does the job unintrusively! No motherboard to exchange. No wires to solder. No chips to pull. Just plug it into a standard card slot, and type the magic word, "PFAST."

If you really didn't want an AT in the first place, just what it could do for you, call or write: Phoenix Computer Products Corp., 320 Norwood Park South, Norwood, MA 02062; (800) 344-7200. In Massachusetts, 617-762-5030.

Programmers' Pfantasies™

NOW OUR MORE THAN 1,000 LARGE NETWORK USERS CAN BRANCH OUT.

BECAUSE NCR COMTEN JUST PUT A FULL-SCALE DATA COMMUNICATIONS PROCESSOR IN A SMALL-SCALE PACKAGE.

From the data communications company accepted by exacting network users around the world, comes the Comten 5620—offering a new level of flexibility to meet a variety of network needs. It's a remote node concentrator or small network front-end processor. Its VLSI technology supports IBM, IBM compatible, or NCR hosts. It handles both SNA and non-SNA traffic concurrently. It saves significant line costs while providing greater access to host applications and data. And the 5620 offers modular components so you choose the capacity right for you—and expand as needed.

The functionality of a full-fledged data communications processor is now available in a small-scale package. To fit a small-scale space. At a small-scale price.

Join the over 1,000 large network users who are currently benefiting from NCR Comten's cost-effective, innovative solutions for network connectivity. Write "Data Communications," NCR Comten, Inc., Dept. 8015, 2700 Snelling Ave. No., St. Paul, MN 55113. Or call 1-800-334-2227. **In Canada call 1-800-543-5713.**

UK users moving to MVS

Security called catalyst for migration from DOS

By John Desmond

BUCKINGHAM, England — DP auditors in the UK who are demanding improved data access security are helping to drive conversions from IBM's widely installed DOS/VSE to its strategic MVS operating system.

That is according to Michael Kerford-Byrnes, principal of MKB Technical Services, a consulting firm that specializes in DOS-to-MVS conversions.

"Here, internal and external auditors who come to computer installations actually have some teeth, and because they have a bit of computer knowledge, they know where to bite," Kerford-Byrnes said in a telephone interview from England.

"A lot of users are running out of steam with DOS' and they need [Extended Architecture (XA)]. They need it for capacity, for function, and they desperately need it for security," he continued. "The general attitude over here is rapidly becoming if you're going to have any sort of access control, it's got to be RACF or something like it," he said, referring to IBM's Resource Access Control Facility MVS security control program.

Thus, he said, more and more users in Europe are being attracted to MVS for a reason other than the need for increased functionality and capacity. Rather, the demand for better data security is becoming a chief motivation to convert.

Notes from the software industry front

Sunnyvale, Calif.-based Data Design Associates, Inc. and Applied Data Research, Inc. (ADR) of Princeton, N.J., announced a development and marketing agreement through which Data Design's four mainframe financial applications will work with ADR's Datacom/DB relational data base management system. Data Design's accounts payable, general ledger, fixed assets and capital project management tools will be compatible with Datacom/DB.

■

Mitrol, Inc. of Woburn, Mass., has purchased worldwide exclusive distribution, marketing and maintenance rights to Rockville, Md.-based General Electric Information Services Co.'s (Geisco) Mims manufacturing applications development system. Mitrol said it will market Mims in North and South America. Through Geisco's partnership with Teamco of Norway, Teamco will

DOS micros get IBM link

Multi Soft, Inc. of Edison, N.J., has announced Super-Link, a micro-mainframe link package for data transfer between IBM's PC-DOS or Microsoft Corp.'s MS-DOS operating systems and IBM mainframes.

Super-Link includes a microcomputer control program, a library of mainframe subroutines and a microcomputer screen management program.

Super-Link will support IBM mainframes running VM/CMS, TSO or CICS and micros running PC-DOS, MS-DOS and S1, a microcomputer operating system developed by Multi Solutions, Inc., parent company of Multi Soft. S1 is available for several Motorola, Inc. 68010 microprocessor-based micros.

The micro-mainframe product provides links to applications running on the mainframe, rather than direct links into data base management systems. The VM/CMS version is available now, and the CICS and TSO versions are scheduled to be available by the end of October. Super-Link is priced from $10,000 to $60,000 depending on the hardware and number of micros.

Cobol 85 plods to acceptance

There's a good chance the beleaguered Cobol 85 standard will finally cross both the international and American finish lines before the end of this year.

But don't be overly surprised if the standardization process stretches into the new year and what could have been Cobol 85 becomes instead Cobol 86. The controversial — to say the least — Cobol 85 standard has exhibited a real knack for discovering stumbling blocks as it plods along toward International Standards Organization (ISO) and American National Standards Institute (Ansi) approval. Whether the proposed standard will find yet another such obstacle before January is anybody's guess.

The proposed Cobol standard was known for years as Cobol 80 and was initially envisioned as a routine overhaul of the existing Cobol 74 standard. But Cobol 80 was just not to be. Cobol 85's official label, 8X, replaced the 80 as a sign of just how uncertain the final date of approval would be. If the standard does indeed become known as Cobol 85, it will represent the first internationally embraced upgrade of the most widely used programming language in 11 years. That's simply too long.

Though a programming language like Cobol may seem dry and uninteresting to the uninitiated, it is a language that, like any other, must evolve over time if it is to survive. As with English, programming languages have to change to accommodate new ideas and new approaches.

Changes to spoken languages are subtle and reflect shifts in attitudes

If Your Job Accounting Requirements Are Unique...
BDBF gives you the flexibility to be creative

Just as artists have different styles, billing requirements vary from installation to installation and from user to user. The Billing Database Facility (BDBF) is designed with the flexibility to meet these varying job accounting and chargeback requirements in MVS and MVS/XA environments. It is written in SAS®, providing the flexibility to tailor the standard reports and the freedom to create reports and graphs to meet special management requests.

Harris offers engineering tools

Modules include design, drafting

Harris Corp. has introduced Harris Civilcad software with design, drafting and data management capabilities for civil engineering and construction applications.

The software runs on all H series superminicomputers from the Fort Lauderdale, Fla.-based company. Civilcad includes seven modules: Digital Terrain Modeling, Cogo, Hydro, Bill of Materials, Earthwork, Roadway Profile Design System and Civilcad Drafting.

Each module can be purchased separately or in combination. On the entry-level Harris 60, up to 48 users can work with the Civilcad software modules for concurrent handling of various tasks. Harris processors can host Harris microcomputers or any IBM-compatible microcomputers as workstations or terminals.

A turnkey Civilcad system with hardware, software and peripheral equipment for a four-user civil engineering environment costs $194,000.

The system includes a Harris 60 superminicomputer, a 474M-byte disk drive, a streaming tape drive, a floating-point processor, a matrix printer, four graphics terminals, four digitizing tablets, a plotter and Harris Drafting, Cogo and Digital Terrain Modeling software modules.

The price for all seven modules in the Civilcad package is $56,000. The packages are available now.

Pick users to set guides

LAS VEGAS (CWN) — Major licensees of the Pick operating system have formed an association that will seek to establish basic standards designed to allow portability of users' applications under the numerous implementations of the operating system.

Representatives of 11 of the operating system licensees formed the association under the temporary chairmanship of Leonard Mackenzie, chief executive officer of General Automation, Inc., Anaheim, Calif. General Automation uses Pick as the operating environment for its GA Zebra series of supermicrocomputers.

Two interim committees were also formed, a technical standards committee and a committee that will meet in October to formalize the association, elect officers and define its charter.

Dick Pick, the developer of the operating system, has also been invited to join the association through his company, Pick Systems, Inc. of Irvine, Calif.

CDC provides consulting service

Control Data Corp., based in Minneapolis, has announced a consulting service to help Cyber 180 series computer users running the NOS or NOS/VE operating systems manage present and future computer resources.

The Capacity Management and Performance Analysis Service consists of two component services, Vital Signs and Work Load Analysis.

The Vital Signs service provides software said to monitor and analyze system use, establish a base line, recommend system tuning alternatives and monitor system performance.

In addition, a report prepared every quarter provides a summary of resource usage, system dynamics, system overhead and resource overlap and recommends ways to improve system performance and throughput, a spokesman said.

The Work Load Analysis service predicts future work load levels and generates configuration alternatives to process the predicted work load, which is based on customer forecasts of applications growth, according to the vendor.

Prices range between $14,000 and $22,000 per year for Vital Signs; Work Load Analysis costs between $14,000 and $30,000 per year, CDC said.

Operating system out for HP Series 200

Whitesmiths, Ltd. of Concord, Mass., has announced that its Idris operating system is now available for Hewlett-Packard Co.'s Series 200 technical workstations running on the HP 9000 minicomputer.

Idris is a real-time, multiuser, multitasking operating system created by Whitesmiths for software development. Idris was designed to run on small machines, such as the HP Series 200. The operating system is said to provide a real-time environment compatible with AT&T's Unix.

The product is managed by a hybrid schedule, which allows for both deterministic execution of real-time processes and reasonable response time for interactive time-sharing processes in a time-sharing system. Idris provides low-level file and device I/O services and interprocess communications using shared data, locks, events and messages as well as Unix-style "pipelines."

Device drivers are included in C source for floppy disk drives, hard disks, printers, serial I/O, terminals and integral CRTs and keyboards. Approximately 100 utilities are provided with Idris, including Whitesmiths' C and Pascal compilers as well as an assembler, linker, librarian and related object tools.

A variety of software tools for such functions as communicating with other systems, controlling multiuser login and security and sending and receiving mail are also included.

The single-unit price for Idris running on the HP Series 200 is $2,500.

TONE Software Corp.

ANNOUNCING THE FIRST BUSINESS MODELING SYSTEM WITH ARTIFICIAL INTELLIGENCE

INGOT is the first DSS which simulates decision making of a chief financial officer to minimize capital costs. INGOT takes into account daily financial events, corporate policies, interest rates, and your business forecasts. INGOT's CASHMOD command makes simultaneous equations obsolete.

Other standard capabilities in INGOT give you more for your DSS dollar, including:

- PERT project management with automatic calendaring.
- Times series forecasting and advanced statistical methods.
- Flexible graphics for floor plans, maps and diagrams.
- Data entry with automatic validation and user defined HELP files.
- Optimization with linear and integer programming.
- Built-in financial and manufacturing models as commands.
- 100% of reference manual on-line for easy use.

INGOT runs on IBM MVS/TSO, DEC VAX, Prime, Tandem, DG AOS/VS, Apollo, CDC/NOS-VE, HP 9000, Honeywell GCOS, and most UNIX systems. Ask us about any others.

Get the Facts. Call 800-323-7830 or in Illinois 312-869-5556.

Panelpro boosts on-line applications development

Interactive Software Systems, Inc. of Chicago has announced Panelpro, a programming aid that allows Cobol programmers to develop on-line applications without knowledge of IBM's CICS.

Panelpro requires a programmer to know only Cobol to develop command-level programs, a spokesman said. Panelpro uses statements familiar to Cobol programmers such as Read/Write and Rewrite, which are said to reduce the need for CICS specialists.

Panelpro introduces the Procedure, Screen and Report verbs. Screens are painted by preparing subsequent screen lines, which range from one to 99,999 in number. Pseudo-conversational programming starts with the procedure code, circumventing conventional commentary normally required in Cobol.

In other features, Panelpro offers forward and backward paging, creation of temporary data names during coding and automatic editing.

Panelpro works with IBM Vsam file structures, eliminating the need to convert existing files when the system is installed. Panelpro is priced at $15,000.

Software said to translate PDP-11 programs to VAX

Virtual Systems, Inc. of Walnut Creek, Calif., has announced a program, Macrovax, that translates assembly language software written for Digital Equipment Corp. PDP-11 systems into VAX assembly language.

Originally written to translate the company's own library of PDP-11 source programs into VAX native-mode assembly language, Macrovax is now commercially available, according to the vendor.

Running on either the PDP-11 or VAX system, Macrovax can translate 98% of the PDP-11 assembly language programs with minimum programmer effort, a spokesman said. Assembly language directions and control statements are translated in such a way as to ensure optimum performance on a VAX.

Macrovax automatically segregates PDP-11 programs into code and data areas, and models the PDP-11 stack in the data area. Programs may be of any size, but data is limited to a 64K-byte area.

The Macrovax program is priced at $10,000 per CPU. The system includes manuals and a one-week training session.

SCA introduces source-to-load tracking option

Software Corporation of America (SCA) has announced the Connection option for its Change Tracker mainframe software, which automatically tracks changes made to executable libraries. The product runs in IBM OS, MVS and MVS/XA environments.

A spokesman for the Herndon, Va.-based SCA said the Connection option provides source-to-load change tracking capabilities. The option captures and records information about source modules as it is extracted and input to the compiler.

The information is carried forward through the compilation into the linked-edited load module. Used together, the Change Tracker and Connection options are said to eliminate manual efforts required to identify the source modules that comprise a load module.

The Change Tracker is integrated with the linkage editor and records each time a program is added or changed.

The Change Tracker is priced at $6,500 for a single-CPU permanent license and $9,900 for a site license. The Connection option, to be available in November, is priced at $3,500 for a single-CPU permanent license and $5,000 for a site license.

MProlog out for Lisp system

Logicware, Inc. of Toronto, Ontario, has announced that its MProlog language is available for the Symbolics, Inc. 3600 Lisp-based computer.

Previously available on a variety of machines, MProlog reportedly now allows artificial intelligence applications written in Prolog to run under Lisp.

According to the vendor, MProlog allows users to develop programs on a Lisp Symbolics 3600 machine and move those programs to a Motorola, Inc. MC 68000-based system. MProlog on the Symbolics 3600 costs $12,000.

"One thing I'm sure of: all my engineers hate computer downtime as much as you do."

SYSTEMS SOFTWARE

■ Key Solutions, Inc. has announced Version 1.2 of the Missing Commands data inquiry and maintenance package, offering display or update of any IBM System/38 file in hexagonal, character or formatted mode.

According to a spokesman, the Missing Commands package can be used to display and update any System/38 file one record at a time or one full page at a time.

In other added features, Missing Commands has an additional screen to display a full page of records, showing only the data from fields specified by the user, and a feature to scan optionally by field name. The product also has a new facility for deleting records and a display to provide current file information.

The Missing Commands is priced at $560. Current users can update to Version 1.2 for $75 per copy.

Key Solutions, 111-G Shelley Ave., Campbell, Calif. 95008.

■ Adaroc, Inc. has announced the Project Implementation and Control System (Pics) for the IBM System/38.

Pics is designed to monitor programs that are frequently updated and altered. The system supports multiple libraries and a variety of object management functions and ensures that production source and objects are synchronized and have been properly secured. It also ensures that new or changed objects have been successfully transferred to production, the vendor said.

Written in IBM's RPG-III, Pics is menu-driven and includes a management checkpoint feature that validates documentation and test requirements prior to job implementation.

Pics is priced at $1,850.

Adaroc, 30 Mohawk Drive, Northboro, Mass. 01532.

APPLICATION PACKAGES

■ Prescience, Inc. has announced Hieroglyph, a report writing package for Sun Microsystems, Inc. workstations running AT&T's Unix.

Hieroglyph integrates text processing, graphics, document aids, document filing, data handling and production tools, a spokesman said.

The software offers concurrent application processing, multiple window editing, computer-aided design graphics capabilities, the ability to embed graphics in text, the ability to scale graphics, support of laser printers, a spelling checker and three user-experience levels.

Hieroglyph sells for $2,400.

Prescience, Suite 300, 830 Bay Ave., Capitola, Calif. 95010.

LANGUAGES

■ Pyramid Technology Corp. has announced optimizing Fortran 77, C and Pascal compilers for its Pyramid 90X, 90MX, 98X and 98XE processors.

The compilers work with Pyramid's Common Language Environment, a standardized high-level program development and execution environment integrated with Pyramid's OSX operating system. The operating system is said to incorporate both the University of California at Berkeley's Unix 4.2 and AT&T's System V Unix features.

The C optimizing compiler will be bundled and shipped with OSX. Pyramid's optimizing Pascal and Fortran 77 compilers are priced at $6,000.

Pyramid Technology, 1295 Charleston Road, Mountain View, Calif. 94043.

■ Touch Technologies, Inc. has announced that its data base language Intouch can now call routines written in other Digital Equipment Corp. VMS languages.

Cobol, Fortran, C or Basic procedures can be executed from Intouch, a spokesman said. No compiling or linking is necessary.

Intouch is priced at $7,500 for the DEC VAX-11/730 and Microvax II, at $15,000 for the VAX-11/750, $25,000 for the VAX-11/780 and 785 and $40,000 for the VAX 8600.

Touch Technologies, Suite 101, 609 S. Escondido Blvd., Escondido, Calif. 92025.

■ Franz, Inc. has released Opus 42, a version of its Franz Lisp interpreter and compiler that is said to provide compatibility with Common Lisp and object-oriented programming capabilities.

A feature known as Flavors has been added to the Lisp kernel to give object-oriented programming capability, the vendor said. Other enhancements include the ability of functions to return multiple values, a package feature that allows multiple name spaces to reside in the Lisp environment, hash table objects, closures to control the scope of a variable definition and a history mechanism.

Opus 42 costs $5,000 for the first copy and $1,000 for subsequent copies. The new version is available on processors from Apollo Computer, Inc.; Sun Microsystems, Inc.; Cadmus Computer Systems, Inc.; Masscomp; Tektronix, Inc.; Harris Corp.; and Digital Equipment Corp.

Franz, 1141 Harbor Bay Pkwy., Alameda, Calif. 94501.

■ A C compiler optimized for the Motorola, Inc. 68020 microprocessor is available from Alcyon Corp.

The C6820 compiler will run under

HAS THE PHONE COMPANY PUT YOUR FUTURE ON HOLD?

The Centrex folks have you right where they want you: Plugged snugly into their decade-old technology.

That was fine when all your competitors had the same handicap. And when you had no choice.

Stop living in the past. Phone ROLM. Ask about the ROLM® CBX business communications system.

It'll put your future under your own roof. Not theirs. And help you control unstable phone costs. Now.

What's ROLM got going for you?

True integrated digital voice and data. (We started the whole thing.) ROLM brings 56 Kbps of data right to your desktop. So you don't poke along with Centrex analog technology. Or pay the freight whenever they get around to upgrading switches. Or hassle with their jury-rigged hardware to get the features you want.

Our superb CBX comes with all the bells and whistles you've secretly craved. From call forward-

SOFTWARE & SERVICES

the following systems: Versados on most Motorola development systems; AT&T's Unix; Digital Equipment Corp. VAX VMS or Microvax computers; and Regulus on Alcyon processors, a spokesman said. An upgrade of Alcyon's C68 compiler, the C6820 contains the instructions and addressing modes of the MC68020 32-bit microprocessor and the MC68881 floating-point processor.

The C6820 is said to be a full implementation of the Kernighan and Ritchie C language specification and consists of a macro processor, compiler, relocatable assembler, linking loader, support library and utilities.

Support utilities download executable programs and symbol tables to the MC680X0 target via a serial channel.

Prices are $2,295 for Motorola hosts, $2,995 for VAX Unix systems and $3,495 for VAX VMS computers.

Alcyon, 8716 Production Ave., San Diego, Calif. 92121.

ON-LINE DATA BASES

■ Zandar Data Corp. is offering the Surplus Electronics Component Acquisition Program data base of excess electronic and computer components that manufacturers want to sell.

The seller pays $10 per item listed on the system, plus a 5% commission when the material is sold. The purchaser pays the seller directly, a spokesman said. Users order items through the system; the owner of the material makes the delivery, according to the spokesman.

Accessing the data base requires a terminal or computer operating at 300 bit/sec. Menus direct users to the desired categories where a catalog of available items is displayed.

Zandar Data, 2923 Osmundsen Road, Madison, Wis. 53711.

TRAINING

■ Pansophic Systems, Inc. has announced that videos and workbooks are now available to aid users of Easytrieve Plus, the company's information retrieval and data management system.

The basic video course offers instruction on computers and storage and on how to create an Easytrieve Plus program. The intermediate course covers 10 topics, such as writing Easytrieve Plus procedures and job activity tables.

The videos are free to Easytrieve customers with maintenance agreements. For new customers, the Easytrieve Plus videos cost $2,000 each or $3,000 for the two-video set.

Pansophic, 709 Enterprise Drive, Oak Brook, Ill. 60521.

ing to conferencing to least-cost routing. You can even get fully featured voice-messaging. All with the one touch feature access you'd expect from the industry's most advanced and complete line of digital phones.

Centrex has another little bugaboo. You can never own one. But you can own a ROLM system even if your capital's earmarked. (Just ask about our affordable leasing program.)

ROLM has 150 nationwide service centers that'll show you how to grow from 16 phones to more than 20,000 phones, terminals and computers. Nimbly, painlessly, cost-effectively.

Don't be the last one on your block to cling to your Centrex.

Call ROLM instead. We're the folks who taught phones and computers and people to work together on one system. Today, next year and into the next century.

Buy now. You won't pay later.

ROLM
an IBM company

800-538-8154. (In Alaska, California and Hawaii, call 408-986-3025.)

If you don't mind being insecure about data security, ACF2 might make sense.

ACF2 data security. Sense or nonsense?

With data security, you can't afford a #2 system. A second-best solution that demands a lot of time, talent and costly attention to operate and maintain.

TOP SECRET

That's why TOP SECRET software is the #1 choice of more and more busy security decision-makers.

With TOP SECRET, you get the world's best MVS data security. Without the hassles.

Now, we'll tell you why.

You're more secure with TOP SECRET. We made TOP SECRET a no-nonsense security program right from the beginning. Everything you need for total MVS protection is part of the product. And it only improves with age.

At the core is a unique user-to-resource architecture that controls access to your facilities, resources and data at the people level. Where security really takes place.

With TOP SECRET, security never stops you from keeping up with processing demands. In short, we make sure the good guys get to authorized data quickly. And the bad guys get caught right away.

No fault default. From the moment you put in ACF2, everything is off limits. To everybody.

ACF2 gives you a closed system from the word go. Whether you're ready for that level of security or not.

TOP SECRET gives you default protection, too. But TOP SECRET lets you choose the best time to introduce it.

With TOP SECRET you efficiently secure resources and users in logical sequence. Not by rigid product demands.

And that's our secret: we make it easy to fit the world's best data security into the busiest dp schedules.

Fast, flexible security. For the way you do business. Whether you have 1000 branch offices in fifty states or hundreds of users in one location, TOP SECRET lets you custom-tailor security for a perfect fit to your organization.

ACF2 sets you up with centralized administration. And it's hard to change.

TOP SECRET software's flexible decentralized administration lets you delegate all or part of the security function where it makes the most sense for you. Within a department. At the divisional level. Or with only one security administrator, down from the top, if that fills the bill.

Security. With no strings attached. Because ACF2 requires modifications to the operating system, it ties up your technical staff. First they have to install the product. Then back it out and reinstall it every time there are mods. Whether IBM PUT-tapes or your own OS changes.

Since ACF2 doesn't comfortably support phased implementation, your technical team has to remain on call to phase in every new stage of security.

Plus you need them to write essential security requirements (like a password history!) that should be part of the product.

The fact is ACF2 chains your systems people to security maintenance.

With TOP SECRET, you may never need them at all.

Except for the hour or less it takes to install, TOP SECRET frees your systems people for other important jobs. You get easy maintenance without paying extra manpower premiums.

TOP SECRET. The sensible solution. So why do people put up with the inconvenience, added costs and high anxiety of ACF2?

Well, you're right. It makes no sense.

To find out why so many satisfied TOP SECRET users agree, call 1-800-CGA-TEAM (in New Jersey, (201) 946-8900) for more information. Or set up a TOP SECRET trial in your own shop. Free for 30 days. And make sense out of security yourself.

Micro-mainframe concept striving for MIS acceptance

SOFTLINE
Thomas O'Flaherty

To paraphrase Mark Twain: Everyone talks about micro-mainframe links, but no one does anything about them. Or so it must seem to the dozens of link vendors that have seen their wares picked over but infrequently bought.

The frustrating thing is that so many people, both MIS professionals and end users, can see that micro-mainframe linkage would be the answer to many of their problems. A link cannot only get data to a user but also put the processing of that data into the end user's hands. More thoughtful MIS managers understand that pushing data and processing deeper into the organization will inevitably lead to cleaner data and more reliable processing.

Many observers have predicted a rapid increase in the use of micro-mainframe links. Instead, the growth in micro-mainframe applications has been relatively slow. But the term micro-mainframe link is already in danger of joining management information systems, distributed data processing, decision support systems and others that once promised to revolutionize data processing but instead were ignored or became objects of derision.

Actually, the micro-mainframe concept suffers the opposite problem from the fads listed above. Where they were heavy on concepts and light on practical choices, the micro-mainframe area presents a plethora of choices and, if anything, not enough conceptual glue to bind them together.

If, for example, micro-mainframe choices were limited only to data downloading, then, ironically, there would almost certainly be much more of it. The demand for data downloading is certainly high on most users' initial wish lists.

Downloading, if not too ambitious, can be accomplished relatively easily and can offer real benefits, reducing rekeying, combining data from different sources, ensuring better quality data and so on. There are many products available that can perform downloading reasonably well.

But even within downloading there are two issues that have slowed acceptance. The first is that the very number of products that can serve people's needs hinders and may even immobilize the decision process. In addition, selectors assume, usually incorrectly, that they are making a long-term decision with many implications, similar to choosing a data base management system.

Intertwined with the selection problem is that of overspecifying. As users begin to understand what they might want in a link, they begin to want more. Awkward, current-generation downloading is not enough for them. What they really want is the type of interactive downloading that would result from cruising through the mainframe data base and selecting/joining whatever data they need.

Obviously, such tools do not exist yet. Even if they did, the complexity of real-world mainframe DBMS, both from a technical and conceptual standpoint, would make the exercise far beyond the capabilities of most users, even those who fancy themselves computer literate.

MIS staff members sometimes contribute to the overspecifying by listening too closely to what users think they want — and users have become much more assertive as a result of real and imagined successes in using micros.

Typical MIS mistake

Ironically, the typical MIS error is to try to plan too far into the future. Authoritative checklists recommend such micro-mainframe capabilities as mainframe-type error checking and access security, multivendor environment compatibility and operational efficiency.

These capabilities are excellent. However, in most cases they are examples of the best being the enemy of the good. Far too little is known about the ultimate uses of micro-mainframe links to be able to say what the characteristics of any link should be within a particular organizational setting.

At the same time, one should not downplay the real problems that exist. Those organizations that have ventured beyond simple data downloading have begun to see that the real opportunities in the micro-mainframe environment are balanced by equally real problems.

What are the major problems? In strictly technical terms, users will not see seamless, distributed data base products for a very long time. Multiple data base management will be a painful experience where micro data bases are allowed to be both independent and meaningful.

As mentioned above, both data integrity and data security are in-

DOS/VSE
WITHOUT UCCEL SYSTEM MANAGER PRODUCTS
IS WORKING WITHOUT A NET.

From page 47

UK users converting from DOS/VSE to MVS

Nothing with the equivalent credibility of RACF exists in the DOS market, Kerford-Byrnes said. Also, few, if any, security products in the DOS market offer compatibility with MVS. "People aren't going to get hooked into a security system in the knowledge that they'll very likely have to abandon it when they go to MVS. So they decide to go straight to MVS."

Different auditors have different concerns. "Some don't like application programmers being able to change the little message on your credit card statement. Other companies don't like anybody being able to dial in, type in a password and get on-line to somebody's system. Others don't like the idea of source code even being read by anybody but the person who wrote it or the DP manager," according to Kerford-Byrnes.

Conversion outfits like MKB Technical Services are in demand because they have experience in DOS-to-MVS conversions, something few users can boast. "We've made nearly all the mistakes you can make. We know the things we must not do. In a DOS-to-MVS conversion, there is a list of things you must not do when setting up the MVS side of things. It's only once you've done those things you realise they're wrong. By that time, it's too late to go back," Kerford-Byrnes said.

For those shops that try conversion on their own, "It can stop application development work dead for anywhere up to a year," Kerford-Byrnes said. Even for those that hire a service, there are risks. "There is always going to be some sort of interruption of development work, because somebody's got to check it all out. Secondly, you have to provide education in the new technology."

Advance planning consumes one-third of an MKB conversion project's time. Planning encompasses subroutines, source code, sequence of job execution, an inventory of every program to be converted, setting of standards and procedures and a target completion date schedule.

Training users in an unfamiliar operating system is a major task of a good conversion service, Kerford-Byrnes maintained. "We provide education services to train the users in the standards and techniques we've derived for that shop," he said. "We teach them to be self-sufficient." In conjunction with the conversion team, the users write the JCL and procedures needed to operate the MVS system. The system is brought up live by the users under the guidance of the conversion team, the consultant said.

While applications and operations personnel in a DOS shop may know how to run the company payroll program blindfolded, they are not so confident with a new system. "If you take a turnkey conversion service and they get MVS up and running for you, and three weeks later you find you've got to rerun all three weeks work because there was a user data error, how do you do it? All you have is the working payroll system and the JCL to execute it. You've still got to learn how to run the converted system. And that is no small task."

The hardest part of the conversion process is taking applications that work in the DOS environment and making them work in the very different MVS environment. "You need to spend an awful lot of money converting something that works into something that works. Probably with a great deal of disruption, aggravation, hassles and bad feelings. With no immediate tangible benefit. That's a pitfall," Kerford-Byrnes said.

Despite the risks, the sooner users make the conversion the better, in Kerford-Byrnes' view. "The longer users leave it, the harder it will be, because they'll have more work to convert." Whether a user goes to MVS or directly to MVS/XA from DOS depends on the shop. "There's no point in spending all that money [for XA] if you don't need it," he said.

From page 54

Micro-mainframe links look for MIS acceptance

creasingly important issues when trying to combine the micro and mainframe worlds. Micros hooked to mainframes often do not observe even the most elementary rules of terminal security. The problem is, though, that micro-mainframe security must go beyond mere terminal security, if the micro-mainframe benefits are to be obtained. There are answers, but they are complex and not always complete.

The most critical technical problem is the one that is often not even perceived as an issue: How do you build micro-mainframe systems? Our slowly bought experience in designing and implementing traditional host systems has to be at least partially relearned in a micro-mainframe environment.

Basic questions have to be asked, including "How do you segment data? How do you segment processing? Who, or rather what, maintains control?"

Some mainframe-oriented design and implementation methodologies will not be able to be retrofitted at all. Others will need extensive changes in both concept and detail.

The micro-mainframe concept is real, but it will not overtake the world quickly, unlike the way that micros themselves did. Rather, the precedent is probably closer to that of DBMS, which took five to 10 years to become established even after there were viable products and concepts available.

Micro-mainframe experience can only be obtained the way that most experience is obtained, slowly and sometimes painfully.

FUTURE-CALC
THE WORLD'S MOST POWERFUL SPREADSHEET

SOFTWARE
- Runs on IBM Mainframes under CICS and TSO

SPEED
- Runs up to 100 Times Faster Than Other Mainframe Spreadsheets

FILE ACCESS
- Interactively accesses and updates existing files and data bases — Performs automatic data conversions
- Can access data from your existing accounting files

3-DIMENSIONAL MODELING
- Provides fully modular, 3-dimensional modeling
- Spreadsheet models can contain up to 256 sheets
- Any sheet can have up to 5500 rows or 256 columns
- Simultaneous system-wide sharing of spreadsheets, models and formulas
- Any sheet can be used simultaneously in many models
- Any set of formulas can be used with any sheet

CONSOLIDATION
- Consolidate up to 256 sheets into a summary with one command
- Consolidate unlike sheets

USER DEFINED FORMULAS
- Users can define their own functions and procedures which are available system wide

POWERFUL FEATURES
- Many spreadsheets can be "PAINTED" without entering formulas
- Cells, rows and columns can be addressed using meaningful names such as SALES, COSTS, TOTALS
- Many different table lookups including 3-dimensional lookup
- Sort simultaneously on any number of keys
- Perform arithmetic using calendar dates
- Exclude or hold any row or column
- Dynamically assign formats and attributes under procedural control
- Provides data entry and ad-hoc query capabilities

SECURITY
- Control Security at the spreadsheet, user or file level
- Security is easily implemented even for classes of users

ONLINE HELP
- Comprehensive explanation of commands and error messages
- Text Editor provided to allow user-defined documentation

MARKETING
- FUTURE-CALC is being purchased by many companies who previously acquired other mainframe spreadsheet software because FUTURE-CALC:
  - Runs much faster and uses 80% less file space
  - Is easier to use and has much more power
  - Provides a much better method for file access

Cobol 85 plods along on its way to acceptance

and culture. But changes to a programming language must be adopted in a more formal fashion to ensure that they are consistently applied. That is especially true in Cobol's case because it is the premier business programming language and must mean one thing to all people if it is to have any value at all.

Thus it is ironic that the very process by which Cobol is upgraded and standardized is in danger of killing the language.

Perilously close to death

In the time since 26-year-old Cobol was born, the world of information processing has been completely reshaped. It is to the language's credit that it has survived this long. But during the period since 1978, when the Cobol 85 drafting process actually began, Cobol's image took a beating, and the language came perilously close to dying. Some said Cobol contracted an illness — obsolescence — from which it may never recover. Even an approved standard may not be medicine strong enough to save Cobol, they said.

Cobol has two things going for it of which the so-called fourth-generation languages, which have picked up so much ground in the last few years, cannot boast. One is the gargantuan inventory of existing Cobol programs, which provides an incentive for shops to stick with Cobol. The other is the fact that Cobol is an industry standard, and no fourth-generation language has emerged yet to take on that mantle.

But even the most zealous Cobol advocate would readily admit those qualities alone will do little to prolong Cobol's useful life. The only way it will survive is if new features and functions — that address the problems of productivity and maintenance — are added in a timely fashion. The drafters of Cobol 85 were well aware of that, and they took pains to implement a rich variety of features that make Cobol stronger.

However, many of the features embodied in Cobol 85 were envisioned years ago, and, had they been fully implemented in standard compilers, users could have enjoyed the benefits they offered much sooner. The overlong gap also prompted vendors to implement selected features of Cobol 85 in their compilers before the entire standard was approved. That posed a problem for users, eager to take advantage of the new features, who had to choose among different compilers, each offering selected pieces of Cobol 85.

The standards-making bodies have taken steps to refine the draft approval process, and credit should be given to those Ansi and ISO members who pushed for reform. Essentially, Cobol will now be given new features — addenda — every two or three years, and the language will be fully overhauled every decade.

It is imperative that the organizations make those reforms work. And it is important that the groups continue to implement new procedures for improving Cobol — and other widely used languages — in a swifter fashion. Age alone is no reason for Cobol to grow feeble and die. Those who rely on it must better address the task of ensuring its continuing health.

Notes from the software industry front

ment Systems, Inc. (AMS) of Arlington, Va., will jointly market the AMS Computer Assisted Collection System to banks, financial houses and telecommunications companies as a result of an agreement penned recently by the two firms. AMS will license the software, which supports the collection of delinquent credit accounts, directly to Tandem Nonstop processor users as part of the Tandem Alliance.

■

In artificial intelligence happenings, **Inference Corp.**, Los Angeles, and **SRI International, Inc.** of Menlo Park, Calif., entered into an agreement through which Inference will train SRI knowledge engineers in the use of its Automated Reasoning Tool for expert systems development. SRI personnel will then provide consulting services for both Inference and SRI customers to aid in the building of expert systems.

■

Also in the AI world, **Teknowledge Federal Systems, Inc.** of Thousand Oaks, Calif., and **Computer Thought Corp.** of Plano, Texas, have indicated that negotiations are under way on a deal that would have Computer Thought convert Teknowledge's S.1 Version 2 knowledge system development tool to Ada. A Teknowledge representative said the conversion would allow the company's aerospace and defense customers to comply with the U.S. Department of Defense's Ada requirements.

■

Palo Alto, Calif.-based **Quintus Computer Systems, Inc.**, developer of a Prolog compiler and other programming tools, unveiled agreements with **Digital Equipment Corp.**, **Xerox Corp.**, **C. Itoh Data Systems** and **Apollo Computer, Inc.** DEC will market, sell and distribute Quintus Prolog for its VAX systems; Quintus will deliver a version of the compiler for the Xerox 1100 series of artificial intelligence workstations; Apollo will jointly market the Prolog tool for its Domain workstations; and C. Itoh will distribute Quintus Prolog for the **Sun Microsystems, Inc.** Sun-2 workstation in Japan.

■

Primavera Systems, Inc., Bala Cynwyd, Pa., and **Control Data Corp.'s Cybernet Services Group** have entered into an agreement that makes Primavera's Project Planner and Primavision graphics software a key component in Control Data's new Cybernet Express Project Manager engineering project management software.

■

Quadratron Systems, Inc. of Sherman Oaks, Calif., will supply six of its software products for **Burroughs Corp.**, Detroit, B20/B25 and XE processors. The packages include Q-Office+, Q-File, Q-Plan, Q-Phact data base, Q-Chart and Q-Zed source code script editor. Burroughs will support the software with its version of AT&T Unix System V, which is scheduled to be released later this year.

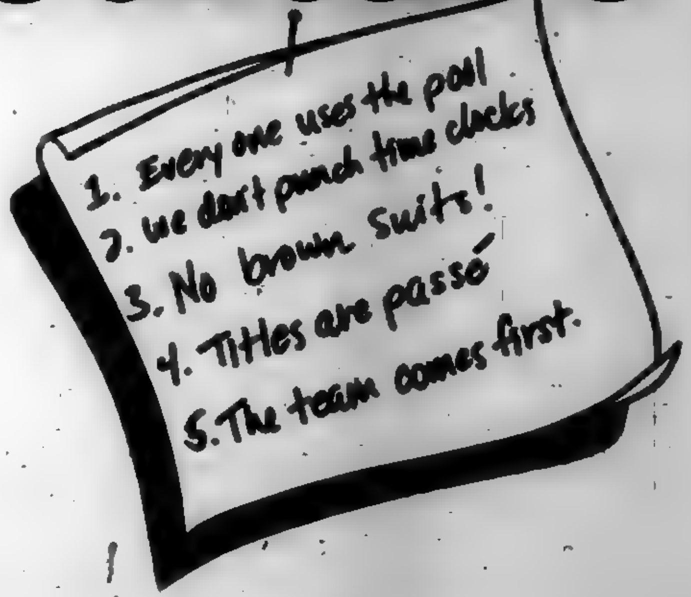
Harnessing Corporate Culture

By Jane Linder

The unwritten rules of corporate culture can confound the neophyte and the veteran alike. But once alerted, information systems professionals can put culture to work for them.



A large, successful manufacturing firm was known for its decentralized decision making. Autonomous operating units were structured as profit centers with full line and staff functions.

In this environment, the vice-president of manufacturing asked his information systems manager to begin installing common systems throughout the plants. The idea made sense to the manager. He began to staff projects and move toward installation. After 12 months of conflict, arguments and all-out confrontations, the manager conceded defeat and left the company.

One could blame his political skills for the debacle; the truth is that he ran afoul of the company culture. In this firm, the operating managers held clear, indelible authority for results and the means of achieving them. There was no value on cooperation; competition raged between groups.

The vice-president who suggested the changes had neglected to inform the powerful plant managers that they were to accept common systems. Instead, he asked the information systems manager to brave those waters on his own. Without visible support from the top, the manager had embarked on a countercultural effort to implement cooperation and some centralized decision making. From the outset, his chances for success were almost nil.

Corporate culture profoundly affects our ability to succeed. We can have a major influence on it.

Those who define culture speak of long-standing unwritten rules, matter-of-fact prejudices, customs for relating to colleagues or simply "the way we do things around here." Cultural anthropologists describe culture as a mechanism for adapting to the environment. In other words, culture is a set of behavioral prescriptions that help employees cope with the problems and decisions that face them daily.

These behavioral prescriptions represent, in codified form, the values of the company. Within a company, then, culture is an important mechanism for encouraging the "right" behavior — actions that uphold what the company stands for and help the company succeed on its own terms.

Culture influences both the systems we build and how we approach them. In addition, by building the "right" kinds of systems and using the "right" approaches, information systems can influence corporate culture.

Cultures vary tremendously, but five general dimensions describe common attributes of business culture (Figure 1, ID/2). These represent preferred behaviors: what is appropriate and "smart" behavior within the organization and what is not. Although these attributes are clearly simplifications of complex behavior patterns, they are useful for analysis.

Helping the company succeed

Let's assume that we are trying to support a stable, strategically valuable, existing culture. For each cultural dimension, we can identify the kinds of systems and information systems approaches that are culturally consistent.

There are three reasons why a culturally consistent approach is important:

- Well-defined cultures can help companies succeed. A strongly felt company culture encourages strategically correct behavior far more effectively than a network of control-oriented procedures. The culture's content — shared values, beliefs, implicit motivators — is a powerful, positive force in implementing company programs and guides behavior toward what is best for the firm. All things considered, it behooves information systems professionals to contribute to building a strong culture in whatever ways they can.
- On a more pragmatic level, information systems professionals succeed more often when they understand the company culture. Using culturally consistent systems and approaches is simply less risky. When the system fits the way business is conducted, end users feel comfortable and are

---

Jane Linder is president of Linder & Associates, Inc. The Lexington, Mass., consulting firm works with senior MIS managers doing organizational planning.

satisfied customers. By carefully considering the firm's culture, MIS can make some predictions about what projects are most likely to succeed.

■ Very few of the tools for influencing culture are so easily engineered and implemented as information systems. Any information systems effort to influence culture should be part of the comprehensive, officially stated program.

Non-MIS tools such as compensation policy, hiring programs, supervisor training and management education are extremely influential to corporate culture. But their implementation is often longer term, so information systems can have a much more specific, much more immediate impact on behavior.

Spotting conservatives

So-called entrepreneurial firms encourage risk taking and are informal, aggressive, even impulsive. Above all, they value results. Conservative companies tend to be exactly the opposite. They are typically risk-averse, formal organizations with deliberate decision-making policies. The people in them adhere to procedures — they focus more on how something is done than on what is actually achieved.

Xerox Corp. used to be considered entrepreneurial but now might be seen as conservative. Most would agree that AT&T is trying to change from conservative to entrepreneurial. The stereotypical big company is conservative; the small one, entrepreneurial.

The entrepreneurial culture can be an exciting environment for information systems. Entrepreneurs are comfortable with state-of-the-art, unproven technologies. Their willingness to experiment can extend to challenging, high-payoff information systems projects.

Armed with a prototype approach, loose project definition and flexible tools, a staff of business analysts and technical wizards can match the action orientation that this culture values. Personnel should be dedicated to particular user areas to maximize service. In addition, a strong data administration function is vital to provide some glue between user-directed projects. (It need not, however, report through the information systems organization.)

The prototype methodology does not mean the entrepreneurial approach condones abandoning information systems planning. What is required is a top-down systems and telecommunications architecture — a rough blueprint for major data and processing blocks and the flows among them. Specific systems can be planned bottom-up with their respective users.

One problem that the MIS department faces in such a company is prudent resource management. One large entrepreneurial firm counted 1,100 MIS professionals in its ranks, compared with 250 in a conservative company with the same sales volume. Also, because of the interest in new technology, maintenance programmers and operations personnel tend to be accorded even less stature than usual.

A final difficulty for information systems in an entrepreneurial firm is enabling sufficient data access. The type of ad hoc systems that this culture tends to foster are normally data intensive. Add the fact that they are in constant flux and that information systems have great difficulty providing certified, available data.

In a conservative culture, on the other hand, proceduralized systems and proven technologies are preferable. Systems should be developed through a traditional life-cycle methodology using Cobol for efficiency.

The premier planning dimension in conservative companies is financial. Projects are selected based on tangible savings and return on investment, consistent with an overall spending guideline. All project and recurring expenses are charged back to the user to complete

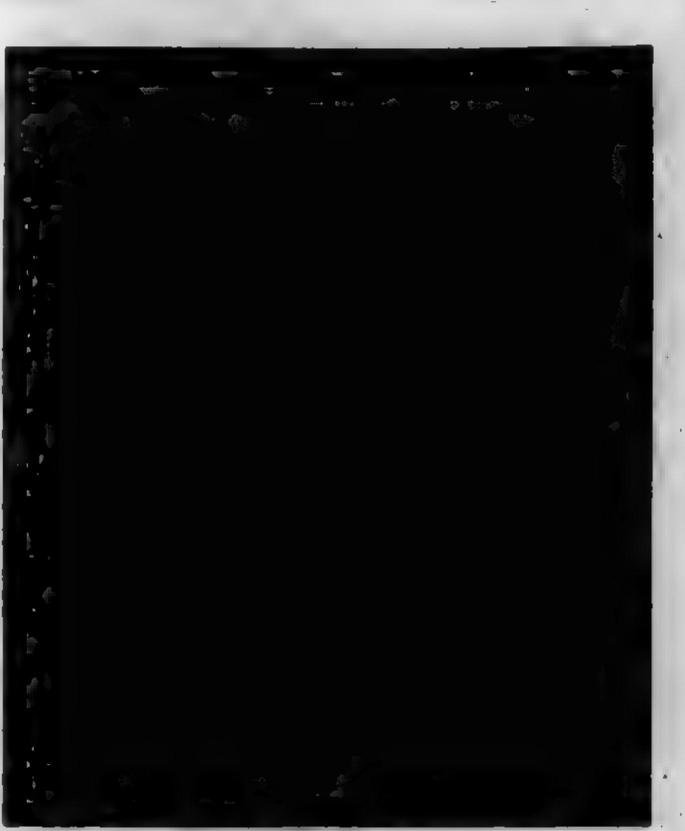


Figure 1

the picture of financial accountability. A monthly user steering committee sets priorities and monitors resource allocation.

Information systems development personnel in a conservative firm should be organizationally pooled for maximum productivity. Some may argue about whether pooling achieves greater productivity, but the important point from a cultural perspective is that business conservatives perceive that it does.

Maintenance personnel, on the other hand, should be dedicated to particular systems for operating stability. Strong, solid technicians should dominate the staff. The business savvy needed by individuals in the entrepreneurial setting is unnecessary here — the requirements are understood, and the pace of change is slow. Data center and telecommunications operations must be superb. These should be managed as factories using all the efficiencies made possible by a known environment.

Lines of authority

MIS issues in this culture include enforcing technology followership. The upshot may be a chronic exodus of the most capable people to more exciting shops. Occasionally, a "soft" benefit project will be important for the company. MIS personnel must find ways to identify these and sell them to top management.

In one conservative bank, analysts simply "jury-rigged" the cost/benefit projections to favor a telecommunications project. Senior management, comfortable with the financial analysis, approved a project that turned out to be unexpectedly important for the bank's competitive position.

Companies with clear lines of authority place decision making in the hands of a specific person. They align authority with responsibility and reward people for "stopping the buck."

Opposite these companies stand firms with ambiguous authority, firms that need to build support for ideas and action plans before they proceed. They lean toward matrix management structures where authority and responsibility are often shared or out of balance.

In many cases, an ambiguous authority structure is a veneer over highly centralized decision making. The military is an example of an organization with clear lines of authority. Texas Instruments, Inc.'s pre-1983 matrix management structure — since changed — institutionalized ambiguity.

When lines of authority are clearly drawn, information technology can be developed accordingly. Departmental functions can be automated under departmental aegis; the divisional data center can handle divisional decisions. Almost the only technology that cannot be distributed easily is corporate telecommunications.

The distributed architecture of hardware and software leads also to a hierarchy of data access in these firms. Each level of management receives the data needed to make the decisions for which it is responsible. Planning must be bottom-up, and MIS can play an important consulting role to ensure a coherent finished plan. Business unit managers should be allocated specific personnel and have ultimate responsibility for project progress and spending.

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro [illegible]

DP TRAINING

The Chubb Institute has been providing quality DP training for 15 years. Our OS/VS training is skills oriented and learning is reinforced by in-class drills so students are immediately productive at the end of each course.

Registration Code	Course	Dates	
TCWS	TSO/ISPF	Oct 21-23	NJ
JCWS	Job Control Language	Oct 7-9	NYC
VCWS	VSAM in COBOL	Oct 28-30	NJ
BCWS	Assembler	Oct 7-18	NJ
CCWS	CICS (Command Level)	Oct 7-11	NJ
NCWS	Data Processing for the Non-DP Manager	Nov. 20-22	NJ

In addition to these courses, our applications training curriculum includes ANS COBOL, Assembler Language, VSAM in COBOL, and CICS Command Level Coding.

The PC curriculum provides separate training for DP professionals and the general business audience.

10% discount for three or more attendees in the same course.

The main stumbling block in project methodology is access to the real decision maker. As the anecdote in the beginning of this article indicates, the MIS manager failed partly because he took his orders from the vice-president. In that case, the plant manager turned out to be the real decision maker.

In this highly delegated environment, however, some important central functions may languish. The firm must maintain a central technology scanning or research and development function to stay abreast of changes in the field. Once such a function is established, a corollary problem is disseminating its results. One large, decentralized chemical company staffs its central high technology group with people who have both technical and strong consulting skills. It is their job to sell innovations to their business constituencies.

In an environment with ambiguous lines of authority and responsibility, "unowned," shared systems and large, tightly coupled systems fit well. Policies that substitute for individual operating decisions can be embedded throughout such systems. When these are managed by cross-unit steering committees, no single user has the authority to mandate substantial changes.

Because no one is really certain who will be making what decisions, users at all levels must have access to the most detailed data. MIS project methodology must deal with the resulting confusion. Consensus time and detailed walk-throughs should be built into all but the smallest projects.

The same rules apply to whatever MIS planning is required. Planning is a consensual process, with MIS taking the lead to make things happen. In fact, MIS will find itself the agent of change on almost any front. This cultural bias should be reflected in MIS staff selection — strong "sales" personalities — and represents a structural risk in the ambiguous environment. A commitment to internal communications among a lean MIS senior staff substitutes for clear, articulated demand from the users.

Cooperative vs. competitive

Cooperative companies emphasize teamwork. People build strong relationships across organizational units and strata. Mentors abound, as senior people nurture and cultivate their subordinates to succeed them. Competitive firms place great importance on individual achievement. They are populated with "stars" who close big sales or produce hit shows. Japanese firms epitomize the cooperative culture. The stereotypical large law office or consulting firm is competitive.

Figure 2

"Owned," shared systems are consistent with a cooperative culture. These are systems that are shared among several operating units. Each has the freedom to go elsewhere, but they choose to share. To the extent that business conditions enable these users to cooperate, the versions of the system remain identical.

A cooperative culture is also fertile ground for systems that build corporate data — where one group enters data so that another can add to it or use it. Also appropriate here are systems that enable easy access not only to cross-unit data but to ways of analyzing it, such as template libraries. For ownership, systems must be decoupled. But for the

best access to data, systems must be integrated. The architecture in a cooperative environment, then, is one of buffered integration and loose linkages.

Project methodology must be vitally concerned with shareability. Strict technology standards will ensure that users throughout the company can share software and data. In a similar vein, the MIS planning process must include a coordination step after the usual bottom-up effort. Personnel can be pooled, shared or moved across functions easily.

Implementing an architecture of shareable data and systems is not trivial. Strong central data administration, telecommunications and standards functions are critical. These groups can devote considerable energy to enabling broad access to certified data and to pacing the introduction of new technologies.

The competitive culture's separatism skews the MIS architecture toward single-owner sites with private data bases and strong internal security measures. Departmental computing prevails here. One large, competitive-culture firm had a separate data center for each business function — manufacturing, marketing and so on — and countless stand-alone minicomputer sites with Rube Goldberg-type telecommunications links between them.

The project methodology in a competitive culture must address security concerns in far more depth than other cultures require. In addition, existing systems should be periodically audited to ensure that they are operationally sound.

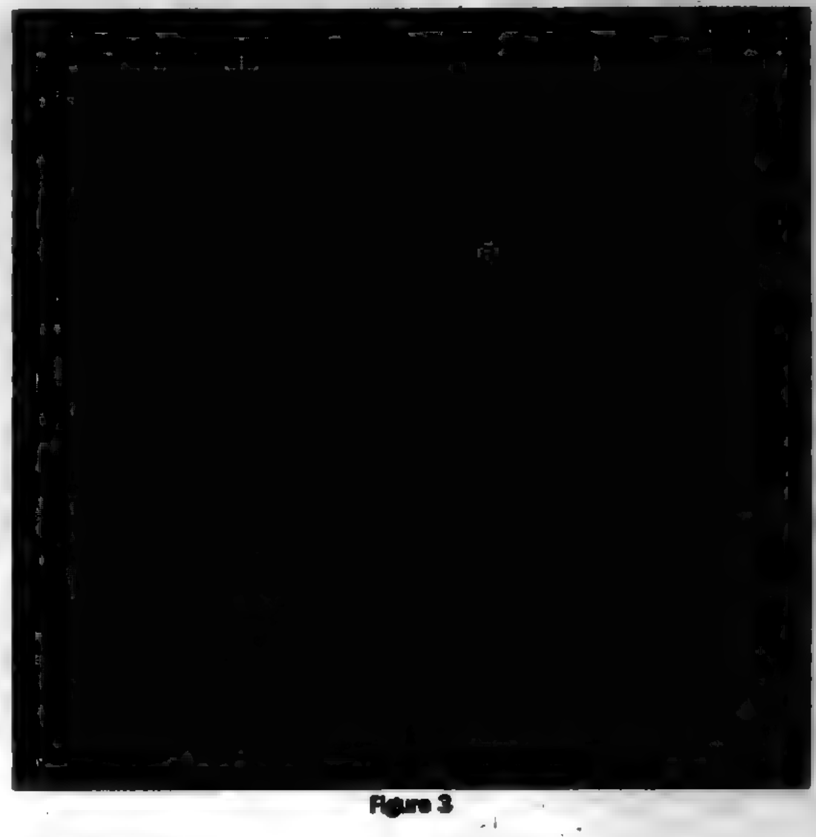

Figure 3

To fit in this culture, information systems resources are thoroughly decentralized, with solid-line reporting and strongest loyalty to specific users. As MIS adopts the competitive "we-they" attitude, movement among information systems groups is difficult, and joint projects are virtually impossible.

Whatever overall MIS planning and resource allocation is done is the province of a single senior executive. In keeping with the culture, unit plans are approved or denied at this level, almost unilaterally. MIS shoulders the burden of maintaining its service image when business unit projects are cut.

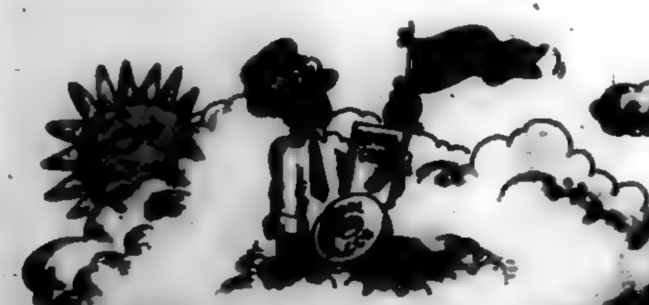
The issues this culture raises for MIS are serious. Central functions such as standards, data administration, planning, R&D and telecommunications risk becoming empty and ineffective.

Led vs. managed

When a company is led, it has clear, long-term goals to pursue. It had a vision of the future; it is creative; and it cares about the "big picture." A firm that is managed focuses on financial objectives that are often shorter in term. Its statement of values depends on the problem at hand, yet it is a hotbed of the latest analytical techniques. Lee Iacocca's Chrysler Corp., despite its attention to financial matters, is led. IBM and Hewlett-Packard Co. are led. Colgate-Palmolive Co.'s ill-conceived "shopping spree" of the '70s reflects the fact that it was managed.

The interesting thing about companies that are led is that they know where they are headed and what is important to them in getting there. Armed with this knowledge, MIS can build systems that provide specific information support. This is what corporate data modeling is all about. Computer systems can deliver strategically selected information to decision makers at all levels. This stands in stark contrast to a leaderless firm, which sits with a pool of detailed data, unable to decide which elements are important and which are not.

Organizationally, the strategically defined data bases demand a robust



Only Softool's CCC™ Offers True Automatic Configuration Management!

That's why more and more major users are selecting Change and Configuration Control (CCC) ...there's no competition!

CCC Automates: management of changes and configurations • control over who makes what type of changes and where • tracking of trouble reports • reconstruction of previous versions • document control • management reports • archiving • and much more.

CCC is Interactive and Friendly. It supports all programming languages, and comes with on-line tutorials.

CCC is a Proven Product. Over 1,500 Softool products are installed worldwide. CCC is supported on these computers: Apollo • DCL Ustation • DEC VAX • DG MV • Gould S.E.L. • Honeywell 6000 series (level 66, DPS 8/xx) • HP 3000 • IBM 370, 30XX & 43XX • Sun Microsystems.

CCC is the Solution for the 80's. It resolves the most important problem facing the software industry today: configuration management. CCC offers true configuration control...where all components of a given release can be managed as a unit.

There is more. CCC is a stand-alone component of Softool. An integrated Programming Environment (PE™) is also available.

Call today for more details or a hands-on demonstration.

Reach over 65,000 Italian computer professionals.

Advertise in CW Communications' Italian publications and sell your products directly to the fourth largest computer market in Western Europe. According to International Data Corporation (IDC), the world's leading information industry research firm, Italy's total DP expenditures for 1983 were $6.8 billion. IDC forecasts that DP expenditures will nearly triple by 1989 to $18.1 billion.

CW Communications has two publications covering the Italian market: *Computerworld Italia and PC Magazine.*

Every week, 35,000 MIS/DP executives read *Computerworld Italia.* Modeled after *Computerworld*, its sister publication in the United States, *Computerworld Italia* covers the latest developments in hardware, software, terminals and supply products.

And every month, 30,000 IBM PC users and potential buyers read *PC Magazine*. The editorial focuses on a wide range of topics including software, hardware, in-depth articles and programs.

CW International Marketing Services makes advertising your products in Italy, and around the world, easy. We have over 30 publications in more than 25 countries. For more information on our wide range of services, call Diana La Muraglia, General Manager, CW International Marketing Services, at (617) 879-0700 or (800) 343-6474. “Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect.”

EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is “. . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC.”

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, “. . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment.”

The results? “*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld’s* editorial calendar where appropriate.”

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing, Enertronics Research, Inc., St. Louis, Missouri.

data administration function. Because the driving force is company direction, MIS staff should include business analysts to make the connection between corporate strategy and their daily activities. Among the MIS executive's most important roles is gaining access to strategic circles in the company, so it is imperative that the MIS executive be a leader in his or her own right.

Information requirements in managed companies change often because there is no substantive long-term direction. As a result, flat, detailed data bases must be maintained so virtually any question can be answered.

Managed firms are often concerned with their MIS spending as a percent of sales. The irony is that their short-term, financial objectives dictate expensive, detailed, central information sources. A short-term view — usually no more than one budget cycle — drives stopgap projects with shortcut methodologies.

No energy is "wasted" on standards and documentation; the focus rests with on-time, in-budget delivery of today's top-priority projects. This is an exceptionally difficult goal to meet because the priorities change with the caprice of daily business problems.

To succeed in this environment, MIS must maintain a fluid organization and follow the shifting priorities. In addition, MIS staff members should plan to complete all projects within a single budget cycle. Longer term efforts are simply outside the attention span of the "managed" business.

The main problem MIS experiences in a managed culture is keeping personnel. Turnover often exceeds 40% per year. Of course, this undermines MIS credibility because undocumented, nonstandard systems are passed from one set of inexperienced hands to another.

Emphasizing ethics

Ethical companies distinguish outwardly between right and wrong. Their policies emphasize honesty and fair play. An ethical firm would never condone an employee bribing foreign officials, even if it were the foreigners' accepted way of doing business. So-called amoral cultures are closer to Machiavellian ones. Success is deemed good, regardless of how it is brought about.

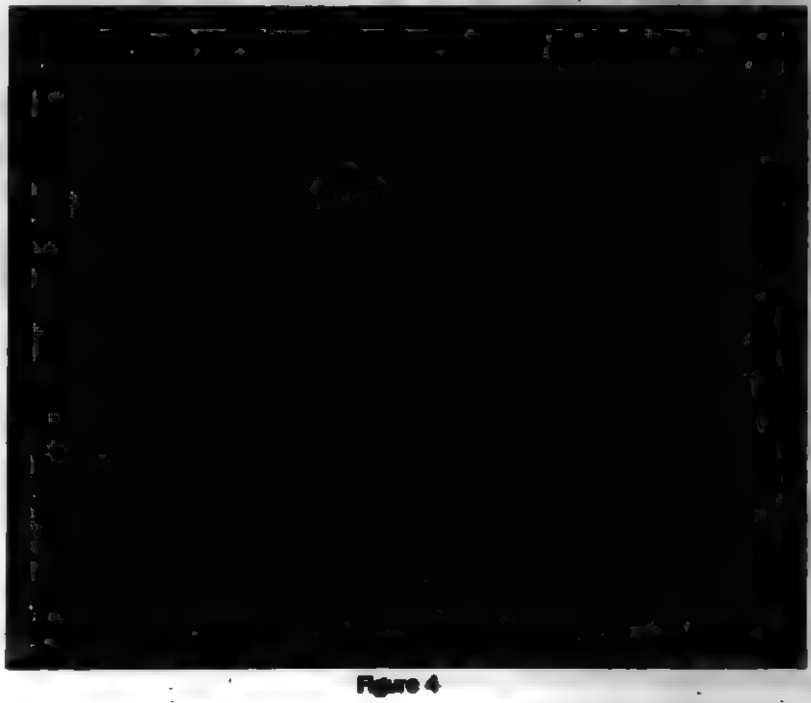

Figure 4

Ethics start with people, but computer systems can be supportive, influencing high standards of behavior with internal checks and balances. This form of "policing" is actually much more palatable than audits and supervisory reviews. The more traditional approaches establish an atmosphere of defensiveness; people are seen as basically untrustworthy. Computer controls are automatic, quiet, depoliticized inspections.

Just as systems can support ethical behavior, an absence of computer controls is consistent with amorality. In one large high-tech firm, there was no automated (or even manual) system to ensure that what was shipped was also billed. There was no way to identify what capital equipment each department owned.

In that firm, company property commonly found its way into employees' homes. Sales representatives "loaned" units to favored customers. It is interesting to note that senior management turned to tighter computer controls for a solution.

In any analysis of culture, we must understand that a company is not homogeneous. Each division, sometimes each department, has a subculture of its own, even though the corporate culture is strong. MIS managers must take these into account as they plan culturally consistent activities throughout their realms. Many failures can be attributed to MIS' having projected the cultural bias of its parent organization onto the other units it supports.

Permanently on hold

ABC Co., a fictional subsidiary of a Fortune 100 manufacturing firm, was active in a variety of business sectors. It held a large market share in hospital supplies and had a strong franchise in several industrial lines. Its widely distributed consumer products unfortunately appealed to a steadily declining segment of the population.

Its sales had been flat for several years, and its profits were stable but softening. Some recent acquisitions, particularly in the hospital supplies area, brought in new products that ABC hoped would fuel future sales growth.

The company had a long-standing ethical and cooperative culture. Its lines of authority, however, were so ambiguous that it could rarely put together an organization chart. ABC was extremely conservative — risk averse and process- rather than action-oriented. Its managers' days were filled with meetings in which very little was accomplished.

In addition, ABC was effectively managed by the one-year financial goals placed upon it by its parent company. ABC had no spelled-out strategy or long-range plan; it had no leadership.

One of ABC's largest rivals was using information systems to strategic advantage by offering terminals to purchasing agents who placed orders directly into the firm's order processing system. ABC's MIS people worked with its marketing sponsor to outline a system that would allow ABC to catch up.

Together, they envisioned a fully functional system that would be owned by marketing. Both MIS and the marketing sponsor were justifiably excited by the challenge and opportunity this project presented.

Over the course of the project, there was some personnel movement. The manager in charge of development transferred. A new supervisor was installed between the project leader and the new manager. The marketing sponsor left the company.

Despite these developments, the project leader pushed on, selecting a distributed architecture. A local vendor was to provide a turnkey system with communications links and a language that were new to ABC.

Breaking the rules

This project broke several cultural rules. First, the strategic system that they envisioned could not easily exist in a managed company. Secondly, the MIS department planned a distributed system. The firm's ambiguous lines of authority made the aberrant marketing champion a critical figure. Unfortunately, he had left.

In the aftermath, MIS failed even to convene a steering committee to shepherd the project. In short, they had no vehicle for building consensus. Finally, the lack of a chargeback system made it impossible for the department to tell the customer what the system cost. This uncertainty, in a conservative firm, proved untenable.

The outcome? A working system was delivered. But there were so many technical and political problems with it that it was placed in endless pilot and eventually deprived of funding. MIS was credited with a failure.

ABC's long-range MIS plan also called for installation of a complete set of integrated manufacturing resource planning (MRP) systems with a common data base technology. Again, the MIS department led the effort, convincing the manufacturing vice-president that the project would pay off handsomely in the long run. A one-plant pilot was approved.

The department tackled the project with enthusiasm and professionalism. The package was implemented; the skeptical plant manager was converted to an ally; and the benefits were counted. All this took about a year.

The MIS management prepared a presentation for senior management to try and gain approval for the next step. The price tag was $30 million, and the payback period was eight years. The project was turned down cold.

The MIS professionals had committed two fatal cultural errors. First, they had embarked on a multiyear plan in a managed, short-term-oriented company. To fit comfortably into this kind of environment, any project must be funded within a single budget cycle. Otherwise, it risks having funds cut off midstream.

In a related error, MIS undertook an effort with visible costs and less tangible benefits. Managed conservatives become very nervous when asked to fund projects with long paybacks of soft benefits.

The MRP II project was left in endless pilot as the MIS group was sent off to find a microcomputer solution that could be implemented on a shoestring.

A common mistake

XYZ Corp. was a high-tech firm growing at a 35% compound annual rate. Although only in its second decade, its market success had brought it into the Fortune 200.

[illegible] share, and present results with the SAS System. Plus you can file employee and applicant records, analyze benefit programs, and manage the payroll. The [illegible]

# SYSTEM
for Your Information Center.

The culture was, above all, entrepreneurial. It was ethical and competitive, with ambiguous lines of authority held over from its days as a smaller company. The original founder continued to lead the company with a clear, well-articulated vision for the future.

Because of its rapid growth, XYZ had outstripped the capacity of its core transaction processing systems. The director of MIS began a project to address order processing, billing, accounts payable and accounts receivable. As one might expect, MIS managed the project with a well-controlled, traditional life-cycle method.

A user manager was named to participate fully in the project team, and a respected consulting firm was hired to define and document the requirements. Their superior expertise was retained for general and detailed system design and for programming. After three years, three major design revisions and about $30 million in out-of-pocket expenses, there was still no system. After the third year, the name of the project was changed to conceal the continuing disappointment.

Where did MIS plans go awry? In an entrepreneurial firm, the traditional MIS approach is dead wrong. Even though the systems they were building were traditional transaction processing systems, the MIS team should have been using a prototype approach.

Possibly the only way to satisfy these users would have been to define a broad architecture, then begin roughing in the pieces with high-level languages and packages. With rapid deliveries and an evolutionary attitude, MIS would have been able to keep pace with the needs of a changing business.

> ”
>
> *Xerox used to be considered entrepreneurial but now might be seen as conservative. AT&T is trying to change from conservative to entrepreneurial.*

The first assignment given to the new MIS manager of XYZ was to investigate a stalled project and recommend an action plan. As he looked into the matter, he found two camps arguing over which software package to implement.

On one side, the user had selected a clearly superior package that was consistent with the way she did business. On the other side of the argument was the MIS director. He wanted to implement the system that was already being used worldwide for similar functional groups. Although the package was an older batch-type system, the MIS director believed consistency would serve the whole company better than a little extra capability in one group.

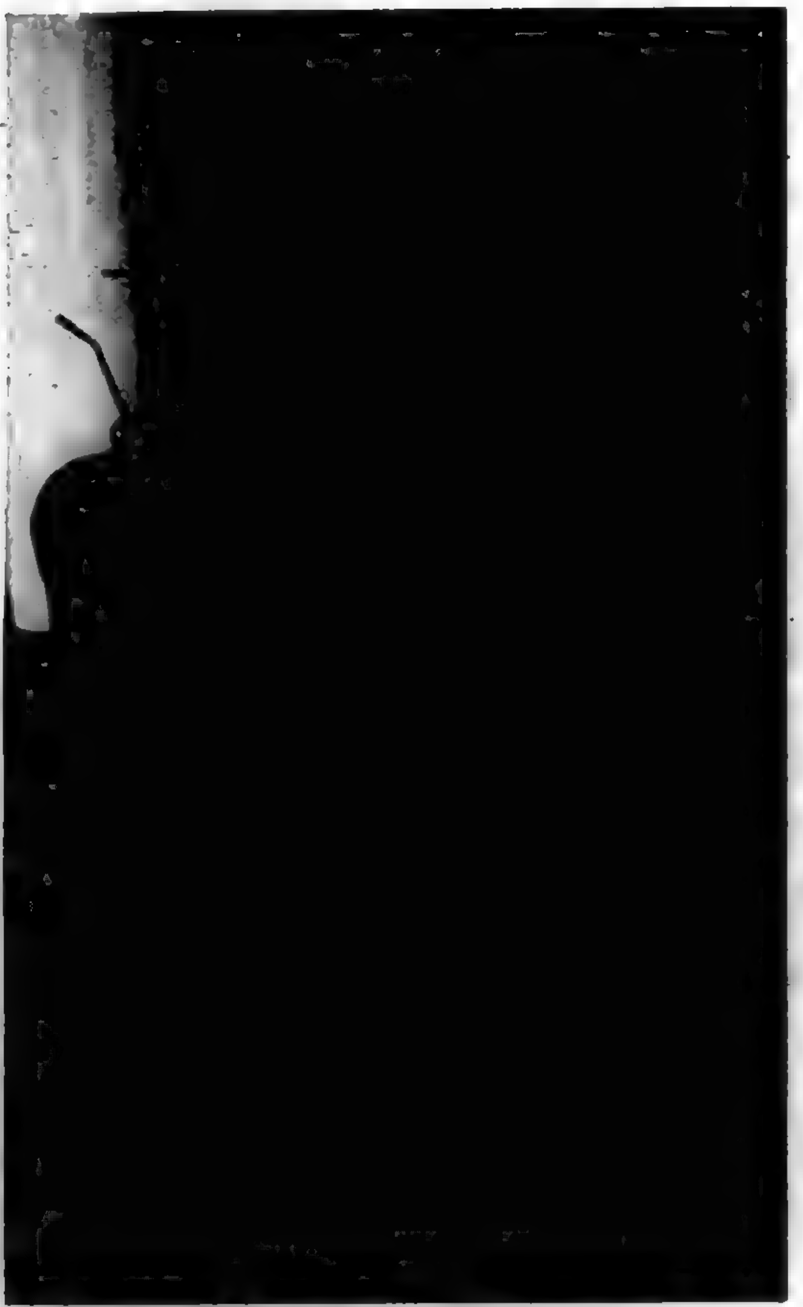
The MIS manager backed the user's choice rather than his superior's. Although he had compiled a thorough analysis of both systems, the real reason for his decision was cultural. He perceived the culture to be individualistic and competitive, not cooperative. In that environment, the key to success is meeting the needs of the user. Period.

Culture building

In general, MIS professionals can be more successful by identifying important aspects of their corporate culture and adjusting their policies and approaches to fit within the environment. Sometimes project success is a matter of changing only a few key, countercultural practices that have stymied solid efforts at progress.

Culturally consistent MIS activities will benefit the corporation by strengthening and solidifying the firm's culture. Obviously, MIS activities alone will not drive culture. They can, however, make a significant contribution toward influencing behavior and then values, as part of a coherent, culture-building program.

At the same time, MIS can participate in influencing culture. As we saw in the vignettes above, some of the cultural attributes of ABC Co. and XYZ Corp. were undesirable. With careful planning and the support of executive management, MIS professionals can play an important role in helping a firm modify its values.



It's a fact of business life. No matter what job you were hired to do, you were hired to make the right decisions. And we all know that in business there's nothing more satisfying than looking good.

If you're in the market for a multiplexer, we'd like to suggest a way you can look good.

Get a Codex T1 Multiplexer.

It lets you merge simultaneous voice, data, and video transmission. And with the enhanced T1 multiplexer you can do it faster and more efficiently than you can with your current system. Which means you're going to save a lot on line costs. And because digital line costs continue to go down, you're going to look very very good.

We've added important features like automatic reconfiguration, channel routing, and network control, so the T1 multiplexer product line offers you better reliability and better control than any other system available.

Regardless of how complex your network is and whatever system you have now, you could do better with a Codex T1 multiplexer. And if you could do better, shouldn't you?

Our applications experts would like to show you why Codex is the right decision. For more information, give us a call at 1-800-426-1212, ext.243 or write

Codex Corp.
Dept. 707-243,

MOTOROLA

[illegible]

Software maintenance:
penny wise, program foolish

By Girish Parikh

U.S. programmers shave days off software development time while squandering weeks on ad-libbed software maintenance. Soviet and Japanese companies have a jump on developing rigorous methods.

Computer professionals still ignore software maintenance. For software development, there are at least some methodologies, even if U.S. companies are drifting from them. But for software maintenance, there are no systematic methods in place yet.

The ideal way to systematize software maintenance would be to build techniques into the software development methodologies. Today most development facilities avoid dealing with the maintenance phase, and in this respect, they are incomplete. Judging from the alarming software maintenance statistics — 50% of DP budgets allocated to maintenance, more than 50% of programmer time consumed by ongoing maintenance, and more than $30 billion spent on maintenance annually worldwide — the omission is critical.

The pervasive lack of attention to the subject persists on a national level. The much-touted race between Japan and the U.S. on developing fifth-generation computers receives wide publicity. But the one-sided competition in software maintenance, which may affect the eventual outcome of the fifth-generation race, simply is not addressed by most computer professionals in the U.S.

Software maintenance consumes substantial resources. By streamlining and automating this work, the saved resources can be diverted elsewhere — toward developing applications for fifth-generation computers. Japan seems to understand the software maintenance problems and is making moves to solve them, as evidenced by the Software Maintenance Engineering Facility project under development by the Joint System Development of Japan.

The U.S. is perhaps more aware of the Soviet Union's threat to American technological supremacy regarding software. The fear seems to be: "The Russians are coming! The Russians are coming!" It seems to me that almost any country, even a developing one, can surpass the U.S. in the software field simply by making software reliable and modifiable and by developing modification techniques that can be taught.

On a company level, what is the effect of lack of attention to software maintenance for a data processing manager? The impact may or may not be immediately visible; however, the long-range effect can be devastating. When management considers maintenance a low-priority activity, the staff doing maintenance gets the message immediately.

In most companies, development programmers also handle maintenance. Instead of using systematic maintenance processes and updating documentation, they rush through the work by patching the programs so they can get back to development work quickly. Over time, the programs become almost impossible to modify, and documentation deteriorates.

Cleaning up the maintenance mess will be much more difficult and expensive than preventing it in the first place. By instilling "positive maintenance attitude," by encouraging the use of software maintenance techniques and tools and by providing maintenance training, many problems can be avoided.

Weak foundations

I have been through the software maintenance trenches for several years and observed the weak foundations of many applications systems. At the moment, U.S. software consists of precarious skyscrapers of unstructured and disorganized code on the verge of collapsing under severe maintenance problems. A better balance cannot be attained unless these basic problems — not just the symptoms — are promptly solved, and new software is developed with a methodology that includes teachable modification techniques.

You cannot avoid software maintenance: It is intrinsic to software. Why not do maintenance right and avoid the problems?

To be complete, software methodologies must offer exact guidelines for maintaining the software

---

Girish Parikh is a Chicago-based consultant, lecturer and writer. His newest report, "There Is A Fortune To Be Made in Software Maintenance: Opportunities in the $30 Billion Software Aftermarket," is published by Shetal Enterprises, Chicago.

developed with those methods. That way, the original structures are preserved, and maintenance operations can continue effectively, efficiently and economically. A methodology that can help solve the maintenance problems of unstructured software, as well as provide guidelines for maintaining structured software, would be even more useful.

Further, a country can develop national standards for software development and modification. There is already at least one technology eminently suitable for such standardization: Jean Dominique Warnier's logical methodology. The French systems scientist's technique of designing programs, called logical construction of programs (LCP), is such that any LCP programmer can maintain almost any LCP program anywhere.

To my knowledge, Warnier's methodology is the only one that provides precise guidelines for modifying programs; even more important, the modification techniques can be taught. Imagine how much maintenance saving can be achieved by such national standardization and education.

> ”
>
> *U.S. software consists of precarious skyscrapers of unstructured and disorganized code on the verge of collapsing under severe maintenance problems.*

In searching for the root of the problems, some have named Fortran and Cobol as the culprits responsible for the development and maintenance problems. I do not think this is the case.

Although the trite phrase "It's the fault of the computer!" is a popular one, we have all learned that the program can also be at fault. In fact, in almost all cases the program is at fault; all things considered, it is relatively rare that a computer malfunctions. So we changed our strategy and started blaming the "bug" in the program. But from where did the bug come?

Whodunit

Of course, a high-level language or any language that helps develop clear structures can help prevent or eliminate bugs. However, to a large extent it is the program design that makes the difference. So if the program is poor, it's generally the fault of the program design or rather the fault of the programmer who did a poor job of designing. Or, in an all-too-familiar scenario, it is the fault of the programmer who did not even care to outline the program before starting to write code.

In a worst-case sense, this is like rushing to start building a house before preparing a blueprint. It will be a miracle if the house is built at all, and if it is built, it may not be functionally sound or even safe. And such a house, if it gets finished at all, would cost a fortune to build, not to mention its subsequent maintenance. How many times would it be torn apart and construction started all over?

Applying this same principle to coding without preparing a design outline, we see that maintenance for these programs is even more awkward than usual. The difficulty is intensified because typically there is no adequate documentation to support the maintenance effort.

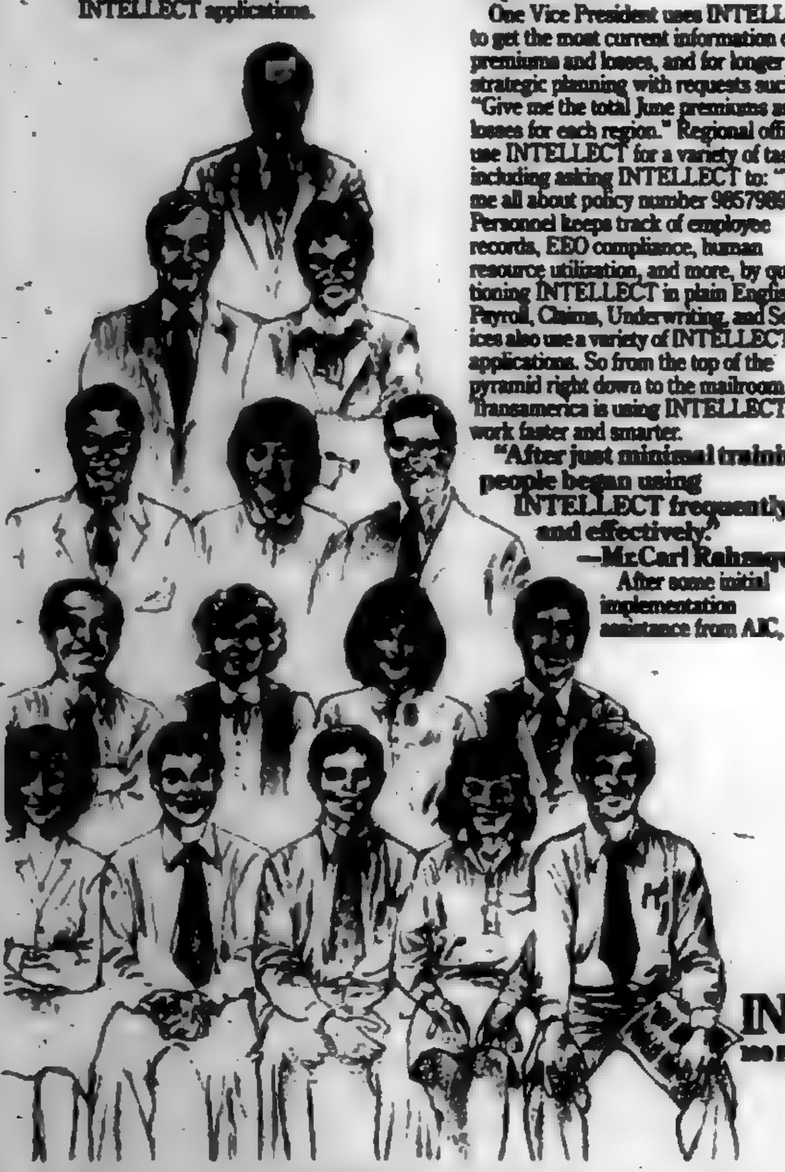
Again I must point out that Warnier's LCP technique can help design optimal (efficient in memory usage and execution speed), clearly structured, well-documented, reliable and easily modifiable programs. Programmers can code in Fortran, Cobol or almost any other programming language using LCP, because the design technique is independent of programming language and hardware.

LCP programs can save a bundle in the long maintenance cycle, starting in the initial development stage. The technique saves in testing time during development and maintenance, as programs work on first or second effective test. Since, in

TO INSURE THAT EVERYONE CAN ACCESS DATA, TRANSAMERICA USES INTELLECT AT EVERY LEVEL OF THE PYRAMID.

"We use INTELLECT because we want to give our users a better way to do business."
—Mr. Carl Rahmqvist, Senior Systems Manager, Information Systems, Transamerica Insurance Group

Transamerica Insurance Group is recognised for the pyramid-shaped building of its parent, Transamerica Corporation, and for being one of the country's leading commercial and personal insurance companies. In some quarters, Transamerica is also recognised for its variety of innovative INTELLECT applications.



At Transamerica they see INTELLECT as more than a state-of-the-art natural language information retrieval system. They see it as a new way to do business: Giving all their end users—even those with no computer skills—instant access to more information than they'd ever had before.

"When they saw how easy, fast, and resource-effective it was to use, INTELLECT became a very popular tool."
—Ms. Sandra Dahlgren, Information Center System Supervisor

One Vice President uses INTELLECT to get the most current information on premiums and losses, and for longer term strategic planning with requests such as, "Give me the total June premiums and losses for each region." Regional offices use INTELLECT for a variety of tasks including asking INTELLECT to: "Tell me all about policy number 98579897." Personnel keeps track of employee records, EEO compliance, human resource utilization, and more, by questioning INTELLECT in plain English. Payroll, Claims, Underwriting, and Services also use a variety of INTELLECT applications. So from the top of the pyramid right down to the mailroom, Transamerica is using INTELLECT to work faster and smarter.

"After just minimal training, people began using INTELLECT frequently and effectively."
—Mr. Carl Rahmqvist

After some initial implementation assistance from AIC, Transamerica's Information Center took over, developing custom INTELLECT applications for each department. Mr. Rahmqvist and Ms. Dahlgren trained a group of Transamerica's "veteran" INTELLECT users to go into the field to train the company's 15 regional office personnel in using the company's many applications. Transamerica's INTELLECT Support Staff helps company personnel use INTELLECT more effectively. They've also devised several methods for enabling users to access their many INTELLECT applications. Easily understood menu screens help beginning users work faster, while experienced people can use an express mode for their application needs.

"We've found that we've saved both time and money by using INTELLECT to obtain pertinent information."
—Ms. Sandra Dahlgren

Anyone who can ask a question in everyday conversational English can get the information he or she needs. Immediately. You can imagine how much time a system like that can save an information-dependent organization like Transamerica. Combine that with the ability to get more people into the system and you can see how INTELLECT has increased the pyramid's power.

Find out how INTELLECT can get your organization into better shape. Write for a free demo diskette. Or for fast action, call AIC at (617) 890-8400.

I want to know more about INTELLECT! CW

Now you can paint your entire IMS application system.

APS

THE APPLICATION PRODUCTIVITY SYSTEM FOR IMS AND CICS DEVELOPMENT CENTERS

APS, the leader in providing productivity savings to IMS and CICS users, now features exciting new painter technology that makes application prototyping and implementation easier and faster. Using APS, your development staff can:

PAINT screens, reports, data structures and programs in a fraction of the time and cost it currently takes.

PAINT a visual "at-a-glance" representation of an entire application system that shows the relationships of all application components.

PAINT prototypes that clearly demonstrate application systems to end users—from simple screen sequences to full working prototypes that include program logic and data mapping.

LIFE CYCLE SAVINGS

Using APS, your staff can easily extend prototypes into full production systems that support your most complex functional requirements. From your painted source, APS automatically generates native COBOL code including DB/DC syntax and produces comprehensive system documentation. And, during maintenance, your staff can quickly and easily make enhancements at the productive painter level.

So unlike some productivity tools you may have seen, APS won't paint you into a corner. It simply helps you do your job better, and in a fraction of the time and cost.

To learn more about the integrated family of APS products, attend a free APS Seminar. Call us toll-free at 800-638-8703 or just send in the coupon below.

APS supports batch and online requirements for DB2, IMS DB/DC, CICS, DL/I and VSAM production environments.

the traditional development cycles, testing takes about 50% of resources and time, LCP techniques can save a bundle in initial testing alone, not to mention the continuing saving in the maintenance cycle. In addition, program modification techniques can be taught.

Learning on the fly

One observation illustrates how deep the maintenance problems reach. It may sound ridiculous to non-DP executives, but it is a fact that in many large companies it takes about six months for a programmer to be productive in maintenance work. In the end, such work usually amounts to more than half of a programmer's responsibilities.

Without formed methodologies, many of these programming professionals lack formal training in software maintenance, and they are forced to learn on their own. This pickup, on-the-job training does allow them to complete the assigned work.

But maintenance skills learned the hard — and expensive — way, if they are learned at all, are generally not of much use when programmers hop jobs. Statistics quickly reveal the implications: Programmers change jobs every 1½ years on the average. In all likelihood, they then spend another six months learning how to use the nonstandard maintenance techniques of their new posts.

Ironically, the frustrating maintenance work itself contributes to the high programmer turnover. What a colossal waste of programming resources! It is easy to see why backlogs for new systems now amount to years in length.

Most companies contribute to this wasteful cycle by failing to take software methodologies seriously. Just look at the DP job section in the Sunday newspaper of your city. How many companies look for designers and programmers with experience in a certain methodology? Most advertisements specify skills in programming languages (usually Cobol and even Bal) and some software packages such as CICS and IMS, but not in software maintenance techniques.

We may be seeing a symptom of a deeper phenomenon. The concern of many DP managers seems to be to get the development job up and running, to get a pat on the back and maybe a promotion and a raise. If the system doesn't work out or if a time comes for them to modify or maintain their brainchildren, there is almost always another job to go to instead.

The concern of the U.S. still seems to be focused on the front-end work of development, even though software maintenance is estimated at 67% of the software life cycle. There are an estimated one million programmers in the U.S. alone, most of whom are spending more than half of their time on ongoing maintenance. But most training programs address only development issues. How much programmer time and resources are wasted doing trial-and-error maintenance, not to mention losses incurred because of incorrect changes?

Creating new methods

Though maintenance work is influenced by the development method used, (typically ad hoc method — that is, no method at all) we need to address maintenance problems on their own terms also. For a given development method, we should create maintenance techniques drawn from that method.

The task of creating maintenance techniques for unstructured software, developed without using any method, will be a challenge. But if we want to close the software maintenance gap, we must deal with these problems by treating the causes, not just removing the symptoms.

There are several options available for dealing with unstructured code, such as redeveloping, replacing with an off-the-shelf package and restructuring. In addition to techniques for maintaining software treated with the former options, techniques are also needed to handle maintenance work on the unstructured software as it is.

Understanding software becomes one of the keys to making correct changes. With unstructured software, maintenance programmers spend about half their time just understanding the programs. If the tools and training are developed to expedite standing of unstructured software, companies will realize a significant saving.

In 1975, Goal Systems created a VSE library management product called FLEE/XP. Ten years later, FLEE/XP took first place in the Data Decisions user survey with the highest score ever recorded. Now, with PDSMAN/XP we offer a product that provides MVS users with the same peace of mind FLEE/XP has been giving for a decade! One indication of that is PDSMAN/XP's recent reception of an ICP Million Dollar Award.

Attain the confidence of complete audit control over program development, and total security for program access . . . at the member level (PDSMAN/XP can be used with popular batch security products). PDSMAN/XP also reduces library compressions with a library space reuse facility. And best of all, PDSMAN/XP is from Goal Systems, the library management experts! So if you're an MVS user, or in the process of converting to MVS, try PDSMAN/XP.

FLEE/XP and PDSMAN/XP. Two of a kind from Goal Systems.

THE NEW DATAPHONE I MODEMS FROM AT&T.

They make data transmission safe at any speed. With DATAPHONE® I modems you can expect trouble-free transmission—all the way up to 14.4 KBPS. This line of fast-talking, analog, private-line modems is built to AT&T's high standards of quality and reliability. So you can be sure they're dependable. And they work with any synchronous terminals—equipment from AT&T as well as other vendors, including IBM.*

You won't need a special technical staff to manage these modems. They virtually take care of themselves. Even installation is easy; you can do it yourself. Build a complete network of DATAPHONE I modems or combine them with the equipment you already have. Both stand-alone and rack-mounted models will fit right into your existing network. And once in place, built-in diagnostics insure these modems will keep working hard for you.

If you want help looking after your network, contract for our DATAPHONE I PLUS Service Management. Any problem, we'll do whatever's necessary to make it right. A single call to one of nine AT&T Data Maintenance and Operational Control Centers will put our service team to work for you.

DATAPHONE I modems are just one more example of AT&T products that better meet your data communication needs. They reflect our commitment to developing new products and services that help to make the most of your network.

For some straight talk on ordering DATAPHONE I modems, call your AT&T Information Systems Account Executive. Or call 1 800 247-1212.

> *Programmers change jobs every one-and-a-half years on average. In all likelihood, they then spend another six months learning the maintenance techniques of their new posts.*

Recently a debate has started about the validity of current terminology. An excerpt from Dr. Edager W. Dijkstra's privately published newsletter "EWD" in May 1983 pointed out that "maintenance" itself is a misnomer: "To begin with, a program is not subject to wear and tear and requires no maintenance." Dijkstra coined the term "structured programming" but has not coined a new term for maintenance; he simply laments over the established one. Yet the term "program maintenance" has been in practice since electronic computing began over 30 years ago.

My question to those who have started debating over the term now is, where were you all this time? Of course, most of us were preoccupied with other computer topics — especially development. Though maintenance work was and is being done by programmers around the world since the dawn of electronic computing, no one seems to have paid much attention to it or even to its name.

Was it laziness? Or did we have a misconception that by developing methodologies for the front-end development, software maintenance would naturally fall in place? Did we simply not have the foresight to worry about the future, to see what was going on below the surface in the real world?

Perhaps the reason lies in programmers' general dislike for software maintenance. Some even hate the work. They want to remain high on the excitement of new development. It is a challenge to solve a problem by developing a new program. But once the program is installed, the excitement abates; programmers start seeking new pastures to satisfy their appetite.

Unfortunately, they have to work on existing programs. After all, these programs were their (or their fellow professionals') brainchildren, and they cannot abandon them. There are heavy investments in existing software, and management wants to make the most of it. So programmers grudgingly carry on, correcting errors, modifying code, adding new requirements, adapting to new software environments and so on.

Instead of changing the label, why not develop a generally accepted definition of the term and go on — identifying the variety of topics and subtopics on and related to the subject. In other words, develop a taxonomy, define the terminology for the subject and then get on to the more important work of developing software maintenance methodologies, both technical as well as managerial. With a generally accepted terminology, we will be able to communicate with the world at large.

Time to act

In 1981 the National Science Foundation commissioned a group of industrialists, scientists and teachers, known as the Computer Science and Engineering Research Study. Their study yielded a report that aptly predicted the threat to U.S. dominance in the software field:

"If software practices continue to drift, in 20 years the U.S. will have a national inventory of unstructured, hard-to-maintain, impossible-to-replace programs written in Fortran and Cobol as the basis of its industrial and government activities. Conversely, the Soviets may very well have a set of well-structured, easily maintained and modifiable programs in more modern languages because, in fact, they plan to leapfrog Fortran and Cobol.

"In this case, the competitive process of selecting efficient industrial processes among feasible alternatives will be impaired in the U.S. but facilitated in the USSR. We could then face a software gap more serious than the missile gap of some years ago."

Since then, it seems that fear has acted as catalyst for the U.S. Department of Defense to start the Software Engineering Institute centered at Carnegie-Mellon University in Pittsburgh. The institute plans to hire some 250 engineers to conduct a study of software methods and their applicability to defense systems. But it remains to be seen how the Software Engineering Institute tames the giant of software maintenance.

It seems that even in 1985, not much attention is being paid to software maintenance. It is naive to believe that by working on front-end development methodologies, the software maintenance problems will go away. In fact, if development is the front side of the coin, software maintenance is the other side, which stays much longer in view.

We are more than 30 years behind when it comes to software maintenance. We have awakened late. The giant subject of software maintenance may prove to be even larger than development and harder to tame. We have created enough mess with the existing software. Now instead of skirmishing around with the term, let's get started on the real work — honing the subject into an engineering discipline, developing software maintenance tools and producing educational and training courses and materials.

FUJITSU
BAND PRINTERS
*The Numbers
are Right.*

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

6000 *Hours MTBF is a Long Time without Failure.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. For additional information, contact Fujitsu at 3055 Orchard Drive, San Jose, CA 95134, or give us a call. Our number is (800) 626-4686.

MICROCOMPUTERS

Rockwell signs unlimited license pact

Agreement authorizes duplication of Smart

By Eric Bender

OVERLAND PARK, Kan. — An unlimited software site license agreement, signed this summer, was recently revealed by Innovative Software, Inc. and Rockwell International Corp.

The deal gives Rockwell, which employs more than 100,000, perpetual worldwide rights to copy Innovative's Smart Software System, a series of integrated modules for the IBM Personal Computer and compatible systems.

Creating a standard for Rockwell, the arrangement will provide several important advantages, said Gordon Armour, staff specialist for emerging technology at Rockwell Defense Electronics Operation's information systems group in Anaheim, Calif.

According to Armour, these will include greater interchangeability of personnel, easier interchangeability of files, the development of expertise with specific programs, general availability of high-quality software tools, a chance for broadened user training, the ability to create ancillary products and "the obvious economic benefits."

Rockwell, which expects to sign a similar deal for another type of micro software next year, did not disclose financial terms or release estimates of the number of personal computers involved.

In fact, the Fortune 50 firm did not disclose details on the magnitude of its micro installations to Innovative, which complicated initial negotiations. "That was the first hurdle we had to get over," Innovative Marketing Vice-President Ron Ferguson told *Computerworld*. "If you find out, I'll be glad to read about it."

However, Ferguson said, it made sense to sell a license as a service to an organization, as mainframe software may be sold, rather than by number of machines. "We, as an industry may be setting some artificial limitations in terms of selling our services to this segment of the market."

Under the agreement, "Rockwell has the right to duplicate and use the programs as they exist today; all else is unbundled," he said. Other contracts give Rockwell options to buy documentation updates or support from Innovative.

After duplicating the programs from master disks provided by Innovative, Rockwell will distribute and control the software internally through technical libraries. "We will have rigorous control procedures at the technical libraries," Armour emphasized. One benefit of these procedures is that as Smart Software enhancements come along, "we can simply pump the updates downstream," he said.

All software will have a special screen tailored for the company and an individual serial number, Ferguson noted. Although "we do not prohibit user copying, Rockwell does not want them to do it from the perspective of control of updates," Ferguson said. Users will be reminded that the software is a corporate asset and that they are not authorized to copy it.

"With the employer behind that, there will be much less misuse within the organization," Ferguson said.

SMALL TALK
Eric Bender
CW Senior Editor

Micro vendors willing to deal

The year 1985 has been far from a gangbuster one for microcomputers so far, but the landscape is changing lately — most noticeably in software licensing.

After a year and a half of sound and fury about site licensing, we're starting to see some significant activity. Behind the flurry of announcements, which turned out to be simple volume purchases (stop the presses!), are coming deals with genuinely different contractual arrangements.

One example is Innovative Software, Inc.'s recent agreement with Rockwell International — a perpetual, worldwide unlimited license for the Smart System software (see above story).

Controlling micro software

Negotiations may be a lengthy, complicated process — for example, Rockwell would not tell Innovative exactly how many micros were installed — but they hold the promise of coming up with a more sensible way for corporations to buy, distribute and control micro software.

We're also seeing a host of vendors dropping copy protection. Many of these are tiny firms, struggling to stay alive in a slow market that has created some significant disappointments even for stars like Lotus Development Corp. But regardless of vendor motives, dropping copy protection makes life a little easier for corporate users.

Microsoft Corp. bit that particu-

Software Publishing enhances PFS:Write word processing

Software Publishing Corp., based in Mountain View, Calif., has enhanced its best-selling PFS:Write word processing package for the IBM Personal Computer and compatible systems, providing an integrated spelling checker, wider documents, additional character enhancements, microjustification, context-sensitive Help screens and a quick-save feature.

Available now at the same retail price of the previous version, $140, the upgrade uses features requested in 1,500 responses to a customer survey that Software Publishing carried out earlier this year, according to product manager Dave Burns.

PFS:Write's spelling checker uses a 75,000-word dictionary to correct documents for misspellings, typographical errors, repeated words and irregular capitalization, according to the vendor.

The package now supports documents up to 250 characters wide and offers added character styles such as italics, superscripts and subscripts.

The quick-save feature permits users to save documents with a single keystroke during editing, rather than requiring them to go out to the main menu, Burns noted.

Current PFS:Write customers can upgrade to the new version for $35, according to a company spokeswoman. Software Publishing also is offering the software bundled with PFS:File, PFS:Plan, four utilities and two diskettes for $350.

PFS:Write requires IBM's PC-DOS or Microsoft Corp.'s MS-DOS 2 or higher and 256K bytes of random-access memory.

Software Publishing declined to give sales figures for PFS:Write, although it noted that independent research by Software Access International, Inc., a Mountain View firm, found that the software is the most popular word processing package available for less than $300. More than 1.7 million PFS series packages have been shipped, the spokeswoman said.

Ven-Tel takes wraps off modem

Internal, stand-alone versions offered for IBM micro families

Ven-Tel, Inc. of Santa Clara, Calif., has announced a 2,400 bit/sec. modem for the IBM Personal Computer series in both internal and stand-alone versions, both priced at $695.

The Half Card 24 expansion card reportedly provides communications for the micro at 2,400, 1,200 or 300 bit/sec. The card fits in a short slot in the Personal Computer XT and uses the standard Personal Computer AT command set.

Half Card 24 is said to be fully compatible with Ven-Tel's Half Card 1,200 bit/sec. modem and the Hayes Microcomputer Products, Inc. 1200B. It also supports software available for 1,200 bit/sec. modems and comes packaged with Microstuf, Inc. Crosstalk XVI communications software.

Other features include local and remote test modes, call progress reporting, automatic speed selection and automatic fallback to 1,200 bit/sec. when calling another modem operating at the lower speed.

A spokesman for Ven-Tel said the 2400 Plus stand-alone modem is fully compatible with the Hayes Smartmodem 1200 and the Ven-Tel 1200 Plus. The autodial, autoanswer modem can operate in both asynchronous and synchronous modes.

The stand-alone modem also includes automatic fallback, compatibility with 1,200 bit/sec. software, local and remote test modes and call progress reporting. Both the stand-alone and internal products are AT&T Bell Laboratories 212-A compatible at 1,200 and 300 bit/sec. and V.22bis-compatible at 1,200 and 2,400 bit/sec.

Micro communications package debuts

VM Personal Computing, Inc. of Danbury, Conn., has introduced and shipped Relay Gold, a microcomputer communications software package said to provide multitasking, a new-generation script language, full menu- or command-driven operation, flexible screen scroll-back and a learning mode.

The $225 program is available for all versions of the IBM Personal Computer, IBM-compatible systems, the Data General Corp. Data General/One and the Wang Laboratories, Inc. Professional Computer.

Unlike most other communications software, Relay Gold permits users to continue working on an application while files are being transferred, the company said. The software also allows personal computer users to send a file, receive a file and exchange messages with each other simultaneously.

Script language

The script language allows users to write a script of commands for Relay Gold, using features such as conditional waiting and branching, variable handling and error trapping, according to VM Personal Computing. This reportedly permits the software to handle virtually any communications task.

In micro-to-mainframe communications, Relay Gold is said to allow either the micro or the mainframe to control the operation, permitting cooperative, distributed and multisite processing. Binary, text and data files can be uploaded or downloaded to and from IBM mainframes using the vendor's Relay/3270, with error detection and correction maintained in both directions, the vendor said.

Relay Gold emulates TTY, DEC VT100 or VT52 and IBM 3270 terminals. The software supports the public-domain Kermit and Xmodem protocols in addition to its own bidirectional protocol. Modems are supported from vendors including Hayes Microcomputer Products, Inc., AT&T, Penril Corp., Prentice Corp., Racal-Vadic, Inc., Rixon, Inc. and Telenetics Corp.

Tools link IBM micros

Gateway Communications, Inc. of Irvine, Calif., has unveiled a series of micro-to-micro and micro-to-mainframe communications link software packages for the IBM Personal Computer line. The products were developed by Network Software Associates, Inc.

The five products in the G/SNA series reportedly allow the IBM Personal Computer, Personal Computer XT and AT to communicate with each other and with a mainframe in the IBM Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) environment at speeds up to 19.2K bit/sec.

G/SNApc 3270 allows the micro to access an SNA host by emulating an IBM 3274 controller equipped with a 3278 or 3279 terminal and 3286 or 3287 printer. It sells for $585.

G/BSCpc 3270 permits 3274 emulation in a bisynchronous rather than SNA/SDLC environment and costs $475.

G/SNApc 3770 emulates an IBM 3770 remote job entry workstation for mainframe access, allowing the micro user to submit a mainframe job request and to download, locally process and upload mainframe data. It costs $585.

G/SNA PCcom is a direct micro-to-micro link using the SDLC protocol and including interactive message exchange, file transfer and remote/local IBM PC-DOS command capabilities. It is priced at $475.

G/SNApc Combo provides 3270 and 3770 micro-mainframe communications for a price of $795.

Anex unveils expansion unit

Anex Technology, Inc. of Congers, N.Y., has announced an expansion system that reportedly gives four-user capability to the IBM Personal Computer AT and other Intel Corp. 80286-based micros running IBM's PC-DOS or Microsoft Corp.'s MS-DOS.

The basic configuration of Multi-AT/4, priced at $1,695, includes an eight-slot expansion chassis to support IBM-compatible keyboards and monitors as workstations, a hookup for a second workstation and Anex Multi-DOS, the multiuser software enhancement for PC-DOS.

The chassis is said to provide for memory expansion of up to 640K bytes for each workstation with Anex Multi-RAM memory expansion cards.

The Multi-DOS software replaces selected system calls with new code for faster response time at the same processor speed, according to the vendor. Each workstation is said to maintain the same performance of a stand-alone micro, regardless of the number of workstations running on Multi-AT/4.

Each workstation is able to run the same or different programs concurrently and transparently. PC-DOS-compatible programs can run on any or all of the workstations, Anex said.

TO CONFERENCES

EXHIBITS OPEN 9:30 AM

COMMUNICATION NETWORKS '86

CN'86/JANUARY 28-30, 1986
WASHINGTON CONVENTION CENTER
WASHINGTON, D.C.

- CN'86 offers an impressive conference program given by leading industry experts. For immediate conference information please call 800-225-4698 (in Mass. 617-879-0700).
- For your FREE exhibits-only registration, fill out and mail the coupon below before December 1, 1985, and we will send you your credentials by January 15, 1986. You will save the on-site registration fee and you'll avoid waiting in line to register.

Fill out this coupon completely and mail to: Communication Networks, Box 880, Framingham, MA 01701. CW1

☐ YES, I want to pre-register to attend the exhibits-only for FREE at CN'86! I understand that if I send this coupon in before December 1, 1985 I will receive my badge at no-charge.

☐ Send me information to exhibit at CN'86.

☐ Please send me information and prices for the CN'86 conference program.

☐ Send me hotel and travel information.

(You must return this coupon in order to receive your FREE registration.)

Please send my credentials to:

Samna upgrades tool to aid data transfer

Samna Corp. of Atlanta has announced an enhanced version of its Samna+ integrated software that reportedly supports the Document Interchange Format (DIF) for easier data transfer with other spreadsheet packages.

Release 3.1 of Samna+, the so-called Turbo version, is said to perform common operations faster than Release 2.11. DIF support facilitates the exchange of Samna+'s word processing, word-base management and spreadsheet data with Lotus Development Corp.'s 1-2-3 and Symphony.

Samna+ Turbo is targeted for IBM Personal Computer users producing extensive documents with numerical data. The software requires a minimum of 415K bytes of memory, excluding the requirements of the PC-DOS operating system.

The product is priced at $695. Users of Release 2.11 may upgrade for $50 or at no cost if they purchased the previous release after July 23.

Interactive enhances PC Screen

Interactive Data Corp. of Waltham, Mass., has announced an enhanced version of PC Screen — the IBM Personal Computer, Personal Computer XT and AT software interface for the vendor's Standard & Poor Corp. Compustat financial data base.

Version 2 features code rewritten in Lattice, Inc. C language that is said to halve the software's response time. Increased calculating power reportedly allows processing of nested match calculations.

PC Screen examines data on publicly traded companies according to criteria set by the user, including available variables, ratios or user-defined calculations.

PC Screen requires a micro with a minimum of 256K bytes of memory and the user's subscribed access to Compustat.

PC Screen Version 2 is available to current users free of charge. The annual license fee for Interactive Data's financial service is $15,000 for the first user in an organization and $7,500 for each additional user.

Corona Data gives micro MS-DOS, net

Corona Data Systems, Inc. of Thousand Oaks, Calif., has announced that its shipments of the Mega PC micro after Oct. 1 will include the Microsoft Corp. MS-DOS operating system with the MS-Net local-area network software.

The bundled software reportedly allows the Mega PC to expand to up to eight user workstations.

The new operating system and local-area network are included in the price of all Mega PC systems. Current users of MS-DOS 2.11 on the Mega PC may upgrade to DOS 3.1/MS-Net free of charge.

Prices for the Mega PC are $5,345 for the 10M-byte hard-disk version and $1,675 for each additional workstation.

SOFTWARE

■ **Information Technologies, Inc. has cut the price of its terminal emulation software for the IBM Personal Computer line.**

The firm's Linkup System Coax reportedly enables an IBM Personal Computer to connect to an IBM 3274 or 3276 controller and to emulate an IBM 3278 or 3279 terminal.

Linkup System Coax now sells for $495. The product previously sold for $995.

Information Technologies, 7850 E. Evans Road, Scottsdale, Ariz. 85260.

TI announces the portable sales tool for General Electric Plastics' field communications.

Instant access with their technical data base and 24-hour communications with headquarters. That's what the SILENT 700™ Model 707 with its easy access module means to GE Company's Plastics Sales Division. Regardless of time zones and sheer distance from the home office, GE Senior Sales Representative Ray Forester can get the latest product data and cost analysis information he needs to prepare for and close a sale. All he needs is his TI 707 portable data terminal and a telephone.

"With the terminal, I can tap into GE Plastics' data base. When ERIS (Engineering Resins Information System) is accessed by my TI 707, I can provide a customer with technical information and product specifications on the spot and leave him with a printout to review.

"The terminal also acts as my message center when I'm in the field. I transfer messages through the GE Crossfile (electronic mail), and the individuals receive them in written format when they pick up their messages. They seem to respond more promptly with accurate, hard copy in front of them. And since I can receive messages anytime, anywhere, the TI 707 all but eliminates 'telephone tag.'"

Ray Forester believes that the TI 707 is ideal for the salesman on the go. It's lightweight and rugged, takes up approximately one half of a briefcase, and is quiet even at peak operation. "It's exactly the productivity tool we needed for our division's field communications," he concluded.

Find out about the Model 707 SILENT 700 Portable Data Terminal from TI and how it can solve your communications problems. Call 1-800-527-3500, ext. 709; in Canada, 416-884-9181. For more information write TI, P.O. Box 809063, Dept. DTB 1930W, Dallas, Texas 75380-9063.

Software

■ **Boston Business Computing, Ltd. (BBC) has introduced software permitting Digital Equipment Corp. VAX mainframe editing functions to be performed on micros.**

The program, BBC PC/EDT, is said to provide the functionality of VAX EDT Versions 3 through 17 for DEC PDP-11 and of VAX/VMS Version 4 on the DEC Rainbow, the IBM Personal Computer, Personal Computer XT, AT and compatible computers.

Editing features include multiple buffers; undelete line, word and characters; and redefine keyboard.

Users can execute PC-DOS or MS-DOS commands from BBC PC/EDT, the vendor claimed. The software supports directory and subdirectory commands for PC-DOS or MS-DOS Versions 2 and higher and requires one disk drive plus 128K bytes of memory.

BBC PC/EDT costs $200, the vendor said.

BBC, P.O. Box 121, 1211 N. Main St., Randolph, Mass. 02368.

■ **Software for plant and facility maintenance that runs on the IBM Personal Computer XT and AT is available from Project Software & Development, Inc.**

Called Maximo, the package is said to perform work order tracking, inventory control and equipment history applications for a range of sites, including manufacturing sites, hospitals and universities.

Maximo uses a mouse and menu-driven screens that users can design by adjusting parameters such as length and field descriptions. A report writer produces predesigned or user-formatted reports containing data for work orders, inventory or equipment history, the vendor noted.

Written in the C programming language, Maximo runs on the IBM PC-DOS 3 operating system and requires a hard disk and 640K bytes of internal memory. Maximo is available as software only or as a turnkey system. The software-only package includes the program, reference manual, tutorial and mouse for $17,900.

Priced at $22,900, the turnkey system includes the software, a 640K-byte IBM Personal Computer AT, 20M-byte hard disk and color monitor with Personal Computer interface.

Project Software & Development, 20 University Road, Cambridge, Mass. 02138.

■ **Decisionex, Inc. has unwrapped a program that runs on the IBM Personal Computer and compatible systems for calculating the cost of renting commercial space.**

Called Tencost, the program projects all costs of occupancy associated with a single lease from the corporate tenant point of view by accounting for actual or proposed lease provisions and by comparing alternate lease proposals on a present value or level rent annuity basis, the vendor explained.

Tencost costs $495.

Decisionex, 1200 Post Road E., Westport, Conn. 06880.

■ **Assimilation, Inc. announced an interactive program that combines word processing with data base storage, manipulation and merge features for the Apple Computer, Inc. Macintosh.**

The program, known as Business Essentials, contains two modules: Autowriter and Data Merge.

Autowriter, the word processing component, is said to store words, names, sentences and paragraphs in the Macintosh for later insertion into standard correspondence forms.

The data base module, Data Merge, can list 600 items in 16 different fields for cross-referencing and manipulating data, the vendor said.

Business Essentials costs $79.

Assimilation, 485 Alberto Way, Los Gatos, Calif. 95030.

■ **Reference Software, Inc. offered software that lets IBM Personal Computer users access the Random House Dictionary and Random House Thesaurus.**

The package, called Reference Set, allows users to check the spelling of words, find synonyms and insert changes directly into text without having to exit programs or save files.

Macros are provided for storing words and phrases that a writer uses repeatedly and for entering these text strings with one keystroke.

Reference Set runs on the IBM Personal Computer, Personal Computer XT, AT and compatible computers. It requires IBM PC-DOS or Microsoft Corp. MS-DOS Version 2 or higher, 128K bytes of memory and either two floppy disk drives or a hard disk drive.

The software package costs $89. The dictionary and thesaurus are available separately for $69 each.

Reference Software, 2363 Boulevard Circle, Walnut Creek, Calif. 94595.

■ **Primavera Systems, Inc. has released Version 2.5 of its project management and control system, Primavera Project Planner, and Version 1.6 of Primavision, a compatible graphics plotter package. Both run on the IBM Personal Computer line.**

Version 2.5 of Primavera Project Planner provides screen graphics to view activity data in bar charts, resource and cost histograms and resource and cost profiles.

Users can produce graphics displays for all project activities or use the automatic sorting feature, Autosort, to look at only selected activities. Scrolling allows users to view a specific time period or group of activities, the vendor noted.

Continued from page 60

Other project management system enhancements include free-float computation, reporting and sort/select, which allows an activity to be delayed without affecting the start of its successor.

In addition, a Generate command creates text files in the same format used to input records in Primavera's batch system. The command reportedly lets users break large networks into subnetworks by transferring files to a relational data base or report writer for further processing or by reentering files in the project manager for updating progress and performing "what-if" analyses.

Primavision Version 1.6 offers full match lining of multipage plots to produce images that span up to 10 sheets. Relationship lines on time-scaled logic diagrams can be suppressed to compress charts, according to the vendor.

Other upgrades include the ability to increase lettering sizes, thermometer bars for charting progress on a bar chart and network logic diagrams, the ability to save plots to user files and the ability to generate plots using start and end days and months.

Version 1.6 also adds support for Calcomp's 1040 and 1070 series plotters and other 907 Calcomp controller plotters.

Primavera Project Planner, at $2,500, and Primavision, at $1,500, run on the IBM Personal Computer, Personal Computer XT, AT and other compatible microcomputers. A minimum configuration is 512K bytes of memory, a hard disk and DOS 2 or higher, according to the vendor.

Primavera Systems, Suite 925, Two Bala Plaza, Bala Cynwyd, Pa. 19004.

■ **A sales/contact management system for the IBM Personal Computer, Personal Computer XT and compatible machines is available from Business Systems International, Inc.**

Called Salesbase/PC, the package is said to schedule follow-up actions, maintain a data base of contacts, create selected or mass mailings, forecast sales, record customer purchase histories, automatically dial contact phone numbers directly from the data base and create tutorial screens for on-line sales training.

The software also includes an on-line Help facility that can be accessed with one keystroke, the vendor noted.

System requirements are 256K bytes of memory, IBM's PC-DOS or Microsoft Corp.'s MS-DOS Version 2 or higher and a monochrome or color monitor. Salesbase/PC costs $895.

Business Systems International, 20942 Osborne St., Canoga Park, Calif. 91304.

■ **A word processing package that includes a 100,000-word dictionary, thesaurus, document indexer and word library for the Apple Computer, Inc. Macintosh computer is available from Rio Grande Software, Inc.**

Called RGS Wright+, the word processor is also said to provide a math module, graphics package, on-line Help facility, an undo function and the ability to merge data and charts into new and existing documents, the vendor claimed.

RGS Wright+ is compatible with Corvus Systems, Inc., Davong, Inc. and Tecmar, Inc. hard disk drives and interfaces with Apple's Macwrite and Macpaint. The software sells for $195.

Rio Grande Software, P.O. Box 5906, 221 Nolana, McAllen, Texas 78504.

■ **Fast Forward, Inc. has unveiled an electronic bulletin board with security, electronic mail and intercomputer file transfer capabilities for business users of the IBM Personal Computer.**

The electronic mail facility, known as Corporate Bulletin Board (CBB), includes an on-line text editor and is said to let users create public or private memos, certified mail, carbon copies and mailing lists. It reportedly allows the user to upload memos as files, edit and forward memos and keep confidential messages in private mailboxes.

CBB can transfer software programs, spreadsheets, word processing documents and data base files from one unit to another, including exchanging files between the Apple Computer, Inc. Macintosh and IBM Personal Computer. An Xmodem error-checking file transfer meth-

Introducing the TI 880 AT Printer.
Because you need a multi-user printer that works overtime.

The last thing you need is the wrong printer. A printer that quits when your work is nonstop. Or one that burns out from overwork.

Let's say you have a typical multi-user environment or a local area network. It includes IBM Personal Computer ATs, PC/XTs or compatibles. What you need now is a printer that can handle your system's entire workload. A printer you can trust your business to.

You need a high-speed printer that's software compatible with PC industry standards and capable of sustaining 300cps. It should have straight paper paths to eliminate jams, changeable fonts and enhanced print modes to take care of draft, correspondence and graphics. Its design should be rugged, durable and as reliable as you've come to expect from TI printers.

The OMNI 800™ Model 880 AT Printer from TI fits this description.

The printer that works overtime.

Because business doesn't stop just because your printer did.

Find out about the new TI 880 AT Printer and how it can help solve your multi-user printing problems. Call 1-800-527-3500 ext. 809, in Canada 416-884-9181.

od gives 99.6% error-free transmission over noisy long-distance lines, the vendor claimed.

Data protection is provided by passwords and security levels. A call log records system activities, including security violations and incorrect passwords.

CBB runs on the IBM Personal Computer, Personal Computer XT, AT and compatible computers. The software supports IBM's Topview and Digital Research, Inc.'s Concurrent PC-DOS in both foreground and background modes, the vendor said.

A minimum configuration is 192K bytes of random-access memory, two floppy disk drives, a Hayes Microcomputer Products, Inc. Smartmodem, asynchronous communications card and communications software.

CBB sells for $495.

Fast Forward, P.O. Box 14706, Portland, Ore. 97214.

■ Semantic Microsystems has announced Macscheme, an implementation of Lisp for the 512K-byte Apple Computer, Inc. Macintosh.

Macscheme is said to conform to the standards for Scheme, a Lisp dialect, and to support such Common Lisp features as lexically scoped variables, first-class procedures, macros, generic arithmetic including floating-point and infinite precision integer arithmetic and the concept of continuations.

The software reportedly provides an interpreter with runtime error detection and debugging plus a Smalltalk-like interface that offers multiple scrolling windows.

Macscheme costs $125.

Semantic Microsystems, Suite 543, 1001 Bridgeway, Sausalito, Calif. 94965.

■ Rockkind Software Corp. unwrapped Ride/DM, a version of the high-level business language Ride, that is said to let programmers develop multiuser data base applications for networked personal computers.

Ride/DM works with The Database Machine, Cogent Data Technologies, Inc.'s board for the IBM Personal Computer, Personal Computer XT and AT, which acts as both file server and hard-disk controller for the network. The Database Machine gives networked micros simultaneous access to shared data files.

The software includes Ride programming features such as a screen forms manager and string processing. Ride/DM sells for $495.

Rockkind Software, 3060 Valmont Road, Boulder, Colo. 80301.

■ Cubicomp Corp. has upgraded its Picturemaker three-dimensional design and animation software — which runs on the IBM Personal Computer — with additional imaging and motion scripting features.

Imaging enhancements include texture mapping to superimpose two-dimensional images onto 3-D objects, shading to create reflective surfaces and the ability to generate transparent objects.

New motion scripting features include velocity profiling, which allows an animator to vary how fast an object accelerates in 3-D space, and metamorphosis, which smoothly transforms a 3-D shape into another.

Picturemaker costs $39,500.

Cubicomp, 3165 Adeline St., Berkeley, Calif. 94703.

■ West End Film, Inc. has added antialiasing to its Artwork three-dimensional display list drawing software for the IBM Personal Computer and compatible computers.

Antialiasing is a technique that is said to eliminate the jagged edges that appear in computer-generated images by ramping the edges on lines and planes of color to fade into the background and appear as a higher resolution image.

Antialiasing in Artwork requires the Number Nine Computer Co.'s Number Nine Revolution graphics card, the vendor said.

Artwork software costs $2,450.

West End Film, 2121 Newport Place N.W., Washington, D.C. 20037.

COMMUNICATIONS

■ Gamma Productions, Inc. has announced the Gamma-Net 3.1 local-area network for the IBM Personal Computer line, based on the MIL-STD-1553 standard developed for digital data communications on board military aircraft.

Gamma-Net 3.1 runs at 2M bit/sec. with a data throughput of up to 400K bit/sec., a spokesman said. The product supports IBM's PC-DOS 3.1 software and can service up to 255 nodes.

The network is installed using coaxial cable and an add-on controller card for each node. The card can be installed in an IBM Personal Computer, Personal Computer XT, AT and compatibles.

Features include collision avoidance and collision detection, error-checking on three levels and packet size varying from 4 bytes to 64K bytes. Cable segments can be as long as 1,500 ft of RG-58-type coaxial or up to 4,000 ft of RG-8-type coaxial without repeaters.

The Gamma-Net 3.1 local-area network is priced at $299.95 per node.

Gamma Productions, Suite 102, 817 10th St., Santa Monica, Calif. 90403.

■ Softronics, Inc. has announced three versions of its Softerm PC terminal emulation software. The program now runs on the Texas Instruments, Inc. Professional computer, NEC Corp. Advanced Personal Com-

Has your well of support gone dry?

VPS replaces 'em all

IBM's DS Print • IBM's 328x • Others

Support when you need it

700 Sites driving over 50,000 printers believe that the VTAM Printer Support System (VPS) is the best way to support 3270 family printer networks and PC printers, reduce local and remote printing costs, and improve reliability.

- Timely—knowledgeable support is as near as your telephone.
- Total RJE replacement for Batch Reports, CICS Spooled Reports, DS Print, VM, IBM 328X, and other products.
- Operates under JES, standard routing parameters, spooling and recovery. No system modifications, JES tables or additional hardware. Compatible with MVS/XA.
- Shares printers, control units, lines and network resources with CICS, IMS, etc.
- Transparent to existing DS Print commands and CLIST's.
- Uses full JES and VTAM error recovery. Produces SMF records.

Call or write for additional details, or to arrange a trial (ATTN: Marketing Department).

MICROCOMPUTERS

Continued from page 63

puter III and the Wang Laboratories, Inc. Professional Computer.

Softerm PC reportedly includes emulation capabilities for more than 30 terminals, including the Digital Equipment Corp. VT100 and VT220, IBM 3101, Data General Corp. D200 and D410 and the Televideo Systems, Inc. 925 and 950. The software also includes file transfer and utility functions.

The software requires a micro with a minimum of 256K bytes of memory, a monochrome or color monitor and Microsoft Corp. MS-DOS 2. The TI Professional computer version also requires an asynchronous communications controller card.

Each of the three versions is available for $195.

Softronics, Suite 203, 7730 N. Union Blvd., Colorado Springs, Colo. 80918.

■ Systech Corp. has released a data communications processor for Intel Corp. Multibus-based microcomputers that was designed to provide serial interfaces with a wide range of standard and custom communications protocols.

The four-channel DCP-8804 board is said to raise system throughput by off-loading communications-related functions from the main computer. It enables Multibus-based machines to operate in asynchronous, bisynchronous, Synchronous Data Link Control, High-level Data Link Control, X.25 and Systems Network Architecture communications protocols.

For OEMs, the company also provides AT&T Unix-compatible software drivers that enable the OEMs to adapt the DCP-8804 to their computers.

The DCP-8804 with 256K bytes of random-access memory costs $3,575. The X.25 optional software costs $7,000. Installation of an IBM 3780 emulation package costs $4,500, and the license fee for remote job entry software is $200.

Systech, 6465 Nancy Ridge Drive, San Diego, Calif. 92121.

■ Avatar Technologies, Inc. has announced a hardware and software system that reportedly transfers files between the Apple Computer, Inc. Macintosh and a host IBM mainframe running CICS, TSO or CMS.

Macmainframe was designed for use with Avatar's standard host file transfer software running on the mainframe. Macmainframe is said to give Macintosh users full IBM 3278 terminal emulation and either local or remote connection to the host, with dial-in capability for multiple users.

The hardware unit connects an IBM 3274 or 3276 control unit to the Macintosh modem port with coaxial cable. It reportedly provides an auxiliary RS-232 port with terminal pass-through capabilities for asynchronous communications.

The Macmainframe software reportedly operates in conjunction with Apple's Macterminal program, allowing file transfers to be set up in standard Macintosh format with the mouse or keyboard. Macmainframe is compatible with Avatar's Turbo series of IBM Personal Computer-to-mainframe links.

Macmainframe is priced at $1,395.

Avatar Technologies, 99 South St., Hopkinton, Mass. 01748.

■ Gateway Communications, Inc. has announced Advanced Netware/G, a network operating system compatible with IBM's PC Network and PC-DOS 3.1 that reportedly supports up to eight file servers on a local-area network.

Advanced Netware/G runs on Gateway's G/NET, a network that interconnects the IBM Personal Computer, Personal Computer XT, AT and compatible computers and is said to make G/NET compatible with the standard defined by Microsoft Corp.'s MS-NET and IBM's PC Network with PC-DOS 3.1.

Multiuser applications software running under PC-DOS 3.1 will reportedly operate unmodified in the Advanced Netware/G environment.

Features of the network operating system include electronic mail, remote workstation access, full-function printer spooling, system security and applications development support.

Advanced Netware/G is priced at $1,595. Each file server on a network requires a separate copy of the software. Netware/G users can upgrade to Advanced Netware/G for $295.

Gateway Communications, 16782 Red Hill Ave., Irvine, Calif. 92714.

■ Grafpoint unveiled a Tektronix, Inc. 4107 graphics terminal emulation package that lets MS-DOS-based personal computers locally run mainframe graphics software and off-load graphics operations from a host.

Called Tgraf-07, the software supports from 640- by 480-pixel to 1,024- by 1,024-pixel resolution boards, including the IBM Enhanced Graphics Adapter, the IBM Professional Graphics Adapter, the Verticom, Inc. M-16 and the TAT Galaxy series.

Additional boards supported include the 720- by 300-pixel resolution Texas Instruments, Inc. Professional and the 640- by 400-pixel resolution AT&T Personal Computer 6300, NEC Corp. APC III and Sperry Corp. Personal Computer.

Tgraf-07 is said to be compatible with such mainframe packages as Manufacturing & Consulting Services, Inc. Anvil-4000 three-dimensional computer-aided design system and United Computing Services, Inc.'s Ansys.

Tgraf-07 sells for $995.

Grafpoint, 4340 Stevens Creek Blvd., San Jose, Calif. 95129.

STORAGE

■ Cipher Data Products, Inc. has introduced its Series 9000 system, a transportable ¼-in. tape subsystem for use with the IBM Personal Computer line.

The Asian Computerworld reaches the fastest growing computer market in the world.

You can take advantage of Asia's $1.8 billion computer market, by advertising in *The Asian Computerworld*, Computerworld's sister publication covering the Asian marketplace.

There are two geographic editions of *The Asian Computerworld* providing readers and advertisers with more specific coverage of the Asian market. The Southeast Asian edition circulates to 5,400 computer professionals in Singapore, Thailand, Brunei, Malaysia, Indonesia and the Philippines. And, a separate edition circulates to 5,600 computer professionals in Hong Kong, China, Korea and Taiwan.

The editorial (written in English) keeps company executives, computer users, potential users and people in the computer industry up-to-date. Both editions have access to the CW International News Network, the only daily wire service specializing in computer-related editorial material. And, each edition also provides local industry news.

CW International Marketing Services makes advertising your products in Asia, and around the world, easy. For more information on *The Asian Computerworld*, just fill out and return the coupon below.

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 100 staff years of assembler language systems experience on our development team.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above the 16 megabyte line in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conductive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

SAS Institute Inc.
SAS Circle, Box 8000
Cary, NC 27511-8000
Telephone (919) 467-8000 x 7000

I want to learn more about:

☐ the C compiler for MVS software developers
☐ the C compiler for CMS software developers
☐ the cross-compiler with PLINK86 and PLIB86

today...so I'll be ready for tomorrow.

Please complete or attach your business card.

Continued from page 94

The Series 9000 reportedly permits Personal Computers to read and write to either 10½- or 7-in. magnetic tape reels, as used on such larger systems as the Hewlett-Packard Co. 64000 mainframe.

The unit includes a controller card and a cabling and program diskette for use under the IBM PC-DOS 2 or later. The 9-track drive can read and write data in the IBM/Ansi-compatible, phase-encoded format at 1,600 bit/in., or 1,600/3,200 bit/in. in its dual mode.

The price of the Series 9000 ranges from $5,995 to $10,995.

Cipher Data Products, 10101 Old Grove Road, San Diego, Calif. 92138.

■ **Advanced Digital Information Corp. has introduced a ¼-in. cartridge tape storage system that reportedly offers general-purpose interface bus compatibility to data logging and automatic test equipment.**

The Model 570 Data Library, which connects to IBM's Personal Computer, Personal Computer AT and XT and compatibles, is said to provide 67M bytes of formatted user capacity. The data cartridges have permanent forward/reverse reading block keys that establish block locations.

The unit costs $3,900.

Advanced Digital Information, P.O. Box 2996, Redmond, Wash. 98073.

■ **Acknowledge, Inc. has introduced its AN-9600-PC 9-track magnetic tape subsystem for use with the IBM Personal Computer and Wang Laboratories, Inc. Professional Computer.**

The product reportedly permits file transfer between mainframes and personal computers by way of standard ½-in. tape.

Included with the AN-9600-PC reportedly are software utilities to allow conversion of Ebcdic mainframe files into the Ascii format used by personal computers.

It costs $4,995 for the IBM Personal Computer and $5,995 for a Wang-compatible unit.

Acknowledge, 10 Pennsylvania Ave., Framingham, Mass. 01701.

■ **National Memory Systems Corp. has introduced its NMS 01-OL 400M-byte laser optical memory system for use with the IBM Personal Computer line.**

The NMS 01-OL reportedly has a 15-msec access time and write-once capability. It stores 400M bytes of data on removable 5¼-in. media.

Also included in the unit are said to be a hard-disk storage unit, available in capacities ranging from 84M bytes to 335M bytes. The unit's host controller serves as interface and controller for both the hard disk and the laser disk.

The unit costs $15,900 with a 335M-byte hard disk.

National Memory Systems, 355 Earhart Way, Livermore, Calif. 94550.

■ **Genoa Systems Corp. has unwrapped internal and external 60M-byte cartridge streaming tape backup subsystems for IBM Personal Computer XT, AT and compatible computers.**

Model 3160 (internal) and 3260 (external) subsystems of the Galaxy line back up a 20M-byte hard disk in less than 4.3 minutes, according to a spokesman. Data transfer reportedly occurs at 86.37K byte/sec. at 90 in./sec. streaming mode speeds.

Features include multiple-window software, menu-driven commands, a context-sensitive on-line Help facility, an intelligent command line editor for editing entries without retyping and compatibility with local-area networks from 3Com Corp., Novell, Inc. and other vendors. An IBM PC-DOS toggle lets users run other applications or PC-DOS commands without exiting a Galaxy program in progress.

Reports are said to include partial or full directories plus tape utilization reports after backups.

The subsystems run under PC-DOS 2, 2.1, 3 and 3.1 and require 256K bytes of memory, a floppy disk drive to install the software, an 80-char. by 25-line color or monochrome display and two expansion card slots.

The system includes tape drive, interface card, cable, ¼-in. streaming tape cartridge, software in a 5¼-in. diskette and documentation.

Prices are $1,395 for the Model 3160 and $1,645 for the Model 3260.

Genoa Systems., 73 E. Trimble Road, San Jose, Calif. 95131.

Micro vendors willing to deal

lar bullet for its net version of Word.

That introduction also represented another quiet sign of change, in that Microsoft Word for Networks is the supplier's first application specifically tailored for a local-area network. The debate about pricing of network software may be over before anyone notices.

There's some chance that the debate will be over before Lotus figures out its network policy. Lotus has been announcing plans to announce network plans for about a year now, so the current hints don't really send that delicious shiver of anticipation up and down the spine.

The 1-2-3 upgrade policy finally detailed earlier this month does show that Lotus is listening to its larger customers, who will get different pricing and other arrangements.

These long-threatened, long-promised changes are spreading, and today's soft market will accelerate them.

IRMA LIST: $1,195
OUR LIST: $495

And our system is *better.*

That's my statement and I'll stand behind every word of it.

Jim Pitre, President

I'm talking about head-to-head competition on a Coax-Connect interface System for the IBM PC, XT and AT. It's IBM compatible, connects to IBM 3274/3276/43XX...even includes file transfer at no extra charge.

Support? We make the same claim as everybody else, *with one big difference:* if we do not live up to *any* of our claims, call me, Jim Pitre, at 1-800-431-3460. Like our $495 price, our Information Technology commitment has my name on it.

COMMUNICATIONS

Communications tool for file transfer bows

By John Gallant

NATICK, Mass. — Software Research Corp. recently announced multivendor communications software that will allow processors from IBM, Digital Equipment Corp. and Wang Laboratories, Inc. to share files and messaging capabilities.

Software Research's Strategic Network Environment (SNE) Release 1.1 File Transfer Version 1. The first of a planned series of SNE products, the File Transfer software runs as an application under IBM's MVS or MVS/XA, DEC's VMS, Wang's VS, IBM's PC-DOS and Microsoft Corp.'s MS-DOS operating systems and supports messaging and a variety of file transfers between the diverse systems.

Using an IBM mainframe under MVS as a central or controlling node, a spokesman for Software Research said, SNE File Transfer allows users to link DEC's VAXs, Wang's VS minis and IBM's Personal Computers, Personal Computer XTs and compatibles as nodes off the mainframe. The software provides the file transfer and messaging capabilities between any two of the nodes.

SNE File Transfer supports text or binary data file structures including IBM's Vsam, Qsam, partitioned data set and generation data groups; DEC's RMS; Wang's DMS; and PC-DOS and MS-DOS sequential files. In addition, the product performs any Ascii or Ebcdic data format conversions required to transfer supported files among different environments.

The spokesman said the product, dubbed a "universal file transfer network utility," allows users to assign symbolic

Peer-to-peer protocol debuts

By John Desmond

BERKELEY, Calif. — Orion Group, Inc. has announced the Orion SNA6.2 Peer Communications Facility, said to implement fully IBM's System Network Architecture (SNA) peer-to-peer communications protocols Logical Unit 6.2 (LU6.2) and Physical Unit 2.1.

The protocols enable microcomputers, minicomputers, mainframes, terminals, file servers and other devices to exchange information directly rather than going through a central host, the company said.

The networking facility was written in C under AT&T's Unix System V and was developed in conjunction with Apple Computer, Inc. The package requires no custom hardware and is being directed at OEMs and value-added resellers. Apple, the first licensed customer, is using the product to connect indirectly its Macintosh microcomputers with an IBM System/38, according to a spokesman.

Orion President Paul Rampel maintains his product is the first third-party product to offer full implementation of the IBM SNA 6.2 and 2.1 protocols, which many believe will become the industry standard for passing data between unlike computer systems. "These network protocols have been identified by IBM as a point of convergence for all its equipment, and no hardware vendor will be able to ignore it," he said. "Companies that implement the LU6.2 standard first will be way ahead of the game."

Rampel maintained that his product helps provide a missing capability of Unix System V — advanced networking capability. "We have a distinct advantage in the Unix marketplace," he said.

AT&T adds microwave bypass

Having once said it would not encourage users to bypass local telephone companies, AT&T has introduced two microwave bypass systems, an endorsement that will sap revenues from the former Bell operating companies.

The AT&T Network Distribution System product line includes a low- and high-end system. The low-end Network Distribution System Digital Radio 23 (DR23) is provided under a multimillion-dollar private-label contract by Digital Microwave Corp. in Santa Clara, Calif. It is a 23-GHz digital microwave system that supports transmission rates from 1.544M to 6.312M bit/sec. for up to 10 miles.

At 6.312M bit/sec. — commonly referred to as T2 speeds — DR23 is said to be able to accommodate up to 96 digital voice channels, each operating at 64K bit/sec. The system's antenna can be installed on a roof or within an office, facing out a window.

Both the DR23 and its bigger brother, the DR6, provide point-to-point links for data or voice communications. The links can be used in common bypass applications, such as linking corporate facilities or linking a company directly to its long-distance communications carrier, thus eliminating the need for using the telephone company's local loops.

The high-end DR6, developed by AT&T Bell Laboratories and manufactured by AT&T's Network Systems Group, is a version of a system that AT&T has been selling to the divested Bell operating companies for their use or resale since August 1984. The system includes a 6-GHz digital microwave radio that transmits at 45M bit/sec., or T3 speeds, at distances up to 40 miles, supporting up to 672 voice channels at 64K bit/sec.

AT&T reported that it would provide in-

■ Wang Laboratories announced the Wang Telephone Message Exchange, an operator-attended communications facility for telephone messaging and directory services/73.

Few MIS execs manage both voice and data functions

Poll shows most firms expect no integration

By Paul Korzeniowski

The MIS manager who oversees both corporate data and voice communications functions represents the exception rather than the rule.

That was a finding from a *Computerworld* survey sent to a random sampling of subscribers in July. The 1,000 surveys were mailed with a dollar incentive, and 422 readers replied.

The survey found that in a slight majority of companies, separate departments manage voice and data communications (see chart). Few of the companies that manage the two functions with different departments plan to integrate the two functions (see chart).

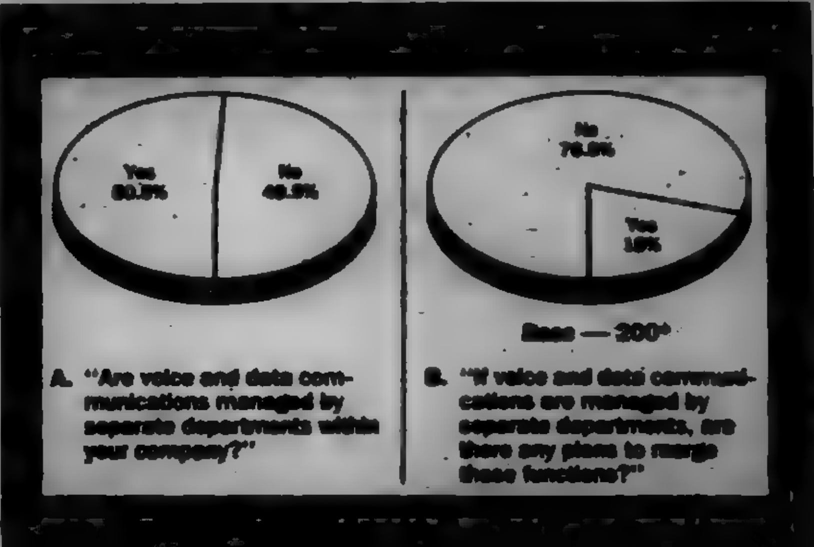
As one may expect in companies where the two functions are split by department, the MIS manager rules data communications. Close to 85% of the companies listed data communications as the responsibility of the MIS department. Less than 2% said a communications department was responsible for data communications.

In the cases where voice and data functions were split, the department overseeing voice communications was less clearly defined. In 35% of these companies, the director of operations or administrative services supervised voice communications. Other titles mentioned were vice-president, assistant vice-president and telecommunications manager. In three out of four cases, these people worked in general administration.

Where voice and data functions are merged, two-thirds of the companies said the MIS department supervises both functions. In 20% of the cases, general administration oversees both functions.

Continued on page 70

MITCHELL J. HAYES



A. "Are voice and data communications managed by separate departments within your company?"

B. "If voice and data communications are managed by separate departments, are there any plans to merge these functions?"

MEET OUR ERGONOMANIAC.

MIS/DP and communications are peer operations under a single executive.	35.3%
MIS/DP and communications are separate operations in separate groups.	30.5%
Communications is under MIS/DP.	29.8%
MIS/DP is under communications.	1.0%
Other	3.4%
Base	416

From page 67

Few executives manage both voice and data

Overall, only 30% of the companies surveyed said their MIS managers also oversee communications responsibilities (see chart). In 65% of the companies, MIS and communications are ruled by different groups. Of these companies, roughly half have communications and data processing as peer groups in the same department; the rest have MIS and communications reporting to different departments, with MIS typically reporting to finance and communications to general administration.

Interestingly, few companies reported they had a telecommunications director. Asked what the title of the person was that manages voice, more than 35% said director of operations/planning/administrative services. Only 12% said they had a telecommunications manager.

The survey also examined how local-area networks and private branch exchanges were used at these companies. These results will be printed in next week's *Computerworld.*

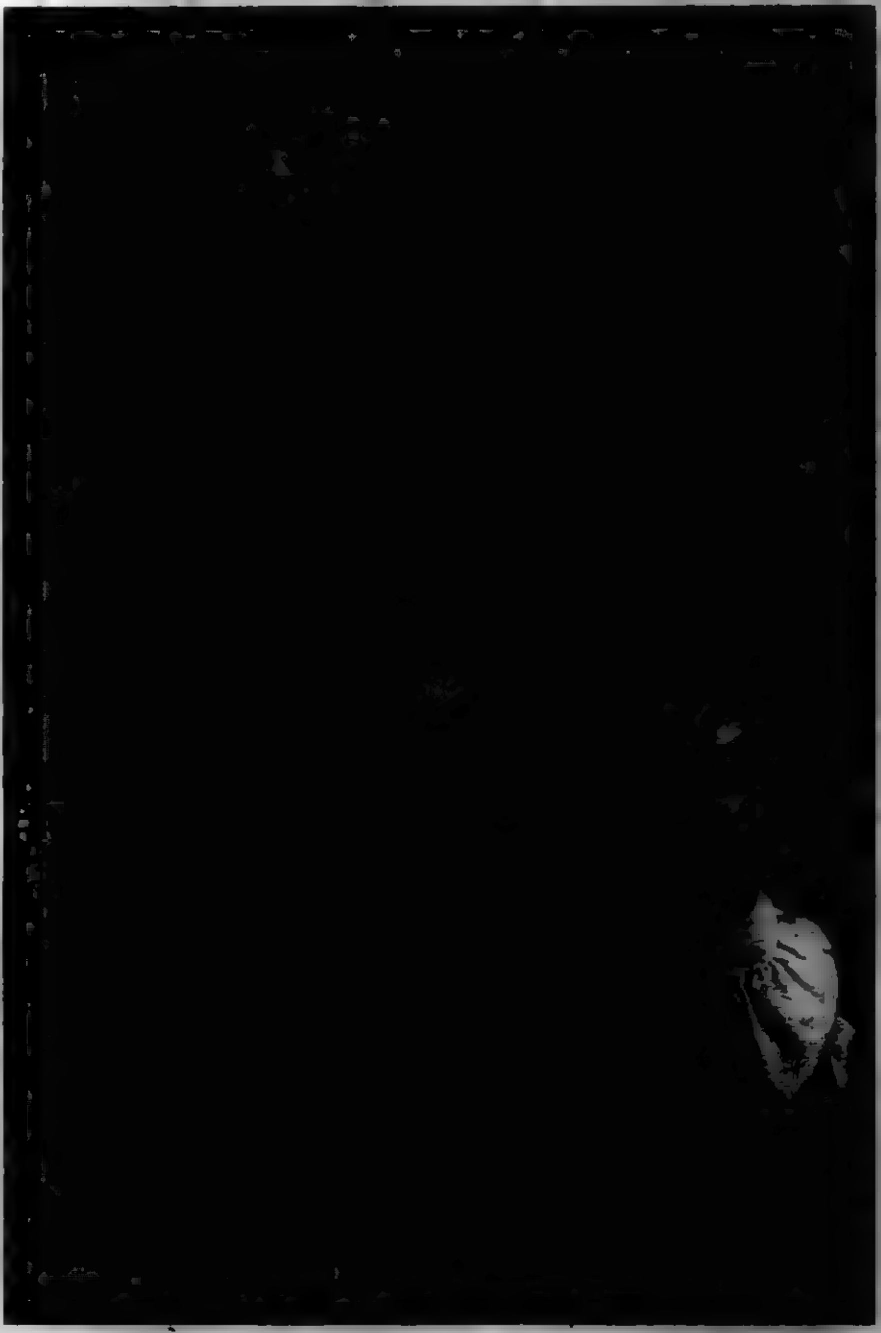
MARTIN MARIETTA

Looking for an information center system that handles just about anything they throw at you?



Trying to juggle end user demands without losing control?

Then you need Martin Marietta's RAMIS® II, the first information center system that's as good to you as it is to your end users.

RAMIS II is a comprehensive, integrated system. It enables your end users to develop everything from simple reports to complete personal applications without having to transfer data from one product to another. And it generates reports directly from VSAM, DB2 or almost any other file.

RAMIS II is the only product designed to support every level of user expertise. It offers a choice of a non-procedural language, easy-to-use menus and Artificial-Intelligence-based natural language processors for French or English.

What's more, with RAMIS II on the PC, you gain a stand-alone workstation or a seamless extension of your mainframe.

Now you can make end user computing effective in your company at last. With RAMIS II, another of Martin Marietta's Natural Selection™ products: an interrelated family of products that work with an extraordinary variety of machines, environments, applications needs and degree of user sophistication.

If you thought you'd never find a way to balance your needs with those of your end users, you're in for a nice surprise:

It's ready now.

MARTIN MARIETTA

CW-[illegible]

Martin Marietta's RAMIS II. We're ready now.

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

Peer-to-peer protocol debuts

Physical Units are used to describe types of devices used within an IBM SNA-type network. Equipment based on the Physical Unit 2 standard can only address IBM 370-based architecture in a hierarchical master/slave relationship. The Physical Unit 2.1 emulation enables peer-to-peer communications between a range of systems, including System/36 minicomputers and System/38 superminis, IBM 5520 Office Administration Systems, IBM Displaywriters and IBM Scanmasters.

Although Physical Unit 2 supports only a single communications link and one logical session per link, Physical Unit 2.1 can support up to 512 concurrent logical links, enabling that number of users to share the expense of a single physical cable.

"We don't think hardware, storage or the operating system are the constraints today. The constrained resource today is access to data," Rampel said. He noted that microcomputer board manufacturers can put the Orion software onto chips, and developers of local-area networks can use the facility as a gateway to connect two nets.

The principal advantage of LU6.2 is its accommodation of intelligent, low-cost network devices. "These days, data must be shared. The LU6.2 network design recognized this by permitting any device to talk directly to any other device without intervention."

The company offers its SNA6.2 Peer Communications Facility on a license and royalty basis.

Wang rolls out TMX facility

Wang Laboratories, Inc. of Lowell, Mass., has announced the Wang Telephone Message Exchange (TMX), an operator-attended communications facility for telephone messaging and directory services. The product features 24-hour telephone message retrieval without operator assistance.

With the Wang TMX, a telephone call is forwarded from a person's telephone to a Wang TMX Message Desk operator. The operator's workstation, a Wang Professional Computer linked to a Wang VS minicomputer supporting Wang Office Software, displays a personal profile created by the called party. The operator uses the profile to give a customized response and appropriate information, such as a relayed message or alternate contact.

The caller has the option of leaving an electronic message in the user's Wang Office mailbox, forwarding the call to a designated alternate or directing the call to the Wang DVX voice mail system for the caller to leave a personalized voice message.

The Wang TMX permits notification and retrieval of messages from any workstation in the Wang Office network. Wang Office messages can also be sent to a printer from a workstation or push-button telephone, according to the vendor.

The Wang TMX package consists of hardware and software for the Wang VS and Professional Computer. Hardware requirements include a VS with 2M bytes of main memory and a minimum of 147M bytes of disk storage, Wang Office software and a Wang Professional Computer with 640K bytes of memory.

The Wang TMX package will be available in the U.S. in the first quarter of 1986. The Professional Computer portion of Wang TMX costs $3,500 per workstation. The VS portion costs $500 per VS processor for a stand-alone system and $1,600 per VS processor when integrated with Centrex or the Meridian SL-1.

From page 67

Communications tool for file transfer bows

file names rather than learn specific vendor file naming and attribute conventions. It features interactive facilities for users to enter simple transfer requests and more complex sequences where request dependencies are required.

SNE File Transfer also allows a data processing professional to implement procedures in the product that automatically refresh file inventories within information center processors from production systems.

The system, which runs as an IBM Vtam application under MVS, supports IBM RACF security software and other Wang and DEC security systems.

The Software Research spokesman said that future releases in the SNE line will include electronic document interchange capabilities and support for IBM's VM, both of which are slated for release in the first quarter of 1986.

SNE File Transfer is currently available. The initial license fee is approximately $17,500 for an MVS host, $6,000 per minicomputer and $400 per personal computer.

From page 67

AT&T adds microwave bypass systems

dividual components, such as stand-alone radio products, or complete engineering, installation and maintenance. Options include local and remote alarms, centralized maintenance, hot standby protection, power options and signal encryption.

The Network Distribution Systems are custom priced and are available now from AT&T's Large Business Systems direct sales force. Prices for the simplest configuration start at $30,000.

PROTOCOL-CONVERTER COMPETITION AGAINST WALL

	WALL DATA [illegible]	PCI 270	[illegible] 74816	LOCAL DATA [illegible]/3274	[illegible] 74-18
MULTIPLE CONCURRENT PROTOCOLS OPTION	YES	NO	NO	NO	NO
DIALBACK SECURITY OPTION	YES	YES	NO	NO	NO
DOWNLOAD NEW PROTOCOLS	YES	NO	NO	NO	NO
REMOTE SW DIAGNOSTICS & LINE MONITORING	YES	NO	NO	NO	NO
$ PER LINE	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

If you're about to sign a purchase requisition for a non-Wall Data protocol converter, it would be in your best interest to throw your pen toward some non-populated area of the office. Trust us. You can retrieve it after you've read this ad.

You have all these ASCII minicomputer terminals and personal computers. Right? And you want them to be able to communicate to a host mainframe or a System 34/36/38, some perhaps over phone lines, in SNA/SDLC, BISYNC, etc. Right? And you've done your homework. Right?

Then ask yourself the same five questions your management and staff are guaranteed to ask you over the lifetime of the product. Over and over again:

1. Can you handle multiple, concurrent protocols to multiple hosts? Not unless your protocol converter is from Wall Data.
2. Is your data secure from unauthorized outsiders who dial in? If your protocol converter doesn't ask for a user's ID and then hang up and call back to the authorized phone number for that user, you're asking for trouble. Why not ask for Wall Data?
3. Can you just download protocol software when new protocols become available? Or when software enhancements are made? You can't with the others.
4. If you suspect there is a problem with either the system software or a data line, can you dial into the protocol converter's console port and do remote diagnostics? Yes, but only with Wall Data.
5. What is the price? Actually, it's quite high... if you aren't dealing with Wall Data. For all the above reasons. Plus the obvious fact that Wall protocol converters are the market price/performance leaders.

Now, about that pen you threw across the office. If someone asks you about it, just say you were conducting an experiment. Then ask them to kindly bring you your pen...and a blank requisition form. You can now conduct your experiment.

TRY ONE FOR TWO WEEKS, ON US

Now that you have that blank requisition form, call 206/883-4777 for help in filling it out. You can return the unit within two weeks without obligation. So far, we've shipped hundreds of units. We've gotten back two things: Prompt payment and stories of how our competitors have reacted to going up against ...the Wall.

SYSTEMS & PERIPHERALS

SHOP TALK/BAO T. NGUYEN

DBMS vs. data base machine

Despite advances, the technology of software data base management systems still has problems. These problems include excessive overhead and limited performance. A software DBMS consumes a significant portion of the resources of a general-purpose computer.

Performance suffers when many users access data and when the information required from the system calls for data relationships different from those originally defined for the system. Although the relational DBMS is much easier to use than its Codasyl counterpart — reducing both initial program development costs and long-term maintenance costs — the flexibility of the relational DBMS is appreciably slower. This is due to a fundamental mismatch between the architecture of CPUs designed for the sequential execution of algorithms and the architecture required for data management. Data management is inherently a parallel activity.

In other words, the general-purpose processor is asked to do something it was not designed to do.

Data base machines attempt to overcome the deficiencies associated with conventional architecture by using a special-purpose, functional architecture designed to handle different functions of data management simultaneously. They are used as back-end machines, freeing the host computer to perform the functions for which it is better suited, and as data base servers in a collection of networked workstations or cluster minicomputers.

The data base machine is one of two major categories of data base processors. While the data base machine offers all DBMS functions, the I/O off-load processor, the other category, is limited to the physical retrieval of data. The I/O off-load processor system does not offer DBMS, data dictionary or nonprocedural facilities.

The data base machine places the data base management function on a separate processor with exclusive access to the data base. The host machine collects data management requests and transmits them across an inter-

Single-vendor service

MIS execs report growing interest in concept

LEXINGTON, Mass. — The single-vendor service concept, where one vendor maintains all of a customer's equipment regardless of the manufacturer, is of increasing interest among management information systems directors, according to the Ledgeway Group, a market research and consulting firm.

In a recent telephone and mail survey of MIS directors in Fortune 1,000 firms, Ledgeway found a growing interest in having a primary vendor maintain other vendors' products, according to Ledgeway managing director Richard C. Munn. Ledgeway noted that 46% of the surveyed MIS directors indicated that they might be interested in the single-vendor concept. That 46% figure was obtained by combining the 15% who said, "yes" they would consider single-vendor service, and the 31% who answered "maybe" to the same question.

Munn said the most common benefits cited in connection with single-vendor service were elimination of finger-pointing among vendors and better coordination of diagnoses and repairs.

In addition to increasing interest among customers, the single-vendor service concept is gaining popularity among vendors, according to Munn. Among those vendors, the idea receiving "considerable attention" is that of having a single vendor act as the customer's service manager. Munn said that in such a role, the single vendor is responsible for fault diagnosis and isolation, repairing or managing a subcontractor making the repair and areas such as service contract administration.

But Munn noted that the service-manager concept is less popular with customers who prefer having their primary vendor service all equipment.

He also cited two surprising findings of focus groups conducted in conjunction with the survey. Those groups, one with customers and another with district and branch service managers, re-

Off-site storage protects data

HARD TALK
Donna Raimondi
CW Staff

Information is as important a resource as labor, capital and raw materials. As users begin to accept the need to protect their data, they would be wise to investigate storing copies of their magnetic media in safe places.

That is the advice given by Reginald Weller, president of National Safe Depository in San Jose, Calif., in a paper titled "Off-Site Data Storage: A Changing Industry."

Although Weller is president of a storage company and, therefore, has a vested interest in how people store their information off site, it is worth looking at his views. Too many companies still trust the Fates to keep their data safe and feel that they need not participate in disaster planning.

Information is one of the most fragile, volatile and easily destroyed of all corporate assets, and yet it is among the easiest of resources to preserve. Management can quickly calculate the cost of hardware and software, but few can state the value of their data base.

A key element in disaster planning and management should be an off-site storage program for one — or preferably two — sets of duplicate backup records, Weller advised. Off-site storage costs less than on-site storage, he said. He pointed out that the average storage account costs $200 to $300 per month, while a single in-house security guard could cost $1,800 per month.

The odds of a company's data base being destroyed decrease dramatically if the data base is stored in two or three locations, the paper said. One common yardstick for how far off site that storage should be is that data should be retrievable in two to four hours. This criterion varies from company to company, but most companies

"Everybody I talk to offers
that fit their products,

solutions
instead of my needs."

"Better talk to

AT&T.”

AT&T knows the
What you've already
as what you will buy.

Today, buying any computer product means thinking about where you've been—and where you're going.

AT&T understands this. Our computers are designed to protect your investment—with integrated products and solutions that help your system work *as* a system.

With AT&T Computers you can feel confident that your investment is and will remain a safe, sound business decision. It will pay off handsomely in increased productivity today and easy, efficient expansion tomorrow.

Three important questions:

Before making any investment in computers, invest a few minutes asking some tough questions. The answers from AT&T may surprise you.

1. Will the computer products I'm about to buy work with my existing system?

AT&T computer products conform to accepted industry standards. From minicomputers to modems, they're designed to fit in beautifully with your current IBM or compatible system.

In fact, AT&T Computers can talk to IBM® mainframes for easy access to host data using SNA/3270 or BSC/3270 protocols. Also available at a competitive price is the AT&T E4540 family of 3270-compatible controllers, keyboards and displays.

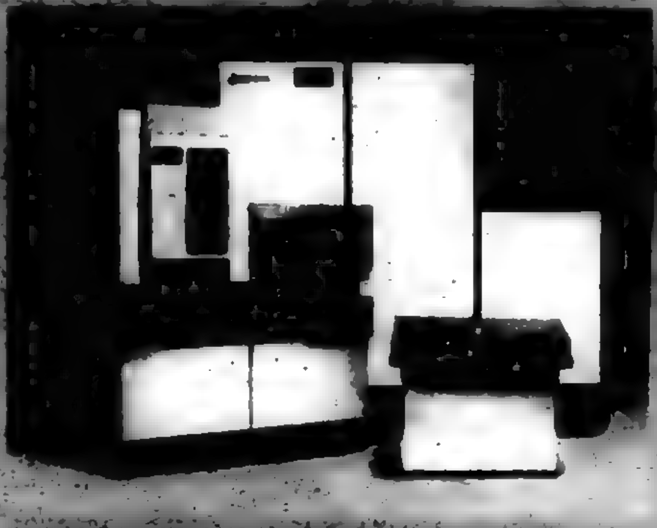
Our recently enhanced 3B Computers offer the performance advantage of UNIX™ System V in a departmental system, yet can be networked with existing MS-DOS™-based PCs.

Built on the principle of non-obsolescence, the DATAPHONE® II System is a full line of high-performance modems, multiplexers, data service units, and diagnostic control devices. These combine data transmission and sophisticated network management capabilities, thereby maximizing uptime of either simple or complex networks.

2. Will these products deliver the capabilities I need today? Am I getting my money's worth in terms of price and performance?

AT&T can answer "yes" to both questions.

reality of your computer needs. bought is just as important



THE COMPUTERS WITH THE FUTURE BUILT IN

[illegible] Computers

Our line of high-performance computer products can be linked together to cost effectively deliver end-to-end communication and information management—from desktop to department, and from department to mainframe.

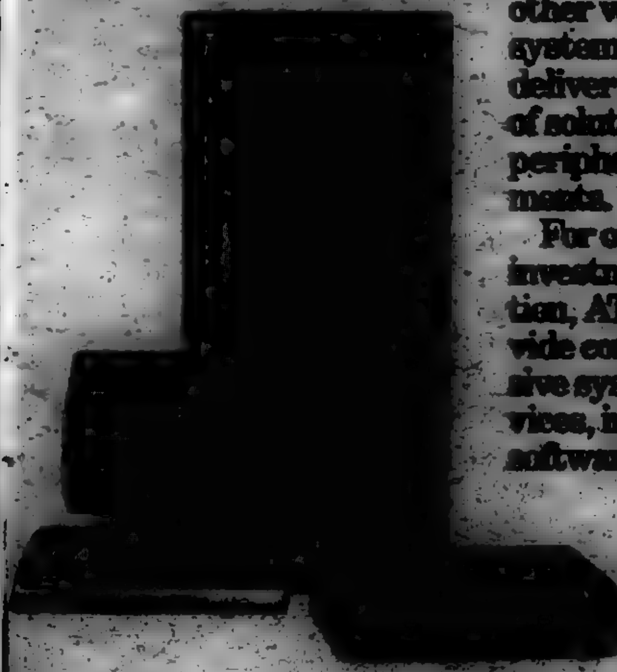
Our MS-DOS-based AT&T PC 6300 is twice as fast as the IBM PC, and has built-in color graphics capabilities and an easy-to-expand design.

Taking advantage of the UNIX System's multi-tasking, multi-user features, the AT&T UNIX PC offers a unique combination of power, ease of use and communications capabilities.

Our UNIX System V-based 3B Computers—five new or enhanced supermicro and minicomputers—provide distributed and departmental computing at a competitive cost per user.

We also offer full-featured, reliable peripherals—synchronous and asynchronous terminals, printers and plotters. Compatible with AT&T Computers and other vendors' systems, they deliver a full range of solutions to your peripheral requirements.

For ongoing investment protection, AT&T can provide comprehensive system services, including software development, system design, implementation, and training. A 24-hour technical hotline is available for hardware and software support.



AT&T DATAPHONE II System

3. What about tomorrow? Will these products keep my growth path open to accommodate future needs, especially in terms of networking capabilities?

No need to worry about the future when you start with The Computers With The Future Built In from AT&T.

As technology advances, AT&T will enhance and support its products, increase performance, and maintain compatibility with industry standards.

Our commitment to an open architecture and support of industry standards—MS-DOS, UNIX System V and SNA/3270 and BSC/3270 protocols—gives you the flexibility to satisfy your applications needs.

The power of the AT&T 3B Computer family can be networked in a variety of ways. Because they run UNIX System V, the 3B Computers offer an opportunity to build an open system with hardware independence and software portability.

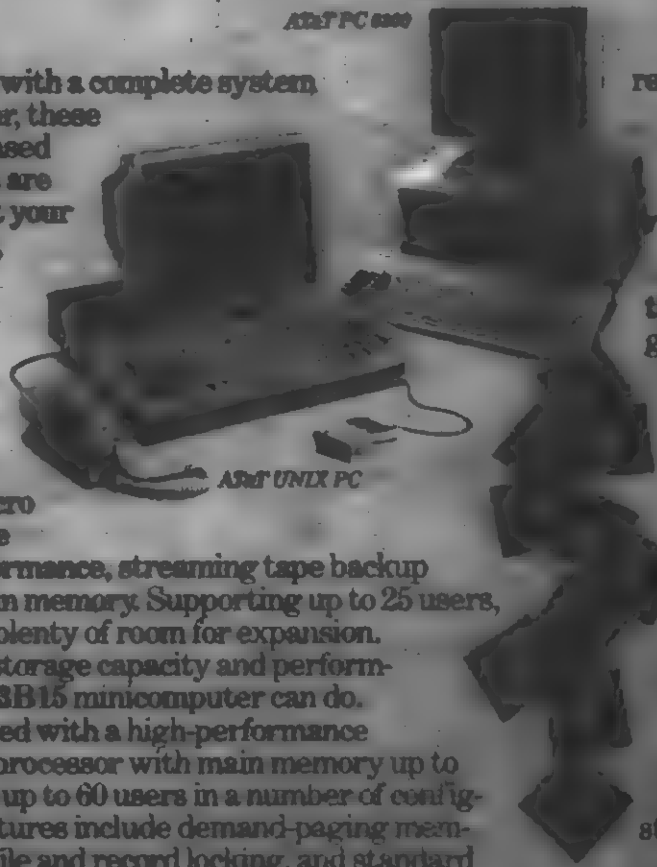
What's more, our UNIX System V software base is growing by volumes.

AT&T's Information Systems Network links your equipment in a single corporate-wide network. The AT&T STARLAN NETWORK is our low-cost local-area network that uses existing phone wiring to tie your PCs together.

However your needs change, one thing won't change: Your investment is protected with AT&T Computers.

For a more detailed look at what AT&T computer products can do for you, just turn the page.

See what makes AT&T computer products a sound investment.



AT&T PC 6300

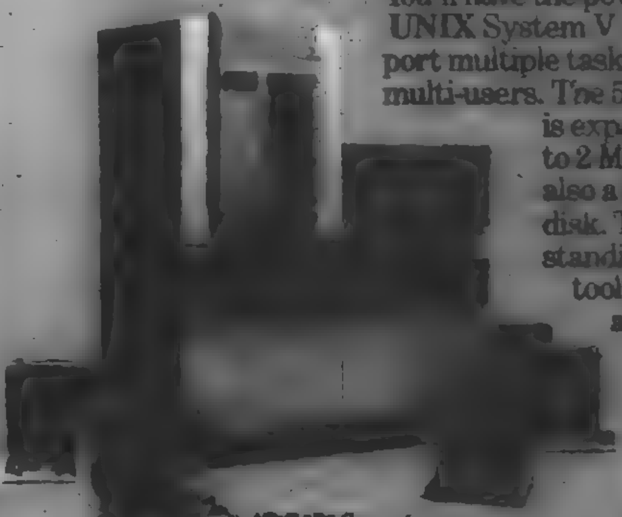
AT&T UNIX PC

Whether you start with a complete system or a single computer, these communications-based computer products are designed to protect your investments—past, present and future.

Our new **AT&T 3B2/400** Computer takes full advantage of UNIX System V. This true 32-bit micro offers full hardware floating point performance, streaming tape backup and up to 4 MB main memory. Supporting up to 25 users, the 3B2/400 offers plenty of room for expansion.

For even higher storage capacity and performance, see what our **3B15** minicomputer can do. The 3B15 is equipped with a high-performance WE™ 32100 microprocessor with main memory up to 16 MB. It supports up to 60 users in a number of configurations. Other features include demand-paging memory management, file and record locking, and standard floating point performance.

For those looking for the next step forward in personal computers, the **AT&T UNIX PC** offers a unique combination of computer capabilities. You'll have the power of UNIX System V to support multiple tasks and multi-users. The 512 RAM is expandable to 2 MB. There's also a 20 MB hard disk. This outstanding business tool also features a built-in modem and communications features to easily access remote processors and departmental file servers.

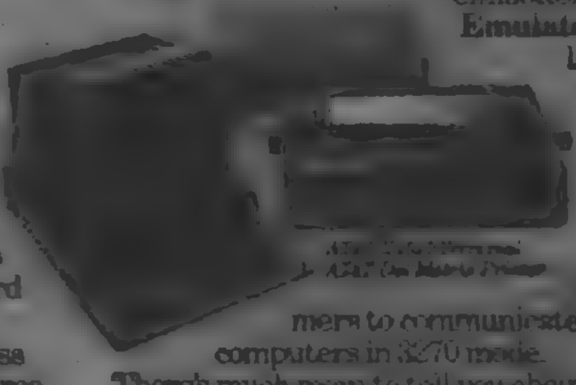


AT&T 3B5 Computer
AT&T 4418 and 4425 Terminals

The DATAPHONE II System is a family of digital and analog modems, multiplexers, data service units, and diagnostic control devices for multilevel network management and control. We have added the **DATAPHONE II [illegible] and 2600 Series Digital Data Service Units** to the family. An integrated DSU and channel service unit in one compact, easy-to-operate unit. It features a graphic LCD display for instant recognition of test results and is compatible with DATAPHONE II equipment.

The AT&T 6540 family offers true 3270 compatibility, and a choice of keyboards, controllers and screen colors. With Asynchronous Host Adapter option, you'll be able to switch back and forth easily between synchronous and asynchronous applications.

Our connectivity products conform to industry standards to insure that AT&T 3B departmental computers as well as desktop workstations can access your mainframe applications. For example, SNA 3270 Emulator + software provides fully configured SNA IBM 3274 controller emulation; BSC 3270 **Emulator +** software emulates the BSC IBM 3274 cluster controller.



[illegible]
AT&T Dot Matrix Printer

AT&T Application Program Interface access routines allow C language programmers to communicate directly to host computers in 3270 mode.

There's much more to tell you about AT&T computer products, and how they can help solve your business problems.

So before you invest your computer dollars, invest a few minutes of your time with an AT&T Information Systems Account Executive, an authorized AT&T supplier, or call 1 800 247-1212.

The right choice.

True CIM hinges on information link between systems

By Sheila L. Cotter
and Charles S. Skinner
Special to CW

True computer-integrated manufacturing (CIM) will not become a reality until manufacturers can freely exchange detailed product, manufacturing and other information among a variety of systems, be they computer-aided engineering (CAE), design and manufacturing or others.

For example, product data is needed to perform numerous manufacturing tasks such as numerical control equipment programming, process planning, tool design, production planning and control, quality control and assurance and the like. Similarly, manufacturing data is required by the engineering/design function to achieve cost-effective products.

The information link between CAD, CAE and CAM systems, unless on a system purchased from a single supplier, is still maintained largely with paper documentation using engineering drawings. This method requires a great deal of product definition interpretation. Automating this link requires a common product description that must be characterized by the following:

- Complete from a manufacturing as well as a design perspective.
- Usable by all the applications that need product data.
- Understandable by both people and the computer.

Issues to resolve

Even though the CAD marketplace is substantial, growing and includes some powerful key players, it has some fundamental issues to resolve:

- Failure to capture all product definition data needed for manufacturing and other functions of the enterprise.
- Inconsistent product information formats.
- Lack of compatibility of CAD equipment and software supplied by a variety of manufacturers.

Risks involved

Committing to a single supplier for one's CAD/CAM systems to acheive compatibility and integration is fraught with risks:

- The supplier may not continue to offer the most cost-effective systems available.
- Systems from a variety of suppliers may be required to meet a broad array of needs by numerous units of the enterprise.
- Compatibility of multisupplier CAD and CAM systems is required for the enterprise to interact effectively with customers and vendors.

Taking CAD systems as a case in point, communications between dissimilar systems are made possible through compatible networking and a common language like Iges.

Booz, Allen & Hamilton, Inc. conducted a nine-month study to test 12 different vender and user-developed Iges translators to determine the degree of compatibility between dissimilar CAD systems and thus the quality and level of implementation of the Iges standard.

The effort was performed under McDonnel Douglas Automation Co.'s Product Definition Data Interface project funded by the U.S. Air Force.

Based on these tests, which did not exhaustively examine every aspect of Iges but did provide an in-depth evaluation of its implementation, problems were found with both Iges itself and with the translators developed by the suppliers and users. At the time of the tests, no participant had completely implemented an Iges Version 1 pre- and postprocessor. There was wide and generally successful implementation of wire-frame geometry and annotation, but not of sur-

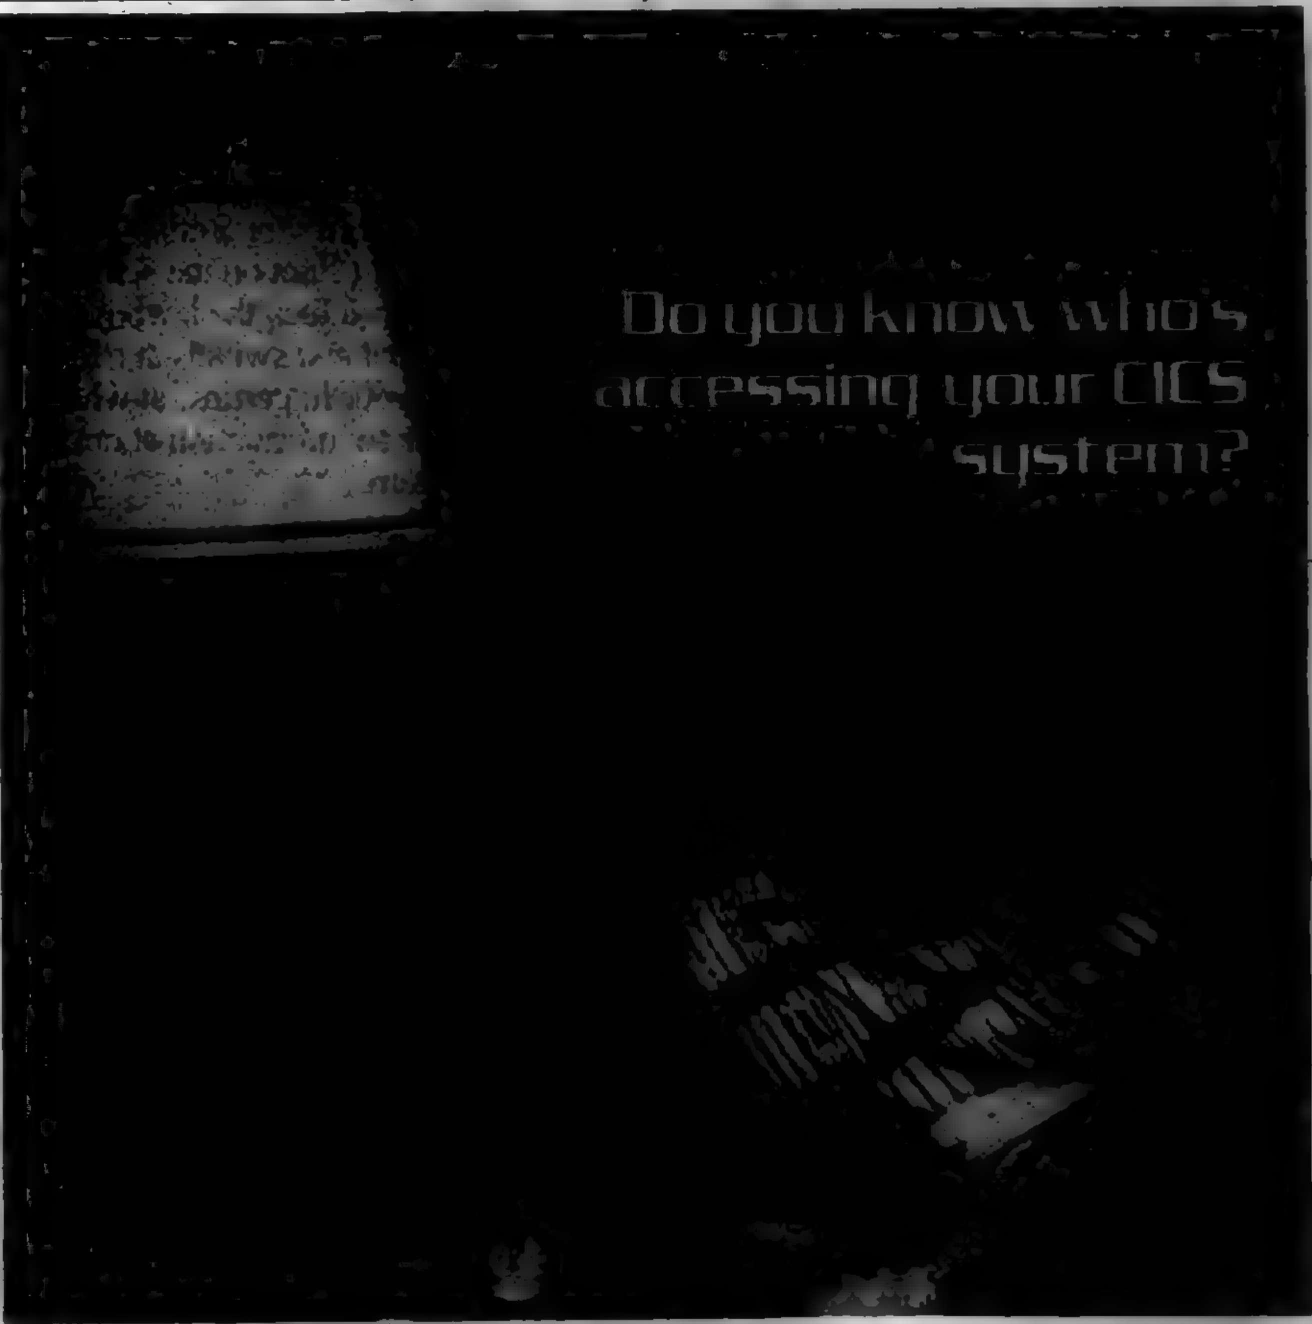
Cotter is an associate, and Skinner is vice-president for Booz, Allen & Hamilton, Inc. of Cleveland.



ALERT/CICS® allows you to avoid the threat of not having your CICS system adequately secured, by providing comprehensive security in an easy-to-use product.

As a completely menu-driven CICS security system, ALERT/CICS is designed for security administrators. There is no rules language to learn and no programs to write. You simply fill in the blanks of ALERT/CICS's security screens. Displaying exactly what each user is permitted to access is also very easy.

ALERT/CICS is comprehensive. With ALERT/CICS each authorized user is only permitted to access the transactions, programs, files, and fields within maps that were defined for that user. Terminal security is also available at each of these access levels.

You'll love ALERT/CICS's modular design, too! You can turn on as much or as little security as you want. This makes it easy for you to "phase in" ALERT/CICS's security.

So if you're uncertain about the security of your CICS system, call us today at 800-848-4640 to obtain more information. And start resting easy.

Off-site storage protects information

want access as quickly as possible.

According to Weller, storage customers should be aware that if data is stored in an on-site vault, the vault may remain intact in case of a fire, but the contents could be destroyed by heat. Buildings that have suffered fire, flood, earthquake, smoke or toxic gas damage are sometimes closed by health or fire authorities for several days — or even weeks — after a disaster, Weller said.

Del Monte's experience

That was the case with Del Monte Corp. in May 1983. The $3 billion food processing and distribution company's users were completely cut off from their main computer system for eight days that month when a transformer blew, leaving the systems intact but also leaving the threat of chemical contamination that made health authorities close the building.

The threat of damage by a company's employees should also be considered, according to Weller. Human-caused catastrophes include vandalism, arson, riots, strikes, sabotage, accidents, oversights and human error.

A company should undertake a careful risk analysis that identifies and measures the economic impact of various risks, Weller said. Management should ask itself the following questions:

- What will it cost if certain data is lost?
- How long can the company be closed, in whole or in part, without threatening its ability to survive?

Records should be classified by order of their importance to the company, Weller said. Critical data should receive off-site storage backup.

Noncritical data — data that can be regenerated if needed at a cost that is less than off-site storage costs — can be backed up on site in a way that keeps it protected as much as possible.

In selecting a backup site, companies should do the following:

- Visit all available sites within a chosen area, eliminating storage companies that will not allow a tour of their facilities.
- Check out the site for fire protection, climate control protection, access and delivery services.
- Meet the people who run the business and make sure you are comfortable with them.
- Obtain references from present customers.

From page 79

True CIM relies on data link between systems

faces and structure. Most were generally successful in dealing with the Iges format and translating the test cases.

Even though most of the identified problems were specific to certain sites, there were some generic Iges issues that required future resolution.

Wire-frame, two-dimensional and three-dimensional geometry has been successfully implemented because it is similar to and adequately replaces engineering drawing product design information. As a result, many CAD users are content with this well-developed aspect of Iges, thus minimizing the pressure on suppliers to develop more difficult surface representations.

Furthermore, Iges is not truly neutral in that it was based on early commercial CAD systems representations. Systems substantially different from Iges have greater difficulty processing some Iges entities.

Several development needs were identified from this survey that are key to achieving CIM. Many boundary representation solids are still approximations not suitable for numerical control programming because of product precision requirements.

There is a clear need for greater integration of shape and nonshape data structures and a definition of manufacturing data in computer-understandable form. Part features need to be defined. And, finally, product definition data formats need enhancement, and a single format needs to be agreed upon as an international standard.

From page 73

Single-vendor service concept growing in MIS

vealed that there is a degree of skepticism of single-vendor service and a feeling that the operations staff may be threatened by such coverage. The groups also showed that there is "considerable cooperation between service personnel representing different vendors at the local level." Munn theorized that that cooperation stems from the service representatives' allegience to their craft and a desire to avoid wasted time.

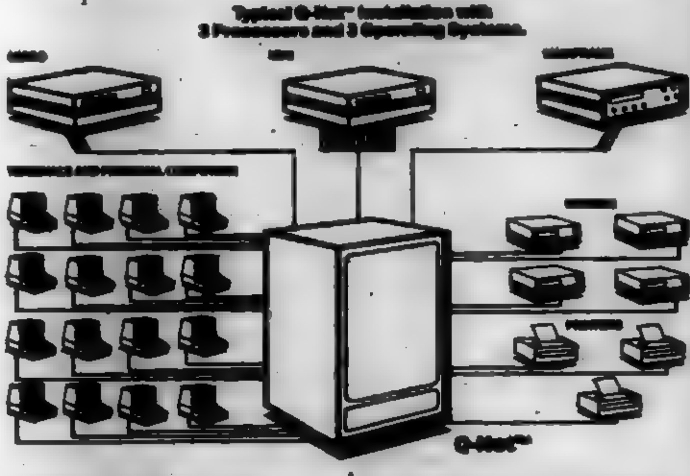
Munn noted that companies including AT&T Information Systems, Control Data Corp. and Digital Equipment Corp. have introduced single-vendor service and that other companies are offering such service on an ad hoc basis.

"This is a very difficult service to offer successfully, and there are a number of risks for any service vendor considering these concepts. At the same time there are opportunities to expand the range of services offered and certainly help gain more control over an account. As vendors expand and promote these services, there will be much greater competition for third-party service companies, and many smaller vendors will be relegated to subcontractor roles," Munn said.

The study, "Service in a Mixed Vendor Environment," and videotapes of the focus groups is priced at $2,750.

You'd fire an employee with as much "idle time" as your computers.

Q-Net,™ an intelligent switch, lets dissimilar CPU's communicate...work full time...suffer no system slowdown...all for as little as $100 per port!



Q-Net™ LET'S YOU TAP ALL THE SYSTEM CAPACITY YOU ALREADY HAVE.

Like many of us trying to maintain state of the art, you may have succeeded in achieving a "state of confusion" with a mixed bag of hardware, software, operating systems and peripherals. None of them communicate with each other. Many stand idle most of the time in spite of your need for more capacity. And when you try to network them, everybody using the system suffers "cursor creep"...a slowdown that gets worse with each new added station.

Chances are you may have all the computer power you need...if you could direct temporarily idle capacity in part of the system to stations where it is needed. The Q-Net Resource Manager allows you to utilize ALL of the capacity ALL of the time...simply and inexpensively.

PROVIDES UP TO 128 RS-232 PORTS.

With Q-Net you can interconnect up to 128 ports...including any combination of 8, 16, or 32-bit systems of any trademark, any operating systems, terminals, printers, modems, point of sale or other peripherals...with no degradation of the system. And even if your system should reach capacity, highly unlikely with Q-Net, the smart switch queues additional service requests for instant response at first availability.

The basic Q-Net system provides ports for 32 interconnections and is expandable in blocks of 32 ports to the maximum of 128.

DISPLAY REPLICATION FOR CLASSROOM OR SALES PRESENTATIONS.

With Q-Net, any terminal in the system can be designated "master" for a group. It can override all stations in the group and replicate displays on all screens. Stations, when released by the master, automatically continue at the point of interruption.

Call (800) 334-3595 toll free or (404) 996-6551 or write for literature and price list to Microscience Corporation, Dept. C, 8601 Dunwoody Place, Suite 136, Atlanta, GA 30338.

Inquiries from distributors, systems houses, and end users are welcome.

microscience corporation

From page 73

DBMS vs. data base machine

face to the data base machine. Status and results are accepted from the data base machine by the host and sent to the appropriate application programs.

The more a data base machine does in off-loading work from the host computer the better. However, there is a limit. The host machine should handle query translation, end-user facilities support, terminal communications, scheduling, formatting of user output data, system integrity and security and application logic.

The benefits of using a data base machine include the following:

- Host independence. A data base machine can interface with a wide range of machines.
- Flexibility. When expansion or upgrading is needed, the data base machine is more economical than the next larger computer.
- Performance. The architecture was designed to perform only data base management functions, so data base machines can perform data base operations much more quickly than a host computer can, and less powerful hosts can support required levels of response.
- Shared data base. Many different computers can share the same data base.
- Off-load host or isolation of DBMS overhead. Data management requires large programs and consumes a large percentage of a host computer's capacity. Moving the work into a data base machine frees the host to perform other tasks.
- Reduced cost. Data base machines cost substantially less than the hosts they off-load. Also, the intangible costs of a computer system's resources must be added to the tangible costs of a software DBMS, while the data base machine can support multiple hosts without duplicating peripheral equipment.
- Efficiently supported relational models. Relational data bases are powerful and flexible but are slow performers and heavy users of computer resources. Data base machines can efficiently support the relational model.
- Security. Data base machines provide a second level of security control:
- Speed. The processing speed of data base machines is limited only by the speed of the secondary memory.
- Central control. In a net environment, the data base machine provides a central data management facility. Several computers can share access to data stored on the data base machine because concurrency control and protection functions are implemented within the machine.
- Improved recoverability. As the data base management functions are separated from the host, the recovery of these functions becomes feasible without impacting the system.
- Modularity. The separation of functions enhances the concept of modularity through the system and translates to future growth by data base sharing through multiple machines.

In some cases a host processor must be connected to multiple data base servers, and, since many installations already have host processors interconnected on a local-area network, the data base machine should be connected in this environment.

To accomplish this, local network hardware must be standardized, since data base machine designers and manufacturers cannot afford to offer interfaces for more than a limited number of network types. Fortunately the Institute of Electrical and Electronics Engineers, Inc. is making progress in local-area network standardization.

The second level of standardization requires standardization of the communications protocol used by the host processors to communicate with the data base machine over the local-area network. For the U.S. Department of Defense, even with TCP/IP as a base, a higher level protocol — an application protocol — will be needed for standardization.

Specifications, development and adoption of such protocols by data base machine vendors will provide tremendous flexibility in purchasing and using data base machines.

There are several data base machines now, or soon to be, in production. These include the following:

- The Teradata Corp. DBC/1012.
- The Valence data base machine being built by Ordain, Inc.
- The IDM-500, built by Britton-Lee, Inc.
- Data base machines being built in other countries. There are two projects in France, two in Japan, one in West Germany, one in Italy and one in the UK.

STC to supply tape subsystem to Honeywell

In a $15 million multiyear OEM agreement, Storage Technology Corp. (STC) of Louisville, Colo., has contracted to supply tape subsystems to Honeywell Information Systems, Inc.'s Large Computer Products Division of Phoenix.

Under the agreement, STC will supply Honeywell with its 4600 series Fips tapes subsystems, a 200 in./sec. dual-density 1.6K and 6.3K bit/in. recording formats. Introduced in 1983, the 4670 features an optional 3M byte/sec. throughput rate.

A Honeywell official said the tape subsystems will be available in early 1986 with Honeywell's DPS 8, DPS 88 and DPS 90 systems.

COMPUTER INDUSTRY

Giants not ready for war

By Paul Korzeniowski

NEW YORK — Before AT&T and IBM can begin to compete directly, both must overcome challenges evident in the traditional markets each has dominated.

Archie McGill, who served in executive positions at both companies and is now president of Rothschild Ventures, Inc., a New York investment firm, made that claim recently at "IBM — AT&T, New Technologies, New Directions," a seminar sponsored by the New York-based market research firm, Eastern Management Group.

Even if both companies do make the necessary moves, head-to-head competition will not take place until 1990, he said, adding that analysts have underestimated how much effort is needed for either company to forge a presence in the other's market.

A primary challenge that IBM faces is that mainframe sales have peaked and are now the slowest growth area in the industry. "I expect that the 3090 series announcement will increase IBM's mainframe sales, but sales will not grow more than 7% a year," he said.

Users are confused by changes in the industry and are looking to companies like IBM for answers, but the big companies have failed to deliver on promises, he said, citing IBM's yet-to-be-introduced local-area network.

Many analysts have praised the purchase of Rolm Corp., but McGill claimed that IBM will have problems digesting the communications company. "IBM will need a few years before it realizes a profit from that acquisition," he claimed.

Rather than purchasing companies; McGill predicted, Big Blue will enter more joint marketing agreements like those inked with MCI Communications Corp., Stratus Computer, Inc. and Bytex Corp. "Not even IBM has the breadth to compete with all companies on all fronts," he noted.

AT&T, on the other hand, faces the most complex and complicated challenge in the history of American business, according to McGill. "The company has to change revenue and profit streams that have existed for more than 100 years," he explained.

Compounding the problem is that every one of AT&T's revenue streams is under pressure. The

'Fit' vital in buy-outs

Acquisitions should complement strategy

By Clinton Wilder

NEW YORK — The most successful corporate acquisitions are motivated by strategic rather than financial considerations, according to an executive of one of the most active corporate buyers of software and services firms during the last five years.

Peter Lessler, director of acquisitions for Dun & Bradstreet Corp., told a recent industry forum that regardless of how attractive the cost of a potential purchase may be, financial issues should only be considered after measuring the strategic fit of the buy-out candidate.

"Understand the dynamics of the market you're thinking about entering — who's gaining market share, who's losing and the position of the acquisition candidate," Lessler said at the Association of Data Processing Service Organization, Inc.'s (Adapso) annual seminar on mergers and acquisitions activity in software and DP services. "The company to be acquired must fit the acquirer's profile in marketing, product direction, operations and, most difficult to assess but perhaps most importantly, in management characteristics."

Lessler noted that Dun & Bradstreet, after making 33 acquisitions during an 18-month shopping spree, including McCormack & Dodge Corp., is now trying to build on its existing businesses rather than continuing to diversify.

Considerations to assess the proper fit, Lessler said, include the current and potential product and geographical overlap in marketing and the potential for sharing technological resources. In market position, the most likely software and services acquisition candidates have small to medium

Global-Ultimacc looks ahead

By Peter Bartolik

The management team at Global-Ultimacc Systems, Inc. gained a new lease on life recently when the U.S. Bankruptcy Court in Denver approved the sale of Storage Technology Corp.'s (STC) majority ownership in the firm.

Charles J. Siefert, chairman of Waldwick, N.J.-based Global-Ultimacc and one of the five company executives who bought out STC, said in a phone interview that he expects Global-Ultimacc to regain profitability by the end of the year.

"The major change, and we've already seen it happen, is the perception in the marketplace," he said. "Customers are no longer concerned about us being pulled into bankruptcy; technically, STC could have done it any time. All they had to do was call their debt."

Global-Ultimacc absorbed the customer base and field engineering force of bankrupt Magnuson Computer Systems, Inc. and markets IBM 4300 plug-compatible systems and turnkey systems. Siefert said the company hopes within weeks to be able to announce an OEM agreement providing a next-generation processor but said he could not provide details until the deal is finalized.

After watching revenue almost double in 1984 to $29 million, the company was essentially left out in the cold when STC filed for reorganization protection last winter. The situation was critical because Global-Ultimacc depended exclusively on STC for most

Adapso winning Pyhrric victories?

INDUSTRY INSIGHT
Peter Bartolik
News Editor

Let's face it, sometimes industry lobbying groups get carried away with the thrill of victory and neglect to consider the seeds of discontent that could someday lead to the agony of defeat.

A case in point — the Association of Data Processing Service Organizations, Inc. (Adapso) in the latest issue of its newsletter, "Adapso Data," begins with the headline "Adapso victorious on California warranty bill."

The text thereunder went on in more humble terms to explain that "due in large part to Adapso's coordinated opposition," a California Assembly committee suspended any action on AB 1507. That bill, for those who haven't been following the revolutionary actions of its sponsor, Assemblywoman Gloria Molina, would have, Adapso explained, "dramatically changed the relationship between buyers and sellers of computer hardware and software by prohibiting the disclaimer of implied warranties while requiring developers to provide a refund or replacement if a product did not meet users' expectations."

Perish the thought that the seller of a product should be required to actually deliver on his promises!

Here's a typical disclaimer, taken from a Microsoft Corp. package, of the type that Adapso is so committed to preserving: "The program is provided 'as is' without warranty of any kind. The entire risk as to the results and performance of the program is assumed by you. *Should the program prove defective, you (and not Microsoft or its dealers) assume the entire cost of all necessary servicing, repair or correction* [emphasis added]. Further, Microsoft does not warrant, guarantee or make any representations regarding the use of or the results of the use of the program in terms of correctness, accuracy,

Major lessors shun Comlease

By Maura McEnaney

NEW YORK — During a year of waning trade show attendance, a group is venturing into untested waters, launching what it claims to be the first trade show on computer leasing.

But like many of the shows this year, next week's Computer Leasing Conference and Exhibition (Comlease) seems to hitting a period of vendor apathy. Some familiar names, such as Citicorp Industrial Credit, Inc., Greyhound Capital Corp. and World Leasing Co. will be present. But Comlease will debut without the participation of several leasing giants, including IBM Credit Corp.; Comdisco, Inc.; Dataserv Equipment, Inc.; and CMI Corp.

Show manager Ken Burroughs told *Computerworld* approximately 20 exhibitors have accepted booth space at the show, scheduled for Sept. 30 to Oct. 2, at the Marquis Hotel here.

An IBM Credit spokesman said Big Blue received information about Comlease after the com-

Contracts key for clarifying software owner's rights

FOURTH IN A SERIES

By Jerome J. Roberts,
Marianne D. Paine
and Michael P. Brownell
Special to CW

A contract provides two indispensable elements in any software protection plan: It implements and amplifies the rights and duties arising from intellectual property law; it also provides a mechanism to create additional rights and duties, enabling the software owner to protect elements of software products not otherwise protected by intellectual property law.

Contract protection provides the glue to bring together all available protective tools into a comprehensive and cohesive proprietary protection plan.

Contract protection of software should be in writing, preferably signed by both parties. Written contracts should be used for any transaction involving the disclosure or development of proprietary software such as software licensing, software development projects, marketing and distribution arrangements, beta test site situations and employment and independent consultant relationships. Confidentiality agreements of a general nature can be utilized for miscellaneous circumstances in which proprietary information is to be disclosed.

The presence of a written agreement does not automatically ensure adequate contract protection of the relevant software proprietary interest. Often, unfortunately, such contracts fail to allocate the parties' respective rights and duties relative to important proprietary rights issues. Without contractual guidance, such issues will be resolved by statutory and/or common law principles, often yielding uncertain, unexpected and undesirable results.

Each software-related contract will present certain proprietary rights issues specific to it. Consequently, specific contractual measures necessary to protect software require a case-by-case analysis. The following, however, are some of the topics that should be addressed:

- Proprietary materials should be defined as completely as possible. Such definitions often address the following considerations: the type of software element, for example, programs, documentation or report formats; medium of expression, for example, source code, object code, microcode; media on which the software resides; and accompanying manuals and other documentation.

The definition should extend to all copies of the software and related materials made by the recipient, as well as to all software modifications furnished by the owner — and possibly created by the recipient. Finally, the applicable proprietary rights existing in and arising from the software and related materials should be recited.

- The respective rights and interests of the parties in the proprietary materials to be disclosed and/or created must be delineated carefully. In a software license, the

Contracts key in software mart

owner should reserve ownership and require the licensee to acknowledge the same. The issue of ownership may be a subject of debate in contracts calling for software development. In employment agreements, the employer should retain ownership of materials created by the employee in the course of his employment.

■ The purposes for which the recipient is permitted to use the software must be defined clearly, and measures used to protect the owner's interests in the software should be specified. Restrictions on use, copying and disclosure of the software may be in order.

Examples particularly appropriate for the software license include the following: Use of the software should be limited to those activities reasonably related to the purpose of disclosure; if copying is permitted, it must be limited to specific purposes and quantities, and all copies should contain the proprietary legends appearing on the original software or as otherwise directed by the owner, and the recipient should notify the owner upon suspicion of misuse.

■ A provision should be inserted that requires the recipient to return or destroy the software upon the termination or expiration of the purpose of disclosure.

■ The recipient is often required to indemnify the owner against any loss or expense incurred as a result of the recipient's failure to comply with its proprietary protection obligations.

■ The agreement should state that the recipient's proprietary obligations survive termination or expiration of the agreement for a specified time period or until the software ceases to be proprietary to the owner.

ITC drops Tandon's trade suit

WASHINGTON, D.C. — The U.S. International Trade Commission (ITC) recently dismissed Tandon Corp.'s unfair trade practices suit against South Korean disk drive manufacturer Gold Star Tele-Electric Co.

The ITC refused to bar imports of Gold Star disk drives, upholding a previous judge's ruling that Gold Star did not violate international trade regulations by importing its 5¼-in., half-height, double-sided drives into the U.S. in 1984. But Tandon's related $150 million civil lawsuit against Gold Star is still pending in U.S. District Court in Los Angeles.

An attorney for Chatsworth, Calif.-based Tandon said the ITC case had essentially been moot since December 1984 when Gold Star stopped importing the drives in question. But Gold Star spokeswoman Darlene Rabe said the ITC's ruling should help in the federal court case, in which Gold Star has filed counterclaims charging Tandon with abuse of process, antitrust violations, business and contractual interference and unfair competition. "The ITC ruling upholds what has been our position throughout the case," Rabe said.

The case stems from Tandon's allegations that the Gold Star products were based on technology stolen from Tandon by current and former Tandon employees. The employees helped to found now-defunct Format, Inc. of Los Angeles, which manufactured the drives for Gold Star, according to Tandon attorney Raymond Lupo. Tandon also accused some of the Format founders with sabotage and industrial espionage while they worked for Tandon.

The Gold Star case is not related to Tandon's pending cases before the ITC and in federal court against several Japanese disk drive vendors.

"Somebody does."

Hewlett-Packard. Whether it's for presentation graphics, design and data analysis, or alphanumerics, you can adapt our new terminals to the task. Use the keyboard, or the optional touchscreen. Or daisy-chain a graphics tablet, mouse and barcode reader into a single input port.

This leaves an output port free for a printer, plotter or film recorder. Our new terminals even work with ANSI-speaking computers like DEC. And with a lot of third party software like PLOT 10. All this HP quality costs just $2095* for the monochrome HP 2393A; $3095* for the color HP 2397A.

For details, call your local HP office or (916) 786-0196. In Canada, call 1-800-387-3867.

AT&T strong in large user mart, weaker on other fronts

NEW YORK — AT&T has defended and strengthened its hold on the large user long-distance marketplace but has not made significant inroads in other areas, according to a market research firm.

Approximately 1% of the communications company's customers supply AT&T with 40% of its revenue, according to Eastern Management Group of New York. The firm presented its analysis at a recent seminar titled "IBM and AT&T, New Directions, New Technologies," held earlier this month.

Most large customers have experimented with long-distance services from common carriers such as MCI Communications Corp. John Malone, president of Eastern Management, claimed that eight out of every 10 of the Fortune 100 companies have some type of agreement with a carrier other than AT&T.

However, AT&T controls 96% of the market that consists of companies spending $80,000 a month on long-distance calls. "Large companies tested services from vendors like MCI but have returned to the AT&T fold," Malone said. Poor service drove those companies back to AT&T.

Since divestiture, AT&T has entered a number of new markets. The company competes with Digital Equipment Corp. in the minicomputer market, IBM in the personal computer arena, Ungermann-Bass, Inc. in the local-area network niche and foreign telephone companies. However, these moves have done little to increase AT&T's profits, according to Malone.

A better way for AT&T to improve its financial position would be by cutting costs, Malone claimed. A principal area to reduce costs would be in fees paid to former regional operating companies. AT&T is spending close to 60 cents on each long-distance dollar for access charges to the operating companies. "That 60 cents is money disappearing out the back door," Malone noted. If AT&T could bypass the local connection, it would significantly cut costs.

Also, AT&T is paying the operating companies $2 for each bill sent to AT&T customers. "AT&T has to be losing money billing residents who make few long-distance calls," the analyst noted. By taking the billing function in-house, the company could eliminate the $2 charge.

AT&T does not have any avenues for rapid revenue growth. Eastern Management does not think that the private branch exchange market represents a great opportunity. "AT&T has done a better job selling its PBXs this year than in any other year and has increased its market share," he said. "But the rate of growth in the PBX market has declined and will continue to decline."

In 1984, the communications company announced 100 products primarily directed at the computer industry. Despite the slew of introductions, sales from 3B or personal computers accounted for only 3% of AT&T's revenue. Malone estimated that AT&T Information Systems, which delivered most of these products, lost $1.5 billion dollars in 1984.

The analyst concluded by predicting that AT&T will have to sharpen its focus on its communications services and choose a few markets to enter rather than competing on a number of fronts.

— Paul Korzeniowski

From page 63

Grants not ready for war

communications company is losing its stranglehold on the long-distance market, which is growing at a rate of only 5% per year. The company could face severe cash-flow problems as it attempts to diversify its business, according to McGill.

AT&T has always been action oriented and would immediately announce products that were technical breakthroughs. In 1984, the communications company launched technically oriented product thrusts rather than marketing-oriented product entries.

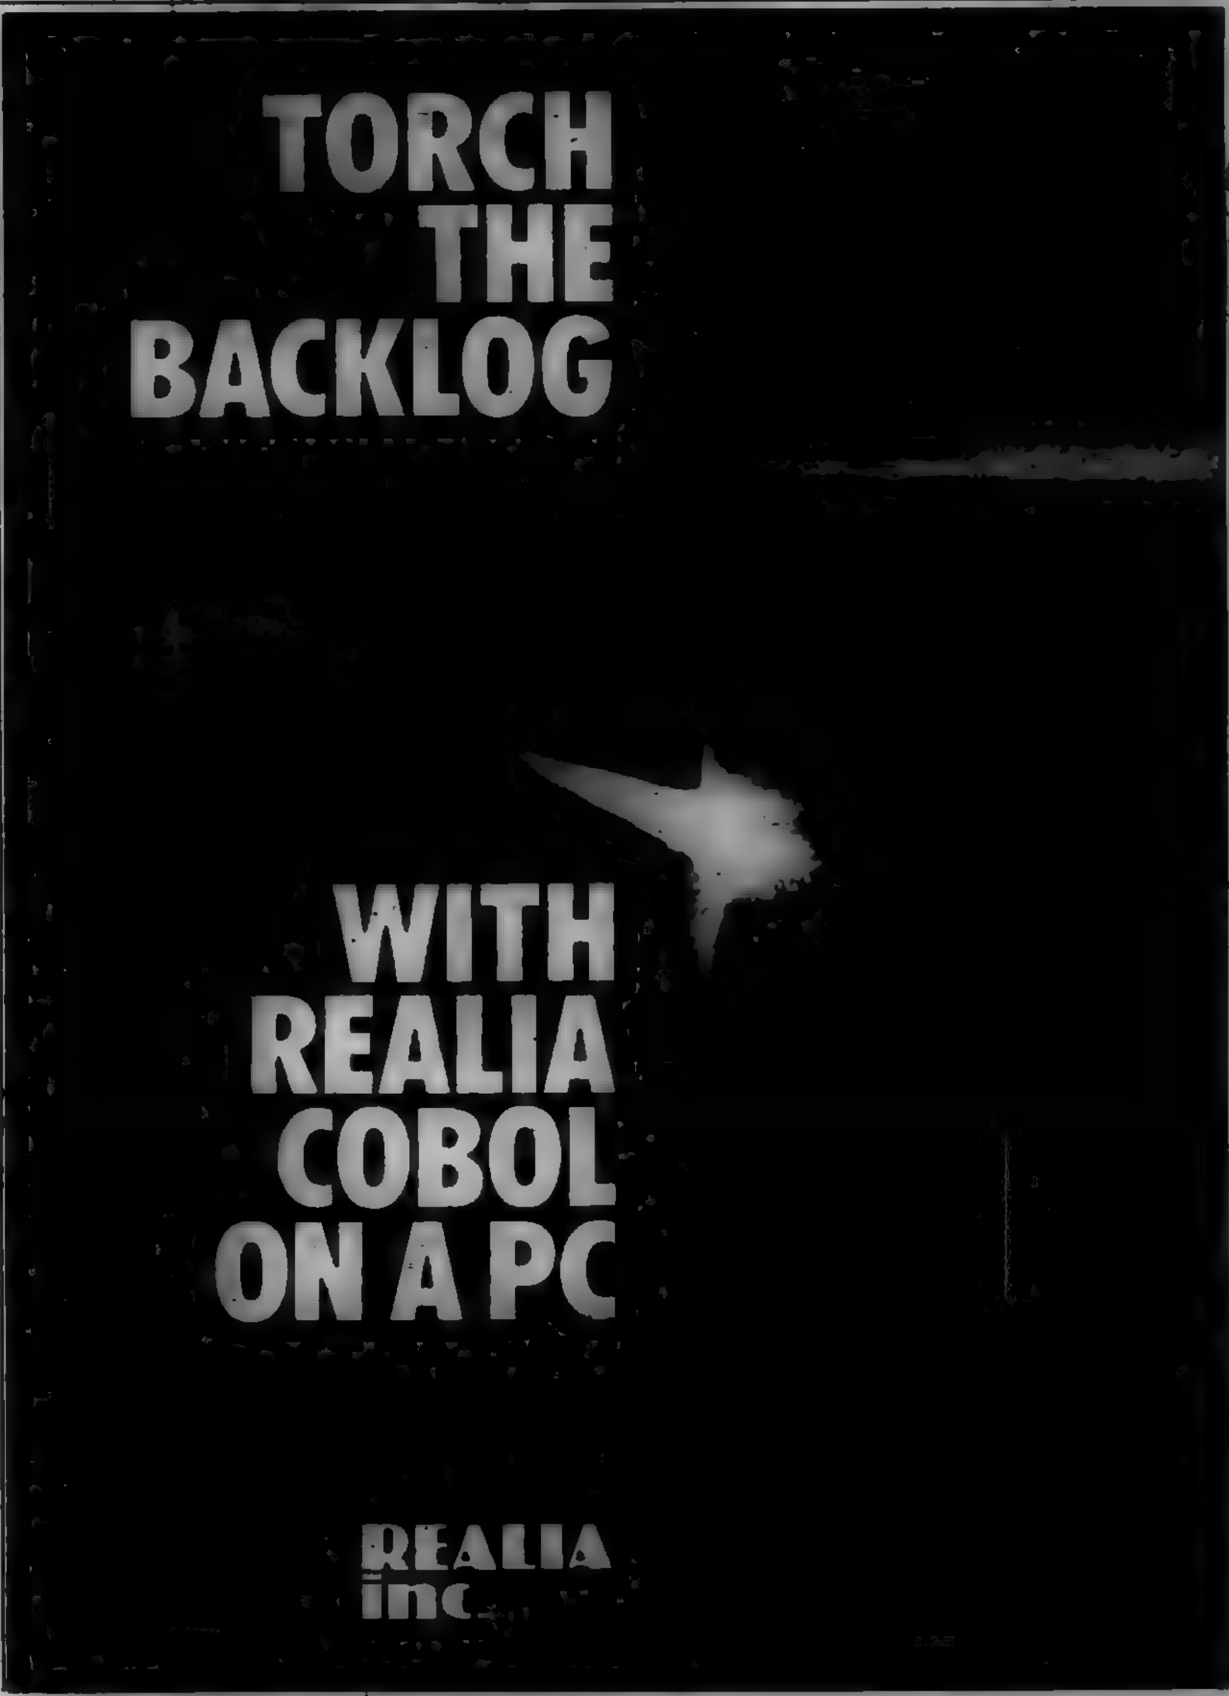
"Technically, the 3B line has some very nice machines," McGill noted. "Its problems are software and AT&T's inability to convince companies to write for the machine."

He said AT&T has saddled each positive step with negative connotations, pointing to the recent layoff of 24,000 employees. "The company knew in 1984 that such a move was needed," he said. "I don't understand why it waited so long to make it."

McGill also classified the AT&T-Ing. C. Olivetti & Co. partnership as a stroke of genius. "AT&T needed an entrance to foreign markets and Olivetti provided it," he said. Even though that was a good move, AT&T has not worked that or other partnerships to the fullest advantage.

McGill echoed the views of other analysts who claimed that AT&T needs an office automation partner like Data General Corp. or Digital Equipment Corp. to make inroads into large corporations.

For either IBM or AT&T to succeed, each must be able to throw away old methods of doings things and quickly adapt to new marketplaces.



Haven't you always dreamed about multiple sessions?

**INTRODUCING PIE SOFTWARE,
MULTIPLE SESSIONS AND MORE.**

With multiple sessions on your terminal everything that was impossible becomes possible. You just press a key to switch between applications (TSO to CICS or IMS), environments (MVS to VM to DOS), CPU's (Chicago to New York to Los Angeles), etc.

PIE is the advanced technology that provides a unique degree of flexibility and performance. The "preferred environment" approach of PIE delivers multiple sessions using only single sign-on ID.

HERE'S WHAT PIE DOES:

When you log on to your "preferred environment" PIE automatically establishes your multiple sessions. Your installation can control who uses PIE, how many sessions they are allowed, what applications they can use, etc. PIE has a status menu that shows you a summary of all your active sessions.

You can switch back and forth between up to 12 sessions with a simple keystroke. All displays are saved exactly as you left them – even the cursor is in the right place.

New sessions can be started automatically or selected from a menu of available applications.

WHAT ABOUT PIE COMPARED TO HARDWARE SOLUTIONS?

"PIE provides more facilities than a 3290 or 3270PC without the overhead or expense," says the Director of MIS for a major insurance company.

"For less than the cost of a couple of 3290 terminals, we bought PIE and gave multiple sessions to over 200 users," says the Data Center Manager of a Fortune 100 company.

HOW ABOUT COST JUSTIFICATION?

"First year savings because of PIE exceeded $106,000," said the Manager of Technical Services for an East Coast manufacturer.

"There are people literally saving hours of time per day because of PIE. As an example, the first day we installed PIE, our security officer saved over two hours work after only a five minute demonstration," states the Capacity Planning Manager of a Midwest consulting firm.

WHAT ABOUT PERFORMANCE?

"PIE dramatically reduced response time, boosted productivity, eliminated extra terminals, and provided these benefits virtually without restriction," said the Data Center Manager of a top financial institution.

"I don't know how PIE does it, but with over 200 users we haven't noticed any increase in resource consumption," quotes the Manager of Systems Programming at a Southwest data center.

PIE/TSO, using ONLY ONE TSO-ID, allows you to switch between multiple ISPFs, SDSF, RMF, OMEGAMON, SAS, FOCUS, INFO/MVS, CICS, DISOSS, IMS, IDMS, VM, NCCF, etc. on the same terminal at the same time. You have dataset menus, full screen TSO Help, the ability to pass screens back and forth between users or capture screens to notepad or disk (great for help desk, documentation, troubleshooting, etc.).

PIE/VM gives the VM user up to 12 sessions of CMS, PROFS, DISOSS, or any guest application such as CICS, SAS, FOCUS, TSO, MVS/consoles. Application menus, single sign-on, PF Key assignment, and more make PIE/VM a powerful tool. You also have full protocol conversion – any Personal Computer or ASCII terminal can interface to any application as a 327x terminal.

PIE/CICS provides tremendous application benefits by running multiple CICS transactions simultaneously from the same or different CICS as well as connections to any other VTAM application such as IMS, TSO, ROSCOE, etc.

PIE also comes with "pop-up" help, notepad, prompt, and menu windows that appear and disappear leaving your screen intact.

And PIE enchances your present security system. You can manually "lock" your terminal or have it lock automatically when you walk away from it.

Over 250 installations are now doing the impossible with PIE's advanced multiple session tecnology. No IPLs or changes are required to your operating system, applications, security systems, or software tools. PIE installs in 20 minutes and is immediately ready for you to use.

Call or send in the coupon today... and get a complete data kit on PIE, the hottest selling software for MVS and VM.

AMD announces plan to unveil one product per week

By Clinton Wilder

SUNNYVALE, Calif. — In the midst of its first operating loss in 10 years and the continued pessimistic indications for the semiconductor industry, Advanced Micro Devices, Inc. (AMD) recently announced an ambitious scheme to introduce one new product per week during the fiscal year beginning Oct. 1.

The new chips, which would represent roughly twice the number of products AMD introduced in the past year, will include bipolar Cmos and Nmos technologies.

AMD unveiled the plan in conjunction with the announcement of its operating deficit, a $14.4 million pretax loss for the quarter ended June 30. With the loss, AMD became the latest major U.S. chip maker to post an operating loss in the current semiconductor slump, the industry's longest and deepest ever.

After tax credits, AMD was able to post a bottom-line profit of $739,000, or 1 cent per share, for the quarter. Revenue was $150.5 million, a 36% fall from $234.2 million in the same quarter a year ago. AMD earned $38.2 million, or 66 cents per share, in the year-earlier period.

The slackened demand cited by AMD in announcing its results showed little sign of abating in the industry's leading growth indicator, the book: bill ratio. The ratio of new chip orders to shipments in August was .74, up barely from .72 the previous month, but still lower than any other month since February.

The San Jose, Calif.-based Semiconductor Industry Association predicted that semiconductor billings in the third quarter will be down 28% from 1984 levels.

With the worst slump in demand coming in so-called commodity chips, such as 64K-byte random-access memory circuits, AMD is reportedly attempting to move more agressively toward sophisticated, application-specific products in the next 12 months.

"Even with demand down overall, it turns out that you can sell new products," AMD spokesman Elliott Sopkin said. "The computers that are being sold are the ones that have a technology advantage, and those improvements are achieved by technologically advantageous circuits."

One industry analyst expressed skepticism about AMD's product goal. "If you're considering every rerouted gate array a new product, that's one thing," said James Feldhan, vice-president of In-Stat, Inc. in Scottsdale, Ariz. "Their goal gets harder and harder to achieve as applications get more specific. Even a new gate array takes a couple of weeks to run through. But if it's possible, AMD is one of the better companies to try it."

Japanese firm to buy exchanges

By Takahiko Kondoh
Special to CW

TOKYO (CWN) — Daini-Denden, Inc., one of the first Japanese companies to step into direct competition with Nippon Telegraph and Telephone Corp. in the now-private telecommunications marketplace, recently announced it will purchase digital exchange systems in an estimated $10 million deal with Digital Switch Corp. of Richardson, Texas.

Daini-Denden is a group of 225 corporations, led by Kyocera Corp., Sony Corp. and Mitsubishi Corp.

Daini-Denden reportedly made its debut after a series of three telecommunications business laws were enacted in Japan last April, forcing Nippon to go private and withdraw from its decades-old monopoly of domestic telephone and telegraph services.

Open procurement policy

Apparently to soften U.S. complaints about closed markets in Japan for foreign-built telecommunications equipment, Daini-Denden had committed itself to an open procurement policy with which to treat overseas vendors without bias.

Major manufacturers, such as AT&T, Northern Telecom of Canada, NEC Corp. and Fujitsu Ltd., reportedly had vied for a Daini-Denden contract for digitized telephone exchanges.

The two other new telecommunications companies, Japan Telecom Co. and Japan Teleway Co., previously decided to purchase similar equipment from undisclosed Japanese makers.

Contract in the U.S.

In the U.S., according to Digital Switch, the turnkey contract calls for the firm to provide four DEX 600 switching systems and a network control center, as well as training and support.

The contract also provides for options, the company said.

Kondoh is international editor/Asia for CW Network.

IF YOU HAVE NEVER SEEN SPITAB®, YOU HAVE NEVER SEEN AN ON LINE TABLE MANAGEMENT SYSTEM!

Your applications use a huge quantity of tables.

SPITAB will simplify the task of organizing and managing tables.

SPITAB reduces development and maintenance costs by eliminating the need to write programs to manage tables.

Allows your end users to maintain their own tables. Improves the performance of your applications by optimizing accesses to tables.

SPITAB supports DOS, MVS with CICS (VSAM, DL1), IMS/DC, IDMS.

'Fit' imperative in buy-outs

shares of a high-growth market. Companies with higher shares in growth markets are generally not for sale or are available only at a prohibitive price, he added.

The two most important criteria in evaluating a potential partner's financial future are cash flow/return on investment and earnings per share, Lessler said.

Although Dun & Bradstreet has added handsomely to its bottom line with acquisitions, other firms have been much less successful in their acquisitions. Heading the list of such companies is Control Data Corp., according to George Grodahl, a partner in Broadview Associates, the Fort Lee, N.J., merger consulting firm that conducted the Adapso seminar.

"CDC is the best example that the most important factor in acquisitions is how well you integrate them," Grodahl said. "For years, their acquisitions seemed totally lacking in focus. Now, they've come full circle and have a vice-president of divestitures."

The flurry of recent mergers and acquisitions activity in the software and services industry can be attributed to changing attitudes among entrepreneurs about selling their companies. "More and more often, selling your company means you are still able to run it," according to Gilbert Mintz, a founder of Broadview. "Being acquired has become a sign of success, not failure."

Within that context, however, the seller must realize the fundamental changes inherent in a deal, according to Dataline Corp. President Gerald O'Connell, whose Wilton, Conn., turnkey accounting-systems firm was recently acquired by Display Data Corp.

"There is a lot of opportunity on both sides, but remember there is no such thing as a merger," O'Connell said. "The fact is, you have sold your business. Don't be naive about that, or you'll be very disappointed."

Acquisition is rapidly replacing venture capital as the growth mechanism for privately held software and services firms, Broadview's Edward I. Metz said. "Five years ago, the typical start-up strategy was the business plan, three rounds of venture capital and then a public offering," Metz said. "Today, venture capital is much harder to come by, and you see far fewer initial public offerings."

From page 83

Major lessors shun Comlease

pany's annual trade show schedule had been set. Decisions to attend trade shows are often made up to a year in advance, the spokesman said.

According to Bob Bardagy, senior vice-president of marketing at Comdisco, one of the nation's largest independent computer leasing companies, a trade show for leasing was inappropriate for Comdisco. "We do a lot of education seminars on our own, and we don't see the need to throw ourselves into a trade show," he said.

Bardagy added, however, that the show could achieve some success. "It may be a very palatable opportunity for a small leasing company that may not have the ability to get their message across on a national basis, but I would question how many people would travel a long distance to go to something like this."

Dataserv Vice-President Tim Gegner said that although the concept of a leasing show was a good one, his company also passed up Comlease. "It would almost have to be done on a real large scale to make it worth our while," he said.

But scale is of no concern to Tom Martin, president of Computer Financial, Inc. and Comlease chairman. A show like Comlease is necessary, Martin said, because of the changing facets of the computer leasing industry.

"The responsibility for leasing computers traditionally falls within [DP], whereas with other companies, leasing assets are the responsibility of the treasurer. There are a lot of things that users need to know," he said.

Martin said the slim showing of exhibitors could be attributed to the fact it is sometimes difficult to sell services at a trade show. "It's a hard concept to sell an intangible product in a booth," he said.

Global-Ultimacc looks ahead

peripherals and owed STC $20 million.

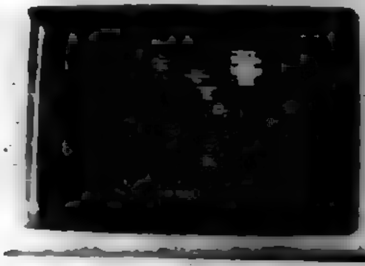
That dependence may not last much longer, Siefert indicated. "At the present time our systems will include STC peripherals, but over time we will be shopping around for other vendors' products that are more competitive or better priced."

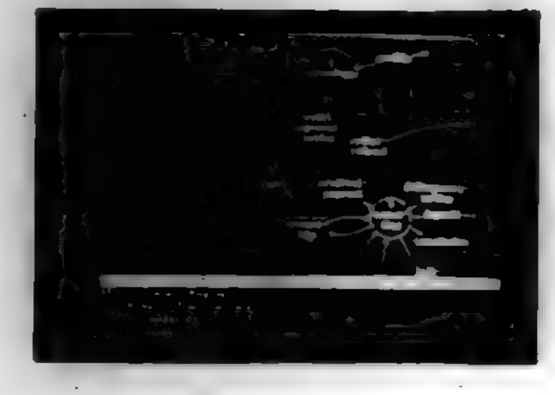
Seifert said the transaction added up to $2 million. The management team put up $336,000 for the stock, and STC received about $1.8 million in cash accumulated by Global-Ultimacc as repayment of the debt. "That's roughly five to 10 cents on the dollar, which is a pretty good deal," he said.

"We expect to continue the momentum we had going back in 1983 and 1984 prior to the STC bankruptcy," he said. "The bankruptcy impacted us greatly; there was the perception that we couldn't guarantee we were going to be around."

Joining Siefert in the buy-out were Thomas A. Nagy, executive vice-president of operations; Thomas A. St. John, executive vice-president of sales and marketing; Richard G. Snow Jr., vice-president and general counsel; and William O. Sweeney, vice-president of technology.

Finally, Structured Analysis as easy as 1-2-3!





Now with Data Dictionary Support for $995.00!

Introducing a Computer-Aided Structured Analysis tool PCSA for the IBM-PC/XT/AT. PCSA provides capabilities to create and maintain the **leveled data flow diagrams** and the **project data dictionary**. PCSA uses some state-of-the-art graphics and software technologies such as the famous **bit block transfer (bitblt)** operations, and one of the most powerful user-interfaces **Object-Oriented Pop-Up Menus** on a **bit-mapped high-resolution display with a mouse**. Great features include: manipulating data flow diagrams by **dragging** and **rubber banding**; **fast smooth curve generation**; **integrated data dictionary** based on a **relational data base**; immediate **consistency checking** for **diagram balancing**, for data dictionary and between diagrams and dictionary for **methodology enforcement**; **cross referencing** and **global name replacement**. It is very easy to learn, easy to use and very efficient.

Call or write for more information or if you prefer, send us a check for **$50.00** (**$60.00** for countrys other than USA and Canada) for a demonstration version of PCSA and manual for evaluation.

OEM brings Mitsubishi back to court

By Donna Raimondi

BOSTON — Leading Edge Products, Inc. has again instituted court proceedings against its equipment supplier, Mitsubishi Electronics America, Inc., seeking to recover funds.

Leading Edge, which is an OEM for Mitsubishi products, requested that U.S. District Court find Mitsubishi Electronics in contempt of the court's order originally issued in February and modified Sept. 4. The order requires, in part, that Mitsubishi pay an adjustment to Leading Edge.

The two companies have been battling in the courts since Leading Edge charged Mitsubishi Electronics, a California-based branch of Japanese firm Mitsubishi Corp., with trying to cut off its supply of components in 1984 [CW, Feb. 25]. Mitsubishi was the sole supplier of the major components in Leading Edge microcomputers at the time.

According to a petition filed Sept. 9, Leading Edge charged that Mitsubishi had failed to pay them $638,707 due to a yen adjustment. The adjustment was to offset the higher value of the yen to the U.S. dollar over a period of time.

The adjustment was ordered by the court to be retroactive to Jan. 1, 1984, Leading Edge stated. It further said that Mitsubishi had paid such a yen adjustment to its only other customer, Sperry Corp.

The petition claimed that Mitsubishi offered Leading Edge a yen adjustment effective Feb. 11; that the court-ordered adjustment clearly and unambiguously called for an adjustment retroactive to Jan. 1, 1984; and that Mitsubishi has conditioned payment of any adjustment on a business matter not related to the reason for the yen adjustment.

Returned products reportedly refused

According to Leonard Ross, senior controller for Leading Edge, his company returned some terminals and other products that were not covered under any court-ordered agreement to Mitsubishi, and Mitsubishi refused to accept the returned products. Leading Edge stopped payment on a delivery of other products in order to offset the cost of the returned products, he said. Mitsubishi is using that transaction as a basis for refusing to pay the retroactive yen adjustment to Leading Edge, Ross said.

A lawyer for Mitsubishi in Boston, Zachary Karol, claimed that the Sept. 4 order was a modification of the Feb. 11 order and therefore dealt only with orders subsequent to Feb. 11. Karol said that Mitsubishi never made payment of the amount of Leading Edge's stopped payment a condition of receiving the yen adjustment. He sent a letter to Leading Edge Sept 6. asking for an explanation of why Leading Edge did not pay for the order that it did receive. "I suggested a setoff, but it was never a condition," he added. The response from Leading Edge was the petition to the court, with the letter from Mitsubishi attached to it.

Adapso winning Pyrrhic victories?

reliability, currentness or otherwise; and you rely on the program and results solely at your own risk." Microsoft does, however, warrant that the actual disk be free of defects.

This is not picking on Microsoft, because the disclaimer is pretty standard on microcomputer software packaging.

Furthermore, the point of this column is not to further berate such antiuser disclaimers, but rather to point out to software developers the brazen double standard they are holding customers to.

Adapso has been in the forefront of efforts to combat the evil empire of software piracy. Don't be naughty, the organization tells users — any time you copy a program, you are stealing money from the developer, or, as in most cases, the company that bought the rights to the program from the developer.

Adapso has weighed in heavily on the immoral and illegal aspects of denying vendors their pound of flesh for overpriced software packages that too often are "me-too" products that really are approaching commodity status in terms of originality and usefulness.

Yet this same organization that wants users to hold the high moral ground hypocritically denies those same users any guarantee that the goods they are buying actually work and live up to company claims.

Let's go back to the disclaimer cited above: "Microsoft does not . . . make any representations regarding the use of or the results of the use of the program . . ." That is pure bull! Microsoft and every other vendor that buys advertising in no uncertain terms make representations regarding what their products will do, why they are better than other products and so on.

So, before Adapso gets carried away on this victory, maybe it had just better sit back and think about what it is willing to give users in exchange for what it wants from users. Perhaps Adapso members should point out in their disclaimers what states actually prohibit such claims. And maybe — I admit this is really a radical proposition — just maybe there are some leading vendors out there with the guts to actually back up marketing claims and promise users a full refund or replacement in the event of any dissatisfaction.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

POSITION ANNOUNCEMENTS

"It's easy to make good decisions when there are no bad options."
Robert Half on Hiring by Robert Half (Crown)

How to be more successful in your edp hiring.

Using a specialist will increase your success in hiring data processing personnel—and using Robert Half, the most experienced personnel specialist, will increase your chance of success even more. Here's why:

- You get highly personalized service from professionals who understand your edp needs.
- You won't waste time with unqualified candidates. (We'd prefer *not* to fill the job, rather than refer someone who doesn't fit.)
- You'll have the advantage of the resources of the largest organization in the data processing personnel field, with offices on three continents.
- You pay nothing unless we fill the job. And, we back each and every placement with a liberal guarantee.

The next time you're looking for a data processing manager, systems analyst, MIS expert or programmer, call a nearby Robert Half office. You'll be glad you did.

ROBERT HALF®
edp, accounting and financial personnel specialists.

© 1985 Robert Half International Inc. All offices independently owned and operated.

SOFTWARE ENGINEERS

COMPUTERPEOPLE is a rapidly growing regional software services and consulting firm. We have an immediate need for seasoned software engineers to support client applications in real-time digital telecommunications and process control.

A degree in Computer Science or Engineering is preferred; an MSEE would be ideal. We are most interested in people with solid C/UNIX experience but will also give consideration to those with real-time microprocessor Assembler or PASCAL experience.

We are looking for new employees, but will consider subcontractors. Call or send your resume to:

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work.
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS** Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS** Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA
- **Senior System Software Analyst—CICS** Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only

VICE PRESIDENT Operations Division

American College Testing (ACT), a non profit educational service organization with headquarters in Iowa City, Iowa, known internationally for its expertise in the collection and dissemination of information useful in educational and career decision making, invites applications for the position of Vice President, Operations Division.

The Operations Division Vice President is responsible for directing the work of about 200 staff members. These individuals perform functions ranging from policy formulation to the planning, design, development, and implementation of the operational aspects of a wide range of programs and services. Because of actual and projected growth, ACT is seeking a seasoned manager who has excellent interpersonal skills, a keen intellect, and knowledge and experience that will assure effective leadership of the Operations Division in the years ahead.

Candidates should hold a Master's Degree in Higher Education, Business Administration, or Computer Science; experience in managing large volume operations systems is highly desirable.

To apply, submit letter of application, resume (including summary of education, training, and employment, plus salary expectations) and references to:

ACT

Dr. Richard L. Ferguson
Executive Vice President
ACT National Office • P.O. Box 168
Iowa City, IA 52243

Interested persons are encouraged to apply by October 21, 1985.

ACT is an Equal Opportunity/Affirmative Action Employer. Minorities, Handicapped Persons, and Females are encouraged to apply.

Systems and Programming Director

The Los Angeles Unified School District, the second largest in the nation, with a diverse career environment offering future-oriented challenges, is conducting a search for a proven professional to fill the Systems and Programming Director position in the Information Services Division. The Division has more than 300 professional and technical staff members employed over three shifts. Mainframe hardware consists of Sperry 1100 series equipment and IBM 370 type equipment. The Systems and Programming Director administers the units responsible for analysis design and programming.

This position requires the ability to manage a staff of approximately 70 professional programmers and analysts and is responsible for planning, organizing and directing technically diverse data processing activities.

The person selected will have a minimum of two years of strong supervisory experience in data systems analysis and design in a large-scale computing facility. It is desirable that applicants have experience supervising large numbers of programmers or analysts.

The salary range is $49,881-61,843 annually (an increase is anticipated).

Send your resume in complete confidence before October 11, 1985, or call (213) 742-7761.

The future of high tech electronics is right at home at E-Systems in Dallas.

At the Garland Division of E-Systems, our primary objective is concern for you, our employee. We demonstrate this concern in areas that include superior technological programs, innovative work environments, and an excellent compensation package. E-Systems Garland Division is seeking engineering leadership in the following areas:

Contact Ann Olson for specific information about these Senior positions:

PROJECT LEADERS

Responsible for assisting software development managers with definition and implementation of tasks in software project planning, procedures, Unit Development Folders, proposal writing and cost estimation of government-type programs. BSCS, EE or Math with six plus years experience. Experience with VAX, PASCAL and MIL-SPEC standards required. These individuals will eventually assume roles in software management.

SENIOR SOFTWARE ENGINEERS

Responsible for implementing the tasks defined below on software development projects. These engineers will report to project leaders. BSCS, EE or Math with six plus years experience in definition, design, development and delivery of software systems, utilizing VAX or Motorola 68000 computers. Required fluency in PASCAL, structured FORTRAN, MACRO-11 or Assembly languages. Experience with MIL-SPEC standards required.

SENIOR VMS SPECIALISTS

Responsible for definition, development and enhancement of software development environment on VAX systems, BSEE (MS) or CS with seven plus years related experience with VAX systems in PASCAL fluency required. Must be VMS internalist within I/O driver systems. Defense environment background a plus.

Babe McCarrell will give you more information regarding the following:

SOFTWARE ENGINEER

Responsible for design, coding, and testing of systems level software. Position requires minimum of BSCS or BSEE degree with at least two or more years experience with the VAX 11/750 or 780 and VMS operating systems. Experience in one or more of the following areas is desirable: MIL-Standard documentation, UYK series computers and real time signal processing architecture.

BUSINESS PROGRAMMER ANALYST

Responsible for development and maintenance of on-line systems in an IBM OS/MVS IDMS CICS environment. Must have a college degree in Business, MIS or related field, and three to five years experience developing/maintaining on-line systems, supporting Accounting, Manufacturing or Purchasing/Inventory control.

DATA BASE ADMINISTRATOR

Responsible for the installation of IDMS in an IBM OS/MVS environment, for the design and maintenance of the data base and related data dictionary, and for the development and enforcement of standards and procedures for its usage. Requires a college degree and three to five years data base Design/Administration experience.

The Garland Division of E-Systems is impacting the future of electronics with exciting new projects that offer challenge and recognition. You can participate in an advanced human resources program which includes a flexible employee benefits package (FLEXCOMP), and a company-paid Employee Stock Ownership Plan. With Dallas recognized as being one of the most enjoyable and livable areas in the United States, the Garland Division of E-Systems can offer the senior engineering professional what is needed.

If joining E-Systems in Dallas means a move, E-Systems will offer you a personalized relocation program. We realize the difficulties of acclimating an individual or a family group to a different living situation. Our staff makes it a point to assist you and your family members after you have made the decision to join a company embarking on the most advanced programs in existence. Our dual assistance program is designed to ensure your move to E-Systems in Dallas will be a step forward in every area of your professional and personal life. For immediate consideration please write in confidence to: **Professional Staffing, E-Systems, Inc., Garland Division, P.O. Box 660023, Dept. 41, Dallas, Texas 75266-0023.**

E-SYSTEMS
The problem solvers.

ALLSTATE HAS IT ALL

A sophisticated IBM shop...hands-on assignments...expanding applications...long-term growth potential...generous salaries and benefits. All told, when it comes to DP careers, Allstate has it all!

Allstate is one of the nation's largest insurance companies. Our technical environment utilizes 25 IBM mainframes including 3033's, IBM PC's and 8100's which operate on MVS/XA and JES2. And as we continue to grow, we seek professionals in the following areas:

TECHNICAL LIAISON

The candidate will act as liaison between our Database Development Division and the Acceptance Testing area. Responsibilities include technical maintenance of the acceptance testing environment, development of additional testing tools and techniques, plus the technical training of non-technical personnel. 3-6 years experience in a technical liaison capacity required. Also, knowledge of IMS/DL1, CICS, JCL, VSAM, OS/MVS and basic ASSEMBLER language required.

PL/1 & ASSEMBLER APPLICATION PROGRAMMERS

These positions require 2-4 years experience in a large IBM mainframe environment utilizing PL/1 or ASSEMBLER. You should possess good TSO/SPF and JCL skills and have solid communication skills. CICS is helpful.

Allstate offers an outstanding compensation package, a highly competitive salary structure, and excellent benefits including Life/Health Group Insurance, 401K Plan, Pension and Profit Sharing, Sears Discount, Sears Stock Plan, and much more. If you're ready for an all-around better career, you're ready for ALLSTATE. For consideration, send resume with salary history or call:

Build the Systems at Litton Mellonics

If you're a motivated professional interested in pursuing new career directions, investigate these exciting opportunities at Litton Mellonics. We have a 24-year record of excellence and a variety of challenging systems development projects ranging from stand-alone task performance through complex systems implementation.

Systems Engineering

Current openings are available to top level professionals to broaden your base of expertise while working on diverse projects for military logistics, satellite command and control and integrated systems.

Senior Database Analyst

From initial definition of requirements through physical implementation, your expertise will guide the database design process. After deriving requirements from functional specifications, flow diagrams and related materials, you'll provide logical and physical database models. Proven ability in this area a must. Your control and documentation of all phases will ensure the implemented database design meets our high standards for performance, reliability and integrity.

Ten years computer data systems development experience, including 6 or more years involvement with various phases of large database design required, along with a BA/BS in Computer Science, Math, Physics, Engineering or related discipline. MSCS preferred. Working knowledge of structured, top-down methodologies (Yourdon, Gane, and Sarson, etc.), normalization/optimization and/or tuning of database structures highly desirable. Database design work in a distributed systems environment a plus.

Senior Systems Analyst

You'll define requirements for large data systems based on analyses of customer documentation and information obtained through interviews. Outlining various architectural components (with an emphasis on software) and allocating requirements will be key. This involves developing functional descriptions, data flow and component block diagrams, and interface control documentation. Requires 10-12 years computer software systems development experience, including 4 years of requirements analysis and large data systems design. BA/BS in Computer Science, Physics, Math, Engineering or related discipline required; MSCS preferred. USAF/DOD systems design/development expertise desirable. Familiarity with MILSTD 490/483 a plus.

Data Systems Modernization

The upgrade of the Satellite Control Facility through Data Systems Modernization (DSM) which incorporates DSM-Transition and Sustaining Engineering, is a project that requires the expertise of quality professionals who are skilled in systems analysis, specifications development and application programming with real-time command/control systems.

Senior Systems Analyst

Team Leader in systems development to support software design, software development practices and software management. Responsible for the software functions of a real-time interactive command and control system, to include transition, integration, and requirements analysis.

Responsibilities include the investigation and analysis of operational software support; providing plans for development and design of software; reviewing modifications for implementation and integration; the validation of satellite support requirements for space systems; developing operations concepts; and supporting PDRs and CDRs. You will also be responsible for system operations support, training, and will support test and validation and hardware interface analysis.

Requires BS in Computer Science, Math or Physics; 12-15 years technical and administrative management experience; and knowledge of AFSCF/DSM operations.

Systems Analyst

A Team Leader responsible for real-time system definition and design for Commanding and Telemetry. Perform detailed technical analysis addressing satellite operations software support. Responsible for system architecture, system concepts and improvements. You will be involved in software requirements definitions; software design description; software development planning; engineering change proposals; and design reviews and network modifications.

The position requires a BS in Computer Science, Math or Physics; 8 years experience in operational analysis, studies and requirements; and knowledge of AFSCF/DSM operations.

In addition to real opportunities for career growth and exciting technical challenge, we offer competitive salaries and an excellent benefits program. Please send your resume with salary requirements to Kim Pulbrese, Litton Mellonics, P.O. Box 3407, Sunnyvale, CA 94088-3407. U.S. citizenship required for most positions. Mellonics is an equal opportunity employer.

Factory Automation/Process Control

DRAVO ENGINEERS is a leader in computer-based factory automation. We have over 20 years' experience coupled with an aggressive growth strategy in leading edge technology.

Become a part of our success, and share in our growth!

SENIOR SYSTEMS ANALYST

You will perform as part of a team in systems design, testing and start-up for large automated factory automation/process control systems. A BS in Electrical Engineering, Computer Science or related field and 5+ years' experience in the development of real-time control systems is preferred. Lead person experience and experience with DEC computers using RSX 11M and VAX VMS systems is preferred.

For several immediate positions, steel industry experience will be helpful.

PROJECT MANAGER

You will manage the development, implementation and start-up of factory automation/process control projects. Our large integrated systems projects require practiced management skills, coupled with depth in control systems technology. A BS degree and 7+ years' experience in the development of real-time control systems is required.

These positions offer technical challenge, competitive salary and excellent benefits. For immediate consideration, please send your resume and salary history in complete confidence or call 412/566-4659 for additional information.

DEMOGRAPHIC SYSTEMS INC. MANHATTAN

We are one of the fastest growing companies in today's $14 billion direct mail industry...and have done it through our network of capabilities. Serving the largest mailers and information users, our services primarily match, select or eliminate names in a structured, high production environment. To do this, we have a versatile (three tier) powerful computer line-up: IBM 3083 through WANG VS. Achieving this state-of-the-art precision and personalization at low operating costs is our everday standard. Yet sustaining such growth and professionalism requires high calibre individuals, as these three opportunities indicate.

DATA PROCESSING MANAGER Compensation OPEN. Take charge immediately of facilities, operations and programming. Once these are in hand, plan the consolidation of multiple sites into one integrated location. Direct the addition of a new medium-sized mainframe that you and your team will install, staff and operate. This top position requires at least five years of intensive DP experience, with 2-3 years at a management level. Must be able to direct all programming and demonstrate the skills necessary to evaluate, acquire and integrate new hardware. Position reports to the Chief Operating Officer.

BAL PROGRAMMER/ANALYST 30K range This lead position requires Assembler language for new system programming (60% of effort) and maintenance of present programs (40%). There is great satisfaction in successfully programming in our focused, high output system, dealing with the largest files in direct mail. This position will develop program specifications, code and test programs; then document and implement. Two years of applicable experience needed with the opportunity provided for future training and supervisory experience.

SHIFT SUPERVISOR & OPERATOR with 2+ years IBM series 4300 or above OS/MVS experience with JCL and utilities a plus. These positions earn premium for 2/3rd shift.

Send your resume and current earnings, in full confidence, to: Vice President, Demographic Systems Inc., 325 Hudson Street, New York, NY 10013. Besides a challenging environment and upward opportunities, our firm offers a wide range of benefits, including life, hospital and major medical insurance, along with paid vacation, medical leave and holidays. We are an equal opportunity employer.

MOVE AHEAD WITH COMPUTERWORLD

More computer people read Computerworld than any other newspaper in the United States— more than half a million computer people every week. And, among our readers at user organizations, about half claim to look at recruitment ads at least every other week (only a small percentage say they never look at recruitment ads). No wonder Computerworld carries more recruitment ads for computer people than any other publication.

MIS PROFESSIONALS

Atlanta Location

At Hayes Microcomputer Products, Inc. there's an energy level that fuels our confidence. An enthusiasm that is not only encouraged but supported. We are the nation's sixth fastest growing privately-held company and a world leader in the design and manufacture of communications peripheral equipment. Our ongoing expansion has created career opportunities for the following MIS professionals:

MANUFACTURING SYSTEMS ANALYSTS: Experience with MRP II, inventory management, production control, and master production scheduling systems development and implementation.

FINANCIAL SYSTEMS ANALYSTS: Experience in general ledger, accounts payable and order processing and billing systems development and implementation.

Both of the above positions require a degree in Computer Science, Business Administration or a related field. Two plus years experience in both business and computer systems development, including experience in programming supervision and/or technical design activities essential. Should have training and experience in the use of IBM 43XX or 30XX hardware/software including CICS, MVS, IDMS, TSO, COBOL and ADSO.

DECISION SUPPORT ANALYST: Responsible for identifying the tools and providing the training that will help management solve short term business problems. This person should have 3-5 years experience in a financial, accounting, data processing or consulting environment with a strong background in microcomputers. Exposure to modeling software such as IFPS, EPS, System W and spreadsheet software such as Lotus 1-2-3 is necessary. Position requires a Bachelor's degree in a related field such as Business, Computer Science, etc. A service oriented attitude is a must.

Here at Hayes we are committed to the development of information systems that will provide the competitive edge. We offer an exceptional compensation package that includes an employee stock ownership plan. Our location in Atlanta offers diverse cultural events and a myriad of recreational activities. Qualified candidates should send confidential resume including salary history and requirements to: HAYES MICROCOMPUTER PRODUCTS, INC., Dept. 78-278, PO Box 105203, Atlanta, GA 30348. An Equal Opportunity Employer M/F.

NETWORK COMMUNICATIONS SUPERVISOR VAX SYSTEM MANAGER

Ball State University is expanding its staff. We have the following openings.

NETWORK COMMUNICATIONS SUPERVISOR

University Computing Services provides Ball State University with an extensive array of computer services and data communications capabilities. The University Computer Network consists of synchronous and asynchronous communication, utilizing coaxial, twisted pair and fiber optic links. Processors connected to the network include a cluster of VAX 11/780s and IBM 3083 and a PDP 11/60. A supervisory position will be responsible for managing, installing and maintaining the network and a wide variety of user work stations. Knowledge is required in the area of LAN, WAN, coaxial and fiber optic installations and repair and maintenance of terminals and micro computers. BS degree in computer science or related area or equivalent plus 5 years experience in communications networking with 3 years supervisory experience required. Starting salary to $38,500.

VAX SYSTEM MANAGER

Ball State University State has a cluster of 4 VAX 11/785s running VMS version 4, supporting over 10,000 individual accounts. The cluster is focal point of a rapidly expanding computer literacy program utilizing a campus wide network. This position is responsible for managing the VAX cluster, its hardware, software, documentation and user files. A BS degree in computer science or related area or equivalent plus 5 years of systems programming experience including 3 years experience with VAX systems is required.

Application deadline for these positions is 10/18/85. Send resume and college transcript to: Human Resources Department, BALL STATE UNIVERSITY, Muncie, IN 47306.

EDUCATION

EXPERIENCE COUNTS
NON-RESIDENTIAL
DEGREE PROGRAMS

Professionals in any field may apply for one-distance Bachelor's, Master's or Doctoral degree programs in Management, substituting work experience instead of further classroom, and presenting a career accomplishment project instead of a standard thesis. The cost is moderate; the time for completion is shortened. Designed for working professionals. Program authorized by the California Department of Education. Students Worldwide.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Dates: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 461) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's
Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

THE WORKSTATION THAT SLAYS THE MANY-HEADED MONSTER.

All over America, office workers are losing the battle for control of their own desks. Why? Because not only do they need a PC, they also need a separate terminal for every computer they want to access. And before you know it, there's barely any desktop space left.

But there is an answer: Davox. With Davox you don't need separate terminals to access your mainframe, dial-up databases, minis or PCs. And you don't have to remember complicated log-ons for each computer or program.

All you need is a single Davox integrated voice/data workstation. A Davox workstation features 16 single-command "Smart Buttons" that dramatically increase productivity. You can use them to access your IBM mainframe, DEC minis, dial-up databases or IBM PCs—each with a single keystroke. You can even dial a phone number directly from the screen.

And our DavoxNet networking design uses your existing twisted-pair telephone wiring instead of expensive coaxial wiring. DavoxNet's networking power lets you share valuable resources—everything from printers to files to databases, even IBM PCs—all at significant savings in hardware and software costs.

To find out more, call Mike Giltner at (617) 667-4455 or toll-free at 1-800-343-1152. Or mail in the coupon below.

DAVOX™

We are data and voice systems.
We do it all. And we do it now.

☐ Yes! I'd like to find out how to slay the many-headed monster.

Who would be better qualified to design a PC to System/34/36/38 connection than a lead architect of the IBM System/34?

Introducing SSI's PC/5251 Twin™ local work station emulator for the IBM PC.

"As a lead architect of the IBM S/34 SSP, I learned a valuable lesson: Only pride in craftsmanship can produce quality products. Here at SSI that lesson is not forgotten.

"I think this is one of the many reasons SSI's PC/5251® remote work station emulator has been so successful. We all enjoy what we're doing here and we're proud of our work. We have to be. Our *development* people are required to *support* our products. That's why we never release a product until we're sure it's ready.

"Now we're introducing our 5251 twin-axial work station emulator, the PC/5251 TWIN. Although it isn't the only 5250 emulator on the market, you won't find another that's backed by our reputation of quality, support, and total commitment to S/34/36/38 users.

"The SSI PC/5251 TWIN is a complete software and hardware package from the recognized leader in PC to System/34/36/38 communications. Naturally, the PC/5251 TWIN interfaces with our Emulator Transfer Utilities™ and DATA DIALOG™ programs.

"But enough about us. Let's hear more about you. Fill out and return this coupon today. Then we'll fill you in on the specifications and advantages of SSI's PC/5251 TWIN."

"Our reputation was purchased with hard work and commitment, not advertising dollars."

—Joe Frank, SSI Founder and Director of Software Development.

Software Systems, Incorporated

Comment

Two steps from utopia

By Dale Kutnick

The next major phase of the microcomputer revolution will be the cooperative or logical integration of these powerful desktop devices into mainstream information processing environments. This movement will be a four-stage evolution, with many promises and false starts. It will demand a total systems solution that today exists only on paper.

Just a few micro-to-mainframe vendors will adopt this perspective successfully and be able to compete against the large systems hardware and software vendors; the rest will become "niche players," primarily supplying multivendor environments.

The first stage of the logical integration of micros — simple communications links — is well under way with the proliferation of 300 and 1,200 bit/sec. modems, and more recently, 2,400 bit/sec. models.

While this stage has given users rudimentary connections, it has definitely impeded the progress of integrated networks. As individual users attempt to solve their own communications problems, their investment in and commitment to limited solutions take away the impetus for integrated corporatewide networks, which by nature require a top-down strategy.

Stage two is still in its infancy. In this phase, personal computers are attached to some kind of network and can load data from other network resources into their applications. While this loading is still cumbersome and often requires two, three or even four steps, protocol and format conversion exists, as does limited context switching between programs (loading a CICS file into a Lotus spreadsheet).

In stage three, whose development is occurring in parallel with stage two, micros share the same applications/facilities software with minis and/or mainframes. This sharing enables very smooth context switching, but the network software is not yet sophisticated enough to manage defaults and loading from one program to another.

Stage four will bring true cooperative processing — the ability for two or more intelligent devices to share resources and to load-balance applications processing efficiently and transparently between their users. The multimegabytes of memory and high-speed processors required to support these transactions are available now, but the software is far from ready.

In the future, personal computer users requiring information to fill in data base or spreadsheet application programs will simply request that information (using a familiar query facility) as though it were resident on a local disk. If it is not, the personal computer applications program will automatically default to a network program that will initiate a search in the next processor level (a file server, minicomputer or mainframe).

The network software will take care of security, logging, audit trails and so on and then oversee the delivery of the information in its appropriate form to the personal computer. The end user will be unaware that this complex process has taken place. Undoubtedly this configuration will be slow at first.

This "applications architecture" is quite analogous to distributing a large, homogeneous computer system — which has long been the promise of local-area networks. But the current network management, information delivery and application software is, in most cases, still two levels away from this utopia. It is slowly, painfully evolving.

During the past three years, the haphazard and uneducated buying of micros — personal computer anarchy — has outstripped vendors' ability to develop appropriate software. Constantly changing operating environments and applications software exacerbate the problem. Rather than buying now, users are awaiting true solutions, which has contributed to the current industry malaise.

In general, the popular application software packages are used primarily in stand-alone mode. Moreover, most communications programs are simply messengers (stage two in the evolutionary hierarchy), not true network

Comment

software that integrates applications. They require users to suspend their personal computer applications and to sign on to the mainframe or mini. The users then must have a good idea of where the desired information is located, what application contains it and how to extract it. This process can be cumbersome even for experienced users, and it explains why many professionals have been reluctant to embrace micro-to-mainframe links.

Some software, hardware and local-area network vendors are taking different approaches in beginning to address these issues. Mainframe software suppliers such as Oracle, Information Builders and Mathematica have put either full implementations or subsets of their data bases on the IBM Personal Computer.

IBM's LU6.2 protocol — which enables intelligent file transfer between distributed CPUs — is a good example of this new "logical" network software. It will form the basic link for IBM's upcoming token-ring network and for application and facilities interchanges between processors on an SNA network. But implementation of LU6.2 has been painfully slow.

Minicomputer vendors such as DEC and DG support their office automation programs (All-In-One and CEO, respectively) on both their minis and their supermicros, but the latter are generally too expensive for the average commercial user.

The local-area network software vendors, such as 3Com, Ungermann-Bass, Novell, Nestar Systems and Banyan have taken a different approach, using higher level local-area network software (typically "atop" Ethernet) and sophisticated file servers. Their network software efforts aim toward more virtual network access for personal computer users.

Not surprisingly, network software companies are one of the few groups that have managed significant growth during the 1985 computer industry recession. Still, their inability to control the higher level "applications environment" dominated by Cullinet, Applied Data Research, Cincom, IBM and so on will necessitate closer ties with those vendors if they are to move successfully to the next stage.

There are many issues to be resolved in the move toward cooperative, logically linked software. Transparency, information management and control, information delivery, application/facilities compatibility and security must all be addressed before this phase can become a natural extension for microcomputer users.

The message is now becoming clear: Independent software and hardware vendors that do not develop their products to link cooperatively with software running on mainframes and minicomputers will increasingly be locked out of the corporate world.

Dale Kutnick is an independent consultant based in Wayland, Mass., specializing in strategic planning and technical/market analysis. Formerly, Kutnick was research director and a principal of The Yankee Group.

Of things that don't quite work

By David Ferris

It's one thing for a DP manager to plug in an isolated personal computer in a senior manager's office so he can do spreadsheet analysis or compose documents with a word processing package. It's another matter entirely to turn the micros into full-fledged executive workstations that maximize work efficiency and put end users in touch with the information they need.

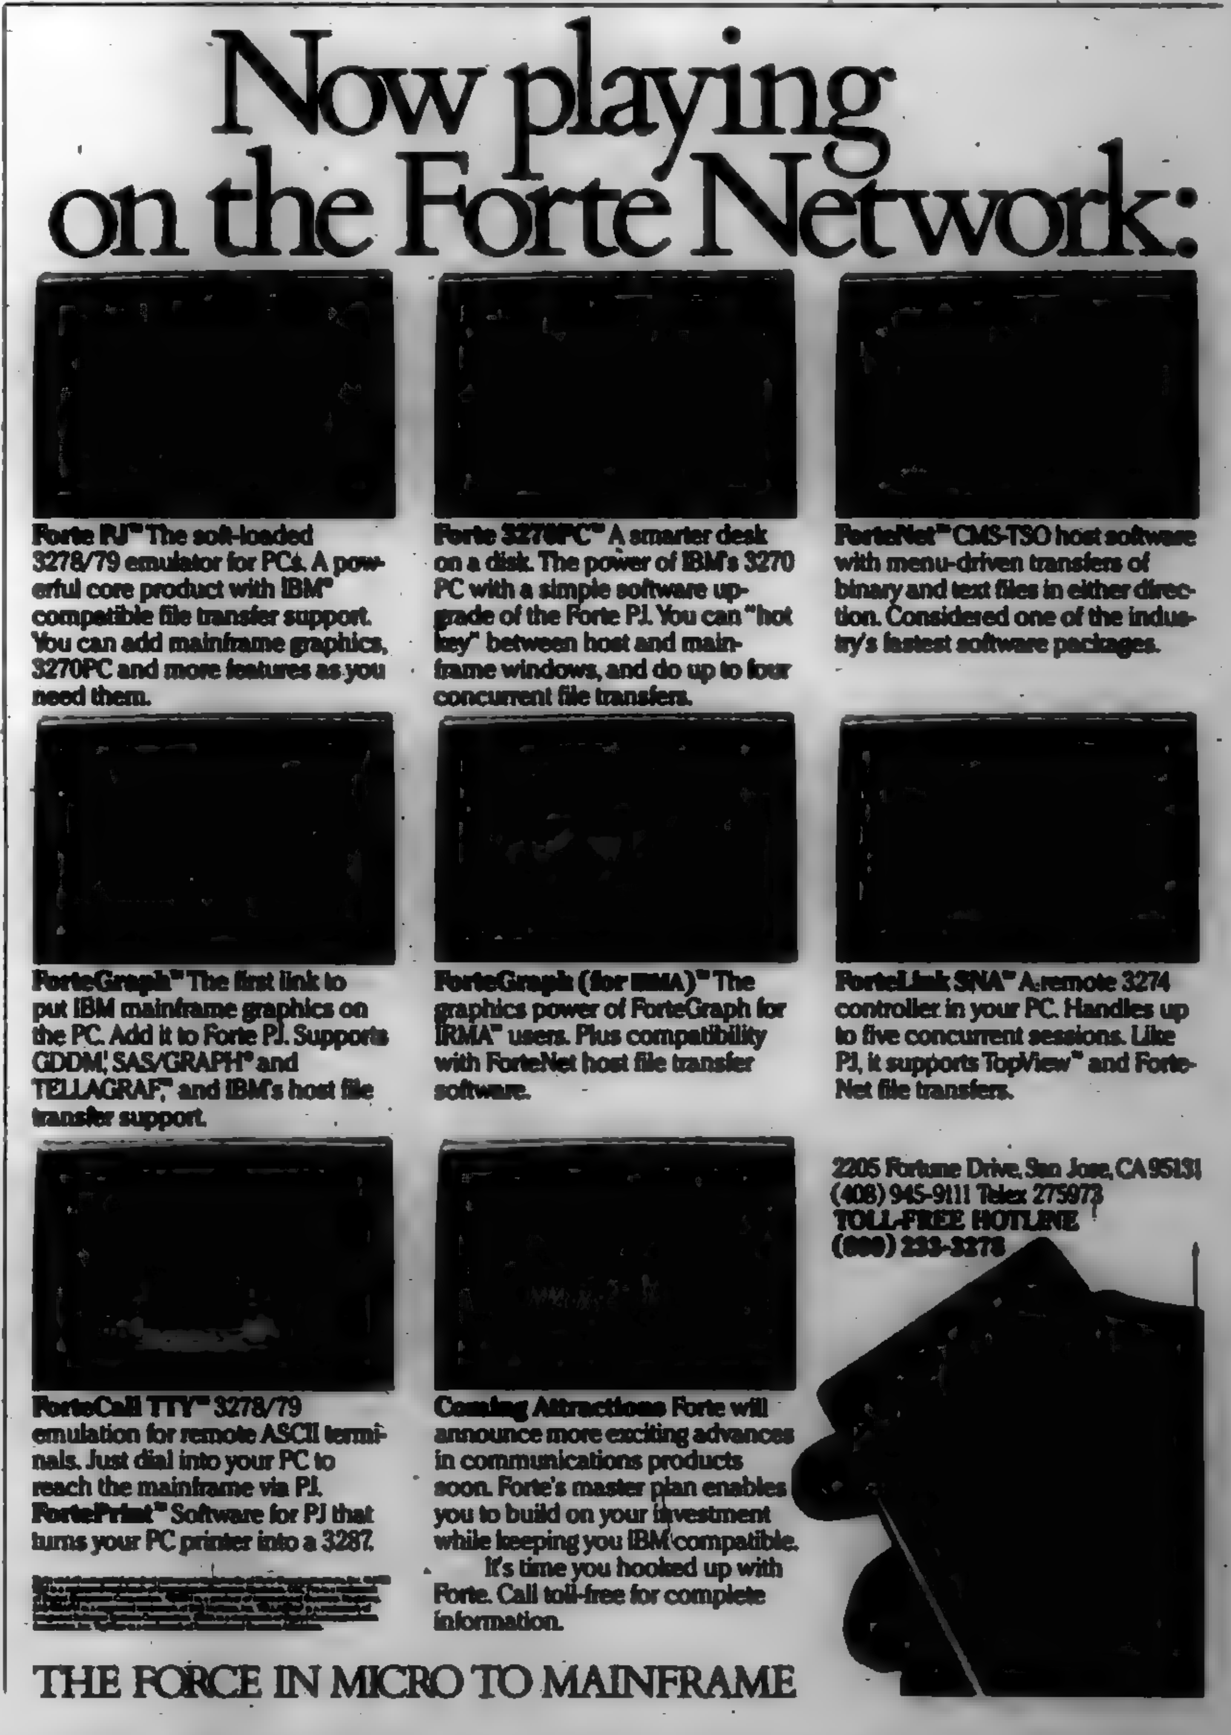
A key difference is the need for the personal computer to communicate with in-house computing facilities and with external resources. The workstation should represent a powerful, comprehensive set of support tools without placing too many of its own demands on the executive's time.

Eventually, micro-based executive workstations will incorporate many of the promised new technologies, ranging from advanced telephony and graphics to artificial intelligence. But the realities of implementing a real, live, functioning executive workstation today, next week or next year require more down-to-earth planning.

To minimize the risk of failure in an industry afloat in things that don't quite work yet, it's important to stick to relatively tried-and-true personal computer and 3270-style components. Start by implementing a conventional menu-driven front end which includes standard housekeeping functions. Then it should provide access to two classes of applications: generic packages that must be tailored by the user and those customized to specific in-house requirements.

Avoid the temptation to offer exotic generic applications just because they're available. It's probably true that, come 1990, many people will use project management and linear programming packages. But unless the company is already familiar with them, it's best to keep to mainstream end-user tools because, in practice, any others are likely to be ignored.

Furthermore, when defining the applications, remember that one of the executive's most important roles is to communicate ideas. As an analyzer and planner who then delegates tasks,



Now playing on the Forte Network:

Forte PJ™ The soft-loaded 3278/79 emulator for PCs. A powerful core product with IBM® compatible file transfer support. You can add mainframe graphics, 3270PC and more features as you need them.

Forte 3270PC™ A smarter desk on a disk. The power of IBM's 3270 PC with a simple software upgrade of the Forte PJ. You can "hot key" between host and mainframe windows, and do up to four concurrent file transfers.

ForteNet™ CMS-TSO host software with menu-driven transfers of binary and text files in either direction. Considered one of the industry's fastest software packages.

ForteGraph™ The first link to put IBM mainframe graphics on the PC. Add it to Forte PJ. Supports GDDM, SAS/GRAPH® and TELLAGRAF,™ and IBM's host file transfer support.

ForteGraph (for IRMA)™ The graphics power of ForteGraph for IRMA™ users. Plus compatibility with ForteNet host file transfer software.

ForteLink SNA™ A remote 3274 controller in your PC. Handles up to five concurrent sessions. Like PJ, it supports TopView™ and ForteNet file transfers.

ForteCall TTY™ 3278/79 emulation for remote ASCII terminals. Just dial into your PC to reach the mainframe via PJ.
FortePrint™ Software for PJ that turns your PC printer into a 3287.

[illegible]

Coming Attractions Forte will announce more exciting advances in communications products soon. Forte's master plan enables you to build on your investment while keeping you IBM compatible.

It's time you hooked up with Forte. Call toll-free for complete information.

THE FORCE IN MICRO TO MAINFRAME

Comment

the executive needs to receive, process and pass information along. Consider providing several of the following:

Electronic mail greatly facilitates communication with the executive's colleagues. The store-and-forward capability is most often based on either a package such as Applied Data Research, Inc.'s E-Mail or IBM's Professional Office System on a corporate mainframe or on a third-party facility such as The Source or Dialcom.

Word processing, at least for simple note-taking, should be personal computer- or mini-based via terminal emulation. In time, many executives will achieve a high level of keyboard fluency and may choose to enter document text as they compose it.

Spreadsheet analysis: The best choices are personal computer-based, such as Lotus' 1-2-3. Terminal emulation to access mainframe-based packages such as Oxford Software Corp.'s Maxicalc is much less effective for this type of processing.

Automated Rolodex — user-friendly list management packages, such as Software Publishing Corp.'s PFS:File, used for storing names and addresses, major capital expenditures, personnel resources or other types of information for quick reference.

Proprietary data base services, such as Nexis and Dow Jones, provide access to financial, investment, economic and general news.

Corporate data downloading: Unfortunately, implementing downloading is awkward, particularly if you need an ad hoc, general-purpose facility. Informatics General Corp.'s Microanswer appears to be the best general-purpose solution.

The custom, in-house applications should be accessed from the front-end menu in exactly the same way as the generic applications. They fall into two general categories. Mainframe report menus are tied to preformatted reports containing operational, planning and personnel data. These services are available to the workstation user via terminal emulation.

Personal computer-based programs also offer a selection of reports which can best be written with application generators such as Ashton-Tate's Dbase III, Information Builders, Inc.'s PC/Focus or the programming languages embedded within Lotus' 1-2-3 and Symphony. It is usually unwise to turn to languages such as Basic or Cobol as implementation vehicles.

Personal computer-based programs are generally stand-alone. A 2,000-line program is not unusual. Some are sophisticated enough to perform a simple level of networking: A Symphony application can retrieve information from external data bases in a process transparent to the user.

The final result is a powerful tool for the executive, who can access information quickly and spend less time getting it and more time putting it to good use. The spreadsheet facilities and access to remote data bases improve the quality of decisions; the electronic mail speeds up communication time with colleagues; and the word processing facilities can, in the hands of a keyboard-fluent user, greatly enhance the quality of documents and speeches.

As simple as this workstation sounds, successful implementation is still far from simple. Microcomputer batch languages are much too rudimentary. What's needed is a good language in which to define menu screens, menu-to-menu control flow, interprogram communications and external communications.

For a start, the command language available with MS-DOS and PC-DOS is inadequate: People sometimes have been forced to program the entire front end. End users often have to type confusing key sequences when accessing mainframe applications because of the difference between most micro and 3270-family keyboards.

A deeper problem is the variety of different application languages that end users must learn. Electronic mail packages have one way of doing things, Dow Jones another, 1-2-3 another and so on. Here, the micro offers better potential than unintelligent terminals because it can provide a more consistent cross-application interface as an executive workstation.

So our personal computer-based executive workstation approach is deliberately conservative. There's no talk of local-area networks, Discos or paperless offices. We don't even include presentation graphics, the use of which is best delegated to the executive's clerical staff. Our workstation uses conventional hardware, typically an IBM Personal Computer XT, a Compaq or equivalent, with a draft- or letter-quality printer.

A critic might characterize this setup as merely stringing together unimaginative applications by means of a top-end menu, with little attempt at integration. I would agree. Our technological caution stems from the fact that the infrastructure required to offer better integration is still being developed and debugged. Personal computer-based executive workstations are now practical and useful, but those implementing them should try to minimize costly experimentation with the unproven.

David Ferris is chairman of San Francisco-based Ferrin Corp., consultants specializing in the integration and support of personal computers and end-user computing tools.

Why settle for a Local Area Network when you can have a Total Information Utility.

From A Company Called TRW.

Great advances in industrial society give rise to the utilities that support them. Waterworks. Electricity. Gas. Telephones. And now, Information.

The TRW Concept 2000 Total Information Utility starts with a broadband Local Area Network (LAN) that supports data, video, and voice communications. But the similarity with other LANs ends there.

With TRW Concept 2000 you can support incompatible networks or connect dissimilar devices on a single cable. Channeling information from office to office — no matter how frequently employees move. Preserving your in-place investment. Today and tomorrow.

Surprised? We've been designing, installing and supporting large-scale networks for ten years. At major corporations, hospitals, universities and government departments. So we know you're concerned with service, support and cost. Not baud rates and protocols.

TRW's total systems integration includes off-the-shelf standard LAN products. Or custom features if you need them. Backed by over 200 TRW service centers nationwide.

Call the Information Networks Division at (800) 526-4879 for our booklet on "The Total Information Utility." (In CA: (800) 523-6619). Or write us at 23800 Hawthorne Blvd., Torrance, CA 90505, Attn: Customer Support.

And get a head start on the Information Age.

Comment

A call to arms

By Thomas Cross

To wait is often the best policy — and certainly it has turned out to be so for some DP departments in managing personal computers. But now the challenge of interconnecting micros, among other issues, forces the MIS director to make a move.

Personal computer users have "had it their way" for the last five years. They achieved independence by taking control of their own applications, proving to DP that they could accomplish a great deal on their own.

But the question remains: Who should direct the growth and usage of personal computers and toward what purpose?

Each department within the company has its own view of the microcomputer's purpose. Top management seeks to determine the "real" benefit of linking personal computers together. The MIS/DP department favors intelligent terminals for interactive programming. The office automation department seeks solutions for office tasks on a departmental level. Farther afield, the information center uses personal computers as massive information repositories.

Each view implies a different approach to designing and implementing personal computer networks, and at present, both end users and DP management are demonstrating myopia in their consideration of network installation. If the micro is seen as a window to an on-line world that links ideas, decisions and policies, then the network proposals emphasize extensive disk storage for holding large amounts of data. If the micro is viewed as a management communications "power tool," the inclusion of X.25 gateways and protocol conversion mechanisms are presented as critical.

Ironically, the personal computer's greatest virtue, personal processing, can be its greatest limitation. Too often the person equipped with a stand-alone micro works in isolation. The answers and insights provided by the computer never get beyond that person's office.

But the stand-alone personal computer has only about four or five years left in its usefulness to the large organization. Users of stand-alone micros will ultimately work in a vacuum.

At this point, there is a critical mass of knowledgeable stand-alone micro users. Now they want to share their information and their expertise. Personal computer networking is about to explode.

The future lies in high-speed networks that integrate voice and data with video (such as the IBM 7730 PC-XT Video Conferencing System) and blur the distinctions between the telephone and the computer.

But networks add new dimensions to the management problem already sparked by personal computers:

- Data security — End users are concerned about security, of course, but not to the point of wanting to enter 10 different password levels.
- Data integrity — Who gets to change what and when? Bureaucracy could not have found a better home.
- Capabilities — Graphics, video and other image technologies throw a wrench into efforts to make terminal emulation work.
- Validity — Was the data sent and received accurately? Did you get a "yes" when you should have gotten a "no"?
- Devices — Someone needs to have the last word on where the extra disk drive went to and who is supposed to fix the printer.
- Applications — Will the application that operates adequately today still operate tomorrow when Unix or another new operating system is used?
- Systems failure — Lost any data lately to static, power surges or pushing the wrong button? Has anyone forgotten to do a backup before the head crashed?
- Management and control — Who is really in control? Now that end users are actively involved in day-to-day data processing, human communications need to be well maintained, too.

It's time for the MIS director to seize the moment — to take charge of the situation and direct long-term strategy. The personal computer user needs help.

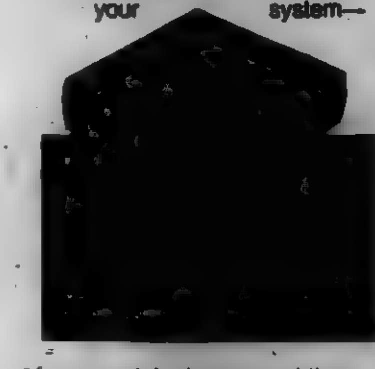
By the same token, DP/MIS has no mission without the end user. The end user is looking for long-term solutions more than quick and easy fixes, so opportunities for developing alliances exist today more than ever before.

But in order for that bargaining to begin, DP/MIS and the end user must approach the table on a peer-to-peer basis. Corporate long-term strategies dictate an end to hostilities and the enforcement of a well-earned truce.

Thomas Cross is managing director of Cross Information Co., Boulder, Colo., which develops telecommunications services and presents symposia on information technology. He has authored several books and articles, most recently Networking Personal Computers in Organizations *(Dow Jones-Irwin), co-authored by James Weidlien, and* Intelligent Buildings and Information Systems Executive Report.

Have SECURE dial access to ANY computer using NO passwords and NO dialback with DATA LOCK & KEY™

Simply connect a **DATA LOCK** (shown above) between your mainframe and your modems. Issue the portable **DATA KEYS** (shown below) to all authorized personnel. Only these members of your staff can access your system—



from any telephone—and they need no passwords! They simply dial in, and are connected.

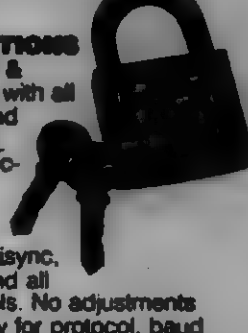
NO PASSWORDS?
Only a **DATA KEY** can provide correct responses to the large random numbers sent by the **DATA LOCK.** Thus the LOCK quickly identifies authorized users, and allows them to access the mainframe. Because the numbers are random, the dialogue between **LOCK** and **KEY** is different every time a user dials in.

Access is not dependent on passwords remembered, forgotten or passed along, so it is faster and more secure.

HACKERS, BEWARE.
DATA LOCK is ever-vigilant. Every unauthorized access attempt is immediately **detected, thwarted, displayed, printed and remembered.** Simultaneously, computer room personnel are alerted by a piercing alarm.

AUDITORS, REJOICE!
Just connect a printer to a **DATA LOCK** to obtain a comprehensive audit trail, which includes the following information:

- Date, time and details of all calls handled.
- Statistics of line usage.
- Unauthorized **DATA KEYS** (i.e. lost or stolen **KEYS**).



SPECIFICATIONS
DATA LOCK & KEY™ works with all computers and modems with RS232 connections. The system is compatible with async, Bisync, SNA/SDLC and all other protocols. No adjustments are necessary for protocol, baud rate, modem type, etc. Protocols and mainframes of different types can be simultaneously supported by one **DATA LOCK.**
LINES SUPPORTED:
DATA LOCK—4
DATA KEY—1
DATA KEYS supported by DATA LOCK: any number.
PRICE: DATA LOCK—$4,000
DATA KEY—$400

War stories from the network front

By John Dounis and Sharon Efroymson

In the battlefield known as micro networks, these users have lost, won, lost and won again. There are lessons here.

The corporate controller's office at Continental Grain Co., a multibillion-dollar international corporation, received a local-area network about two years ago. With a newly installed 3Com Corp. network, the controller can perform more in-depth financial analyses and produce more reports in a significantly shorter time.

"To consolidate information before we had the network, we walked floppies from machine to machine or shuffled it together on one IBM Personal Computer. With the network, we can consolidate without the footsteps and the shuffling," says Larry Stouder, Continental Grain's senior business technology specialist. Savings in time meant that actual output from the office — analyses and financial reports — sharply increased.

The network was the first in the company, and everyone loved it — until it crashed. Routine diagnostics failed to detect the problem, and after numerous attempts at repair, the authorized service representatives recommended by 3Com threw up their hands.

"I yelled and screamed," Stouder recalls. "They kept hitting us with charges and not solving the problem." The culprit turned out to be the file server, which Stouder finally had to fly from Continental's headquarters in New York to 3Com in California.

"We were back in service in about a week," Stouder says. "But a week for repairs in a controller's office is not too good." Repairs included restructuring the hard disk — unfortunate news for the department, which was backing up files on floppies. Prior to the crash, the department had shied away from investing in a tape backup system to keep costs down. After the experience of reconstructing the disk files from floppies, a tape backup seemed a necessity.

The network ran for six more

CW PHOTO BY O'CONNELL/LAROUSSE

months without a hitch then crashed again. Because of an engineering flaw, a gasket had been left out of the server. Stouder endured another round with the service organization without result, then shipped the server off to California again for another week of repairs.

This time, the network ran without major problems for a year before the server was out again because of a motherboard problem. Back to California.

"By this point, the server had had three trips — first class — to California, and I'd had none," Stouder quips. "That bothered me."

War stories like this one are becoming a hallmark of the local-area network industry. Veteran network users like to recount them in detail to anyone considering installation, in an attempt to balance the puffery and promises of network vendors.

It is true that even the best installations have been plagued with all kinds of bugs — simply because there have been virtually no standards. Compatibility has been tenuous between networks and third-party software or peripherals, and vendors and dealers have had little real world experience supporting the networks they are selling.

Surprisingly enough, despite the war stories veteran users stay loyal to the network vendor of their choice.

Brand loyalty

Given the option, most say they would stick with the original vendor, especially as technological advances continue to increase the reliability of networks and as experience improves dealer support. Networks are basically serving the functions for which they were purchased, and in this light, can be considered successful.

Stouder, for example, has tried other networks by installing loaners in his office, including the IBM PC Network and Orchid Technologies, Inc. PC-Net, but he still favors 3Com. However, he has changed dealers to get better service and blames the original server problem on the vendor's use of an OEM.

Continental Grain plans to trade its current server for the newly announced 3Server, which will allow Stouder to upgrade to some of 3Com's not-yet-announced products. 3Com's upgrade policy provides a reasonable discount on the 3Server.

And the industry as a whole is gaining from the experiences of the early local-area network buyers. Some standards are evolving as the technology advances, and many users who held off on installation can now consider it more realistically.

New users can also take advantage of current network users' experience to avoid certain pitfalls. These suggestions include better ways to install and configure networks — what experienced users would have done if they knew then what they know now.

Stouder has specific advice for corporations: Don't use a dealer who focuses on retail as well as corporate trade. He notes, "When a dealer caters to retail, some of his services and policies are colored by it" — to the detriment of the corporation. Retail customers with small installations may be satisfied to have their systems repaired or replaced within a week, so the dealer may not be set up to handle the hour-by-hour demands of the corporate DP environment.

Some local-area network vendors are planning to offer a "warm standby," a secondary system that will come online when a primary system fails. For years mainframe in-

Thanks to Hayes, this Robinson-Humphrey Research Analyst's mind is a thousand miles away.

TERMINAL EMULATION

Softerm PC emulates over 30 popular terminals including the:
- DEC VT102, VT220
- Data General D200, D410
- IBM 3101-20 (block mode)
- Hewlett-Packard 2622A
- Honeywell VIP7801, VIP7803

stallations have relied on this option.

Also, certain standards are emerging. With the introduction of the PC Network and DOS 3.1, many network vendors will be emulating the IBM and Microsoft Corp. standards in their systems.

But this era has not yet arrived, and human communication difficulties complicate already complex technical issues. For example, when a vendor says that the desired software package will run on a local-area network, many users interpret the statement to mean that the software will provide record-level lockout. The vendor may actually mean that the software will run on the network properly only as multiple single-user systems — in other words, file-level lockout.

Deceptive packaging

As a result of such ambiguous vendor statements, network users who have bought Ashton-Tate's Dbase III, for instance, expecting it to provide record-level security, have been disappointed. Two users attempting to write to a file simultaneously find later that their files were corrupted. Of course, there are data base packages that have been successfully adapted for use on networks, and some that have been written specifically for multiuser environments (See story page 31).

Lyle Anderson, a manager with the Office Business Systems Group at Peat, Marwick, Mitchell & Co. who specializes in micro- and minicomputer planning and implementation, has installed Novell, Inc., 3Com, the PC Network and Corvus Systems, Inc.'s Omnitalk for clients. Across the the board, Anderson finds that getting software to run on the network can be a problem because a lot of software packages write intermediate files during use.

"This can be a problem if you have two users using the same software, and both packages try to write the same intermediate file at the same time," he points out. Anderson's solution is to replicate the software on different directories for each user.

"Sometimes you have to trick the system into thinking you're still single-user by setting up paths on DOS. This takes a lot of trial and error." Adding another software user could mean repeating the replication process, and it will often take a generation of corrupted data to remind users to set up additional directories.

Copy protection and licensing is another consideration in setting up a network. Most software packages are not designed for networks, and legally a separate copy is required for each workstation. "It would be nice not to have copy protection on each diskette so that you could boot right off the network," Anderson says. "We either get one copy per workstation or look for site licensing," which is an alternative many vendors of popular software packages are now providing as a compromise.

In a recent installation of the PC Network, Anderson ran into difficulties using non-IBM software and third-party equipment because Installation-Aid, the PC Network's installation program, will not run with third-party disks. "We needed to go with third-party and non-IBM software because IBM doesn't provide high-capacity disk drives for the Personal Computer and doesn't have a competitive spreadsheet product," he explains.

"We've tried to get support for third-party products on IBM's hot-line number, and the answer I get is to talk to the hardware dealer who provided the product."

You're going to need a lot of support over the first six months to a year. You'll need a vendor who's reliable and close by.

Third-party vendors were able to provide the answers, however, and Anderson says he is very pleased overall with the PC Network. He does suggest that when planning installation, users get in contact with the third-party vendors ahead of time to make sure they will provide support.

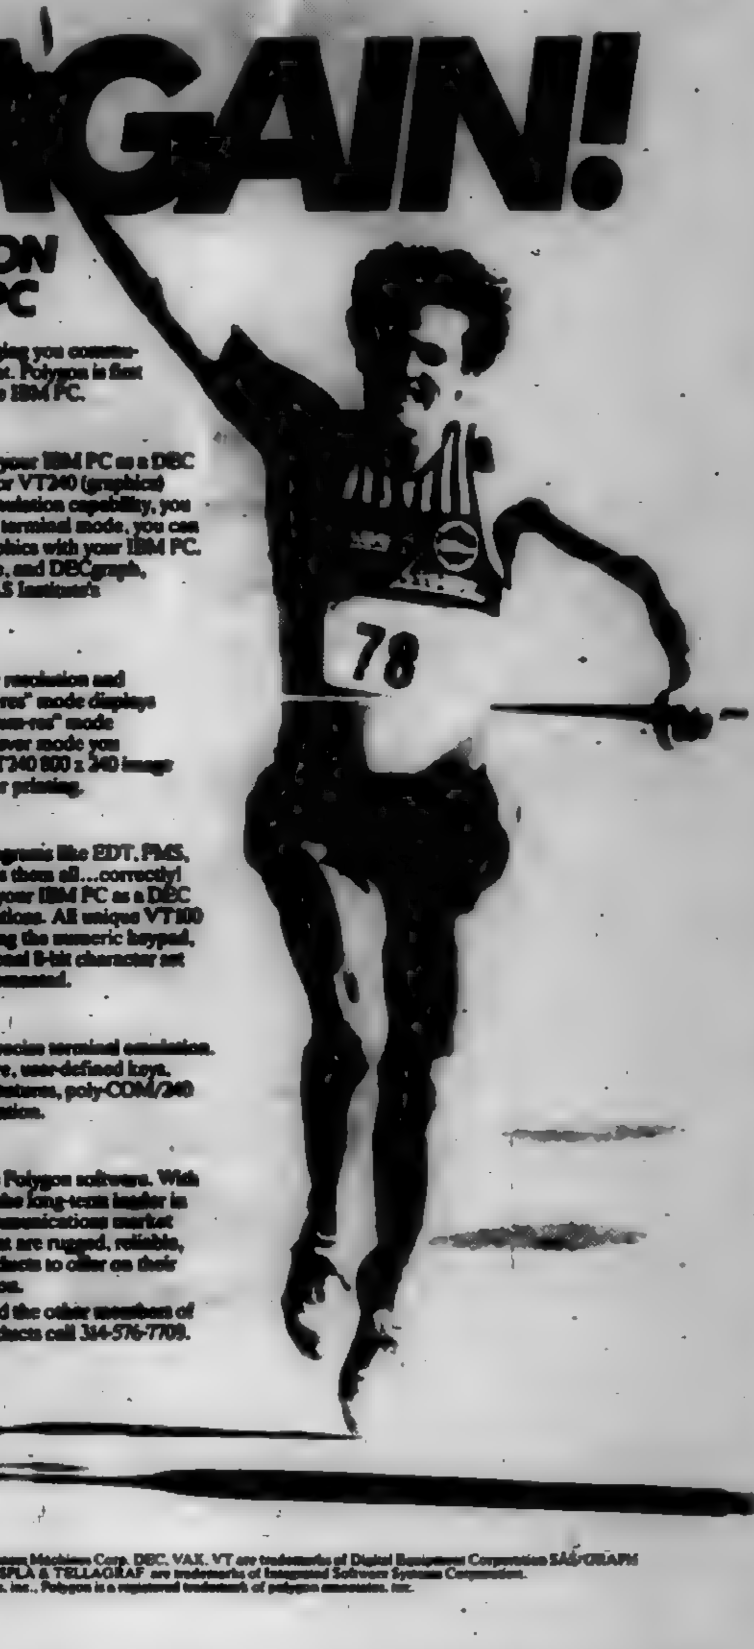
Growing with the vendor

Chuck Fielding, systems analyst at Jayco Management Co., a real estate developer in Houston, has watched the evolution and growth of his network over the past year from its initial six-node installation. Although firmly committed to Novell's Netware, Fielding has had his own challenging time with the network.

"I wish to thank Novell for making us a beta test site without our knowing about it," Fielding says wryly, referring to his recent experience with Novell's Advanced Netware. Fielding asked for the advanced version of Netware as soon as it was available because of Jayco's pressing need for a remote application.

While the local dealer did caution that there were still problems with the product, Fielding assumed they would crop up in the network's new remote features. He was therefore quite surprised to discover problems with basic interfacing commands such as FORMAT and LINK.

Furthermore, a popular word processing program that ran perfectly on the previous version caused the new network to crash when used with the



1ST AGAIN!

VT240 EMULATION FOR YOUR IBM PC

Polygon has consistently been first in bringing you communication software for the DEC environment. Polygon is first again: Introducing poly-COM/240™ for the IBM PC.

Text AND Graphics
poly-COM/240 software allows you to use your IBM PC as a DEC VT52, VT102, VT125 (graphics), VT220, or VT240 (graphics) terminal. In addition to this unmatched emulation capability, you also get error-free file transfer. In graphics terminal mode, you can tap the power of VAX and mainframe graphics with your IBM PC. Programs like DEC's Datatrieve, DECslide, and DECgraph, ISSCO's DISSPLA and TELLAGRAF, SAS Institute's SAS/GRAPH, and many others.

Choose Hi-Res Or Medium-Res
poly-COM/240 lets you choose the display resolution and colors you wish to use: Your IBM PC's "hi-res" mode displays 640 x 200 with two colors, while the "medium-res" mode displays 320 x 200 with four colors. Whichever mode you choose, poly-COM/240 keeps an entire VT240 800 x 240 image in memory for instant viewing, updating, or printing.

Works With ALL of DEC's Software
Do you need to use sophisticated DEC programs like EDT, PMS, All-in-1, or A-to-Z? poly-COM/240 handles them all...correctly! You'll be delighted at how easy it is to use your IBM PC as a DEC terminal in even the most demanding situations. All unique VT100 and VT200 keys are implemented, including the numeric keypad, arrow, and function keys. DEC's international 8-bit character set and the "compose" key are also fully implemented.

Plus File Transfer
We didn't stop at just providing you with precise terminal emulation. With automatic file-transfer, screen capture, user-defined keys, multiple configurations, and many other features, poly-COM/240 becomes a genuine workhorse of a workstation.

Polygon...The Leader
You're in good company when you choose Polygon software. With more than 50,000 installations, Polygon is the long-term leader in the industry. Our six years in the DEC communications market assure you of industry leading products that are rugged, reliable, and easy-to-use. DEC chose Polygon's products to offer on their personal and mini computers. So should you.

To find out more about poly-COM/240 and the other members of the Polygon family of communication products call 314-576-7709.

spooler. Novell took a few months to debug Advanced Netware, but Fielding now has the upgrade, which he says is working fine.

Fielding's experience points to the hazards of working on the front lines of advancing technology. "We've always stayed on the edge of technology, as long as it's reasonable," he says. Reasonable, for Fielding, translates to a willingness to use a new product as long as it comes from a growth company he trusts. However, he doesn't recommend users take that risk unless they have an in-house technical staff for troubleshooting and support.

The process of fine-tuning

Back in March 1984, the same willingness motivated Jayco to be one of the first on the block to install a network. Managers needed a powerful multiuser data base application that would allow them to access up-to-date tenant and property information quickly, and the new personal computer-based network technology was the answer.

Jayco began with a six-node Gateway Communications, Inc. G-Net system, utilizing Novell's Netware/G software and an IBM Personal Computer XT as the designated file server. This linear CSMA/CD system is recommended for small installations. Three users were running a data base; the other three, spreadsheets and word processing.

The network ran into a few start-up snags, and installers ended up making adjustments to both hardware and software. First of all, the network was set up to share a single printer, but the printer unit was under heavy use, often grinding through a box of paper every 1½ hours. Fielding soon realized that the Okidata Corp. Microline 84 did not have the capacity to withstand the usage and upgraded to the vendor's Pacemark 2410.

Fielding says file-level lockout security, one of Novell's main assets, proves to be a nuisance in some instances. "If the person working with a file walked away without exiting from the application, another user would be prevented from accessing that file."

Also, he finds that new system administrators tend to have difficulty conceptualizing the definitions for public and private volumes and security rules. For example, if a program runs on the network, the rules for the program should be defined as shared/read-only. However, for each user, files should be defined as nonshared/read-write. This definition will allow all users to use the programs on the network and still protect files from being accessed and edited by other users. Fielding recommends that COMMAND.COM be installed in a public volume; otherwise, when exiting a program the user may have to reboot. "The manuals are somewhat vague about that," he observes.

Another problem is the training that is required for all network users. Fielding finds the nontechnical user would rather not be saddled with network commands in addition to DOS commands. He sidesteps the training issue by building front-end menus that control the desired network tasks for the users.

A 12-second wait

Even after these kinks were ironed out, there was still one overriding problem. "Our own users found the network too slow," Fielding explains. "Plus, we have a lot of investors who drop by our offices, and we like to show them our technology. A 12-second wait didn't look too good."

Because they realized that they were heading toward outgrowing the practical limits of the G-Net, Jayco's managers decided to upgrade to Novell's proprietary Netware/S Server, a Motorola, Inc. 68000-based token-passing star system, one year after the original installation.

Fielding found the same applications ran 30% faster on the new server. Benchmark tests showed that while accessing an 11K record through a data base application, the Read took 13 seconds on the six-node G-Net. It took 10 seconds on the Netware/S system. Even on a stand-alone Personal Computer XT without any network overhead, it only ran one second faster.

For Fielding, the potential for expandability is one of the true benefits of a network. Local-area networks don't require the steep initial investment of a minicomputer; a company can start with a small, serviceable network and invest more as time goes on.

Fielding does recommend that anyone installing a network make sure that the vendor has a good trade-in policy for upgrades. Other suggestions include:

Don't try to cut costs by mixing and matching hardware. Fielding says Anderson's bad experience with third-party peripherals is not isolated. "People mix all kinds of parts together without the experience to make it all work together," he says. "If a vendor suggests combining products, that's a danger sign. When you try to squeeze bucks, you get burned."

Check that your vendor has a good inventory to use as loaners when your network needs servicing. "You're going to need a lot of support over the first six months to a year," Fielding warns. "If you're buying a proprietary system and one piece goes down, it can take eight stations with it. You'll need a vendor who's reliable and close by so that you can be up and running by the next day."

Don't pay for anything until it works. "A lot of dealers don't know what they are doing. It is hard to understand a network until you've worked on one for a long time." Having been burnt a few times, Fielding has learned to dig in his heels. "I tell the vendor I'll hand the check over when the net works." He admits that one could only do this with a small system; the hardware investment for a large network would be so steep that no vendor would agree to these terms.

Bullish on networks

Another battle-scarred veteran, Laurie Antonell, is in charge of a larger installation. She is manager of micro networks for Merrill Lynch & Co. on Wall Street. The current network environment at Merrill Lynch, consisting of four Novell Netware/S networks that support 80-plus users, has been in place for about two years. The network is used for calendar programs and electronic mail, and the company has plans for new applications to take advantage of multiuser record-lockout capabilities.

In general, the S-systems provide Antonell with good response time for the 18 to 22 users connected to each of the three production systems. A fourth system is used to test new releases of software on the network and to perform regression tests during upgrades.

It is essential that new software be tested prior to migration onto a production network or when a new copy of the software is being installed. Antonell is currently planning a migration to the new Advanced Netware so that all of the independent networks can be linked together, enabling users to access all data simultaneously.

Cable installation

One of Antonell's recurring network problems is cable installation. For example, if someone moves to a different office, she doesn't want to reinstall that cable in the new location. The solution was to install cable within the wall, allowing it to be terminated with an outlet, and routing through a patch panel so users can switch a computer port onto an active line.

"Now I have cables hooked into each office. As people move, I just switch them to their new locations through the patch panel," she says. New users simply plug into an existing outlet. Installation of cable connectors continues to be a problem. When a connector on a cable severs, it is difficult to pinpoint the faulty connector.

Antonell advises that preventive maintenance be a standard practice. Simple maintenance such as backing up all the information on the disk, reformatting it to detect the newly damaged sectors and then restoring the files to the disk saves a lot of sleepless nights.

With six or seven disks in the system, the Merrill Lynch network has had three disk failures in two years. Much to Antonell's satisfaction, her dealer immediately supplied her with

replacement drives, so the network was up and running in 24 hours each time. Service support is high on Antonell's checklist for dealer qualifications. Her suggestions include the following:

- Make sure your dealer maintains adequate inventory. "Go into the closet and see his supplies. The vendor should have at least one set of disk drives, all parts of a file server and a few workstation cards. Of course, if he services a hundred companies' networks, he should have a much larger inventory."
- Check that the vendor employs technicians to handle problems specific to a local-area network. The technician should be able to tell, for example, if your problem is with the controller board, the memory board, the read-only memory chips or the disk drive.
- Choose a vendor who knows how to set up the network for the expected load and for optimum performance, taking into account factors such as the file server's hashing and caching schema, the number of files that can be open at the same time, and disk and block sizes.
- Designate a system administrator for every 25 users. Ten percent or less of an administrator's time will be spent adding and deleting new users and making sure that files are backed up and restored. The administrator should make sure that rules for public use are documented and should know how to add and delete software, how to add files in the proper directories and how to give people rights to it.

The system administrator is responsible for space management and for informing people to erase superfluous files but should not be responsible for doing so. The supervisor needs a data base of the serial numbers of the hardware and software and who has what file or directory access rights.

Wiser now

Richard Watson, chief of computer services at the U.S. Department of Commerce's Eastern Administrative Support Center, has installed a 35-node network from Network Development Corp., with an IBM Personal Computer as a server. He intends to upgrade to a Personal Computer AT but is waiting to see what other technologies emerge.

Watson tells his own war stories. The network ran very smoothly for the first four months — until it reached "some mystical point of activity.". Then, as Watson describes, "It started showing symptoms like random failure — people would go to print a word processing file, and the file would disappear. The error interrupts were really nonstandard."

The department tried a number of solutions. "We suspected the word processor — or perhaps an incompatibility problem," Watson explains. But troubleshooting was of no avail.

"Once we called in the vendor and told them, 'We give up,' they were here right away," he says. The vendor quickly determined that the problem lay with the hard disk, manufactured by a third party. The vendor installed a temporary 135M-byte loaner drive until the other is replaced.

What would Watson have done differently, with hindsight? "I'd have hollered sooner," he said.

Dealers witness many user problems from a unique perspective. Feridan Uygur, district manager for the New York office of Microserv Technologies Corp., a distributor of networking products, has coached a number of dealers on handling network installations.

No place for a novice

Most network problems Uygur has encountered come from improper cabling. People sometimes use homemade cable that offers inadequate shielding and has improper impedance characteristics, making it susceptible to noise. Often the running of the cables themselves has not been done correctly.

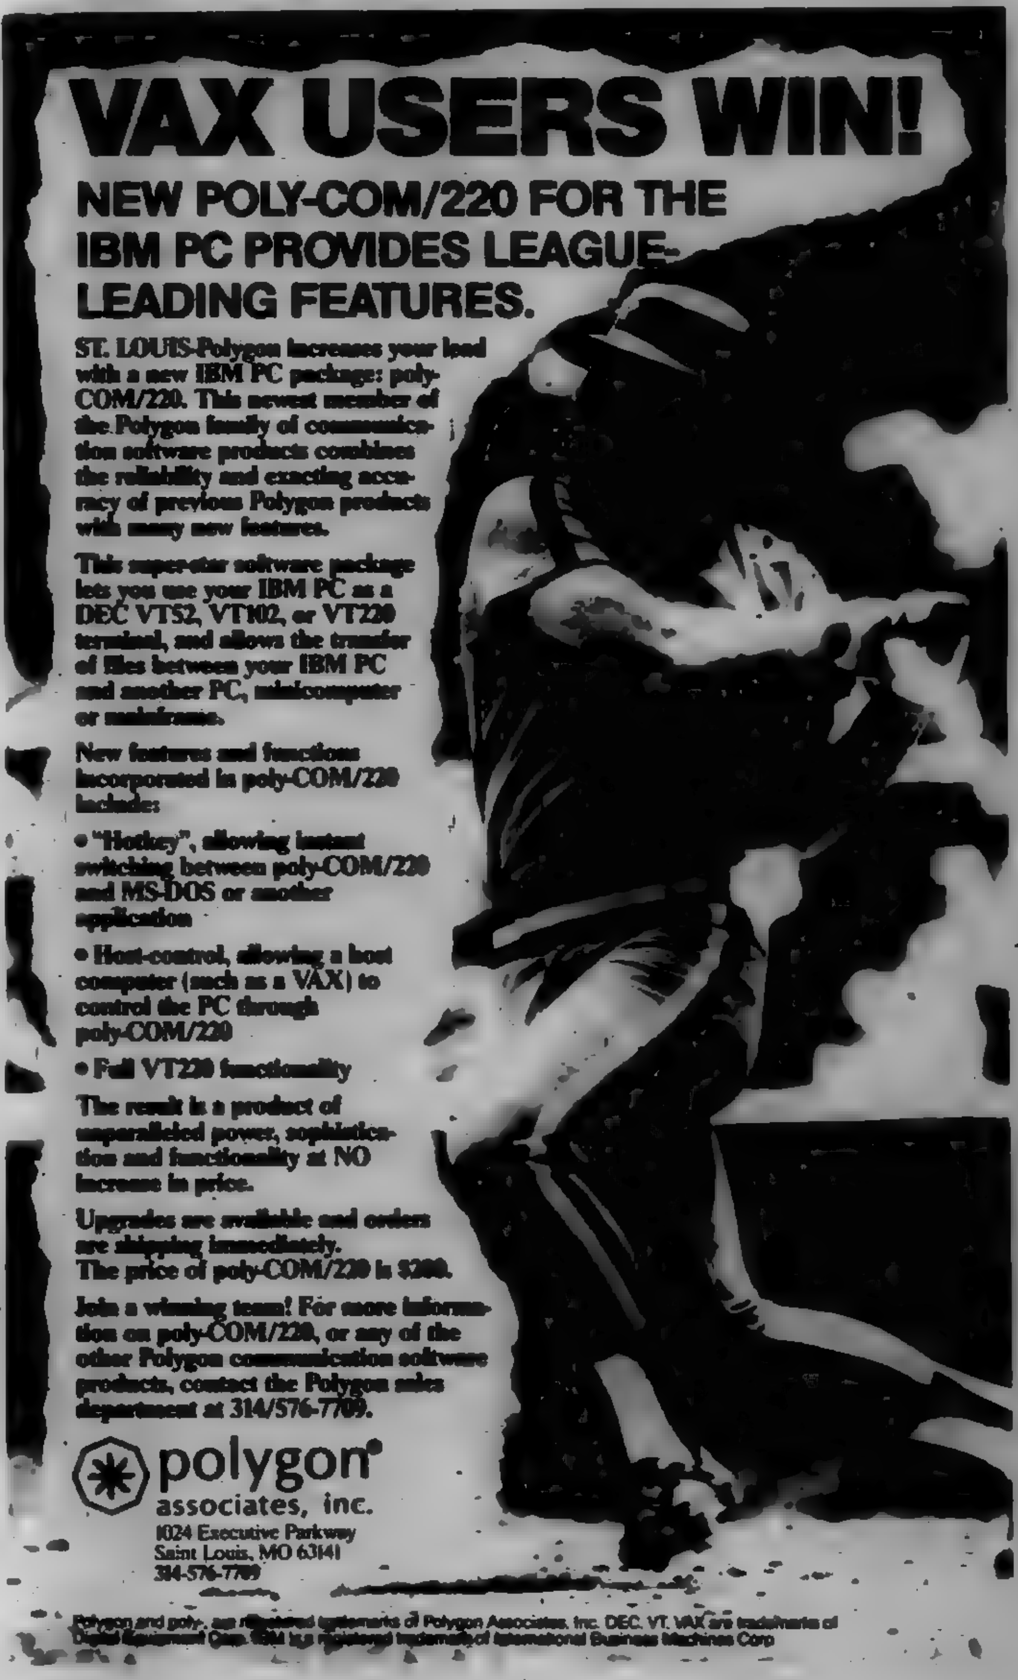
Another problem category is boards. Any time a new board is introduced into a personal computer on the network, there is a threat of incompatibility from conflicting interrupts. Some boards are designed so that their interrupts are changeable, and a technician can alter them. Boards without changeable interrupts are best left out of a network.

Most network problems come from improper cabling. Another problem category is boards.

Programs often requires configuration during installation to gen the software properly for the network. Often, different versions of the software require a patch to make print routines and screen handling work properly. These comments quickly make it clear that network installation is no task for a novice user.

Uygur trains his dealers to run through a checklist each time they install a system for a client. Network purchasers should expect questions like these from consultants; if a dealer or consultant doesn't ask them, it might be cause for concern.

- Do you have cable already installed? If so, what type?
- How many users will be on the local-area network? What number of nodes and how many concurrent



VAX USERS WIN!

NEW POLY-COM/220 FOR THE IBM PC PROVIDES LEAGUE-LEADING FEATURES.

ST. LOUIS-Polygon increases your lead with a new IBM PC package: poly-COM/220. This newest member of the Polygon family of communication software products combines the reliability and exacting accuracy of previous Polygon products with many new features.

This super-star software package lets you use your IBM PC as a DEC VT52, VT102, or VT220 terminal, and allows the transfer of files between your IBM PC and another PC, minicomputer or mainframe.

New features and functions incorporated in poly-COM/220 include:

- "Hotkey", allowing instant switching between poly-COM/220 and MS-DOS or another application
- Host-control, allowing a host computer (such as a VAX) to control the PC through poly-COM/220
- Full VT220 functionality

The result is a product of unparalleled power, sophistication and functionality at NO increase in price.

Upgrades are available and orders are shipping immediately.
The price of poly-COM/220 is $200.

Join a winning team! For more information on poly-COM/220, or any of the other Polygon communication software products, contact the Polygon sales department at 314/576-7709.

users? To what size do you expect the network to grow in the foreseeable future?

- What types of applications will be used on the system? Will there be any that are disk I/O intensive?
- What type of server will be required? Will it be dedicated or nondedicated?
- What will be the physical layout and the resulting topology? What are the distances between machines? Will it run on separate floors?
- Is there a need for remote access? Is there a need for gateways or bridges?
- What kinds of multiuser software do you need? Is it available from a third-party vendor?
- What are the cost parameters in the long run? In the short run?
- What kind of technical support will be needed? How much training will end users require?

The experiences of the veterans show that network installations are tricky, even when procedures are followed precisely. For the first-time network user, installations mean making challenging adjustments, including boards and master programs that need to be modified. Often the documentation is not updated properly by the vendor, and software releases are sometimes sold without being thoroughly tested.

Into the fray

However, the industry is maturing. More vendors are rallying behind the major players. With the emergence of standards, software incompatability will be less of an issue. Furthermore, new users now have a body of experience to draw upon to ease the transition to a fully integrated system. With the proper support from competent dealers and consultants and careful planning, a network may be implemented with much less difficulty than in previous years.

Already, the users who broke the ground in linking microcomputers are moving on to new levels of network technology: gateways to the mainframe. Stouder at Continental Grain is planning a network gateway to large-scale IBM computers the company maintains in Chicago. His purpose is to avoid having personal computer users dial into a protocol converter and then transfer the data between the file server's disk and the mainframe.

It is becoming evident that volume users are pleased enough with their network installations that their battles have produced no bitterness, war stories notwithstanding. These users are now going back into the fray, ready to tackle new technologies in the effort to maximize the potential of the personal computer as a business tool.

Support: Beyond Band-Aids

By Stephen Thurston

Most users of personal computer networks today could be classified as "early adapters." Intrigued by the technology, these pioneers purchased local-area networks soon after they were announced and before the path had been well-worn. By nature, they have been to a large extent self-sufficient in terms of installation and ongoing service and support.

But the customer profile is expected to change over the next two to three years, as personal computer networks are installed in greater numbers among smaller companies and office environments.

A key role in network maintenance is played by the network administrator. If that person is technically proficient and can diagnose problems effectively, there is less need for comprehensive on-site service. But in most cases, it is impractical to plan on installing a network without outside help.

Many local-area network users start by establishing a strong relationship with a local software consulting firm or independent consultant. Even if users are self-sufficient in terms of technical expertise, most rely on a consultant for initial network design, customized application software and ongoing support.

Hardware service has proved less of an issue to date. The mere fact that personal computers are operating in a network doesn't seem to imply greater service requirements, although critical network components — particularly file servers — should be covered by an on-site service contract.

Total system approach

The most appropriate type of service, however, takes the total system approach. From one service vendor's perspective: "What we're really offering here is support of a company's business environment rather than specific hardware and software components. We're offering protection against such things as user error, power irregularities — any number of things that might have an impact on that company's overall productivity and profit/loss."

The users' viewpoint, as expressed by one businessman, echoes the same need: "The computer views the network as a peripheral that is highly reliable. If the network is within one department only, service issues are simple — they're treated as an extension of the processor. But if multiple departments have access to the same network resources, there often is no interest in cooperating on such issues as service and support. It tends to be MIS that can work things out with a service vendor."

Estimates from network vendors indicate that the typical factory-level board repair/replace service has been sufficient to handle 75% to 80% of the customers who elect a self-maintenance approach. But as the network becomes more of an information utility, MIS groups will regain control, and those vendors recognizing the system approach will be the most successful.

Several such vendors have recently enhanced their offerings to accommodate changing requirements:

- Corvus Systems, Inc. now offers an on-line program, extended limited warranty, exchange warranty and on-site maintenance through Decision Data Systems.
- Nestar Systems, Inc. offers on-site maintenance (through RCA Service Co.), factory maintenance and a "rent-a-part" option, in addition to standard time and material rates.
- 3Com Corp. is establishing a program to provide service through a network of authorized dealers in conjunction with the availability of its 3Server product, a more critical network component.

The ultimate objective will be establishing single-source responsibility for network installations — from the planning/design stage through implementation and including ongoing support.

Retail/dealer organizations are best described as still being "on the learning curve" in terms of finding their optimal role in delivering service and support for personal computer networks. For some dealers, network support expertise will differentiate them in the market. Others find that a joint relationship with a local software consultant who provides support works best.

Learning the hard way

Many dealers have learned the hard way that a network sale requires considerable pre- and post-sales support. Having once underestimated the task of network installation and service, dealer service organizations are now wiser. They have also become cautious of naive customers wishing to jump on the network bandwagon who may later balk at installation hang-ups.

One dealer's comment is typical: "You don't rush a network sale. We'd rather turn the business away now than take on an unprepared network customer. Support is not a one-person job — it involves departments such as technical support and training. Our network specialist is now part of the service organization."

Third-party maintenance firms may never become that active in the network service market for personal computers. As a rule, third-party firms are participating primarily by making national agreements with local-area network vendors rather than actively marketing end-user contracts.

While they may be able to offer the advantage of multivendor hardware service, these companies lack diagnostic capabilities as well as the systems orientation for the "soft support" required for networks. Their forte lies in fixing broken machines, not in answering open-ended questions such as, "Why isn't my network running today?"

Third-party software consultants can add value in the form of programming expertise, tailoring industry-standard software to a multiuser environment. Use of such consultants is a common thread among many personal computer network users, and some have joint efforts with a major retail/dealer organization. Continued opportunity for such organizations to provide planning/design services and support is expected.

The ultimate objective, as local-area network users connect to other local and wide-area networks, will be establishing single-source responsibility for installations — from the planning/design stage, through implementation and including ongoing support and management of the "information utility."

Single-source capability

One group will shoulder complete responsibility for diagnosis and correction of any problem in the network, regardless of location and equipment involved. A designated service vendor, in essence acting as the customer's agent, would manage this whole process, including any subcontracting required. The customer would make only one call and hold only one contract.

In fact, some of the systems manufacturers already have this goal in mind as they develop their support services.

The real question is what value customers will place on such a single-source capability and whether they are willing to relinquish overall responsibility for managing these problems.

While a broader range of support services is an indication of the maturity of vendors and markets, users need reassurance that there will be continued service and support available. Those vendors who have effective service and support programs now are better positioned to be the long-term survivors in this emerging marketplace.

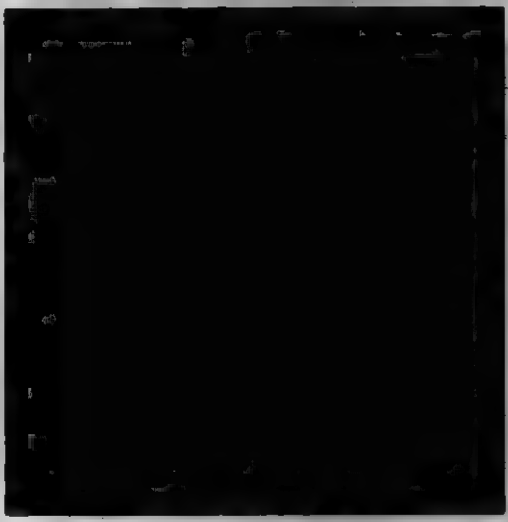
EXTRA

IBM's grand scheme

By Eric Killorin and Paula Musich



CW PHOTO BY O'CONNELL/[illegible]

Printer Attachment, Cluster Program, PC Network, Cabling System, SNA — welcome to IBM products in search of a strategy.

IBM's helter-skelter development approach toward networking is changing slowly into a comprehensive solution.

It used to seem as if there were no overall strategy from IBM about how to link its computers. Different corporate divisions apparently pursued their own networking answers independently, each group concentrating on connecting the equipment it was responsible for supporting.

IBM now has a vision for corporatewide networking. Users expecting a big splash soon will be disappointed, however. IBM's solution will evolve rather than burst onto the scene as a single new product.

Like most large corporations, IBM will move ponderously, weeding out some products and adapting others. To piece together IBM's various Personal Computer network offerings, it's useful to put the needs they serve into a framework — a directory of needs and solutions. The "solutions matrix" defines four levels of networking needs and shows current products corresponding to each level of need.

The lowest level of the solutions matrix represents the need to share resources such as printers and modems. Here IBM offers the Printer Sharing Attachment, a data switch. The device enables four Personal Computers to share the Displaywriter letter-quality printer.

Solutions matrix: A directory of network needs and solutions

Primary User Requirements	Chief Rationale	Domain	Typical Implementations
		Level I: Resource Sharing	
Output Devices Share printers and special-purpose output devices, modems	**Economic** Amortize cost and use shared devices over multiple personal computers	**Work Area** Small cluster (room, office); primarily small stand-alone group (fewer than 10 personal computers, one printer, one modem)	**Data Switches** Switches between personal computers and shared devices; support for standard interfaces (RS-232, RS-423, CCITT V.24). Examples: DEC Mini-Exchange; Advanced Systems Concepts Amps-11; IBM 5218 printer attachment; Apple Appletalk
Secondary Storage Share hard disks, diskettes, tape backups, printers, modems	**Economic** Amortize cost and use shared devices over multiple personal computers; eliminate need for hard disk in each personal computer; share systems and applications software	**Work/Local Area** Small cluster, (building, campus); primarily small to medium-size stand-alone networks (fewer than 25 personal computers, mass storage subsystems, two printers, modem)	**Network Servers** Disk/file servers (typically personal computer-based) or personal computers with onboard network interface units; twisted-pair or coaxial cable media. Examples: Corvus Omninet; IBM Cluster Program; Novell Netware/S; AT&T Starlan
		Level II: Information Sharing	
Local Area Transfer and exchange information, messages, software between personal computers and other processors	**Data Access/Performance** Information sharing in multivendor environments; requirement for high performance; conformity to standards	**Local Area** Intra- and interdepartmental (building, campus); primarily medium-size stand-alone networks (fewer than 100 personal computers, several hosts and shared devices)	**Local-Area Networks** Coaxial cable-based local-area networks with or without servers; baseband or broadband. Examples: IBM PC Network; Interlan NET/Plus; Ungermann-Bass Net/One; 3Com Etherseries; Proteon Pronet
Local/Wide Area Transfer and exchange information as above, with expanded requirements for end-to-end communications across multiple environments/architectures/media — at personal computer level	**High-Level Network Functions** End-to-end message delivery; internetworking (bridges and gateways — local-area network-to-wide-area network, X.25); network management; multivendor support; conformity to Open Systems Interconnect model	**Wide Area** Intra- and interfacility (city, state, country); bulk of communications occurring locally (host systems with several hundred workstations)	**Layered Architectures** Hosts (personal computers if supported) as network nodes, multiple classes of processors/devices on network; routers used for internetworking; gateways used for connection to X.25 or other networks. Examples: IBM Systems Network Architecture; DEC Digital Network Architecture; Honeywell Distributed Systems Architecture; HP Advancenet

Source: Hyatt Research Corp.

Each IBM Personal Computer connected to this small device-sharing network requires the IBM Printer Driver program. The network will route print requests via the Personal Computer's asynchronous communications port to the data switch for subsequent dispatch to the printer.

The IBM 5218 Printer Sharing Attachment competes with the Mini-Exchange from Digital Equipment Corp. and the Amps-11 from Advanced Systems Concepts, each of which perform similar functions.

Network dark horse

The next level of networking need calls for sharing secondary storage, such as centrally located disk drives. IBM's Cluster Program fills this need.

Perhaps because IBM never referred to this product as a "local-area network," it generated little excitement within the user community on its arrival. Its chief strengths lie in its low cost and easy installation and operation. With the Cluster Program, half a dozen microcomputer users can share storage economically.

The IBM Cluster Program consists of software that permits the Personal Computer, Personal Computer XT, Portable Personal Computer and PCjr to share storage and exchange files. The Cluster Program requires single-board network interface units called Cluster Adapters and Cluster Attachments. In its fullest configuration, the Cluster Program supports file transfer, electronic mail and secondary storage sharing (virtual diskettes).

A server-based network configuration uses a Personal Computer XT as a nondedicated disk server, supporting up to 20M bytes of shared storage. In this setup, cluster users can access one private volume and one public volume. Alternatively, the network can be configured to support information sharing only, eliminating the need for a disk server since the network software resides in each workstation.

The Cluster competes with Omninet from Corvus Systems, Inc. and Netware/S from Novell, Inc., two well-established personal computer local-area networks.

> ***Neither the Printer Attachment nor the Cluster Program is destined to survive in IBM's future networking plans. Neither is well suited as a foundation for network expansion, and IBM may not ensure their coexistence with future products.***

IBM freely admits that the Cluster's performance will suffer during I/O-intensive sessions. Having I/O duties performed at the disk server degrades the performance of workstations, and conversely, I/O processes being completed by workstations will affect disk server performance. What all this amounts to is that the Cluster can reasonably support about six users, despite a theoretical limit of 64 users and some marketing recommendations of 20 to 25 users.

Neither the Printer Attachment nor the Cluster Program is destined to survive in IBM's future networking plans. Neither is well suited as a foundation for network expansion, and IBM may not ensure their coexistence with future products.

Off to a slow start

With two low-level personal computer network offerings from IBM, the market was anxious for a flagship local-area network and pinned its hopes on the PC Network, announced late last summer. Unlike the Cluster Program, the IBM PC Network targeted the next level of need — sharing information locally — and was much ballyhooed on its introduction. On closer examination, however, industry observers criticized the network for its use of broadband technology and its limited services. Subsequently, interest in this network declined.

The PC Network uses a different access scheme and different media than IBM's planned token ring network. Market experience so far has shown that the PC Network is not well suited for unsophisticated end users or for distribution through retail channels. It began shipping in limited numbers late in April, eight months after it was announced. It competes with a token-ring network called Pronet, from Proteon Associates, Inc., in addition to the various Ethernet vendors' micro offerings, such as Net/One from Ungermann-Bass, Inc. and the Etherseries from 3Com Corp.

Some dealers blame the product's slow start on a lack of multiuser applications software. However, the network's use of DOS Version 3.1 means that problem shouldn't remain for long. DOS 3.1 appears to be the standard for which personal computer applications developers have been waiting, with an unusually high number of multiuser applications packages for the PC Network already announced.

Other dealers blame the network's slow start on users' uncertainty about IBM's direction in networking. Historically, IBM has developed a multiplicity of incompatible networking solutions to sustain different areas of its product line. Users may be reluctant to invest in what they perceive as yet another limited offering with questionable future use and support.

And they are not wrong about IBM's own lack of commitment to the PC Network. If market and dealer response was lukewarm, the network's acceptance inside IBM has been even chillier. Produced by the maverick Entry Systems Division (the Personal Computer's originator), the PC Network is not considered a strategic network product by IBM's top management; in fact, the PC Network project was nearly canceled when IBM corporate executives learned of it.

Since the PC Network hit the market, it has been a transparent product, with IBM generating little publicity on its availability or use and little support for dealers selling it. IBM's dealer support rests primarily on a three-day training course. Very little else is being done to help dealers sell complex broadband technology to unsophisticated end users.

Selling the network successfully through retailers will require out-of-store sales people who are well versed in the network's operation. In all likelihood, only the full-service dealers who can give users plenty of hand-holding without much support from IBM will do well with this product.

Buy now, pay later?

The real cloud on the PC Network's horizon lingers in the ongoing debate over whether this network is merely a stopgap product that will be orphaned as was the PCjr, or if it will be supported even after IBM's token ring network is available.

Last summer IBM offered the token ring as the solution for end users needing to share information locally. Simultaneously, the company released the Cabling System, a partial media distribution plan for the token ring network. IBM's message was, "This is the network we'll be seriously selling two years from now. Here's the media it will run on. Buy it now, install the cable and wait for the rest of the product."

Only IBM would try such a move;

IDEA IS SHIPPING A 5250 TWINAX EMULATOR WITH A UNIQUE FEATURE.

IT WORKS.

Last Fall, two major companies announced a twinax board for PC-to-IBM System 34/36/38 communications. Today, only one company is shipping a product that's fully functional: IDEA.

Unlike our competition, the IDEAcomm 5251 twinax board comes complete with software. This may explain why the thousands of units shipped since December are making IDEAcomm 5251 the industry standard worldwide.

You'll also find many third-party software packages for the System 3X supporting our board: Decisionlink™ and Intelink,™ for example.

But our customers have found lots of other reasons to choose IDEAcomm 5251.

We provide a "hot key" capability, hard disk access, printer support, four concurrent host sessions, and data transfer. Plus, our customers who benchmark IDEAcomm 5251 tell us that it's incredibly fast.

And IDEAcomm 5251 does all this and still requires only 30K of memory on your PC.

So if you want a 5250 twinax emulator with performance rather than a promise, call IDEA at 800-257-5027.

whether the company will get away with it is questionable. Arch-rival AT&T offers a competitive wiring scheme, the Premises Distribution Wiring Plan. Moreover, the Cabling System is expensive to install: The drop cabling (that portion of cable linking the workstation to the wiring closet) is thick and inflexible, making it difficult for cable installers to manage more than one drop at a time.

Although IBM will not aggressively push the PC Network in the marketplace, it may be the primary Personal Computer interconnection product for some time.

Where does that leave the PC Network? Although IBM will not aggressively push the PC Network in the marketplace, it may be the primary Personal Computer interconnection product for some time to come, even after the token ring product is available. Key to its longevity — in addition to the standard forming around DOS 3.1 — rests in its use of Netbios, the network interface specification at the core of the token ring. In addition, some important software vendors offer packages specifically tailored to the PC Network.

SNA at the highest level

IBM's Systems Network Architecture is an 11-year-old communications architecture for passing information between terminals and hosts. It recently was expanded to support the growing line of IBM office systems and Personal Computers. SNA targets the highest level of networking needs — sharing information in a wide area.

SNA initially grew out of the need to interconnect IBM's hosts with terminals located some distance away. It was designed to distribute access to central processing at the host. As such, it uses a hierarchical structure — a master/slave relationship not well suited for peer-to-peer communications. Despite this dependence on the host for "permission" to establish connections, IBM has chosen SNA as the foundation for integrating its network offerings.

Consequently, SNA is evolving. It provides improved peer-to-peer communications to interconnect IBM's vast array of processors efficiently, and — most notably — the architecture now competes with distributed access models of network architectures such as DEC's Digital Network Architecture (DNA), best known under the product name of Decnet.

SNA has advanced significantly in the area of support for office applications as well. These features markedly improve the way SNA deals with documents passing among office clusters. Key aspects of SNA's office communications functions include the Document Content Architecture (DCA), the Document Interchange Architecture (DIA) and the Distributed Office Support System (Disoss) — all document interchange capabilities.

These specifications within SNA provide the essential ingredients for transferring the power of SNA down to the personal computer level:

DCA defines an encoding scheme for the document's content (what's in the "envelope"). The scheme is divided into two levels: "revisable" or level 3, which allows for editing and modifications, and "final text" or level 2, for print or display, which does not allow for modification. Revisable DCA has advantages in that it permits several stages of editing to be made by different users as the document is passed from one workstation to the next.

DIA defines the document's packaging and, consequently, the method for moving it across systems (the "envelope" itself). Four DIA services are offered: session, library, distribution and application processing.

Disoss acts as a centralized filing and retrieval system for devices in an SNA network. It defines an acceptable environment for passing information among hosts and workstations. Disoss/370, as it is often called, provides applications such as calendar management for managers and executives.

The IBM Office Systems Family (OSF) products permit document passing between Personal Computers, System/36s, and 370s. Among the most significant OSF offerings are the document interchange functions. Personal Services/36, for example, supports a document exchange-based network of System/36s, personal computers, Displaywriters and 5520s. Personal Services/370 allows file transfers from Personal Computers and 3270 Personal Computers to 370s in a Disoss/370 environment.

In spite of SNA's new capabilities, IBM is still far behind some competitors in supporting multiple operating systems on a single network and in allowing network users file transfers and shared peripheral access. Herein lies IBM's network challenge: to support many bus structures and operating systems — mostly incompatible — within a single communications scheme.

network offerings meets an end-user need in the solutions matrix, ranging from simple to complex and from inexpensive to quite costly. These products make up the significant pieces of IBM's networking puzzle. IBM also plans factory networks, private branch exchange-based networks and links to public services networks.

As IBM develops its grand strategy to interconnect all of its processors from the Personal Computer to the large-scale systems, some of those pieces will fall into place; others will be discarded once they no longer fit. Some experts predict that the token ring, running over the Cabling System, will be the premier Personal Computer network offering and will be capable of linking nodes in an SNA environment.

The future of the PC Network is unclear. Some argue that it was doomed from the start because it doesn't fit into IBM's networking strategy of linking multiple classes of systems. They note that its progenitor has been removed from responsibility for the product and replaced by a "true blue" networking executive.

Others believe that the PC Network will survive at least the initial release of the token ring network, that this first release will not include network interface units for Personal Computers. VLSI chip development has been slow to materialize, making such an interface too costly. The token ring will use network interface units and software for medium- and large-scale systems, but Personal Computers will be linked via a bridge to the PC Network using the Series/1.

The PC Network may also never produce the long-awaited blossoming of the local-area network market. That blossoming will require a catalyst with a network architecture that meets the needs of IBM's key customers, runs on the installed Cabling Systems and supports SNA.

When available, the token ring network will provide the fundamental connectivity in IBM's effort to link its systems. The updated SNA, which will look quite different from the SNA brought out in 1974, will be the cornerstone of that network.

In the personal computer network marketplace, IBM may make a number of moves acknowledging AT&T's presence. The Cabling System, IBM's answer to AT&T's Premises Distribution System, will drop in price.

Despite IBM's acquisition of Rolm Corp. and the new MCI deal, IBM is not making overtures to become "your voice company." IBM is trying to maintain control and learn what's necessary to continue being "your data (in other words, information) company."

No single product or event will produce a final solution. However, the future of data processing is inexorably intertwined with data communications, so IBM must lead here as well.

Paula J. Musich is editor of "PC Netline," a Hyatt Research newsletter that analyzes the market for personal computer and office networks.

IBM's LU6.2 the new super link?

By John Doherty

[illegible] printout into a personal computer spreadsheet is still a novel procedure in today's offices. Connectivity can no longer be a buzzword — it must become a [illegible] corporate [illegible].

IBM's answer to [illegible] micro communications in the distributed processing environment is its Physical Unit 2.1/Logical Unit 6.2 (LU6.2), also called Advanced Program-to-Program Communications. LU6.2 is one of several technical additions to IBM's Systems Network Architecture (SNA), which has evolved into the *de facto* communications standard for large systems.

LU6.2 serves as a foundation for IBM's overall office strategy: distributed automation, including the Distributed Office Support System (Disoss) and its supporting cast: Document Interchange Architecture, Document Content Architecture and SNA Distributed Services.

Under Disoss, these new packages standardize data formats and distribution protocols across different classes of computer systems. LU6.2's role is to integrate distributed computers into SNA as intelligent peers, not to have them emulating fixed hardware slave devices.

Surveys show that effective micro links to mainframes are at the top of MIS shopping lists, ranking higher than hardware and off-the-shelf applications. But today most personal computers are really only used as adjuncts to, not active participants of, mainframe systems.

Terminal emulation is still the most widely used micro-mainframe link. When linked to the host in this way, the personal computer loses most of its independent processing power and often functions as no more than a display-only terminal.

Terminal emulation strips the personal computer of the versatility and power that first made it attractive as a desktop workstation. This emasculation of the fledged personal computer is the natural result of prior levels of SNA dictating a slave relationship to a specific device type, such as 3270 terminals. In order for a micro to access host information, it had to "trick" the mainframe into thinking it was one of the host's 3270-type terminals. There was no standard way of allowing micro applications actually to integrate with mainframe applications.

The key to establishing strong micro-to-mainframe links is to have local programs talking directly to networked applications beyond 3270 mainframe slave device restrictions. LU6.2 — designed for exactly this purpose — will allow true distributed processing for the first time.

While today's micro links can download data, the information doesn't make its way to the micro in ways that are easily manageable by local applications. Because the host thinks the micro is a terminal, a dumb input device, [illegible] are formatted to 3270 communications protocols.

The main aim of micro-link developers, therefore, has been to allow micros to move data directly into local applications [illegible] host-linking [illegible] to move host data to local files. With these links, host applications can talk directly with local applications, and the link serves as the interface.

Micro users, by using links that have program interfaces compatible with IBM's Applications Program Interface, could select data from a large host file, transfer it to a micro spreadsheet application to create a special report and then print the report on a local printer, all in a single mainframe session.

Regardless of the type of link, micros are still tied to the mainframe in a master/slave relationship for controlling data distribution functions along the network. Although the end user is insulated during this process, there is much work to do before the link is completely automated. For now, the applications developer still has to treat host data as if it were just 3270 terminal readouts.

LU6.2 is the direct application-to-application interface to mainframes and will ease user dissatisfaction with the drawbacks of today's links. With LU6.2, users running a micro program can call data directly off the disk drive in the mainframe and process it on the local application. This means that users can sit at a micro and structure an Information Management System (IMS) call or query as if it were on the mainframe. To access the host data base, users only have to query the local data base. This peer-to-peer feature of LU6.2 frees the micro from the mainframe's data management controls and places network resources on an equal status for accessing and distributing files.

Under LU6.2, data processing is shared throughout the system, reducing the host's processing load so the mainframe no longer has to move an entire file to relay information to the micro user's [illegible] a [illegible] to be used at all.

The key to establishing strong micro-to-mainframe links is to have local programs talk directly to networked applications beyond 3270 slave device restrictions. LU6.2 is designed for exactly this purpose.

LU6.2 also provides program-to-program communications. Any two programs on any two machines can communicate on the network, regardless of the operating systems or languages used. For instance, a C program that runs on a Unix machine can talk to an IBM 4300 machine running a Cobol program. The programmer does not have to know the language or the operating system of the target program.

In the past, whenever IBM developed a large system, it used proprietary operating systems and was very protective about them. However, IBM found that by releasing its hold on MS-DOS and allowing other companies to use it, the market for MS-DOS naturally expanded, creating greater interest, understanding and revenue from end users than had previously existed.

IBM is doing the same thing with its LU6.2 machines, which include Systems/36 and 38 and Displaywriter. In addition, by letting other vendors use non-IBM micros to access mainframe data as if the disk were locally attached, IBM is establishing an incentive for software developers to provide the industry with interfaces to SNA. These companies are supplying the gateway to Disoss, including LU6.2, and applications developers will follow with products for local applications use.

Essentially, the micro-communications business is at a major junction. On the one hand, communications developers for large systems must continue to market sophisticated links based on current SNA 3270 communications standards. By making these links compatible with LU6.2 for micro applications in the near future, the transition to LU6.2 will be that much easier and swifter.

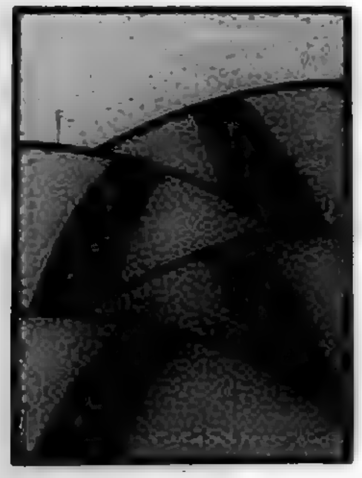
On the other hand, software suppliers must simultaneously help clarify and define future environments for office communications, especially as software solutions to network communications such as LU6.2 and Disoss begin to supersede the hardware boundaries of SNA.

In this new environment, communications software suppliers will play a key role in providing multiple data routes between computers and programs. And traditional applications vendors will continue to create the end-user vehicles. Data communications will continue to change, with more-complex elements but with more productive results.

John Doherty is vice-president of marketing and sales for [illegible] Software Corp., a Malvern, Pa.-based manufacturer of business communications software for micro-to-mainframe links and local-area networks.

On the road to the mainframe

By Gary Audin



The simplest approach is through a cluster controller. Users have made protocol conversion another popular alternative. Networks finish last.

The search for a quick, transparent, powerful micro-to-mainframe link leads users down many a winding path. Today no one alternative presents an ideal solution for personal computer users needing to link to a host. The micro-to-mainframe market is still in its adolescence. Users who need to make connections right away must contend with certain technological issues.

The most familiar approach to micro-mainframe links is straight terminal emulation, where the personal computer mimics a terminal on the host network. In some cases, the mainframe can be programmed to support specific micro communications protocols, but most often the emulation package includes host protocol capabilities for the micro. The exceptions are usually held for higher performance asynchronous protocols such as Xmodem and Communications Research Group, Inc.'s Blast.

A second alternative is to connect the personal computer to a protocol converter, which allows the micro to function as an already supported mainframe terminal. Protocol converters provide the same capability as terminal emulation, but the protocol converter approach can be less expensive and can provide a few extra capabilities as well.

A third approach is to connect the personal computer to the host via a cluster controller, such as the IBM 3274 and 3276 CRT cluster controllers, which involves equipping the personal computer with a special adapter card. This approach has the advantage of exactly emulating an existing mainframe environment and does not require any changes to the host. However, there may be some applications changes needed to make better use of the personal computer. Any approach that restricts the micro to dumb terminal functions reduces its power and effectiveness.

A fourth approach is to take a local-area network supporting personal computers and provide a gateway to the mainframe world. Gateways usually emulate a cluster controller, but other emulations are also available. *[The gateway as micro-mainframe link is covered in depth in "Gateways," p.35.]*

A fifth approach uses a public network service as a conversion mechanism. Services such as Tymshare, Inc.'s Tymnet and GTE Corp.'s Telenet provide protocol conversion as part of their communications function. This approach, however, has a limited number of conversion capabilities, fewer than the other approaches.

Adding terminal emulation software to a personal computer is the original solution to the problem of delivering mainframe access to a desktop micro. The communications program itself may be made up of several components including protocol software, user interface and set of procedures, automatic dialing and directory support, file transfer and in many cases a text editor for deleting and inserting special control codes as necessary.

Personal computers can communicate in one of three modes: text, native or transparent. The text mode allows the personal computer to communicate printable and displayable information. However, it usually requires the filtering out of any word processing, spreadsheet or other control codes prior to transmission. The receiving personal computer or mainframe can usually display or print the information, but all executable codes, such as spreadsheet formulas, can only be displayed, not processed.

Native mode uses a modified protocol to transfer word processing, editing and control codes. The receiving machine can process the information as well as display it. Native mode is limited to specific applications and programs.

Transparent mode, sometimes called binary mode, allows any combination of applications to be transferred between two machines. Transparent mode is especially useful in moving programs and files, since it places no limitations on the data transferred. Transparent mode is the most versatile, but it does not guarantee that the receiving machine can process the data, only that the protocol does not interface with its transfer.

Most terminal emulation software for personal computers provides asynchronous communications, specifically TTY-compatible emulations. TTY-type terminals that are commonly targeted for emulation include IBM 3101, Televideo Systems, Inc.'s 910, Tektronix, Inc. 4010 and Digital Equipment Corp.'s

Figure 1

VT52 or VT100 terminals, but most packages allow the end user to set up particular attributes for the desired protocol. Others provide prestored menus so that end users need only select the type of terminal to emulate. TTY emulation packages vary in their range of capability and are usually, but not always, text mode transmission, sending one message at a time rather than breaking data up into blocks.

There is a second group of asynchronous protocols designed specifically for personal computers. Xmodem, Blast and others fall into this category. These are block-oriented protocols with automatic error detection and retransmission. They are generally transparent as well.

Xmodem is a half-duplex single block acknowledgment protocol resembling the Bisync protocol. It comes with two forms of error detection, a checksum or cyclic redundancy check (CRC). Many additions have been made to the Xmodem protocol, which is in the public domain. Most are compatible with each other, but the user should verify compatibility prior to purchase.

Xmodem and its variants are also available as mainframe software packages, which reside behind the mainframe protocol software operating as an application program.

Blast is a more modern protocol, with many of the attributes of IBM's Synchronous Data Link Control (SDLC). It is a transparent, full-duplex protocol with multiple block acknowledgment; up to four blocks can be sent before transmission will stop. Blast uses the CRC mechanism for error detection. Because of its multiple block feature, Blast is far better than Xmodem and similar protocols at handling satellites.

Xmodem, Blast and their variations are primarily file transfer protocols. The are usually designed with block numbering to ensure no data loss. Many have block number error checking independent of data error checking. The cost of these programs ranges from $35 to $250 per copy, with the bulk costing from $100 to $150 each. Some of the programs are offered with companion mainframe software packages, which integrate smoothly but which usually cost 10 to 40 times more than the personal computer package.

On the other side of the coin are terminal emulation packages that use synchronous protocols such as Bisync and SDLC to emulate specific terminal types. The most common support IBM terminal protocols for the 3270 family, both standalone terminals and cluster controllers, and the 2780, 3780 or 3777 batch terminals. Other vendors, such as Burroughs Corp., Honeywell, Inc., NCR Corp., Digital Equipment Corp. and Wang Laboratories, Inc. also provide support for their own personal computers to connect to their mainframes.

The products themselves work well, but many users have overestimated their capability or expect them to work in environments for which they were not designed.

The synchronous protocols allow devices to communicate at much higher speeds than asynchronous programs can. They require a different kind of communications adapter for the personal computer, one that costs $300 to $400 and may handle both Bisync and SDLC. The number of software packages available and the vendors supporting synchronous protocols are considerably smaller, and the cost of these packages is considerably higher than their asynchronous counterparts, ranging from a minimum of $500 to more than $1,000 per copy.

Aside from price, the greatest difficulty associated with these protocol packages results from polling, which virtually all synchronous protocols use. Polling can make personal computer transactions unusually awkward.

If the communications program is removed from the personal computer so the micro is no longer operating as a terminal, then the micro will no longer respond to polling and selection. The mainframe will continue to try up to a limit, usually seven retries, before it enters a failure detection mode. During this time, it usually locks up the communications circuit so other terminals or micros cannot use it. Once the personal computer in question has failed to respond beyond the specified limit, the mainframe may turn off that personal computer as a terminal or even go as far as terminating all transmission on that communications line.

Mainframe operations personnel must then reinitialize communications for the personal computer. If an end user toggles back and forth between process mode and terminal mode randomly throughout the operating day, this approach becomes not just cumbersome but unworkable.

A multitasking communications program could alleviate this problem but can also place undue limitations on the applications programs. Very few multitasking programs are yet on the market, and they remain largely unproven. Thus, the best candidates for synchronous terminal emulation are users who usually stay within one mode or the other.

More recently, protocol converters have been marketed for personal computers to link to hosts. But most of those on the market assume that the device that is operating in the TTY mode is a dumb, nonprogrammable terminal; in other words, they are not tailored to the personal computer's wide range of capabilities and so fail to take full advantage of them. The success of protocol converters depends in part on which two protocols are being converted and what kind of dumb terminal is assumed.

A protocol converter does more than convert the protocol: It generally performs function and format conversion as well. The most typical protocol converters are for TTY-compatible terminals to communicate to mainframes and in most cases support IBM 3270 series terminals. The typical configuration allows TTY-compatible terminals to communicate through the converter and emulate Bisync or SDLC 3274/3276 Cluster Controllers, 2780/3780/3777 terminals or X.25 devices.

Configurations for protocol converters normally place them between the terminal and the front end or communications adapters on the mainframe. The converter itself could be located at the terminal site with the terminal directly connected to the converter. It could be in the network connected by modems, or it could be coresident with the front end attached locally. In any of these cases, operation is identical. Up to eight dumb terminals can be connected to the typical protocol converter, but smaller sizes supporting just two or four terminals are available.

The protocol converter vendor who supplies the hardware and system may also supply the appropriate software for the personal computer. The personal computer-resident software is designed to work through that converter, but it may not always have all the features that are expected.

Converter systems are available from a wide range of companies, including protocol converter companies, multiplexer companies, those who manufacture packet assembler/disassembers and AT&T and the divested Bell operating companies, as well as IBM and other computer manufacturers.

The cost of these converters varies considerably. A few years ago it was $1,000 per terminal,connected, but the price is now hovering near $350. In the past 18 months, much attention has been focused on tailoring protocol converters specifically to personal computers, making it an easier, more popular choice for users. Now it actually may be cheaper to make the personal computer TTY-compatible and pass information through a protocol converter for about $500 per terminal rather than program the personal computer to operate in a Bisync or SDLC mode costing close to $1,000 per personal computer.

The protocol converter also solves the polling problem that occurs with personal computer-resident software connecting to mainframes. The converter stands between the personal computer and the mainframe and automatically responds to the polling and selection. Even if the personal computer is in processor mode or disconnects, there is no failure condition, since the converter satisfies all the normal conditions on the communications circuit.

Protocol converters have their disadvantages as well. Any kind of conversion system has to store and then forward the information through the conversion process, so protocol converters may cause a noticeable slowdown in response time. The protocol converter generally has to do downspeed conversion, slowing down the mainframe transmission so that it does not overload — typically from 9.6K to 1,200 bit/sec. Doing so extends the transmission time from the mainframe to the personal computer, making it much longer than if the personal computer were operating with the synchronous (higher speed) protocols.

Another problem occurs when the personal computer is dialing the protocol converter. The personal computer connects to one of the available ports on the converter and then signs on to the mainframe at a particular mainframe port (for example, Port 1). If for some reason the personal computer is accidentally disconnected from the converter and the user wants to continue the session, there may be a problem dialing into a different port on the converter. The mainframe only recognizes the terminal on the port it originally came in on, so the end user may have to back up and restart part of the session.

Another problem occurs if the personal computer disconnects and someone else accidentally connects to Port 1. The mainframe does not know that a new user is connected to Port 1 and does not force the user to go through the access procedure. The second end user will be signed on as the first user, which creates a security problem.

Furthermore, while protocol conversion systems can make up for anything that is different in a communications facility, they cannot rearrange keyboards or change the amount of display on a screen. If a terminal can only handle fewer than 25 lines of display, for example,,then it is difficult to emulate the 3270 product line because these terminals normally convey 24 lines of data and a 25th for control.

These problems should not discourage the use of protocol converters but point to a few snags in combining them with personal computers and mainframe operations. Some snags have yet to be ironed out and currently require manual procedures at the personal computer end.

Many existing mainframe systems in the IBM world include 3274 and 3276 cluster controllers, each of which support eight or 32 local CRTs. The communications link between the CRT and the cluster controller is unique to that environment and does not use a normal modem or communications adapter-oriented connection.

If a personal computer is to be attached in place of the CRTs, it must emulate a 3178, 3278 or 3279 terminal. A different form of communications adapter is required for this connection. One of the most common is the Irma board from Digital Communications Associates, Inc. The Irma board is a special processor interface that plugs into the back of Personal Computers or compatibles, substituting for the 3278 terminals. Some newer models of interface boards allow a personal computer to connect to multiple sessions through a common cluster controller — windowing.

The cost of the interface board and its associated software is between $750 and $950 per board. Additional software can be procured for transmitting files and programs between the personal computer and the mainframe through the cluster controller environment. The Irma board is becoming a de facto standard, and many of the descriptions for these software products specify the board as a requirement.

The cluster controller approach solves many of the problems of the protocol converters. Although cluster controllers do store and forward information, their higher speed transmission reduces the delay significantly. The personal computer is always connected to the same port, so the disconnect problem and the security problem of dialing into protocol converters disappear.

The interface board satisfies all the requirements for the cluster controller, so the personal computer can operate in process mode whether or not it is also communicating through the cluster controller. This particular approach is of greatest interest to those who already have installed a cluster controller network.

However, cluster controller connections depend on coaxial cable, which may effectively slow personal computer operations. Although the transfer speed on the coaxial cable is in the 1M-bit range, it is not safe to assume that the transfer to the personal computer will operate continuously at that speed. The cluster controller is servicing other devices and sends bursts of transmission to and from each of the CRTs. The transfer rate will also be affected by the programs placed in the mainframe and by the cluster's connection to the mainframe, which may be limited to 9.6K bit/sec.

Some users may opt to reach the host by tying into existing enhanced network services such as Tymnet, Telenet, Uninet and other service companies that provide conversion and interfacing as part of their communications function. These services offer interactive and file transfer capabilities through worldwide networks. This approach is perhaps the most convenient.

The services predominantly support TTY-compatible devices. At any given moment, approximately four out of five connections in operation nationwide are using this protocol. The network services provide a limited number of conversions to other protocols such as Bisync, 2780, 3780, X.25 and in some cases emulate 3271 and 3275 stand-alone CRTs.

The micro/mainframe connection works best when the personal computer- and mainframe-resident software packages are provided by the same vendor.

The network services have some of the limitations of the protocol converter systems. They do cause delay, and the delay can be significant depending on traffic. It may at times exceed three seconds in one direction, making the round trip delay exceed six seconds.

These networks were designed as terminal-to-mainframe communications services, so their support of mainframes is straightforward. A number of products are available that allow the mainframe to connect to other networks. The network can be perceived as a series of TTY terminals or a number of Bisync devices or even as an X.25 device.

The personal computer user pays per minute for connection time to the network. The connection cost varies from about $4/hr to $9/hr. A second charge is made for the transmission of the data itself, which may be $.05 to $.10 per thousand characters or about $1.50 to $1.60 per thousand blocks or packets of data. Communicating within the U.S. costs the same, no matter what the distance. Thus, it is far more attractive to the regional or national connection and less attractive as presently priced to local or statewide communication.

HyDra II & RCOM

THE MICRO/MAINFRAME CONNECTION
Separately they are Great – Together Fantastic

For over three years the HyDra® II protocol converter/controller combined with RCOM communication software have effectively saved thousands of dollars and simplified network operations for companies everywhere.

HyDra® II . . . channel attached controller:
- Channel attached to IBM 360/370/43XX/30XX
- No 3705/3274 required; All devices appear local to host
- 3278/79 emulation for PCs and ASCII terminals
- [illegible]/3211/3286 printer emulation for ASCII printers
- Full callback security
- Cost as low as $264.00 per port.

RCOM . . . the multifeatured data communications software for your PC:
- Teletype support maintains 40K scroll buffer
- [illegible]/77/78/79/86 support
- DEC VT52 terminal emulation
- PC to PC file transfer
- PC to mainframe file transfer (with HFT on mainframe)
- Advanced autodial support; Compatible with all popular modems
- Baud rates from 110-9600
- AFT [illegible] error-free protocol and also XMODEM/XON/XOFF protocols
- Full 16 color support
- And much more! Offered for just $49.95 (Limited time only)

RCOMHFT . . . for the mainframe:
- Host to PC and PC to Host file transfer
- Host file transfer for ISAM, VSAM, SAM running DOS/VS(E), and CMS under VM (with RCOM on the PC). Price: $3000.00

IBM is a registered trademark of International Business Machines Corp.

Since the deregulation of this type of service in 1982, companies such as General Electric Information Services Co., Compuserve, Inc. and ADP have entered the field. This service may also become more attractive as more of the divested Bell operating companies are allowed to implement packet networks within their territories.

The primary disadvantage of this pay-as-you-go service is that the bills can eventually escalate beyond the cost of protocol converters or cluster controllers. The cost will probably go up as the price of private lines increase. Finally, the number of possible protocol conversions available from public networks is more limited than from protocol converters.

Once the basic micro-to-mainframe connection is made, users must look for ways to smooth operations. There are many programs available from software houses to support communications to personal computers.

Typically, the packages are available for IBM mainframes, although there is a scattering of packages available for the DEC PDP-11 and VAX series and occasionally for Control Data Corp., Sperry Corp. and Burroughs computers as well. The packages normally run as application programs behind the communications software, so they do not disrupt the mainframe environment in most cases. However, if the personal computer user wishes to communicate with existing applications, it may be necessary to revise the resident application program to work with the new communications packages.

As with any new venture, there are going to be difficulties, especially with the earlier products. The products themselves work well, but many users have overestimated their capability or expect them to work in environments for which they were not designed.

For example, not all communications products with the same modems and the same communications circuits perform equally. Depending on the design of the protocol and the operation in the mainframe as well as the personal computer, there can be as much as a 2:1 difference in transfer speeds. Users will see that two different software products operating at 1,200 bit/sec. have measurably different throughput time for files or transactions.

In addition, compared with the documentation DP managers are used to seeing, the manuals for many of these products can be extremely difficult to read. Users may resort to trial and error. Another weak area surfaces as users try to pin down errors and failures and the procedures for responding to such conditions. Most are difficult to understand or just poorly thought through.

Most of these products were introduced within the last two years. The experience level of most users is rather light, and there is very little available information as to the quality and performance of the products. Compatibility is the major issue for the mainframe user, but often it is difficult to ascertain from vendor literature how compatible the products are with the existing environment.

Many communications programs, because they are relatively low in cost, come with little vendor support. Support may be through telephone help lines, which in many cases costs $25 to $250 per year to access. Updates may or may not be included.

And although many of the products are the plug-in-and-go variety, they are not necessarily flexible. It may be difficult for the user to modify the operation, and he may have to work around the facilities rather than develop new ones. The micro/mainframe connection works best when the personal computer- and mainframe-resident software packages are provided by the same vendor. This option may not necessarily lead to increased flexibility but certainly reduces the interfacing and compatibility problems.

But the products and the vendors are improving rapidly, especially those mainframe software vendors who are now entering the personal computer market. Companies such as Applied Data Research, Cullinet and others should be watched closely to see how they produce and support these products in the mainframe environment.

> ***Not all products with the same modems and the same communications circuits perform equally.***

For now, the simplest approach for communicating to the mainframe is through devices such as the cluster controller, which produce the least impact on existing networks. Users who lack experience — or the time to gain experience in a hands-on situation — may be better off waiting for market forces to drive the natural selection process.

Gary Audin is president of Delphi, Inc. and a seminar leader for Datapro Research Corp., the American Management Association and others. He has developed video-assisted instruction and computer-based training (CBT) modules in microcomputer applications and in data communications and telecommunications. The first CBT is in micro-to-mainframe connections.

Dialogue

Joseph Brophy
Senior Vice-President, The Travelers

What happens to a user who is out in front of his industry and his major computer supplier as well? He grows a lot of his own software, for one thing. He weaves integration into a crazy quilt of networks and machines. That's the story of the Hartford, Conn.-based insurance giant, The Travelers, as related here by Joseph Brophy.

Consultant George Colony of Forrester Research, Inc. in Cambridge, Mass., surveys and analyzes how large corporations use technology today and suggests how they could use it tomorrow.

Brophy and Colony discussed practical problems and solutions of micro communications with Extra Editor George Harrar.

ILLUSTRATIONS BY ALAN WITSCHONKE

George Colony
President, Forrester Research, Inc.

Extra: What applications are driving companies to link personal computers?

Colony: One of the problems is that there are very few applications today that really require communications. We're finding that most Fortune 1,000 users have focused on stand-alone applications. With a few exceptions, such as electronic messaging, there's really no driving force.

We're missing the key element. I expect that's going to change over the next two years.

Extra: What will be that key element?

Colony: You're going to see networkable software emerging from companies like Lotus and others we haven't heard of yet — new third-party software vendors — which will have networkable data bases, networkable spreadsheets, better electronic messaging systems.

Coming into play will also be what I call "departmental resource processors," what we now consider minicomputers, acting as software distributors for networkable software.

Extra: Is there a driving force in The Travelers for linking personal computers?

Brophy: Yes, there are two driving factors affecting networking here. We have about 9,000 personal computers; about 4,000 of them are in the offices of independent agencies. They can place their business with The Travelers or a number of other companies.

In our business, traditionally we've had a lot of paper flow from the independent agencies into our field offices and from there to the home office. We've eliminated the leg between the field office and home office by having people in the field office key information directly into our computers through remote CRTs.

We also want agencies to transmit directly to us rather than printing and mailing paper for us to key in. We had a practical business opportunity to have agencies interacting directly with our mainframes. We have turnkey applications that provide our independent agencies with office functions — payroll, insurance rating, policy issuing — and a good deal of interface software.

That has had a beneficial impact in terms of reducing paper flow, redundant keystrokes, printing and so forth. So there has been a practical need to link personal computers from a service point of view, from a cost point of view and from an accuracy point of view.

That's one side of the equation. The other side is that over the years we've had a high level of personal computing in our end-user community — business technicians, actuaries, accountants, marketing analysts. At one time we had as many as 8,000 IDs in our personal computing network, much of it for interactive timesharing.

Now the end users can do a lot of office functions on a personal computer. They do a lot of spreadsheet work, but they also have to communicate with each other. They still have a tremendous reliance on the host computer because they access data and upline and downline load.

Since they are coming from a highly networked environment and moving into a personal computing environment, we've had to provide them communications service.

Colony: Are most of your personal computers communicating by a dial-up link?

Brophy: We've got five environments, one of which is dial-up. We recommend dial-up if you're going to transmit less than two hours a day.

Some personal computers are networked — some are on a local-area network and have a gateway. We're an SNA shop, with about 20,000 terminals. We're also a heavy user of packet networking.

Our fourth environment involves mailing diskettes around. Our executives, for example, conduct some of their business meetings around a diskette, instead of sending a paper report. We have a machine that cuts the diskettes. We probably mail thousands of diskettes every month because it happens to be a very economical way for us to communicate.

The fifth environment is really stand-alone. Many new people using personal computers have no need for communication. As they become more comfortable with the personal computer, they begin to develop communications needs, and we give them four choices: the local-area network; the diskettes; the dial-up; or being actually hard-wired to our network.

Extra: Is that a typical situation in a corporation — multiple options for communicating?

Colony: I don't want to compliment Travelers too much, but I would consider it to be the No. 1 or 2 company in implementing communications for personal computers. Perhaps Aetna and Equitable are on that list as well. Joe's case is distinct among the Fortune 1,000.

We need the most cost-effective way to make logical connections to personal computers in the field. We've solved the physical problem. As far as the logical problem, no!

— Brophy

Extra: You just mentioned three insurance and financial companies.

Colony: Insurance companies are leading in this area. We just did a survey in the chemical industry. We're finding that the level of communications for personal computers in manufacturing is much lower than in information-intensive businesses such as insurance and banking.

In manufacturing for 1985, only about 14% of the personal computers are communicating. By 1987, the companies are estimating it will be 35%. In the service side of the economy, in 1985 it's about 17% communicating and 55% by '87. So there really is quite a difference between the two sectors.

Extra: The Travelers is a strong IBM shop. How is IBM helping you to accomplish the integration of personal computers?

Brophy: I don't want to sound negative, but IBM really hasn't contributed a whole lot of software. Unfortunately, we've been out in front, which has caused us a good deal of frustration. We've had to resort to probably five or six different hardware/software solutions here.

If we're going from asynch to X.25, we go over packet to get into our SNA environment. If we're in a bisynch environment, we'll go through a Series/1, and we've got some pretty powerful software to do these protocol conversions. If we're in an asynch environment in the field and we're dialing in, we might go through a Protocol Computers, Inc. box to get to SNA. We're anticipating help in the future, but we've had to do it in-house so far.

Extra: What would you like from IBM?

Brophy: Fundamentally we'd like IBM to make this whole process of communicating transparent to us. We're anxiously awaiting more details on the free token-ring architecture. We've wired most of our buildings now for token ring. We'd like a lot more networking and applications interface-type software and support from IBM.

Colony: It sounds like you have the physical connection pretty well licked with local-area networks, SNA and dial-up. What about what I call the "logical connection" between personal computers and departmental systems and mainframes? I'm talking about moving documents with a high level of compatibility and perhaps in the future actually moving applications among those three types of systems.

Brophy: We do all that today, but we do it with a lot of homegrown software. There are very complex aspects of moving software around. Keeping data bases in synch, for example, is probably the most complicated transaction we have. If you have data in a remote node and a data base in a host — I don't see anything on the horizon that's going to simplify the integrity and compatibility issues.

We've solved the physical problem. As far as the logical problem, no! We are pleased that we can ensure we are capturing all the data and transactions that we transmit, but we have no guarantee of interim synchronization of data and programs.

Colony: We're observing that a number of the Fortune 1,000 companies are not accepting the System/36 solution IBM is offering, which is basically their logical communications solution. Safeco in Seattle has thrown all their System/36s out, saying that the system isn't performing. Is Travelers going to accept the System/36 solution? Are you buying that solution from IBM?

Brophy: Our need is for the most cost-effective way to make logical connections to personal computers that are distributed in the field and in the home office. To do that, we developed an emulator that runs in the personal computer and a relay program that runs as an application under Vtam, so that we can use a micro over an X.25 network and make it look just like a 3270 terminal. We have made the logical and the physical connection through our own software.

To provide the interhost relationship, we have built — under Vtam again — a host switch that allows the personal computer in the field to access numerous applications through our own software.

There are few applications today that really require communications. We're still missing the key element. But that's going to change over the next two years.

— Colony

Colony: I consider your emulator, your Vtam, your X.25 communications and so on to be the physical side of the communications problem. What I'm talking about here is moving, for example, a Multimate document up into a departmental system and then retrieving that document, perhaps through Disoss, or taking a Lotus 1-2-3 spreadsheet and moving it with full compatibility among a number of different systems. What I'm asking is, is Travelers buying off on the System/36 Personal Services and Displaywrite solution linked with Disoss?

Brophy: I believe the System/36, from what I've read, is a great product. But from a conceptual point of view, I don't see it fitting into our fundamental architecture. We see two nodes — very powerful micros and a great network capability, and our host computers. So I question why we would want another node in a network when one of these powerful micros can serve as the gateway or the office controller.

The departmental computer is a conceptual problem I'm having difficulty with. The System/36 may prove to be an important factor in departmental processing, but right now I don't see it. Moving a Lotus program from one personal computer to any other one — that problem we've solved. We do move files, but we do it through a non-IBM solution at this time.

Colony: I think we're going to have a fundamental disagreement here, because what we're observing in the Fortune 1,000 is not a two-tiered architecture, as you're explaining for The Travelers, but rather that there will be some sort of local resource processor for personal computer users within their sight.

If personal computer users want to get up to the mainframe, they will go through that departmental processor, which will give them SNA or X.25 or your emulation package. They will not connect directly through their own link to the mainframe.

Brophy: We do have a fundamental disagreement. I'm thinking ahead — and it may be wishful thinking — looking for follow-on products to the Personal Computer. The Personal Computer, including the Personal Computer XT or the AT, is not powerful enough in some cases today — and in a lot of cases in the future. I'm assuming that we can extrapolate from the Personal Computer to the Personal Computer XT to the AT and so forth and look for follow-on products that will have sufficient extra power.

I can see file servers and print servers. I can see distributing some of our host computing power into a field office, using a low-end 370-type product, but that would be done for performance reasons — response time, economics and space. I would not see that as a fundamental architectural issue.

Basically, we're going to have very powerful micros, a sophisticated network and large host computers. The host may be in one of our data centers or in fact it could be in the field as well. But we would be thinking of that host as a corporate processor and not as a departmental computer.

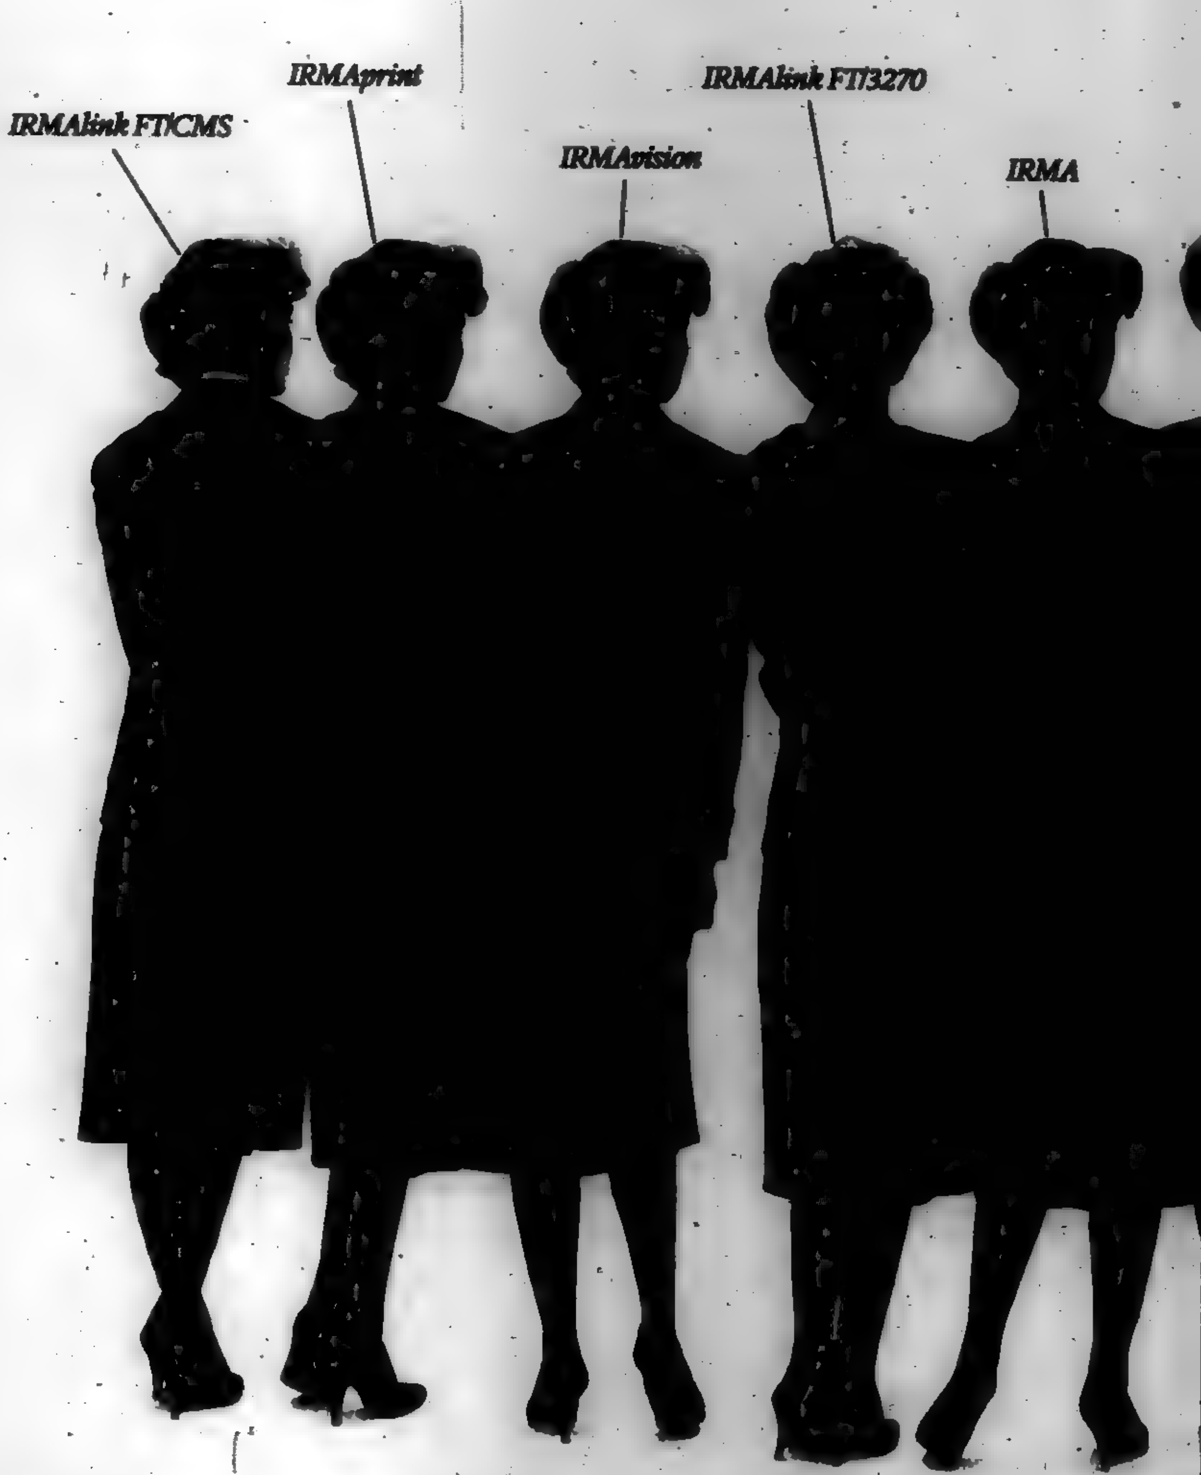
Colony: American Express Co. has a number of personal computers in their New York facility, and at least some of their mainframes are located in Fort Lauderdale, Fla. One of their problems is that if those personal computers start dialing up the mainframe for two to four hours per day or even one hour per day, the communications costs are going to be prohibitively high. So their solution is to take a piece of the mainframe and shove it out into the site of the personal computer user and minimize the communications cost for each user.

Brophy: They may very well want to do that. But I don't see that as an architectural question; it's really a cost/performance problem, and there are other alternatives. I do not interpret your example of American Express as meaning you fundamentally need three levels in your network; rather, it's just a practical problem of where you want to situate your mainframes.

Colony: A couple of things I see coming down the road here: One is site licensing of personal computer software, because again we're talking about corporate customers who want to take their Lotus, put it on their departmental system and let end users simply dial in and downline load that application. Of course, Mitch Kapor doesn't want to do this; he wants to keep his margin on the product. But I see that coming, and you'll need a departmental computer to do it.

The second is the distributed data base. If in fact that animal is coming down the road, we will take a piece of that data base, shove it out to the departmental machine, and 95% of the data base requirements of each personal computer user at that site will be met by that departmental machine. When that extra 5% is required, then yes, they would go out to the departmental system, into the corporate network, out to the mainframe, get that information and bring it back down to the network.

Brophy: If I were Lotus or another vendor, I



Now that you've formed a lasting relationship

With more than 100,000 boards installed so far, IRMA™ has become the standard micro-to-mainframe link in the 3270 environment.

That's just the kind of success that gives a company a lot of big ideas.

Like IRMAline™ and IRMAlette™, remote PC-to-mainframe links that work with the ease of IRMA. IRMAprint™, a 3287 emulator. IRMAcom™, a board that will emulate a 3270 controller. IRMAkey/3270™, a keyboard that puts PC and terminal functions together. And IRMAvision™, a new monochrome display adapter for any IBM personal computer. When used with IRMA, it emulates a 3278 terminal mod two through five.

with IRMA, isn't it time you met the family?

With that kind of exciting hardware, we wouldn't think of disappointing you with any of our new software products.

For example, IRMAlink FT/TSO™ and FT/CMS™, two host-based file transfer systems. And the new IRMAlink FT/3270™, software supporting IBM's PROFS and PROFS PCC.

All compatible with IBM PCs, XTs and ATs.

Find out more. Just call 1-800-241-IRMA. Or Telex 261375 DCA UR.

Digital Communications Associates, Inc.

DCA is a registered trademark of Digital Communications Associates, Inc. IBM is a registered trademark of International Business Machines Corporation.

wouldn't see a distinction between having site software on a departmental machine and on a host. If we have 20 people using that site software going into a departmental machine or going into the host, I'd want to charge them the same.

On your second point, the data base is independent of a departmental computer. The data base, if we distribute one, will be on a file server attached to a microcomputer. I don't see a departmental machine having anything to do with that. The data base is a data base, and it's going to reside on a disk pack.

In our environment, I suspect we'll have it in both places. We'll have a data base on our host computer, and we'll downline load a portion of that data base to a microcomputer. We've got 550 [IBM] 8100s in the field, and they have data bases out there. They're updated during the day and upline loaded at night so we have a copy in the home office. Then, host data bases are downline loaded again — of course, not the entire data base, just the items that change.

Today we could view the 8100 as a departmental computer, but I don't see it in the future, as we have more powerful micro software and more local networking. There are going to be situations where people on the network are going to want to access a common data base, and the economics are going to say it should be on a disk drive sitting out in the field office as opposed to being on the host or vice versa. But it has nothing to do with departmental computing.

Colony: You don't seem that worried about the communications costs between your mainframe and each personal computer. What if every day a Lotus user had to downline load his application from your mainframe — we're talking about 500K bytes. You don't see that as a problem as far as the cost to communicate?

Brophy: I wouldn't encourage that user to downline load his Lotus application. It should be on a diskette locked in his desk, or it should be on a hard disk on his micro.

Colony: What if the site license is so arranged that Lotus only gets money every time that application gets loaded off of some control processor, whether a mainframe or departmental system?

Brophy: I suspect that the economics in our case would favor each person having his own copy of a Lotus package because we could get such a big discount.

If we had 9,000 copies, I'm sure we could work it out with Lotus that it's more convenient to give everyone a copy, but we want the same price or better as a company that had it on a departmental machine and was going to downline load it.

Extra: George, earlier you heard Joe describe generally what he would like in terms of help from IBM in the next couple of years. What can we expect from IBM?

Colony: Despite what Joe has been saying, what the IBM strategists are telling me is that they believe most IBM users will want a three-tier architecture. So I expect IBM to be pushing departmental computing very strongly — based on the System/36, of course, in the short term, and now the System/38 has been brought in. I believe you will see a VM-based, very small 370 offered by IBM in the next 12 months as a departmental system.

What IBM is doing here is divorcing the architecture, and I'm really talking about software — Personal Services and Displaywrite, PC/Attach — from the machines, so that IBM will be able to move that software from the System/36 to the 38 to the small 4300, if required.

Number two, IBM sees itself in a pitched battle with AT&T. AT&T is trying to sell its Premises Distribution System.

I see IBM and AT&T in a direct fight to wire corporate America in the next two to three years. The cable system will be a very important element. IBM will describe that system for third parties and also for users like Joe but not deliver the product until sometime in late 1986 or early '87.

Extra: Joe, you say you are already wired to accept, I presume, the token-passing ring.

Brophy: I guess in the home office we're probably 80% to 90% wired.

Colony: We've found there are about 150 to 200 token networks already installed in the U.S. It has been a big surprise how fast IBM is wiring accounts like Travelers.

Extra: Wiring with IBM cabling but using someone else's token network?

Colony: Wiring with the IBM cable system. Most users who have it are using it for 3270 cabling today.

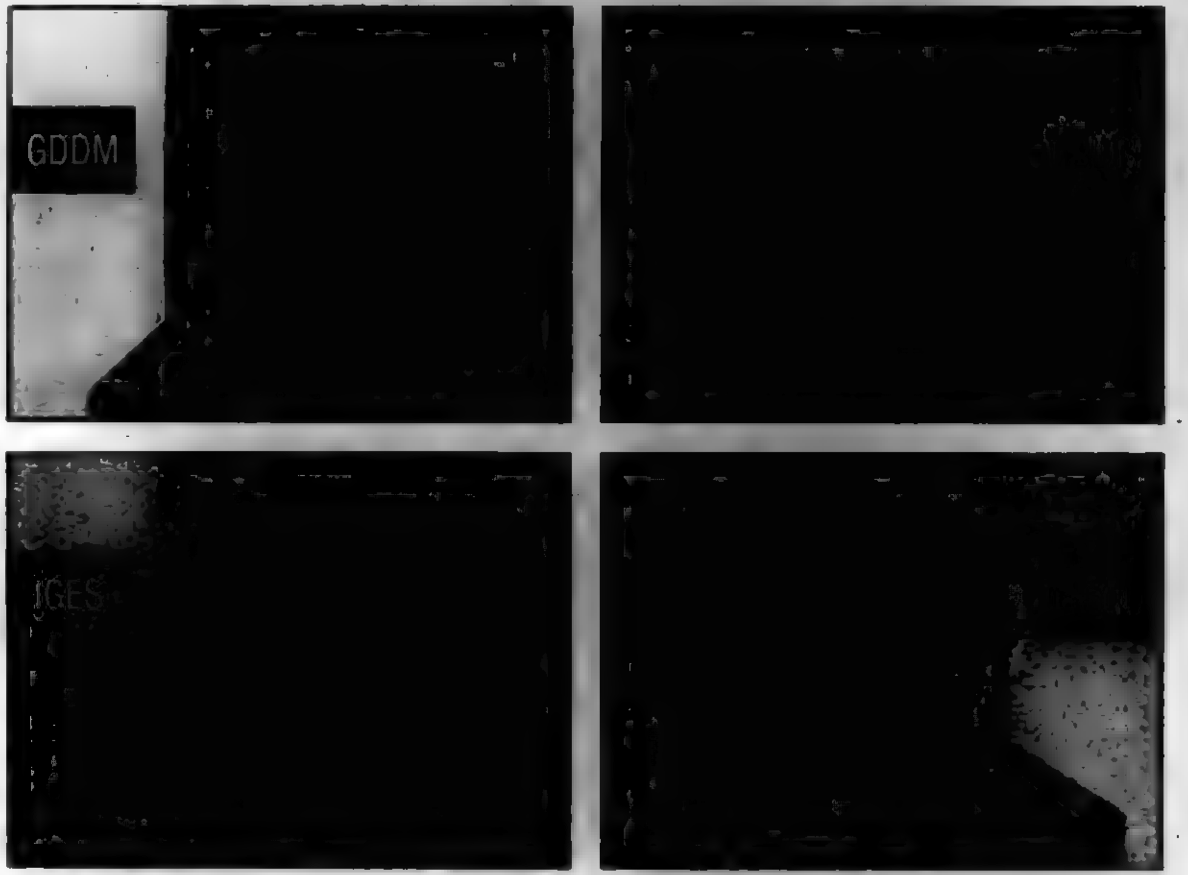
Extra: There are non-IBM token-passing ring solutions that work, too.

Colony: My feeling is those will be irrelevant after IBM begins delivering its network.

Extra: Would you say they are they irrelevant right now?

Colony: They can be a short-term solution for perhaps one department of 20 to 200 people. If users want to

See what EnerConnect can do with mainframe graphics on your PC.



EnerConnect® is the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC/XT/AT or 3270 PC.

Now a PC user can have desktop access to business and technical graphics applications generated by GDDM, ISSCO's Tell-A-Graf® and DISSPLA,® SAS/GRAPH® and IGES datafiles.

Once they're displayed, EnerConnect lets you manipulate them in a variety of ways. You can rotate, enlarge, reduce, cut-and-paste with other elements from different mainframe files, add text and even direct output on low-cost PC printers and plotters. All without using expensive mainframe connect and processing time.

You can also use our PC-based graphics program, EnerGraphics, to interface with spreadsheet data from LOTUS 1-2-3, VISICALC and other packages, turn the data into easy-to-understand bar charts and then combine them with mainframe graphics.

EnerConnect. Your Mainframe-to-PC software link. Developed by the specialists in graphics applications software.

Call or write for our free brochure and see what EnerConnect can do for you.

More Answers from CXI

PCOX is all you need to turn your IRMA board into a 3270 PC.

Its full name is the PCOX™/3270 PC Upgrade (that's pronounced "peacocks").

But you'll pronounce it "terrific."

First of all, it's available today. Not next week, not next month. Now.

Second, it costs just $395. And since it upgrades the IRMA™ board you already have, you can protect your investment. And still get the IBM™ 3270 PC capability you really want.

Third, you can be sure this software's reliable because we've been shipping it for more than a year in our own PCOX/3270 PC.

Finally, like all PCOX products, the PCOX/3270 PC Upgrade is backed by our proven track record in micro-to-mainframe connectivity. Which you'll be hearing more about in this series.

But back to the PCOX/3270 PC Upgrade. For immediate delivery call (800) 225-PCOX. In California, (415) 424-0700. Or write CXI, Inc., 3606 West Bayshore Road, Palo Alto, CA 94303, Telex: 821945.

And turn the IRMA board you have into the 3270 PC you want.

We don't have all the answers, just more of them.

CXI

get some education in local networking and also token access, and they have money to spend, it may be a good idea. But as a long-term solution, the IBM cable system will be the dominant force in the market.

Extra: That doesn't imply a long life for some of the current personal computer network vendors.

Colony: That's right. And in fact, IBM's National Accounts Division has refused over the last six months to sell the PC Network. They believe it's not strategic, it's a short-term product, an Entry Systems Division product, not a viable solution in the long term for large companies such as Travelers.

Brophy: I would agree.

Colony: What do you estimate the cost per year would be for personal computer, interfacility communications at Travelers?

Brophy: It's across our SNA backbone, and personal computers are contributing only an insignificant amount of traffic.

Colony: How many nodes are on your SNA network?

Brophy: We have about 20,000 devices on it. We ran out of address space about two years ago. We were faced with the option of starting up a second network. We had to put in some additional [IBM] 3725s, and we had to do some creative wiring between them to get around the addressing limitations of SNA. We were an [Early Support Program] for [Extended Network Addressing], and it is implemented.

Colony: You've got to be the largest SNA network in the country then.

Brophy: Maybe as an integrated network, yes. In 1975, we had six different networks and network protocols. The economics were such that it was very attractive to convert to a single network and develop the protocol conversion software we now have.

Extra: How many local-area networks do you have?

Brophy: Four types. I'm sure there are more — we have a lot of creative people around here. Then in each field office we have the R loop, so you could argue that we have 550, if you count our installed base of 8100s.

Extra: What are the four types?

Brophy: Our standard is the IBM PC Network. The first one was installed as a test facility as soon as the network came out last fall. Fundamentally, we're thinking PC Net for the immediate future, but we have others, and some are in experimentation. For example, we have the 3Com Corp. Etherseries, the AST Research PC Net2, a couple of Nestars.

Colony: We've found that one reason users weren't installing networks was that the cost to connect was too high. They wanted a cost-to-connect that is 10% to 15% of the cost of the workstation attached. Are those accurate percentages for you?

Brophy: I can't relate our costs directly to your percentages. A driving factor for us was the cost and delays of pulling cables and the other problems of moving a terminal from point A to B. That's one of the reasons we installed super wire. I'm not thinking in terms of percentage costs; I'm thinking in terms of accommodating a transient end-user community.

The competitive pressures in our business caused us to reorganize. We've got 4,000 independent agencies interfacing with our mainframes. Those transactions now bypass our field offices.

So we found it very convenient to consolidate from 300 field offices to 16 processing centers.

Colony: When IBM announced the PC Network last summer, I beat on them because I said they were now offering two cabling schemes. One is the special cabling for the cable system and then broadband for the PC Network. Are you installing broadband cable behind walls for the PC Network, or are you putting it in the floor or ceiling so you can rip it out when you go to the cable system?

Brophy: It's a temporary installation, out of the way.

Colony: That's what I thought. How many nodes are on the networks?

Brophy: The largest one has 15 personal computers connected to it and the smallest about eight.

> *I think it has been a significant advantage to be a one-vendor shop because we can free up good people to work on business as opposed to interface problems. If we can eliminate these interface problems, we can get on with real office automation.*

Enable 1.0...
"everything Symphony hoped to be."
PC Magazine

"Quite simply, this package has so many outstanding attributes that even the worst skeptics of integrated software have to be impressed. The spreadsheet is very close to 1-2-3; the word processor combines the best thinking of WordStar, MultiMate, Volkswriter, and EasyWriter; the data base offers the functionality of dBASE II, but with many of the ease-of-use features of PowerBase; and the program offers business graphics and telecommunication. Taken as a whole, Enable surpasses the functionality of Symphony, Framework, Aura and Open Access."
IBM PC Update
December, 1984

"... as powerful as a collection of stand-alone programs, and it offers the benefits of integration to boot. What's more, it runs in only 192K bytes of memory."
ComputerWorld
March 20, 1985

"Offering true integration among all of its applications modules ... [Enable is] a powerful production tool that can serve everyone in the office, from data entry personnel to the vice-president of marketing. Each module could stand as a full-powered application in its own right."
PC Magazine
February 19, 1985

"Enable is one of those programs that can be up and running with most of the features you need in a few hours. As you need more, you can get deeper into the program and learn at your own pace."
InfoWorld
January 21, 1985

Enable first in "Performance" rating—including speed and capacity of all modules tested. Enable first in "Versatility" rating—including power and functionality of all modules tested. Enable rated first in overall evaluation of the word processor module.
Software Digest Ratings Newsletter
Rating of 15 Integrated Products
December, 1984

"Enable, a five-function integrated system from The Software Group, merits a close look by any individual or organization interested in a solid package that is well balanced in all of its applications."
Popular Computing
March, 1985, Paul Goldner, Raymond Hood, Yoram Lirtzman, Michael Wilding

"... if an office is looking to step up to across-the-board integration with a multitude of functions ... this is the one program to seriously consider."
Personal Computing
March, 1985

"Enable welds its five applications together with outstanding integrity—yet each is exceptionally full-functioned in its own right."
Business Computer Systems
January, 1985

"Enable ... may be the first program to make you give up your dog-eared WordStar, dBASE II, Smartcom and Lotus 1-2-3 disks."
Business Software
April, 1985

"Enable may legitimately claim to be the only package you'll ever need."
Computer Buyer's Guide and Handbook
November, 1984

Integrated software is no longer a matter of choosing which compromises to live with.

enable
integration without compromise

©Copyright 1985, The Software Group, Northway Ten Executive Park, Ballston Lake, New York 12019

Trademarks: Enable — The Software Group; IBM PC, IBM AT — International Business Machines Corp.; Volkswriter — Lifetree Software, Inc.; EasyWriter — Information Unlimited Software, Inc.; WordStar — MicroPro International Corporation; dBASE II, dBASE III, Framework — Ashton-Tate; Symphony, 1-2-3, Lotus — Lotus Development Corporation; MultiMate — Softword Systems, Inc.; Aura — Softrend; Open Access — Software Products International, Inc.; Smartcom — Hayes Microcomputer Products, Inc.; VT-100 — Digital Equipment Corporation; PowerBase — PowerBase Systems

Extra: Early on in the conversation, you brought up network software, George. What is on the market now, and what you would like to see in terms of optimized network software?

Colony: Most of the networkable software out there today is running in the Ethernet environment — from companies like TCS Software, which writes accounting packages to run under Ethernet. My feeling is that most vendors in the Ethernet environment are going to be belittled by the IBM cable system. I'm expecting to see a new fleet of third-party software vendors who are going to write around the cable system and, perhaps in the early going, around the PC Network.

The major point here is that what is coming will be primarily in the area of licensing software. I expect to see the personal computer software residing on a departmental system and being distributed from that point.

In the area of distributed data base for personal computer users, I think that's going to be the second major area in networkable personal computer software.

The third point here is bridge software, enabling personal computer users with specific documents to move up to a departmental system and then bridge from there up to mainframe or Disoss or Document Interchange Architecture/Document Content Architecture (DIA/DCA). A good example is Digital Equipment Corp.'s External Document Exchange, or EDE, which is an exchange between the All-in-One environment through the VAX up into Disoss with full revisable form text DCA. That's the type of software we really see coming. I consider DEC to be the leading developer of what I call "IBM bridge software."

Extra: Is bridge software the same as gateways?

Colony: It's a question of semantics. I consider gateways and bridges the same thing at this point.

We are observing a number of large companies out there, such as Equitable and American Express, who are in a multivendor environment. They're telling me that one of their major problems is the bridge — how do they get a DEC document over to IBM or Wang documents over to IBM? One thing I've advocated is going with one vendor because then you won't need all these bridges. I will presume Travelers is pretty much a one-vendor shop. Do you consider yourself at an advantage or disadvantage in communicating documents?

Brophy: I think it has been a significant advantage to be a one-vendor shop because we can free up good people to work on business problems as opposed to interface problems.

In 1970, we had no IBM equipment. We had mainframes from all the other vendors. We consumed a great deal of energy interfacing. Many of our top technical people are doing business jobs now.

I'm not sure it's going to be that way in the future. As AT&T gets into the act more fully, I believe IBM will open up its architectures because it's in the company's best interest to do that. If we can eliminate these interface problems, we can get on with real office automation and all the good things that are going to flow from that — and we're going to buy more IBM equipment in the process.

Colony: As a one-vendor shop, do you feel you have been burned on products such as Disoss or the 8100?

Brophy: I told IBM I was very disappointed in the 8100. I'm not disappointed in Disoss — except to the extent it has been slow in coming. We've made a heavy investment in the 8100s, and we're going to begin phasing them out of operation in the next few years. Yes, I've been very disappointed.

We made a commitment to distributed processing technology to reduce communications costs and get better response time. I don't think we'd make the same decisions again in terms of 8100s, considering our networking expertise with microcomputers.

I am disappointed, but I wouldn't say we were burned, because the 8100 has been a good investment. We set out to achieve certain economies and productivity, and we achieved all that. More important, during the life span of the 8100 we changed our host computers three times. Some of the 8100s will be around for 15 years.

We've got a number of distributed applications that will be in production for another five years because they're doing the job. In terms of achieving business objectives, it was great; from the point of view of having a building block, a technology in place as a platform to build future technology on, it's been a big disappointment.

Colony: Is it possible you are gun-shy about departmental computers because of the 8100s?

Brophy: It's not a question of being gun-shy. I'm not adverse to departmental computing if it makes sense. I just don't see the advantage. Why put in three tiers when we can do what we have to do with two?

Colony: One of the issues that comes up is that personal computer users don't trust the DP manager to deliver the resources they need at the mainframe level. So those users want to own a machine that sits in a corner of their office and that they probably

Enable 1.1...
now 15 ways better.

When we introduced Enable in late '84, we made two promises:

1. Enable would be the industry's first truly full function, totally integrated system.
2. We would continue to enhance Enable with new features and functions to always give you the best value in microsoftware.

The reviews on the left demonstrate our success with promise number 1.

The new features highlighted below do the same for promise number 2.

And this is merely the beginning. No matter what direction future micro technology takes, Enable, with its open architecture, will continue to advance right along with it. And with you. To ensure this, we've established an end user advisory board to tell us what you want. And we *do* listen.

Now for the new.

System-wide Features

- Data transfer facility—beyond "cut and paste"—lets you transfer specific data from one module to another, linking files across all applications. For example: a field in a DBMS record can contain the name of a spreadsheet, a word processing document or selected records from another database. When viewing that record, Enable will automatically display the other "linked" file.
- User-designed menu generation—tailor Enable to your specific needs with your own unique menus, help and error messages, pop-up windows, and full choice of colors.
- Window to DOS—execute DOS functions without leaving Enable.

Word Processing

- Automatic indexing and tables of contents.
- Multiple column copy and move.
- MultiMate compatibility. (We already gave you WordStar, EasyWriter and Volkswriter.)

Spreadsheet

- User configurable—choose among 6 varied shapes from 255 rows × 255 columns to 4095 rows × 15 columns.
- 1-2-3 macro support—automatically convert your existing Lotus macros or create your own Enable spreadsheet macros with all the same macro commands you used in 1-2-3.
- Greatly increased Lotus file conversion (twenty times faster!).

DBMS

- Comprehensive file maintenance capabilities—verify, copy, update and merge functions.
- Powerful command language—commands for writing routines, reading and updating files, generating printed reports. (All the power of dBASE III without the complexity.)
- Expanded record size—up to 254 real, virtual and computed fields.
- Direct conversion of Lotus spreadsheet data into Enable database format. (Now you can use Enable's full-function DBMS instead of the limited database functions of the Lotus spreadsheet.)

Telecommunications

- Terminal emulation (VT-100 and other popular models).

Graphics

- Increased printer and plotter support (twice as many leading models).

And now for the *really* good news. All this functionality can be at your fingertips on the standard 256K IBM PC, up through the PC/AT (and true compatibles). All for $695.

You can, at last, get out of the quagmire of trying to solve your multi-purpose needs with single purpose software.

Your training and support costs will drop, data sharing will rise. Dramatically.

You can even protect your investment in Lotus 1-2-3, MultiMate, WordStar and dBASE II because Enable is fully compatible with those and other single purpose programs.

And, since trying is believing, we'll send you a demo system for a token $12.95.

If your dealer doesn't carry Enable (and you should raise Cain if he doesn't), give us a call and we'll put you in touch with one who does.

Just dial 1-800-932-0233. In New York, dial 1-800-338-4646.

buy and manage. They'll get some resources from the mainframe, but they want to be able to control their local resources. Is that a factor for Travelers or not?

Brophy: It may be — if you could get inside the head of each end user, they may think that way. But certainly it's not manifested. You can't do your job here without having access to a mainframe.

Basically our people are knowledge workers. We've got 2,500 data bases; we've got 2,800 disk drives; we've got five mass storage systems; I can't tell you how many decision support systems we have which are host-based, driven by end users.

We made a decision in 1979 that we would no longer program reports. We said that it was an end-user responsibility. If anything, I think we have the brakes on, trying to slow down host utilization — not the personal computers. We're trying to encourage personal computers at home and the office, providing assistance through the computer store.

What we're trying to put the brakes on is utilization of our host computing requirements. Personal computers create a latent demand for host resources. I don't think people are concerned about central data processing because we've been the biggest supporters of the personal computer phenomenon and encouraged end users to do their own thing.

Colony: By our accounts, we believe 75% to 80% of the personal computers in the Fortune 1,000 are, in fact, IBM.

Extra: Do you find that the remainder are not being integrated through networks?

Colony: Well, another 5% are Compaqs and other compatibles. The second most installed personal computer in the Fortune 1,000, believe it or not, is Wang. Most of those Wangs are attached to VSs, so they are communicating — with Wang equipment, of course, not with the IBM mainframe.

Brophy: Wang has a great product. The reason I know is that my daughter is a saleswoman for Wang. Unfortunately, Wang has not penetrated our environment, although they have put products in our corporate store.

It's not the quality of the product. I think it's just the momentum of having so many Personal Computers and so much dependence of one Personal Computer on another. So much of our environment is integrated — work is developed on one Personal Computer and displayed on another.

Colony: My baseline comment about Fortune 1,000 personal computer integration is that it's going to revolve around the departmental solution. You're going to have a departmental computer that is going to act as the gateway to the mainframe above. The personal computer will be moved through that departmental system when it communicates to higher level systems. Joe and I are directly opposed in this area.

Brophy: I am not disagreeing. IBM people, from what I've seen from the representatives here, are enthusiastic about the concept of departmental computing. I have no disagreement that a lot of companies may very well use a departmental computer like the System/36.

I think when the dust settles, in many situations it's not going to be necessary to have one. Micro-based products are going to have sufficient capability that you really won't need a departmental computer.

Colony: My scenario for the seven- to 10-year time frame is that communications links will improve so much that we will have basically one very intelligent device in our personal computer talking directly to that very large computer someplace in the country. But now, while the communications costs are still quite high, it will be important to take a piece of that mainframe and shove it out to the local site.

Brophy: You've been saying departmental host. If you would substitute the words "departmental gateway," I would not disagree with you.

Colony: But it's not just a gateway, it's also running a local data base, distributing micro applications, acting as a file server and maybe even as a printer server. It's a lot more than just a communications gateway.

Brophy: I would suggest you look at what IBM is doing as far as the gateway. It includes all of the above. I think the problem is only within IBM, and it has to do with the differential between the System/36 to 38 series and the Series/1. The Series/1 as a gateway does everything you said.

Colony: Give me a good data base running on the Series/1 that Personal Computer users can actually get good quality out of.

Brophy: IBM hasn't announced it, and I'm not going to announce it for them.

Joseph Brophy and George Colony were brought into dialogue for Extra by National Trade Productions of Alexandria, Va., and Intech, the annual integrated information technology conference held in San Francisco Aug. 26-29.

"Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect."

EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is "... the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC ... or 3270 PC."

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, "... we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment."

The results? "*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate."

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing, Enertronics Research, Inc., St. Louis, Missouri

Gearing software to networks

By David Lytel

Some software vendors are rushing to meet the growing installed base of networked micros. And some vendors are running the other way.

When micros were stand-alone devices and networks only existed for minis and mainframes, each micro user had to buy his own copy of a software package — plain and simple. But now that microcomputer networks are sprouting up, customers are starting to demand multiuser and network versions of the software they've known and loved.

Some software vendors are obliging, but others clearly are not. Conflicts over site-licensing and fear of lost profits have generated more than a little foot-dragging.

But in the offices of vendors who have been ahead of the market in offering application software for networked micros, jubilation prevails — their moment has arrived.

Vendors of data base management systems have the most adjusting to do, while word processing and spreadsheet vendors enjoy an easier task. Since word processing and spreadsheets are by nature single-user programs, vendors need only provide file-level lockout and ensure that all changes are transparent to the end user. Some

get away with even less, leaving file security duties to the compatible network operating system. And still there are few network versions of word processing packages on the market.

Keeping the status quo

Software and data sharing traditionally has been handled via site licensing in the mini and mainframe worlds. Vendors license software to a network, rather than an end user, and then don't worry about who is connected to that network. But many micro software vendors are struggling to maintain the status quo — the revenue that comes from licensing individual packages.

Vendors can't afford to have network versions of their software, but users can't afford not to. Using a single-user version on a network puts users in violation of their licensing agreement and jeopardizes their data. Without file locking and record locking as well as appropriate levels of security, data is easily corrupted or lost.

> ***Vendors can't afford to have network versions of their software. Users can't afford not to.***

One word processing software vendor that has worked out a network policy is Samna Corp. Samna's software is marketed directly to major accounts, which has forced the Atlanta company to develop a network policy quickly.

"We would've lost a lot without a network version of our software," says Marketing Vice-President John Day. Samna introduced network versions of its word processing products last spring and sells them based on the number of network nodes that will be sharing the product. The price of the three-user version of Word III is $1,250 and scales up to $5,750 for as many as 15 users. The more powerful Samna+ is priced at $1,550 for three users and $7,250 for 15.

Multimate International Corp. announced a network version of its popular Multimate word processing package in May and began shipping in July. "It was basically a response to requests from our Fortune 1,000 customers," says Marketing Vice-President Suren DerAvedisian.

The idea behind the multiuser version is that it be indistinguishable from the single-user original from the user's standpoint. Single-user versions of Multimate 3.3 and the more capable Advantage product will be priced at $495 and $595, respectively, and $995 and $1,195 for versions licensed to a three-user network. The cost for each additional user will be $295.

These two are the only leading word processing vendors who have made specific arrangements for networks. Microsoft Corp., for example, has not yet announced a network version of Microsoft Word or Multiplan. As the developer of the operating system for the IBM PC Network, the company is "heavily committed to networks," according to Product Marketing Manager Dave Melin.

But Microsoft continues to consider placing its software on a file server as a violation of the licensing agreement. When the company does announce a network version early this fall, Melin says, "I doubt we'll be making specific changes to our products for networks other than our own MS Network/PC Network."

Micropro International Corp. is equally tight-lipped about plans for network versions of Wordstar. Vice-President for Product Development Bill Crowell says, "The technical part has been resolved. It's the marketing part that is a tough nut to crack." In his case, marketing includes selling the idea of multiuser software to his retailers, who also have been accustomed to the one-user, one-package sales income and who are equally threatened by an additional loss of control through site licensing.

Compromising position

Software Publishing Corp. joins other companies who are hoping to pass the buck. Software Publishing has no network versions of its popular PFS series, which Director of Marketing Signe Ostby admits "is a bad position to be in." But the company also produces the Assistant series for IBM. Says Ostby: "We're hoping they'll solve the network licensing problem for us."

Ostby acknowledges that by not having a network policy, Software Publishing has put networked customers who might install the single-user versions on shared hard disks in an awkward position legally. But she does not foresee the company moving against those users. "We don't believe in prosecuting our customers," she says. "I think Lotus is shooting itself in the foot."

Lotus Development Corp., which has more than a million copies of its 1-2-3 and Symphony programs installed, is not only the leading microcomputer software vendor but is also the vendor most publicly resistant to developing a network policy.
"They've been dealing with networks two ways," comments consultant Eric Arnum of International Resource Development, Inc. "Lawsuits and stonewalling."

Lotus has not only gone after customers who place their software on a file server but has also copy-protected

Why the time has never been better to get your own subscription to Computerworld:

FREE CLOCK WITH YOUR SUBSCRIPTION

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desk-top piece for your office. And as we said, it's a gift: from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

UNIX is a trademark of AT & T Bell Laboratories.

☐ **Yes!** Please send me Computerworld for one year at $39 (that's $5 off the annual subscription rate of $44) plus all 10 COMPUTERWORLD FOCUS issues at no extra charge. I understand that my satisfaction is guaranteed and that I may cancel at any time and request a refund on the unused portion of my subscription.

THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

[illegible]

One vendor's research showed that 88% of network users actually run single-user software on their network, some with disastrous results.

certain parts of the programs so they cannot be loaded onto a hard disk. Lotus spokesman Jim O'Donnel reports that the company has "been meeting with key corporations and customers and hammering out arrangements on site licensing" and will announce that policy early in the fall. Communications marketing specialist Chris Noble warns, "We will still require one license per workstation in a network situation."

The new Symphony 1.1 will rely on its compatibility with MS-DOS 3.1 for many of the features required of a network software package. Rather than rewrite Symphony from the ground up, Lotus has written the interface so that the operating system will take care of record locking. With these steps, Lotus is moving with the rest of the software industry toward networking. Says Nobel, "We hope we never have to litigate again."

Vendors of integrated packages enjoy a special challenge. If the multiuser version is to achieve the goal of transparent networking (no functions from the single-user version lost), end users' editing changes will have even greater impact.

If User A raises a figure in User B's spreadsheet to reflect greater sales, the change will affect User B's bar chart as well. Large-scale accounting packages have built-in audit trails, but personal computer spreadsheet packages do not; without totally rewriting the software, there may be no way to trace the changes that have been made to a given file.

One vendor's research showed that 88% of network users actually run single-user software on their network, some with disastrous results. Placing a single-user version of a DBMS on a file server can be a lot more than just a potential legal hassle. If the DBMS doesn't support the network's scheme to prevent two users from updating simultaneously, serious data corruption problems can develop.

Recipe for success

To run effectively on a network, a DBMS package must have — at a minimum — schemes to lock out other users when one user is changing a field or a record. To take maximum advantage of network features, a DBMS vendor can restructure the program from the ground up. Several vendors are moving to meet the growing demand for network data sharing with new DBMS packages.

Microrim will release a network version of its Rbase 5000 DBMS this month. Microrim's multiuser product will provide concurrent access and will be licensed on a per-file-server basis. The $2,100 price of the multiuser version is three times the cost of the single-user version.

Ashton-Tate, however, is not moving as quickly. It offered a multiuser version of Dbase II for sale for almost a year, then pulled it from the market in January. "Basically it was just a patched version of Dbase II," says Scott Brown, Ashton-Tate's technical public relations manager. "The developer had to do a lot of his own customizing and debugging to allow for record locking." The product was only available for one type of network, and Brown says the company found there was little interest in it.

"We haven't jumped on the multiuser bandwagon yet," he notes, "because we want to be able to take full advantage of the network environment when we're ready" — presumably when network hardware settles on a standard for software to follow.

Several smaller companies always have sold multiuser versions of their software and been ahead of the market, which is now arriving to meet them instead of the other way around. Florida software vendor Data Access Corp. markets a DBMS called Dataflex that has been multiuser since the product was introduced in 1981. It runs on 15 different networks and is priced at $1,250 per file server. Account Executive Diana Wilcox reports their shrewd anticipation of the market has yielded 22,000 copies already installed. She predicts 1985 will bring three times the sales of 1984.

One vendor with a very sophisticated understanding of the local network software market is Software Connections, founded in 1981 to target the network market specifically. Gary Kwok, product marketing manager, explains that during the design process, "data security is No. 1. You're now off the floppy, and a lot of people have access to your data and programs. There has to be a way to prevent hackers' tampering." According to Kwok, the DBMS should also provide levels of access for individual users to different files so that personnel files, for example, can be held confidential.

The other most important feature? "Believe it or not — ease of use. A network has end users at a range of experience levels. The user interface has to be easy enough for people who are used to PFS but at the same time offer more advanced features."

Kwok advocates finding software that has been rewritten for networks from the ground up. "It's nearly impossible to do a good job retrofitting. Audit trails and other security and privacy features — we haven't seen these with any retrofitted package."

Software Connections prices its DBMS, called Datastore:LAN, at $1,000 for five users and $2,000 for 16. "We tried per-user pricing," says President Buck Gee, "but it just did not work. It was impossible to police." The company's LAN:Mail Monitor electronic mail package can be used between networks as well — an advantage to software designed by a third-party independent.

Another sophisticated network software vendor is Fox Research, Inc., which began as a vendor of network hardware. Fox brought out a network version of its 10-Base DBMS in the spring of 1984 to run on its local-area network, called 10-Net. 10-Base is available for $895 in a version that supports up to five users.

User at the helm

To many software vendors, networking is a vexing problem. But at least one vendor is making a deliberate strategy out of calling it a nonissue. Lifeboat Associates, Inc.'s Chief Executive Officer Edward Currie insists that unless a vendor sells a product that demands concurrency, it should ignore the problem of multiple users and multiple copies and continue doing business as before.

"Oddly enough," Currie says, "we believe in that approach. We believe that networking will force software vendors to add value to their product, substantive value: life documentation and technical support and updated versions." He expresses the hope that software vendors will stop thinking of their product as a single diskette, a one-shot sale. In his opinion, the product includes updates, and a network version should be handled by the software vendor as just another update to provide for the customer.

In this line of thinking, the ability to copy and share software, rather than being a threat, has been a key element to the development of the software market. "The strongest form of advertising is still word of mouth," Currie says. "Our experience has been that many of our new users first came into awareness of our product by borrowing it from a friend."

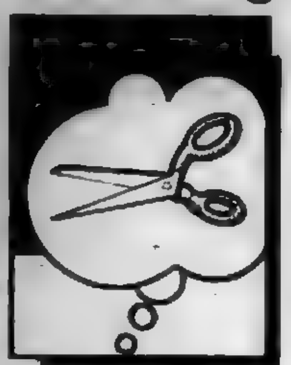
To Currie, this kind of a customer-oriented approach is critical to the future of the computer industry. "We've lost momentum in this industry," he says. To wit, some observers are witnessing a generational change in the leadership of the software marketplace.

As Arnum of International Resource Development puts it, "The dominant software vendors in our present 16-bit IBM world may not be dominant in the local-area network world, in the same way that the vendors who led when CP/M was the dominant operating system are not the same people who are leading now that MS-DOS is dominant."

Senior Analyst Meg Lewis of Future Computing, Inc. says, "Opportunities are now being created for software vendors who will treat their corporate customers the way they'd like to be treated."

Since for many corporate users that means networking, the future seems clear. If the presently dominant vendors don't move to meet the demand for multiuser applications software, there are people in the wings who are ready to pick up those customers and move the industry forward.

David Lytel is a freelance writer based in Ithaca, N.Y., specializing in data communications.



Data Processing Professionals

We Need Sharp Ideas For Our Cutting Edge.

The Travelers doesn't believe in cutting corners.

In fact, we've got a sharp edge on the competition. You'll see it in our advanced environment. Like our 19 IBM mainframes. The largest IMS shop in the industry. A 23,000 terminal SNA network, accessing over 2,500 on-line databases.

But, our commitment to DP doesn't stop there. We're gearing up for the future—with the purchase and installation of 12,000 IBM PCs. And, with several additions to our staff in our Hartford, Connecticut home office.

If you're a DP pro, join a premier financial services company in one of these challenging positions.

Applications Development—Programmer/Analysts—Put your COBOL and IBM mainframe skills to work on a major IBM PC software development project in an on-line, realtime environment. Working closely with our users, you'll develop, install and modify PC COBOL and mainframe application systems.

Requires 2-4 years of strong COBOL and some working knowledge of PC-to-mainframe communications. Previous IMS/VS experience preferred. Use of Telon software a plus.

Applications Support—Programmer/Analysts—Be a key contributor on our Agency Automation team. Support, install and maintain a variety of distributed IBM PC and mini applications for our national user base.

Requires 2-4 years of strong COBOL applications experience in a 308X OS/JCL environment. Strong user skills, the desire to train in the PC area and some data communications knowledge are essential.

At The Travelers, you'll find challenge, exposure and high visibility. A Flextime program, complete benefits, over 50 in-house DP courses, and unlimited career growth potential. Plus generous relocation assistance.

So, if you take pride in your ideas, contact us. This could be the edge we've both been waiting for.

Send resume and salary requirements to: Dorothy Smith, 30-CR, The Travelers Companies, One Tower Square, Hartford, CT 06183.

Data Processing For Dedicated People.

The Travelers Companies, Hartford, Connecticut 06183. An Equal Opportunity Employer

Gateways

By George Elgar

Bridges and gateways give personal computer users universal access to shared resources and one-connection access to the host. Wait till they hear about hybrids.

Bridges and gateways are doing for networks what networks did for micros: eliminating isolated processing.

Today, the local-area network market is crowded with more than 50 vendors offering myriad topologies, access protocols and cabling schemes. Gateways and bridges are required to accommodate users demanding universal vertical and horizontal resource sharing.

The arguments over network architecture — baseband vs. broadband, CSMA/CD vs. token passing and so on — that stymied network development have to some extent calmed down. Custom applications software, "firmware" and intelligent sharing devices are solving these difficulties, freeing network installers to innovate further.

The issue now for the general user is: Will my personal computer run the applications I need and am accustomed to in a multiuser environment? As the market responds in the next year or so, the industry will see a virtual explosion of bridges and gateways.

There remains a great deal of gray area

EXTRA

in the distinction between bridges and gateways in users' minds, partly because the terminology is often used interchangeably. One definition holds that a bridge links two similar networks, whereas a gateway links two different networks.

In a bridge, the protocol passed between the networks is transmitted in its original format; no protocol translation occurs. Bridges can be used to increase the number of addressable nodes on a network or to link two geographically distinct networks.

The benefits bridges offer are substantial. For example, branch offices in Los Angeles and Chicago can send sales data from their respective networks to the main office in New York or perhaps request targeting data, via a bridge. One branch office can address the other directly, as another node on the network, without signing on to a communications service, dialing through a modem or learning new software commands and menus.

Smart router

Bridges now are a combination of both hardware and software. A typical purchase will consist of a "black box" that sits between the two network servers and is connected to each. The bridge has its own processor, memory and software, and its operations are transparent to the network user.

Bridge Communications, Inc.'s Gateway Server/4 product, for example, can be used to connect two Ethernet local-area networks located in the same building. The GS/4 sits between the networks, running two Ethernet cards and a shared memory card off a Multibus. Internal software allows the GS/4 to route data and commands without network users being aware of its interference at all. No additional software is required for the network nodes, and the bridge does not place an additional limitation on the number of users in the network.

The same system could be used to supplement a single Ethernet network. If a very long Ethernet cable were stretched throughout a building, the network installer could choose to break the cable at a point and use the GS/4 to connect the branches.

Bridge Communications' GS/3 product, on the other hand, links Ethernet networks that are miles apart. A GS/3 box would reside at each network, and they would communicate via one of a number of standard communications carriers: telephone lines, T1 connections, microwave and so on. Again the network users are unaware of the transaction, except that the transmission's speed will be dependent on the carrier used. (It will, in any case, not match the 10M-bit speed of Ethernet.)

Further development of bridges will follow the traditional pattern for computer evolution. As the software becomes standard, much of it will be embedded in the hardware, and new facilities will be added. Current bridge products are sold as both standard off-the-shelf products and customized devices.

Although somewhat of a virgin industry in the eyes of users, bridge technology is commanding an ever greater proportion of the computer industry's attention. Several manufacturers offer products that are well established and tested. 3Com Corp. and Novell, Inc. both offer bridges to link their own local-area networks through telephone

The existence of gateways now becomes a factor in the type of local-area network users select. If communication to the outside world is crucial, a local-area network must be chosen not only on its own merit but also on its ability to run through an appropriate gateway.

lines. Other bridge manufacturers such as Ungermann-Bass, Inc. and Associated Computer Consultants provide bridges to connect their own and other vendors' similar networks.

Gateways go further

A gateway does what a bridge can't do — interface two dissimilar networks. Gateways translate one network protocol to another network protocol, bridging both hardware and software incompatibility. This advanced technology goes to the heart of the problems encountered in micro-to-mainframe/mini communications.

Gateways, like bridges, are combination hardware/software products based on powerful processors of their own. Pathway Design, Inc., for example, has recently introduced Netpath, a local-area network gateway that allows IBM Personal Computers and compatibles to communicate with IBM hosts through a dedicated Personal Computer XT. Besides the basic gateway functions, Netpath provides multiple sessions, customized presentation services and an option for multiple host gateways to one local-area network. The Netpath can communicate over dial-up, leased, point-to-point or multidropped lines.

In general, gateways are designed for transparent operations. Gateway users need not know the protocol or medium of the network from which they are requesting or sending data. Some gateways even take care of Ascii/Ebcdic conversion. Furthermore, the conversion may be to a protocol not normally associated with networks — Ethernet gateways to television or FM radio — so connections are not limited to micro-to-mainframe or network-to-network.

The emergence of gateway technology is, in many respects, a result of the closed IBM environment, which has traditionally not furnished outlets to other worlds. There was a strong impetus from users who wanted to connect their IBM equipment with hardware from other vendors. This pressing need gave rise to SNA gateways, which can connect local-area networks to IBM mainframes using Systems Network Architecture (SNA).

Besides adding convenience, an SNA gateway enables microcomputer network users to access mainframe applications, data and peripherals at much lower costs than a direct link. Without a gateway, each personal computer must have its own 3270 hardware card, coaxial cable and mainframe controller port. The SNA gateway requires no additional hardware for the personal computer and needs only one connection to the host, since all data is sent through the central gateway box. The benefits of 50 users on a local-area network sharing a single port on a mainframe are obvious.

X.25 gateways solve more generic connection issues. X.25 is a packet-switching protocol widely used for long-haul data communications. X.25 gateways allow a local-area network to connect to public data networks that use the X.25 protocol, such as GTE Telenet and Tymnet. Again, by using a common passage, the gateways reduce the cost and complexity of connecting dissimilar environments.

Because gateways are used to link two different local-area networks, such as a 3Com Etherseries network and an IBM PC Network, they may eventually help ease the standardization crunch. If and when IBM becomes the industry standard in networking, local-area network manufacturers like Novell and 3Com may provide gateways to IBM's network instead of radically changing their own architecture to conform to IBM specifications. This development should give some relief to users and software vendors alike who are afraid to commit to a single architecture.

It is doubtful that a single universal data communications solution will ever emerge, and in fact, one may not be desirable. No single protocol can accomplish all the required functions. An insistence that all hardware must conform to a single protocol seems impractical; thus, gateways are as inevitable as they are invaluable.

Port is more than a LAN. It's a complete networking solution for personal computers.

PORT –
Networking at its best!

To begin with, Port can network a variety of hardware products, including the IBM family of personal computers – and most IBM PC compatibles.

Flexible
With Port, you decide your network configuration. Port doesn't require a dedicated file server. Instead, each workstation has the ability to provide multiple services to every station in the network. You avoid the bottlenecks commonly associated with LANs because Port lets you distribute services throughout your network.

Robust
Because each workstation is independent of the others, your network won't fail if individual units do. Workstations can be removed from or added to the network dynamically – without affecting the rest of the network.

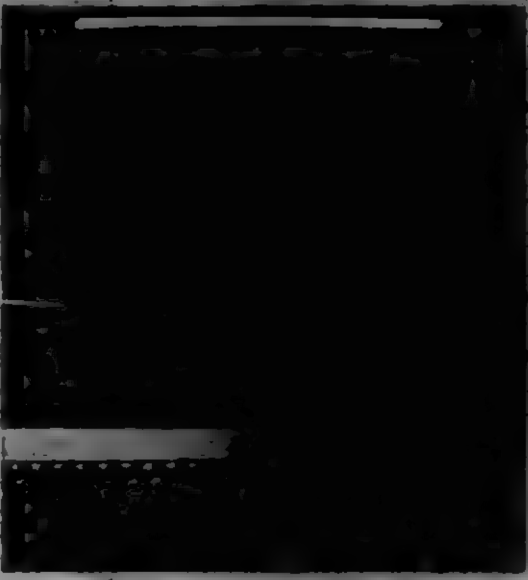
Secure
Confidentiality is no problem either. A sophisticated, yet remarkably simple security system strictly controls access to specific files through password login, voluntary attachment of network file services and file permissions.

PC-DOS Support
All versions of PC-DOS are supported by Port. They can even operate concurrently within your network. And Port provides up to 640K for DOS and its applications.

Advanced User Interface makes operation easy

Port combines these sophisticated network capabilities with an icon-based user interface that's responsive and easy-to-learn.

Think of Port's working environment as a building that contains many rooms (e.g. Lobby, Office, Supply). Each user can have his or her own personalized office containing icons (e.g. Browse, Mail, Back-up). An activity is initiated by simply selecting the appropriate icon. Icons can even start PC-DOS applications. A mouse can be used to further simplify the procedure.



Multi-tasking/Windowing
With Port, up to 12 activities can operate simultaneously at each workstation. For example, you can run your favourite DOS program, print a document, browse a file system, and send electronic mail – all at the same time. Each activity has its own window which you can display or hide while the activity continues.

A design for the future

Port's design is the result of ten years of research at the University of Waterloo. Port solves the problems of PC LANs. That's why corporations such as IBM Canada, Crowntek and Computer Corporation of America sell products based on Port.

Continuing research and product development will ensure that your Port network always keeps pace with the future. Product enhancements are provided through Port's Software Update Service.

Get connected with PORT!

The recent Ungermann-Bass/Microsoft Corp. joint gateway offering may be indicative of trends to come. The product combines the former's Net/1 and the latter's PC Net. The combination hardware/software, bridge/gateway points to a series of joint ventures and mergers resulting in the blending of the two technologies.

Another likely trend will be price drops. Just as the cost of microcomputers and local-area networks has decreased over time while performance has increased, gateways will become both more affordable and effective. As their popularity and acceptance increases and more vendors break into the market, gateways in the $10,000 to $15,000 price range will become available at a lesser cost.

Because gateways are used to link two different local-area networks, they may help ease the standardization crunch.

At the moment, bridges and gateways are being distributed almost exclusively through specialized dealers or through the manufacturers themselves. The complexity of the technology prevents most end users from selecting, installing and maintaining the hardware independently. However, if local-area networks are any indication of future trends, it won't be too long before gateways and bridges may be found in retail outlets, making them even more available to a broad range of customers.

Hybrid networks, perhaps the network architecture of the future, hinge on gateways. Hybrids combine a variety of network environments and protocols in a single network, utilizing each type's strong points to the fullest advantage. For example, a single hybrid network could be composed of a broadband backbone with a dozen or so dissimilar baseband "ribs" running off of it and a fiber-optic link to Europe.

Bridge Communications' GS/6 is already available for such baseband/broadband interconnections. Under this configuration, users can be logically grouped by department to capitalize on the higher speed, lower cost and easier maintenance of Ethernet and still communicate over a broadband backbone with other departments up to ten miles away.

Hybrid networks will also help simplify long-term network planning. Multiple channels on broadband cable can be used to transmit a variety of mediums. Thus, the ability to transmit voice, data and video is immediately available to accommodate changing communications requirements. Other examples of hybrids expected to emerge will bundle voice, data and video environments, with AT&T the most likely leader.

Added pressure

Gateways are beginning to have a real impact on the network industry. The existence of gateways, for instance, now becomes a factor in the type of local-area network users select. If communication with the outside world is crucial, a local-area network must be chosen not only on its own merit but also on its ability to run through an appropriate gateway.

Although gateway technology is rapidly becoming more available, gateways and will not exist to and from every network. Gateway manufacturers will focus their technology on major local-area network players such as IBM, AT&T and 3Com, placing added pressure on the minor network players who can no longer operate in a stand-alone environment.

Of course one of the main factors holding back mass acceptance of gateways in the marketplace has been the delay in the necessary prerequisite — lots of local-area networks. Meanwhile, it will be the value-added dealers, value-added resellers and systems houses that will lead the way for users, particularly as long as sharing resources involves overcoming unfriendly user interfaces.

To the user, the issue boils down to information transfer. The end user's involvement in bridges and gateways should be as transparent as electrical outlets in the home. There is now no technical reason why one computer's resource cannot be shared by another, whether the second computer is a clone of the first or a completely different kind of computer — and no matter how remote.

Incompatible protocols or architectures can no longer be seen as stumbling blocks. The hardware is all there. It is now up to the software industry to develop reliable, practical programs to control and take advantage of this resource sharing, while the hardware industry reduces the user's responsibility to entering an occasional command on the keyboard.

George Elgar is president and chief executive of Microclear, Inc., a New York-based computer consulting and software firm specializing in turnkey services and networking. He is also editor of "Micronews/Views," a monthly software industry newsletter.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 96-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

Hidden costs of networking

By Girard Liberty

Not until you start networking and interfacing personal computers to a host do the major hidden costs of personal computing begin to accrue. These costs include micro-to-mainframe link software, centralized direct-access storage devices (Dasd), shared data base systems, host CPU cycles, telecommunications hardware, network services and, of course, staff support. Such costs can easily become two to three times greater than the original cost of the personal computer and its software.

At Monet, we installed a micro-to-mainframe link called Panlink, Pansophic Systems, Inc.'s adaption of Micro Tempus, Inc.'s Tempus-Link. At a cost of $800 to $1,200 per user, depending on the number of concurrent users, Panlink allows us to use mainframe packages such as Pansophic's Easytrieve data base retrieval language and data dictionary tools through a transparent distributed processing link. Users can either download data for processing on their micros or upload an updated file without needing to know the intricacies of file access techniques or CICS.

The hidden costs don't remain hidden for long after the purchase of micros. The mainframe link, among other things, enables our end users to expand their storage capacity through the use of virtual diskettes residing on central Dasds. During an early experience with this new link, one of our personal computer users managed to consume nearly half of an IBM 3375 disk drive! We have since learned to limit both the size and number of virtual diskettes any one user may have, but we are under constant pressure to raise these limits.

A more subtle cost is the use of mainframe power. As the number of active links grows, cycles are quickly gobbled up. We initially ran Panlink under CICS. In vying for the same address space, our Panlink users were slowing response times for our normal CICS users. Transmitting data at relatively slow speeds was "stealing" CPU cycles.

The resource drain on both Dasd and mainframe cycles should not be overlooked when developing capacity plans. We are now running Panlink under TSO, which has a lower priority than CICS. Currently, we give our MIS applications development personnel and our personal computer users the same priority. Under TSO, however, we have the ability to modify individual user priorities as circumstances dictate.

As more users seek access to mainframe data, we are also finding a greatly increased demand for MIS services. Since we do not allow personal computers to interface directly to production data bases, our end users are pressuring us to provide them with subsets of data that they can download and manipulate. It requires central MIS effort to extract, summarize and format data that our personal computer users can access directly. Employing the staff to provide this service is another cost often overlooked in planning to support personal computer users.

In all, Monet is getting excellent value from its personal computer use. In a recent survey, only 16% of the personal computer users could pinpoint hard dollar saving, but 80% considered the value excellent or very good.

The benefits most frequently cited were work eliminated, return on time and improved decision making, quality of life and competitive edge.

In central MIS, our backlog continues to be heavy, which is surprising in light of the high percentage of departmental micro applications. I believe that pent-up demand existed prior to the proliferation of micros. Users had simply stopped asking for MIS help when the backlog got too large. Most users of MIS services didn't understand the capability of computerized systems until they had the opportunity to develop their first "personal" application.

Girard Liberty is director of MIS for Monet Jewelers of Pawtucket, R.I.

Priced out of the promised land

By Dennis Bizeray

The full costs of an integrated network wouldn't be an issue if we could easily show a realizable offsetting cost saving, but we can't — easily — do that.

Of course, all of us seasoned DP professionals know in our bones that the information age represents profound qualitative changes in the way business can be conducted. Everybody says so, especially the journalists, the marketers, the gurus and the consultants. And we all know someone whose brother's neighbor already enjoys this promised land.

But proving the benefits before incurring the costs turns out to be no easy matter. If we can't talk the benefits up, maybe we'll have to wait for the costs to come down.

At my place of business, we have a formal policy controlling the purchase of micros, and we track what each one is used for. The policy recognizes that micros are not inexpensive when fully configured, endowed with software and equipped with links to our mainframe-based synchronous communications network. They become even less inexpensive when we try to establish companywide standards.

Strictly speaking, we are not supposed to provide a micro to anyone who can't show a clear, matching cost reduction up front. "Merely" saving people time in getting their jobs done doesn't count — there must be a bottom-line saving.

But in practice, we recognize that it takes time to develop benefits, and we allocate micros on a provisional basis to those who can state a decent case. Then we extract a quarterly rejustification for retaining the micro and its complement of software.

We like to imagine fully equipped micros with color screens replacing most of our on-line terminals, with each micro able to access our mainframe (a Sperry 1100) and auxiliary systems (DEC, Prime and others). We'd like to provide multifunction workstations with workmanlike integrated software, too, but we'd need the capacity and I/O speed of hard disks with streamer tape backup or file servers and local-area networks.

Our networking requirements would then threaten to outrun our ability to install and continually modify, maintain and troubleshoot our systems, let alone allocate and justify the costs. We can't afford open-checkbook computing for the rank and file, and the real present-day costs of all the good stuff we'd like to do is way too high for most of our potential users to justify.

We suspect we're not alone in taking hard-nosed corporate attitudes toward costs. If the concern that costs be demonstrably offset by benefits is widespread at the grass-roots level, then maybe the next phase of microcomputer evolution will not begin until fully featured micros — with built-in speed-sensing multimode modems, hard disks with streamers and truly integrated software — are much more aggressively priced.

Certainly we haven't reduced the load on our mainframe by installing micros. Such movement as we are able to make toward a fully integrated, corporatewide system will be accompanied by a significant increase in mainframe load as network traffic builds up and the mainframe application base swells. Our fourth-generation language (Sperry's Mapper) really does live up to expectations and is the vehicle by which most new applications are mounted, but it certainly doesn't lighten the mainframe load.

The on-line networking of micros, and the growth of on-line applications in general, now concentrates processing into the normal hours that people work, meaning that our prime-shift loadings could triple within our planning horizon. You can't blame the micros for this situation, but they are an integral part of the whole scenario.

And that perhaps is the most significant change — how quickly micros have emerged as key system elements. Now, if only we can get their costs into proper perspective.

Dennis Bizeray is director of MIS for Nova Scotia Power Corp. in Halifax, Nova Scotia.

Do You Have Questions?

About IBM Micro/Mainframe Communications?

Since 1982 Innovative Computer Products has helped over 1,000 companies answer the confusing questions about interfacing Micros to IBM 43XX and 30XX Mainframes, and we can help you!

Because Innovative is a multi-vendor solution-oriented Micro/Mainframe specialist, we talk straight about which hardware and software products are best for your applications.

After we identify your needs, we provide a free onsite evaluation of these products... before you make your final purchase decision.

And Innovative has a qualified technical support staff to insure the ongoing success of our recommendations in your installation.

If you have questions about Micro/Mainframe communication, call the specialists at Innovative and take advantage of our products, experience and knowledge to help you Bridge The Gap Between Technology And People.

SPECIALISTS IN MICRO/MAINFRAME COMMUNICATIONS

Authorized Distributor For:

Software Products

Tempus-Link

- High Performance Virtual Disk Technology
- "Executive Friendly" - Transparent to End-User
- PC application to Mainframe application interface
- Built in Access Control and Security features
- Supports over 40 major communication interfaces
- Supports all IBM operating systems and TP monitors
- Installed on over 1300 Mainframes
- Affordably priced per maximum concurrent user on host
- No additional costs for PC software, and it's copyable!
- Compatible with all PC software
- Versions under development for HP3000 & DEC VAX

Hardware Products

3278 Coax Emulators
- IRMA, FORTE, CXI, MICROPLUS

Market Trends

Satisfied customers

By Harry Henry

A survey of 268 communications managers at U.S. user organizations found a large installed base of micros waiting to be networked. User attitudes seem to be: "Now that we went on a spending spree and bought all these micros, let's do something with them before we buy any more."

Information systems managers are now thinking more economically about how better to utilize current resources to satisfy end-user demands. The local-area network solution is popular — 40% of respondents currently have installed a network, and another 29% answer that they are planning do so.

Results of the survey, conducted by the Market Information Center of Framingham, Mass., peg the following as the top three reasons for implementing a local-area network:

- To share the data base
- To share hardware resources
- To see a return on investment

These issues do not involve productivity, standards or stringing cable; they are practical issues (Figure 1). Users are looking for products that can help them manage their current resources more effectively.

The satisfaction level of current users with their networks is high — 74% indicate their network met their expectations after installation (Figure 2). Apparently the user community is finding solutions to networking problems with current products. Vendors may not agree on standards, but users report the products are working and serving their purposes.

This finding may surprise market watchers observing fairly slow growth rates. Because relatively few companies have installed local-area networks, it appears there must be something technologically wrong with the networks. This negative attitude probably stems from the installation stories. Nearly every company suffers installation problems, however minor, and these problems continue to be reported.

The four major problems users encounter most often are software support, cabling, resource limitations of the local-area network and, finally, the user inertia factor (Figure 3). Yet the same high percentage — 73% of those surveyed — would recommend their systems to other users.

Users are actively looking for the IBM answer. Less than 10% of companies with networks installed indicate IBM as the primary vendor, but among companies planning to install a local-area network, more than 20% (twice as many as the next vendor) will consider IBM in their product decision. Other vendors being considered include Ungermann-Bass, Inc., Digital Equipment Corp., 3Com Corp. and AT&T, with Sytek, Inc., Novell, Inc., Corvus Systems, Inc. and 3M Co. not far behind.

The two major suppliers of installed systems are DEC (with the Ethernet influence) and Sytek (with an IBM tie-in). Following them are IBM, Wang Laboratories, Inc. and others. Nine percent of users develop network solutions internally.

While the vendors and standards committees continue to sort out issues involved in network technology and interfaces, customers must deal with choices regarding wiring costs, protocols, cabling media. Their buying decisions will make users the final judges of the products' success and utility.

Judging by outward appearances, communications managers are managing the business of local-area networks quite nicely. Systems are being installed, end users appear satisfied, and the market (at least so far) is being driven by the need to use resources effectively. This purchasing pattern contrasts with the "micro fever" of the past few years, when many micros were purchased without careful attention to how they would be used. As the market matures, so do the products within it. The users are exercising their considerable influence to good effect.

Harry Henry is a cofounder and principal of The Market Information Center, a Framingham, Mass., market research and consulting firm that specializes in vertical markets and communications.

Don't pay your operator to spend the night with your PC.

Get the only SNA/RJE mainframe link your PCs can operate themselves.

Our AdaptSNA™ RJE micro-to-mainframe link turns your remote PCs into intelligent, unattended RJE stations. So now you can transmit massive files anytime of the day or night without remote site operator assistance.

AdaptSNA RJE is a programmable SNA/SDLC software emulator for IBM PCs, XTs, ATs and compatibles. It emulates an IBM-3770 RJE station, which is IBM's accepted method for transferring large amounts of data, while offering additional IBM minicomputer features.

The emulator includes exclusive communications control and error-recovery features. It examines messages from the host, taking appropriate user-defined actions such as log-ons, log-offs, re-starts and other control sequences. So the emulator becomes the PC operator. And you save the expense of maintaining remote site personnel to monitor the transmissions.

AdaptSNA RJE operates in any JES or POWER environment, requiring no modifications to host software or hardware. Other features include file naming flexibility, a hot-button to toggle between RJE and PC-DOS, plus on-the-fly format conversion.

We also offer PCcom,™ the industry's only SDLC PC-to-PC communications link. Plus IBM 3270 emulators.

And complete service and support. So call NSA today and give your operators the night off.

Market Trends

The multiuser alternative

By Andrew Chatha

Multiuser microcomputers, though available for several years, just recently have begun appealing to a broader audience. New multiuser systems from IBM and AT&T, the two companies with the greatest market share, are mainly responsible for gaining users' attention.

Using multiuser systems, corporate business managers can share information and resources without the difficulties of networking: fluctuating industry standards and tenuous compatibility between micro brands.

Once multiuser micros were overshadowed by personal computers in the corporate environment. But the spread of personal computers during the past two years itself quickly revealed the inherent limitations of these single-user systems. The need to share data and software as well as expensive peripherals sent users looking for alternatives.

As it turned out, users' findings created a new level of interest in multiuser micros. In many cases, multiuser systems run more efficiently than a mass of workstations. Personal computers connected by local-area networks can prove inadequate and user-unfriendly.

In practice, the choice between networked personal computers and a multiuser system depends on the investment a company already has made in equipment and on the types of applications that will be performed. Multiuser systems can often be assembled at a lower cost than a local-area network with the same number of workstations. But a local-area network is a good alternative for companies that have already made a substantial investment in personal computers, since a network represents only an incremental expense.

Lack of standardization in local-area networks has also contributed to the high growth rate for multiuser systems — almost 52% during 1985 and higher during 1983-1984 and before. IBM's token-passing local-area network is being eyed as a possible standard, but production units may not be available for another two years. Right now multiuser systems vendors are cashing in on users' reluctance to purchase networks before the IBM version becomes available.

Multiuser systems best serve applications that require users to access a centralized data bank of shared information simultaneously, such as an inventory control system. Networked systems, on the other hand, are more efficient in applications such as electronic mail, where information must be passed back and forth among a large number of end users.

A drawback to multiuser systems is that they tend to be confining: workstations must be within a few hundred feet of the computer. Moreover, everyone's work is interrupted when the central processor of a multiuser system fails. Networks are less vulnerable to single system failures, span greater distances and offer a wider variety of features.

Because they are fully developed already and are currently less expensive, multiuser microcomputers will continue to challenge network-based personal computers through the rest of this decade. Shipments of multiuser systems will increase sharply over the next five years — from less than $4 billion in 1985 to over $12 billion in 1990. However, as communications compatibility issues are resolved and more products become available, network-based systems will prevail.

Andrew Chatha is manager of the computer division at Venture Development Corp., a Natick, Mass. market research and industry information firm. He recently directed several market studies on computer and communications products.

MITCHELL J. HAYES

Figure 1

eForum is a simple cost-effective way to tie together PCs.

*eForum designed by [illegible], Copyright 1984, Network Technologies International, Inc. (NETI).

Electronic meetings continue the automation of knowledge transfer which started with electronic mail.

Electronic meetings are an extension of the communications revolution which started with electronic mail. It takes seconds to send a letter using electronic mail instead of days via regular mail. Certainly e-mail is a giant step in automating correspondence between two people.

eForum goes yet further to provide immediate communications automation. But for groups. It creates electronic meetings which allow attendees to participate in discussion using the dynamic ebb and flow of points, counterpoints, comments and conclusions just like in-person meetings.

From an economics point-of-view, eForum is the most cost-effective method for bringing together the best minds in your company to meet on key issues—without the price of a single plane trip, the aggravation of schedule conflict or time-consuming delay.

eForum is a communications breakthrough product.

You can bring the information created with Lotus 1-2-3 and other individual productivity tools and share them with the other meeting members.

eForum lets you create electronic meetings with attendee lists as large as the company staff or as small as a three-person design team.

Not only can eForum handle hundreds of meetings for your company, but, at the same time, limits each participant to only attending meetings to which he belongs.

Simply attend eForum meetings any time convenient for you. Review new discussion materials. eForum keeps track of what you've seen. Enter your comments or new discussion points. Instantaneously, your ideas

Vendor Views

A random selection of local-area network and micro-to-mainframe software vendors were asked to comment on their products, corporate strategies and the direction of their markets as a whole.

Network vendors

Ungermann-Bass, Inc.
Santa Clara, Calif.

"We don't view personal computer networking as enough," declares James Jordan, executive vice-president. "You've got to offer a communications system for the whole corporation. We are not interested in selling five-station network clusters."

Ungermann-Bass produces two Personal Connection cards, either of which can be used to link personal computers to its Net/One local-area network.

"What Ungermann-Bass believes," Jordan says, "is that the personal computer is the universal workstation of the future. If you are going to offer general purpose local-area networks to corporate users, you better be able to link personal computers."

The company can configure a small network, but the target market is the corporationwide Net/One marketplace with Personal Connection acting as an extension of Net/One.

Ungermann-Bass allows greater flexibility than competing companies, Jordan says, with the possibility of connecting to varied networks (such as baseband Ethernet or broadband networks), use of different media and compatibility with both the Microsoft Corp. MS-DOS 3.1 networking standard and an IBM Basic I/O Subsystem (Bios) interface.

He reports that the coming months will see the company offering additional functionality for personal computers and more interfaces with IBM 3270 devices.

AST Research, Inc.
Irvine, Calif.

"We produce a departmental local-area network, AST PCnet II, that could handle 160 users, but typically is used for five to 20 users," explains Mark Stieglitz, director of local-area network marketing. "It's easy to install, even for nontechnical users." Connections are simplified through use of telephone-type RJ11 jacks and twisted pair wiring.

"Our features include an [IBM Systems Network Architecture] gateway for bisynchronous communication with a host. We supply software for printer sharing and file sharing on a personal computer, which is used as a nondedicated file server. That's important when people have perhaps five personal computers and don't want to make a big capital expenditure for a new personal computer.

"We also use the same [IBM PC-DOS] commands that would be used on a single-user system, so a person doesn't have to learn a new set of commands to use the network," Stieglitz adds.

AST has installed between 15,000 and 20,000 PCnet nodes, including an earlier version of the network, according to Stieglitz.

He also points out that AST will focus future development on compatibility with IBM's PC Network, rather than with IBM look-alikes, because that will be the benchmark by which compatibility is judged.

Stieglitz compares the network compatibility issue to the situation with IBM's Personal Computer, where use of the IBM Bios was the key to compatibility.

3Com Corp.
Mountain View, Calif.

Roselie Tobes, vice-president for marketing, reports, "We have a series of products called the Etherseries, which allows personal computer users to access, share and store information in a local-area network environment. It is intended for two to 200 users, which means we usually target small to medium-size firms.

"The products are based on Ethernet, the industry standard for 10M bit/sec. transmissions. We feel that's fast enough to meet most users' needs."

Tobes notes 3Com's emphasis has shifted in recent years from hardware to software in an effort to maintain compatibility with protocol standards, such as those developed by the International Standards Organization.

"Last year our primary focus was on the first-time user. But this year we are extending our reach to the software engineers and application developers who serve the users we targeted last year," she explains.

"It turns out that as we move into providing more products, we see ourselves more as software vendors targeting different types of local-area networks, rather than being tied to Ethernet-oriented hardware."

Tobes predicts that personal computer-oriented networks will increasingly be used to integrate office automation and distributed data processing functions, replacing low-end minicomputers.

She describes 3Com's plans to increase its ability to move across different types of networks such as Ethernet, AT&T Starlan, Apple Computer, Inc. Appletalk and token passing ring networks. She notes that 3Com is using networking standards outlined

by Microsoft and IBM for third-party software developers.

"The industry is moving more toward this business of giving micro-based networks minicomputer-type functions, such as data base management. We are going to further distribute processing across the networks with products we will be introducing in the next year. The software — the way it is achieving truly distributed processing and power — is going to be the exciting part," she says.

Novell, Inc.
Orem, Utah

Marilyn Capell, Novell's manager of public relations, reports, "We announced our Advanced Netware 86 in the spring. It is a high performance networking product based on the Intel [Corp.] 8088 processor." The Advanced Netware 86 product is designed to support the PC Network while adding functionality.

"Since then, we have introduced more products enabling the use of multiple file servers for internetworking dissimilar hardware configurations." One such product is Advanced Netware/PCN, operating system software that supports Netware Bridges for PC Network users. Netware products are installed at 9,000 sites, according to Capell.

Novell has established OEM relationships with various vendors, including Proteon, Inc., Gateway Communications, Inc. and Standard Microsystems Corp. Under those agreements, Novell bundles its Netware operating system with the vendors' hardware.

The bundled products include Netware/S, a star configuration network based on Novell's own hardware, Netware/Pronet based on Proteon hardware, Netware/G Net using Gateway hardware and Netware/Arc Net, using Standard Microsystems hardware. Other third-party vendors have introduced hardware and software products that require the Netware operating system in order to run, extending Novell's penetration even further.

"We want to offer our users flexibility. We feel one configuration doesn't give customers enough options," Capell says. The key to interconnecting dissimilar networks is Novell's software bridge.

Corvus Systems, Inc.
San Jose, Calif.

"Our recent merger with Onyx Systems, Inc. gives us an interesting perspective in terms of not just being big in the personal computer local-area network business but being in the cluster or departmental work group multiuser microcomputer business," says Bill Lanfri, director of marketing for Corvus.

Corvus's premerger networking product, Omninet, has the advantage of twisted-pair wiring, Lanfri says. Many competitors rely on coaxial cable, which is more difficult to install. "We agree with AT&T that twisted-pair technology is the technology for the desktop into the 1990s."

In the first quarter of 1986, Corvus expects to announce the first products resulting from a joint venture with NEC America, Inc. The research is aimed at developing a very large-scale integrated (VLSI) circuit chip to boost Omninet's transfer speed from 1M bit/sec. to 4M bit/sec., "a next-generation type of thing," in Lanfri's words.

But most of Corvus' efforts in the near term will involve the Onyx merger, approved by the companies' boards of directors in July, according to Lanfri. Onyx manufactures 32-bit microcomputers supporting up to 11 users.

"We obviously have an integration task ahead of us," Lanfri explains. "For the next few months, we have to bring the Onyx and Corvus technologies together . . . under the single banner of departmental computing."

Software vendors

Management Science America, Inc. (MSA)
Atlanta, Ga.

"We've had various releases of our Expert Link micro-to-mainframe product since 1983 and have continued to enhance the product throughout that time," notes Larry Smart, MSA's senior vice-president for development.

"We originally came out with a screen-snatching ability, where the microcomputer user could pull down a screen from the mainframe. Later, we added a dictionary-driven function that allows users to define what data they want."

He adds, "Expert Link is a component of our overall Expert product technology. It allows us to download data and upload data. We can download files from the mainframe to the personal computer and upload from the personal computer to specific application systems on the mainframe.

"We also have a comparatively new function — the ability to do personal computer data entry. With that function, the menus and functionality that the users see are normal personal computer screens on an off-line basis. When they are done, they can upload data to the mainframe. They don't have to be hooked up using mainframe cycle time and connections the whole time."

In the coming months, MSA will be enhancing its Information Expert, a "more generalized personal computer link" designed to work in conjunction with non-MSA applications as well as MSA systems.

Other announcements are likely to involve new development agreements with microcomputer software vendors as part of MSA's move toward links that allow software packages such as Lotus Development Corp.'s Symphony and Ashton-Tate's Dbase II and Dbase III to control the Expert Link activity.

Industrywide, Smart anticipates activity will focus on joint ventures between mainframe software houses such as MSA and microcomputer software vendors. Greater emphasis on security and the acceptance of IBM technologies as standards at the physical link level are also in the works, he says.

Cullinet Software, Inc.
Westwood, Mass.

Cullinet produces a micro-to-mainframe link package that includes its mainframe-based Information Center Management System (ICMS) and its micro-based Goldengate program.

"ICMS and Goldengate provide the micro-mainframe link while giving the information center the means to manage information," explains Jack Armstrong, manager of information center product planning. Nobody else has offered a tool that allows the personal computer user to access the mainframe without having the MIS department step in and perform tasks such as abstracting data.

"ICMS are two pieces of software designed to work together," he notes. One almost couldn't work without the other," he adds. "They enable the end user to interact with the host purely through the interface provided by the software. If I am the user, I don't want to have to look at things like a logon screen.

"We want to completely eliminate the need for the user to know anything about the mainframe. For one thing, it means MIS doesn't have to offer additional user training."

He says of the coming six months, "We are basically doing two things. We are generalizing our communications interface so we can support a wider variety of emulation boards and communications protocols. We are trying to keep the data transfer level independent of the software itself.

"We also will be including in Goldengate a reporting facility for more general use with products such as Dbase II, Dbase III, 1-2-3 and Symphony. We will then be able, for example, to have spreadsheets updated by the mainframe whenever needed.

"For instance, to the user working with a production data table, it will look like the data table is on the personal computer, but it actually will be on the mainframe as an extension of the spreadsheet. The user will only have to press the RECALC key to update the spreadsheet," he notes.

> *The industry is moving more toward this business of giving micro-based networks minicomputer-type functions . . . The software is going to be the exciting part.*

Informatics General Corp.
Canoga Park, Calif.

Rich Shapero, director of marketing for the Answer Division of Informatics, reports that one new offering in the Answer line of micro-to-mainframe links is Alpha Link. The package is Informatics' version of Micro Tempest, Inc. Tempest Link.

Shapero says that when paired with Informatics' Answer Personal Reporter, Alpha Link provides almost 30 communications environments with upload and download capabilities previously available only in 3270 environments.

Alpha Link is a data processing department reporting tool that provides improved file transfer and virtual diskette capabilities in conjunction with whatever microcomputer applications are being used. According to Shapero, Alpha Link "fills in" a gap in the micro-to-mainframe product line.

On the micro side, he explains, "Our Micro Answer product line is primarily the end-user tool. It is for someone who is constantly using 1-2-3 or another spreadsheet. What they are after is mainframe data to manipulate. We are saving them keystrokes and integrating the personal computer into the mainframe environment."

Informatics has 700 mainframe installations and 3,000 users running Answer products on microcomputers, according to Shapero.

VCS
Virtual Communication Service
A user-simple communications link for your IBM PCs and compatibles.
VCS is a mainframe controlled file transfer system and terminal emulator for IBM PCs and compatibles. Developed by Digital Strategies, this micro-to-mainframe link software is being used extensively by MIS/DP managers of major corporations, educational institutions and government agencies throughout the world.
FEATURES:
● Mainframe controlled file transfers offer high degree of security ● Source Code provided for mainframe, enabling site-customization ● Tektronix 4010/4105 Graphics, support for IBM Enhanced Graphics Adapter & Display ● Single CPU & Site Licenses available
For more information, write or call:
Digital Strategies, Inc.
P.O. Box [illegible], Southampton, NY 11968 [illegible]-1217

Vendor Views

"The next need to be met is moving information through intermediate machines," he says. "We feel an awful lot of people out there are making commitments to intermediate machines, so there certainly is interest in shipping data to and from Vsam systems to HP 3000s and other intermediate machines."

For the industry, there remains the burden of responding to customer needs and demands. Shapero says, "The responses we are getting back from users and DP departments are horrendous. We have major technological hurdles that we must overcome."

Digital Communications Associates, Inc. (DCA)
Norcross, Ga.

"The Irma card was the very first of a general series of emulation products for us," reports Robert Zack, director of corporate communications. Irma allows an IBM Personal Computer to attach directly to an IBM 3270 controller.

"It originally was meant to allow you to avoid the hassle of having both a 3270 terminal and a Personal Computer," Zack says. But as it has evolved, it has gone beyond that with functions such as file transfer, and the product line has expanded beyond the card itself."

Examples of the product line growth cited by Zack include Irmaprint and Irmakey. Irmaprint allows a printer attached to a personal computer to emulate an IBM 3287 printer, while Irmakey is a 3270-type keyboard that replaces the personal computer keyboard and allows the user to avoid using combination key-shift commands.

DCA's plans are focused on developing multisession products. "At Comdex/Spring," Zack notes, "we announced Irma X — the second generation of Irma. At the moment, the only announcement we have made is for a graphics product. It does not support multisessions, but we will [soon] be announcing a multisession product which will allow you to have up to four different windows, each one representing a terminal session with the host.

"You would have the effect of four different terminals all on the screen of a personal computer running over a single piece of coaxial cable," Zack points out.

He predicts that the industry of micro-to-mainframe links will focus on IBM's LU6.2 standard, which he says is well defined in IBM's SNA environment but not at the personal computer level. "Anybody who is in the protocol conversion business has got to be looking at and planning for the implementation of LU6.2," he says.

Techland Systems, Inc.
New York, N.Y.

Techland Systems features the Blue Lynx line of terminal emulation products. Product Manager Michael Krieger recalls, "We started out a few years ago in the remote communications market and expanded into the direct-attach game by making personal computers look like any type of terminal."

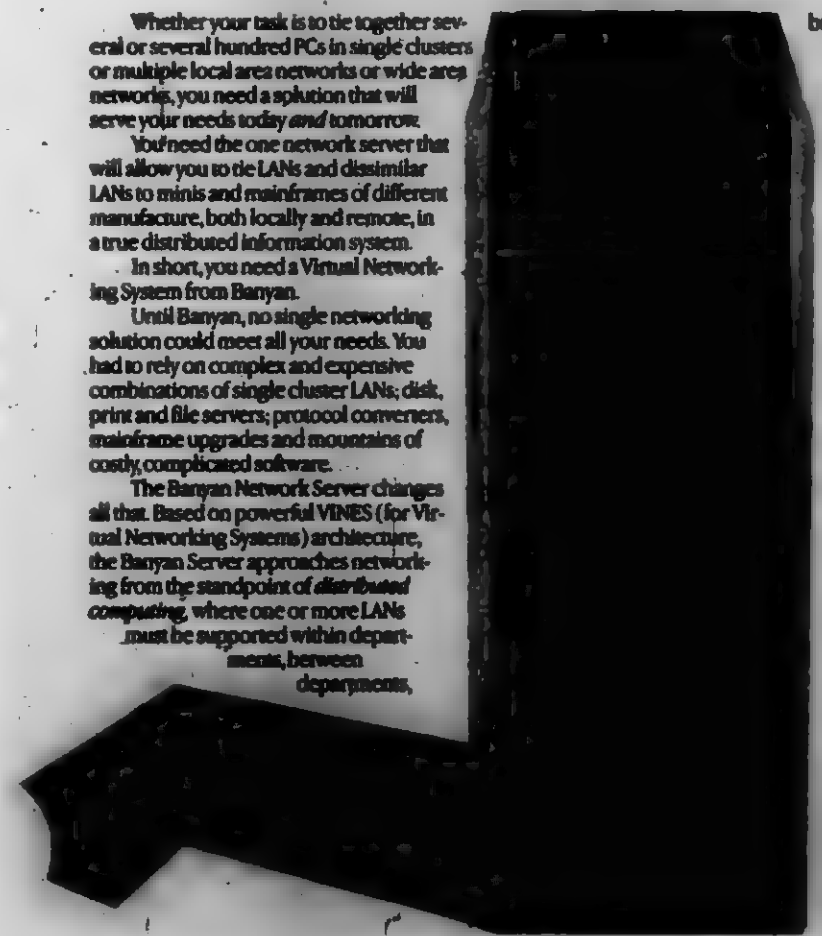
One of the more recent product additions, the Blue Lynx 5251 Model 11, was designed to allow a range of data transfers by emulating an IBM 5251 Model 11 terminal and allowing the personal computer to appear as up to four devices.

Krieger cites the 5251 Model 11 as an example of how memory demands on emulation boards have been reduced. The product's Zilog, Inc. Z80 board uses only 22K bytes of random-access memory (RAM) rather than the 180K-byte RAM used by older competitor boards.

Krieger reports that Techland is preparing to release a 16-terminal 5250 gateway for use in IBM Series/1 and System/38 environments.

The company already sells a gateway product for IBM 3080 series environments, supporting up to 255 personal computers and terminals but with a practical limit of 32 devices.

Of the industry, he notes, "I think you are going to see more emphasis on gateways with one of the personal computers on a network operating as a gateway by emulating an [IBM] 3274 controller."



THE ONE SERVER TO HAVE WHEN YOU'RE SERVING MORE THAN ONE.

Whether your task is to tie together several or several hundred PCs in single clusters or multiple local area networks or wide area networks, you need a solution that will serve your needs today *and* tomorrow.

You need the one network server that will allow you to tie LANs and dissimilar LANs to minis and mainframes of different manufacture, both locally and remote, in a true distributed information system.

In short, you need a Virtual Networking System from Banyan.

Until Banyan, no single networking solution could meet all your needs. You had to rely on complex and expensive combinations of single cluster LANs; disk, print and file servers; protocol converters, mainframe upgrades and mountains of costly, complicated software.

The Banyan Network Server changes all that. Based on powerful VINES (for Virtual Networking Systems) architecture, the Banyan Server approaches networking from the standpoint of *distributed computing*, where one or more LANs must be supported within departments, between departments, between buildings, even in distant cities.

It provides a low cost method of standardizing communications throughout your company, while allowing each department or work group to install the LAN that best serves its needs.

So you can use all your existing applications, build new ones, and integrate them all into a total, corporate-wide information sharing system at any time.

If all this sounds too good to be true, listen to what Francis X. Dzubeck, a well respected industry expert, has to say on the subject: "The Banyan Server, at present, is without equal in the marketplace for flexibility, versatility, cost/performance, simplicity of usage, and implementation philosophy."

To find out more, fill out the coupon, or call (617) 366-6681, Extension 122.

You'll be doing yourself and your company a great service.

ILLUSTRATION BY MARK TAPPET

able to input their own data, do their own spreadsheet analyses and make recommendations and decisions based on whatever information they themselves have developed. Managers are able to accomplish all this without any participation or oversight by the company CIO or any other MIS professional.

This revolution has already fostered in some organizations what could be called "creeping chaos." The strict controls over data purity, traditionally exercised by MIS professionals, are not being enforced. Top-level staff meetings can degenerate into arguments over numbers, leaving the decision makers unable to agree on whose data to accept, much less which actions to take.

Crossing over

In a typical scenario, one Fortune 500 CIO authorized the use of specific brands of micros and software for his company's regional offices. Six months later, he admitted to being amazed at what the managers there were doing with their machines.

Like many CIOs, he had presumed his regional managers would use their personal computers as word processors or as a means of storing local report data. Instead, some managers supplemented the official software with a variety of spreadsheet and statistical modeling systems. Others equipped their micros with telecommunications capabilities and were exchanging unedited sales data among themselves, inadvertently crossing over district lines.

> *The strict controls over data purity, traditionally exercised by MIS professionals, are not being enforced. Top-level staff meetings can degenerate into arguments over numbers.*

The complaints of senior MIS professionals are rarely aimed at simply curtailing middle manager initiative. Most often they center on the inaccuracy of data and subsequent analyses. When inexperienced lay people use computers and spreadsheet programs, they often make mistakes, and these errors tend to get compounded along the way.

A leading packaged goods company, investigating discrepancies in a product marketing report, found that the data dictionary cross-reference file — kept on the marketing manager's personal computer — had not been updated in more than two years with new marketing files. "It was as though you were using a 1976 phone directory to find the newest restaurants in town," complained the frustrated head of marketing.

A financial services company found that an internal report included information on a competitor gathered from a variety of outside sources, including projections from brokerage firms, investment newsletters and business publications, none of which the company could verify. The manager responsible had simply input investment information he had received at home.

What lay managers seldom appreciate is that for 20 years information services professionals have developed effective ways of catching errors and verifying data they use. Most middle managers using popular microcomputer packages don't think to use "reasonableness" checks, validity checks or audit trails. A one-tenth of one percent error may not seem significant, but when it is compounded over a six-month period by many end users, it takes on new dimensions.

Dreaded task

Most corporations will soon face the monumental task of reorganizing and consolidating information from personal computers as control returns to central MIS. A growing number of CIOs dread the day when they will be asked to replace, displace or take possession of personal computer hardware and software in their organizations. They may be in the position of unwelcome policemen, enforcing corporatewide choices for approved software packages and vendors. Even straightening out data integrity snafus — clearly in everyone's best interest — can produce conflict as roles change and end users are told they can no longer operate autonomously.

The inevitable task need not be viewed as a battle between the corporate CIO and middle managers. Rather, each side can now take advantage of what the other has learned in the recent past.

Recall the reason for the proliferation of personal computers in the first place: Middle managers had grown impatient with unkept promises made by MIS management. Rather than wait years for proposed microcomputer networks, these managers purchased their own stand-alone micros, often out of their own pockets or departmental budgets.

Needless to say, as end users gained control, they lost a good deal of MIS/DP support. But the personal computer movement took off and non-information systems executives gave it their corporate blessing.

It is naive to think companies can now return to a disciplined, centralized MIS function that operates without the involvement and personal input of those "lay" executives. The solutions can be developed — but only in concert with these end users, who are now much more sophisticated in their understanding of microcomputer capabilities and limitations.

Some suggestions:

- Provide guidelines on authorized software to make it universal among the various personal computers in your organization. Adhere to a standard means of using such software. (Look for products with validity and error checks built in.)
- Gain senior management support, financial and otherwise, to provide middle managers with the training they require, including regular seminars and refresher courses.
- Most of all, include middle managers in decisions relating to systems and software. Their input can be sought in a variety of ways, including surveys and requests for suggestions.

By 1988, microchips will be built with submicron densities capable of internal memories in the 10M- to 30M-byte range, or about 20 times faster than today's models. Companies must get a handle on the data integrity problem today or face the prospect of losing even more control in a few short years.

William de Gruchy is president of The Rand Group, Inc. in Stamford, Conn., a management consulting firm specializing in information management and customized software. He is also chairman of the CIO Roundtable, an association of chief information officers of major corporations.

SNA Micro to [illegible] Communications featuring:

SNA/SDLC Node with Terminal Emulation
Offers access to any SNA Network from your microcomputer system, opening up the huge SNA market for your sales force.

Low production costs with no up-front R&D expenses.

Allows your terminals to emulate the most popular 3270 and 3770 IBM devices.

Versatility
Easily ported to different operating systems, including XENIX, UNIX, iRMX 86/88, and MS-DOS.

Easily adapted to your specific communication environment, including:
— personal computers
— distributed, multi-user systems
— LAN to SNA gateway services

Modular design with a layered architecture implemented in "C"

Pre-packaged versions requiring no adaptation are available for Multibus and PC bus systems including those in LAN environments.

Enhanced Features
Easily configured for operation in different network environments.

Fully integrated software allows your terminals to interface directly to the communications facilities.

File transfer services.

Support plus Availability
Proven products with world-wide distribution, sales and support.

AVAILABLE NOW

Direct PC to System 34/36/38 Connections Using Standard Twinax Cable.

It's Easy With AST-5251/11™: Fast Hookup, File Transfer, Advanced Features & Reliable Operation.

Standard Twinax Cable Support Makes Installation A Snap. It's simple to use your PC just like a standard IBM® 5251/11 terminal—just plug our AST-5251/11 emulation board into your PC/AT/XT, portable or compatible, and connect the standard twinax cable to your IBM System 34/36/38. Over one million AST PC enhancement products are installed worldwide with over 20,000 PC to System 3X connections to date.

File Transfer Is Only The Beginning. With AST-5251/11 you use your PC as always, while concurrently emulating a features-enhanced Model 11 terminal with the ability to transfer files bidirectionally between your host and PC.

Use Your Favorite PC Software. AST's file transfer support not only eliminates the burden and the errors of re-keying, it adds the ability to manipulate transferred data using your favorite PC software packages, like Lotus® 1-2-3™ and WordStar.® And our Hot-Key support lets you conduct concurrent DOS and host sessions, while our applications program interface (API) makes integrating PC and host applications simple.

Even Greater Efficiency. AST-5251/11 also provides host-addressable 5256 printer emulation for your PC printer in a background operational mode.

A Family of Solutions For Your Smart Office. Whether you need AST-5251/11 direct connections, or AST-5250/Display™ full IBM 5251 Model 11 display attributes, Hercules™ graphics compatibility and IBM PC standard monochrome adaptor compatibility, or AST-5251/12™ remote PC to System 34/36/38 connections, all AST micro-to-mini data communications products are strategically focused and developed to support and evolve in concert with the IBM Smart Office architecture. You can count on AST's connections—today and in the future.

See your dealer, or call our Customer Information Center (714) 863-1333 for more information. AST Research, Inc., 2121 Alton Avenue, Irvine, CA 92714 (714) 863-1333 TWX: 753699ASTR UR.

AST-5251/11, AST-5250/Display and AST-5251/12 trademarks of AST Research, Inc. IBM registered trademark of International Business Machines Corp. WordStar registered trademark of MicroPro International Corp. Lotus registered trademark and 1-2-3 trademark of Lotus Development Corp. Hercules trademark of Hercules Computer Technology. Fusion registered trademark of Fusion Products International. Decisionlink trademark of Laguna Laboratories, Inc. The BOSS registered trademark of TenMan Systems, Inc.

KEY FEATURES

- Plugs into PC/XT/AT and compatibles; connects to System 34/36/38 via twinax cable and supports cable thru.
- Emulates 5251-11, 5291, or 5292-1 display terminal.
- Provides host-addressable 5256 printer support (background mode) on PC-attached printer.
- Selectable DMA and I/O interrupt channels.
- Application program interface (API) and bidirectional file transfer included.
- Complete package includes hardware, software, twinax cable assembly, and comprehensive user manuals.
- Supports fixed or hard disk.
- Hot-Key assist for concurrent host and PC sessions.

OUTSTANDING FEATURES

- IBM FSU compatibility (for virtual disk support on the System 34/36/38).
- Third Party Software support, including ASTLink by Fusion,® Laguna Laboratories' Decisionlink™ and The BOSS® by TenMan Systems.
- AST-5250/Display.
  One card solution for standard PC, IBM 5251/11 and bit-mapped monochrome graphics display.
  Used with AST-5251/11 brings full IBM 5251 Model 11 display attributes to your monochrome display.
  Includes Hercules compatible high-res bit-mapped graphics capability and parallel port.
  Automatically switches from 5251/11 display to PC display without operator interaction.

HP unveils AT clone

Word processing package, local network also debut

By Jeffry Beeler

SUNNYVALE, Calif. — Hewlett-Packard Co. last week entered the IBM-compatible micro fray with the introduction of an IBM Personal Computer AT look-alike that the company said provides 30% greater performance than its Big Blue equivalent for a 20% to 60% lower price.

Formally unveiled at press conferences in New York and California, HP's single-user Vectra PC micro is based on the Intel Corp. 80286 microprocessor. It supports the Palo Alto, Calif.-based vendor's Advance Write word processing software and its Office Share local network, both of which were also an-

Ingres out for IBM VM

By John Gallant

ALAMEDA, Calif. — Relational Technology, Inc. last week took aim at the burgeoning information center market with the introduction of an IBM VM-compatible version of its widely used Ingres relational data base management system.

The introduction of Ingres/CMS for VM marks the company's first foray into the IBM world. With an installed base of more than 1,200 Ingres systems, RTI is the leading supplier in the Digital Equipment Corp. VAX DBMS market and in the high-end Unix-based DBMS arena. Company spokesman Randall Livingston said RTI decided to focus on VM, a cornerstone in many information centers, because the information center market is the fastest growing mainframe market segment.

The Ingres/CMS version for VM offers a capability that may help users in multi-

New Jersey motorists in software jam

By Charles Babcock

TRENTON, N.J. — A bureaucratic snafu of epic proportion has been created for New Jersey drivers, allegedly owing to a system design consultant's inappropriate use of a fourth-generation-language-based application.

As a result, more than a million drivers have been unable to register their cars or have registered them and are incorrectly listed in the state's computers as operating unregistered vehicles. So many New Jersey drivers have been forced to drive without registrations that the state attorney general's office has ordered state police to cease citing drivers for the offense.

The controversial registration system was designed for the New Jersey Department of Motor Vehicles by a consultant under contract from the Price Waterhouse & Co. accounting firm. The consultant used Ideal and the Datacom/DB relational data base management systems, both products of Applied Data Research, Inc. of Princeton, N.J.

The system was designed to notify automatically the state's five million drivers of license and registration renewals and to update daily, instead of weekly, New Jersey's merit rating surcharge system. This system keeps track of violation points against individual drivers and penalizes bad drivers with higher insurance rates.

The Department of Motor Vehicles wanted to expand to 1,000 the number of terminals able to access the system. Instead, officials said, they found the new system foundering with 200 terminals. Response times went from the three to five seconds targeted to as long as five minutes, spokesmen said.

The new $6.5 million system "is simply not

Continued on page 6

TOP OF THE NEWS

One of the very few minicomputer vendors without a microcomputer product is about to take a small step in that direction. Prime Computer spokesmen say that the company will "within weeks" introduce a hardware option for its Performance Terminal 200 business terminal that will make the unit compatible with the IBM Personal Computer XT. The option consists of an add-on board and a storage device — either a floppy or a hard disk.

■

According to West Coast sources, *Newsweek* magazine's exclusive interview with Apple wunderkind non grata Steve Jobs came about when the weekly gave Jobs an offer he couldn't refuse — his picture on the cover. Jobs' visage was ultimately relegated to the upper right-hand corner of said cover when *Newsweek* editors felt compelled to bump their much-ballyhooed interview and give top cover billing to the Mexican earthquake. This may or may not have compelled Jobs to stretch the exclusivity arrangement by calling a news conference at his Silicon Valley estate the day *Newsweek* hit the stands. For

PROFILE

Whiz kid, 22, runs Longman Group operation

By Paul Korzeniowski

CHICAGO — Joseph Stith is at an age when most people begin to look for their first job. But Stith is not like most people.

As the 22-year-old computer operations manager at Longman Group U.S.A., Inc., he has a position that many older computer professionals would covet. Stith is overseeing conversion of the company's hardware as Longman Group implements a distributed DP operation (see story page 10).

"Accelerated" best describes the tall, thin, bearded professional's rise to his current position. Stith began taking college-level courses in the summer between his junior and senior years of high school. At the time, he was contemplating a career in physics or science.

An introduction to computers course sparked his interest in DP. That initial course was supplemented with programming courses at the University of Missouri and Washington University in St. Louis.

Upon graduation from high school, Stith entered Aurora College in Aurora, Ill. "I was looking for a medium-size college with a good computer science program, and Aurora fit the bill," he said.

At college, he majored in computer science and worked in the college's computer operations department. Aurora College's equipment was from Digital Equipment Corp., so Stith became familiar with DEC's PDP-11 series minicomputers and their operating systems.

Stith: He fits Longman's DP bill.

Stith's summer courses gave him sufficient credits to graduate at age 20. His first full-time employment was at Moline Corp. in Chicago, where he worked as a maintenance programmer.

The job supplied insight to the type of career he did not want to have. "I wanted to be more involved with the operating system and the design of the computer systems than with simple coding," Stith remarked.

So approximately a year after he joined the company, he began to search

Apple split brings bitter charges

Analysts see upturn despite company rift

By Maura McEnaney

CUPERTINO, Calif. — The bitter rift between Steven Jobs and the company he cofounded may leave Apple Computer, Inc. without its colorful figurehead, but Apple will survive the turmoil, observers said.

The Apple saga raged on last week, when the company sued Jobs and former senior design engineer Richard Page, alleging that the two breached their fiduciary obligations and misappropriated confidential and proprietary information from Apple.

Filed in Santa Clara County Superior Court in California, the suit accused Jobs and Page — one of five Apple managers who resigned last month to join Jobs in the formation of a new venture — of planning a "nefarious scheme" to create a company. The suit said Jobs falsely told the board that his enterprise would not compete with Apple, use any of its proprietary information or hire away key employees. Jobs publicly refuted the allegations and called the suit "absurd." Contacted by *Computerworld* at his home last week, Page refused comment on the suit.

In Stockholm Thursday, Apple President John Sculley told a press conference that Jobs had presented a proposal at a board meeting and explained that his new company would focus on the educational market and would not be a competitor to Apple. According to Sculley, Jobs said he would not take any key employees with him.

Within 24 hours, however, it became known that five key employees were being recruited by Jobs, Sculley said. "When it was evident that very little progress could be made, our company saw it necessary to sue Jobs," Sculley said.

Formerly close to the Apple cofounder, Sculley explained his reason for backing Jobs' removal from operational functions: "Steve Jobs thought it was up to Apple specifically to decide how computers were going to be used. I saw it necessary to open up and let the market decide on the uses."

But despite the Apple cartharsis, analysts are saying things are looking up for the company, particularly in light of Apple's anticipated fourth-quarter earnings. Apple recently announced it expected earnings in the last quarter to be above Wall Street predictions of between zero and 10 cents per share.

"Apple bottomed out several months if not several years ago," said former Apple employee Trip Hawkins, who now heads up Electronic Arts, a software company in San Mateo, Calif. "It is now in the process of rebuilding."

That rebuilding began more than a year ago, after Jobs brought in Sculley. The company laid off 1,200 employees this year, merged its Apple II and Macintosh divisions and announced plans to close its Apple II manufacturing plant in Dallas.

Even with the ongoing restructuring and the Jobs exodus, "I don't think things will change drastically," Hawkins said.

But, critics said, Apple must begin taking some steps to ensure its position within the business market. John Girton, an analyst with Birr, Wilson & Co. in San Francisco, said Apple "should try to put the full [AT&T] Unix System V on the Mac and make it a Unix workstation. They have to show that [the Mac] is a good workstation that can communicate with the mini and the mainframe world."

Even with the affair of the past few weeks, "The overall mood at Apple is one of relief," said an Apple employee, who asked not to be identified. Employees were not suprised by Jobs' actions or the company's legal response, he said. "Everybody felt Steve Jobs wasn't going to tuck his tail between his legs. He's kind of used to getting his way."

Walker Interactive shuts branch offices

SAN FRANCISCO — Walker Interactive Products, Inc. last week pulled in its horns with a consolidation that centers all of its operations at its home base.

The company issued a terse statement acknowledging a consolidation and declaring its intent to continue to provide service and support. Attempts to contact the company for further details were unsuccessful.

But one Walker customer said he had been informed that the company closed its four regional offices, effective last Monday.

Brad Blackburn, manager of computer services at Sunflower Electric Cooperative, Inc. in Hayes, Kan., said a Walker marketing representative informed him early last week that on Monday "officers of the company were at each of the regional offices closing all three regional offices effective immediately. Everything will be handled out of the San Francisco office." He later received a second call from a company official in San Francisco confirming the consolidation.

Last week *Computerworld* reported Walker has been offered for sale and that several of its leading competitors are bidding for the financially strapped company.

Blackburn said he was told that a sale of the company is no longer expected and that Walker has attempted to cut back expenses so it will be self-supporting and not require further infusions of venture capital.

NCR adds dyadic 32-bit supermini

PARIS — Moving into the European market first, with plans for an announcement in the U.S. in October, NCR Corp. has introduced a high-end system for its NCR 9000 line of superminicomputers.

The 32-bit NCR 9500 was designed as a tightly coupled dyadic processor with a single memory of up to 16M bytes. It supports 24 to 100 users.

The company said that the 9500 is the first member of the 9000 family to feature a dyadic processor and the first to use 256K-bit memory chips. The earlier 9000 series processors, the 9300 and 9400, use 64K-bit chips but can be upgraded to the 9500.

Comparing the 9500 with other large NCR systems, a company official said the 9500 performs 1.1 million instructions per second (Mips) while the 9300 offers 0.37 Mips and the 9400 0.67 Mips. He also noted that the 9500 runs under a multiprogramming, dyadic processor version of NCR's ITX/DP. The 9300 and 9400, which like the 9500 are oriented toward interactive applications, run ITX, while NCR's 8500 family of mainframes runs NCR VRX.

The company said ITX/DP appears as one operating system to the user and the native Cobol compiler in the operating system gives the 9500 twice the performance of the 9400. ITX and ITX/DP are said to feature Virtual Look Ahead, a virtual memory access function.

An entry-level system is said to include 2M bytes of memory, a 45M-byte streaming tape drive, a 405M-byte fixed disk drive, 24 communications lines, a 600 line/min. printer and the operating system for $162,000. The system is scheduled for delivery in April 1986.

With NCR's Link Level Communication Subsystem, the system supports communications protocols such as X.25, IBM Systems Network Architecture and 2780/3780 Remote Batch System and provides distributed data processing capabilities.

CORRECTIONS

A chart that ran with the Network Management product spotlight [CW, Aug. 12] should have listed the number of circuits that are supported by Codex Corp.'s DNCS as 124.

■

The Hardware Roundup section dealing with mainframe systems [CW, Aug. 19] included incorrect information about Sperry Corp. products.

The Sperry 1100/70 H2 was incorrectly labeled as the 11/70 H2. The quoted lease prices for the System 11UP and the System 11MP are for three-year lease terms. The correct price per 1M byte for the company's System 80 Model 4 and the System 80 Model 6 is $20,956. The disk cache memories for the various systems should be listed as 4M to 64M bytes.

SMART COOKIE

Like you, SyncSort DOS is cut from a special mold.

Call (201) 568-9700.

It's healthy for your system.

One thing about smart cookies, they can spot each other a mile away.

While they don't flaunt their derring-do, they quietly know they're the best at what they do. Because substance shows through. Every time.

Especially when the going gets tough. And rough. As it often does in a DOS environment.

For example, a smart cookie doesn't crumble under the pressure of too many programs and too few programmers.

A smart cookie doesn't waste dough — but picks and chooses the right ingredient to keep production on the rise.

And sometimes, even, a smart cookie has to be a mighty tough cookie. That means being on the job constantly. Keeping things running and humming. Without draining vital resources.

All of which brings us to our smart cookie: SyncSort DOS. A cut above the rest if you ever saw one. Check these delicious advantages.

Better Performance

Pop one into your system and you'll see a mouthwatering difference. Immediately. SyncSort DOS will give you performance improvements like those shown in the chart on the left.

And performance features such as:

- Automatic Secondary Allocation. With this feature your sorts will never run out of disk space, i.e., no "sort capacity exceeded" messages.

Better Features to Improve Programmer Productivity

As you begin to digest SyncSort DOS, you'll find it more and more to your liking. With ingredients that cut down to size the amount of programming time going into applications.

- **SortWriter** — A powerful tool that can produce extensive reports as a by-product of your normal sorting — without user exits and the associated programmer investment. Headers, trailers, total and sub-total capabilities provide flexible formatting.
- **Record Formatting** — Powerful features like INCLUDE/OMIT, INREC/OUTREC, SUM and others — with capabilities like data conversion, editing, insertion of literals.
- **Multiple Output** — From a single sorted file, you can create multiple files and reports. Each can include the same or different data as determined by INCLUDE, OMIT, OUTFIL or OUTREC parameters.

Better Customer Service

Still another sweet advantage of SyncSort DOS: help is always there when you need it. 85% of all requests for service are resolved within 24 hours. We always rise to the occasion.

The moral to this story: smart cookies are quick to reject half-baked solutions in favor of SyncSort DOS. Call us for a demonstration. Once you get a taste you will be hungry for more.

SyncSort DOS
One smart cookie deserves another.

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

DOD discloses Soviet effort to acquire U.S. technology

Soviet Ryad computers said to model IBM 370

By Mitch Betts

WASHINGTON, D.C. — The Soviet Union has carried on a massive campaign for the past decade to acquire U.S. computer technology, according to a U.S. Department of Defense report released recently.

Turning up the heat in its own campaign against Soviet bloc technology acquisition, the Defense Department revealed that the Soviet Union used IBM's 360 and 370 architectures as the basis for its Ryad series of computers. Pentagon officials would not disclose exactly how the Soviets copied the IBM mainframes. Generally, the Soviets obtain technical documents or hardware or both, Pentagon spokesman Cmdr. Bob Prucha told *Computerworld* last week.

At a Sept. 18 briefing, Secretary of Defense Caspar W. Weinberger described the Soviet campaign as being a "far more serious problem than we had previously realized." According to the Defense Department report, which is based on new declassified intelligence reports, the Soviets also targeted U.S. semiconductor, communications and fiber-optic and military computer technology.

"By their own estimate, more than 5,000 Soviet military research projects each year are benefiting significantly" from technology acquired from the U.S. and its allies, Weinberger said.

Illustrating the Soviets' strong interest in the 370, Weinberger's report said that in the mid-1970s, the Soviet ministry responsible for producing mainframe computers specifically asked the Soviet secret police and intelligence agency, the KGB, to obtain technical documentation on the IBM 370 Models 145, 158 and 168 and operating system data.

The KGB was asked to get documents dated 1974 or later from IBM in the U.S. and to obtain information about new IBM projects, the report said. By 1974, IBM's 370 architecture had virtual storage and the Systems Network Architecture. However, Prucha said the document request was not directly linked to the copying of the IBM 370.

Officials could provide no additional information about the Soviets' Ryad computers, except that the KGB also acquired Western technology for disk memory systems that improved the "military Ryad series disk drives."

The report, which is part of a Reagan administration campaign to restrict high-technology exports and to cut the number of Soviet bloc spies in the U.S., was written by the 22-agency Technology Transfer Intelligence Committee.

The Soviet campaign has enabled that nation to acquire computer disk memory systems, fiber-optic systems, bubble-memory technology, computer-controlled integrated circuit testers and a complete set of manufacturing equipment for printed-circuit boards. The report said the technology was used for military purposes.

The Soviets have selected major defense contractors as targets of the acquisition program, as well as high-tech universities such as MIT in Cambridge, Mass., and Carnegie-Mellon University in Pittsburgh; electronic data bases; and scientific conferences, according to the report.

The report specifically cited the U.S. Department of Commerce's on-line data base of government research abstracts and the Conference on Integrated Optics, which reportedly helped the Soviets to improve their fiber-optic communications devices.

Furthermore, the report said, Soviet collectors have easily obtained U.S. and Japanese integrated circuits, which can be copied through reverse engineering. Evidence showed that the Soviets' KR580IK80A microprocessor is a modified version of Intel Corp.'s 8080A 8-bit microprocessor.

The report predicted that the Soviets will increase their attempts to gain access to on-line data bases directly from the Soviet Union. One countermeasure would be to prevent sensitive research from appearing in public data bases — but that may inhibit U.S. research efforts as well, the report noted.

Encore exec splits from Fisher's trio

By James Connolly

MARLBORO, Mass. — A high-level shake-up hit Encore Computer Corp. last week, only two weeks after the tardy formal introduction of the company's first superminicomputer multiprocessor.

One of the three founders of the young company resigned last Wednesday, while a second founder was having discussions "concerning the nature of his relations with the company," according to a brief press release issued by the seven-member board of directors.

The board cited differences in operating styles when it said that it accepted the resignation of Henry Burkhardt III, a director and senior vice-president for finance and operations.

C. Gordon Bell, a director and vice-chairman for technology, was the second founder reported to be engaged in discussions about his future with the firm.

Encore's vice-president for corporate affairs, Charles T. Casale, said that a determination of Bell's status might be made within days. In a published interview, company Chairman and Chief Executive Officer Kenneth G. Fisher said he believed Bell would remain with the company in some capacity.

"Some people may interpret this as negative. Henry [Burkhardt] made a tremendous number of contributions to the company. Bell, likewise, has made a number of valuable contributions, although his are of a less direct nature," Casale said. He said the differences of opinion between Fisher and Burkhardt involved management of the two-year-old company and that resulting changes would be unnoticed by outsiders.

Neither Bell, who, the company said, was traveling on the West Coast, nor Burkhardt could be reached for comment.

Fisher, the third founder listed in a prospectus issued when Encore made a public stock offering in April, will assume Burkhardt's duties on a temporary basis.

Prior to the time that the three united to form Encore in 1983, Fisher was chief executive officer and president of Prime Computer, Inc.; Bell was vice-president for engineering at Digital Equipment Corp.; and Burkhardt was cofounder of Data General Corp.

On Sept. 10, the company announced its Multimax superminicomputer and several related communications and workstation products. The Multimax is scheduled for October deliveries, Casale said.

Unveiled later than originally planned, the future of Multimax was clouded somewhat several weeks ago when Sperry Corp. pulled out of a deal to buy much of the company's output.

Casale said Burkhardt also is resigning his directorship and that a replacement may be named within weeks. He said Burkhardt retains his approximately 10% interest in the company.

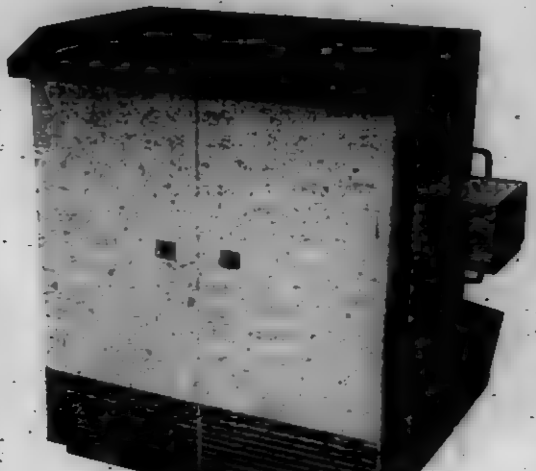
If you're looking at laser printers, let SSI open your eyes.

- 45 or 60 pages per minute
- Cut sheets in document order, with job separation
- 8½ x 11 or 8½ x 14 portrait/landscape
- Low energy use, low heat
- Quieter, cleaner, no toner dust
- Prints forms from memory
- Lowest initial & operating cost.



Mercurion® is a high speed, non-impact printing system proven in hundreds of demanding installations for over two years.

Now available in two speeds—the 60 page-per-minute Mercurion 1 and new 45-page-per minute Mercurion 7450.

These electronic printer systems handle 50,000 to one million sheets (including forms output) monthly. All Mercurion features are accessed from the panel or via software, including 1 to 255 copy capability. Creates and uses variable forms simultaneously. Prints letter quality using up to eight resident fonts, including linguistic variation.

The Mercurion is in use *now* on IBM, Burroughs and other mainframes throughout the world.

IBM Japan, NTT form value-added network venture

By Takehiko Kondoh
Special to CW

Tokyo (CWN) — Nippon Telegraph and Telephone Corp. (NTT) announced last week that it has reached a basic agreement to establish a data communications joint venture with IBM Japan Ltd. The new firm, to be financed equally by the two companies, will go into service later this year.

The venture, with an estimated initial budget of $2.6 million, will provide integrated data communications services by linking up IBM's Information Network with NTT's value-added network.

The pact may carry the brewing confrontation between AT&T and IBM to Japan. In July, AT&T formed a venture with a consortium of more than 200 Japanese companies to establish a value-added network.

The new firm, the details of which remain unknown, also will provide Japanese users with separate access to the Information Network, an NTT official said. For the planned service, the agreement requires that IBM Japan provide software and hardware resources to the physical network maintained by NTT.

Meanwhile, NTT, which went private in April under new telecommunications business laws, apparently will offer peripheral data communications know-how and be responsible for the development of user software.

Architectural differences between IBM's Information Network and NTT's value-added network have blocked interconnection of the two networks. This prohibited NTT from taking orders for its computerized value-added network systems from existing Japanese users of IBM equipment, because NTT, as the country's largest value-added network operator, has made exclusive use of Japanese-built computers for its network.

An industry analyst said that the latest agreement will benefit IBM, which is pursuing expanded presence of networked data communications in the Japanese market and also is stepping up efforts to boost sales of computer hardware to NTT.

Kondoh is international editor/Asia for CW Network.

New Jersey motorists in software jam

capable of handling the volume of work generated each day," Department of Motor Vehicles Acting Director Robert Kline said last week. "Even working overtime and on weekends, the system is not keeping up," he said.

State administrators and spokesmen for ADR both claimed that the system designer used ADR's Ideal fourth-generation language in ways it was never intended to be used, and they questioned Price Waterhouse's reliance on Ideal before the new system was installed. "We found ourselves in the unusual situation of our advice not being followed on our product," said Joseph W. Farrelly, vice-president for research and development at ADR.

A spokesman for Price Waterhouse said last week that the accounting consulting firm has agreed to redo the system and will have further comment. "Frankly, we don't want to get into all the details. We don't feel that would serve any useful purpose," said Kenneth Doyle, director of communications at Price Waterhouse headquarters in New York.

At a hearing in Trenton Tuesday, the attorney general's office aired March 1984 correspondence from Price Waterhouse justifying the selection of Ideal on grounds of "productivity gains anticipated during the coding and testing phases."

"We've got pages and pages of things we feel are wrong with the system," said Bruce Jones, deputy administrator of the state Office of Telecommunications and Information Systems, which now oversees the state's computer operations.

'Barn-burner application'

"It was a barn-burner application, and I'm not sure Ideal was the right technology to use," Jones said.

Said ADR's Farrelly: "The batch sequential processing should have been written in Cobol."

Farrelly said it takes the same number of lines of code in Ideal to accomplish batch processing as in Cobol and that there was no inherent advantage in using Ideal in such a way. He said the 20% of subsystems that required heavy processing should also have been written in Cobol rather than Ideal.

In a Dec. 10 *Computerworld* report on large-scale applications development systems, ADR said Ideal is a "functional replacement for Cobol" and was recommended for developing large-scale transaction-oriented applications. "There is virtually nothing you can develop in Cobol that you cannot also develop with Ideal," the firm said at that time.

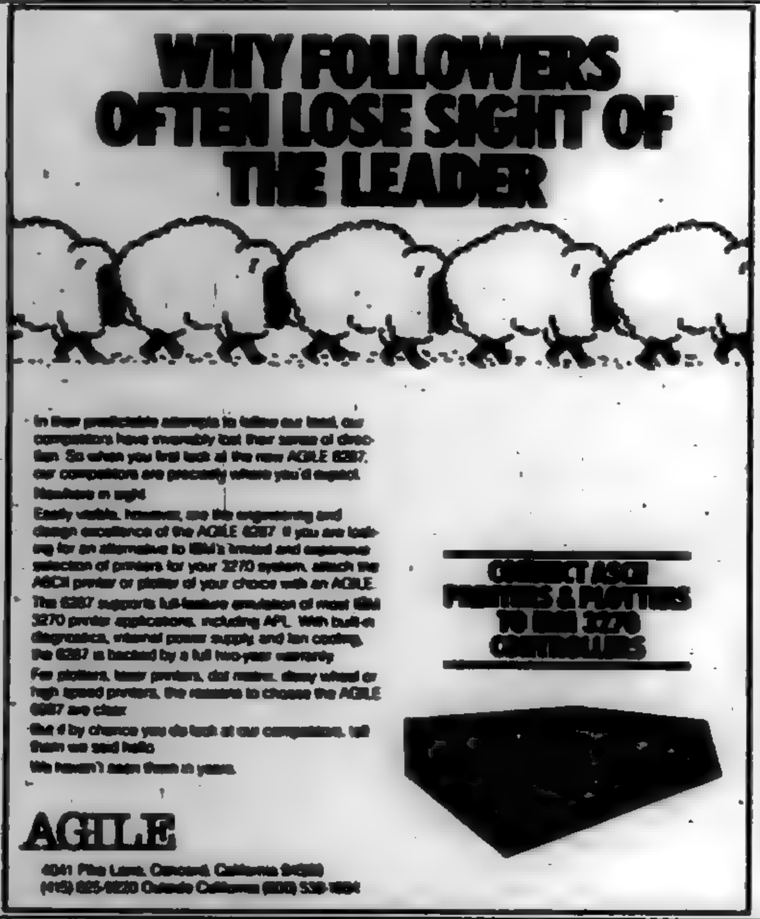
Farrelly said last week the company stands by the Dec. 10 statement "for most applications." However, he added, "In ADR's opinion, the [DMV] has special processing requirements, and ADR recommended that portions of them be put in Cobol and the rest in Ideal."

Jones said the state also ran into problems with the way Price Waterhouse interfaced Ideal with IBM's CICS.

Department of Motor Vehicle spokesmen have acknowledged that renewal notices have been sent to the wrong drivers, and many police cars and other public vehicles have been registered to the wrong municipality, prompting some to question the integrity of the state's entire data base.

"I'm surprised Price Waterhouse didn't do a better job of benchmarking Ideal and analyzing the kind of code it generated," said Mary Heminway, managing editor for Datapro Research Corp.

Price Waterhouse did a computer master plan for the department prior to being assigned the $6.5 million system redesign contract. The selection was made without competitive bids, state officials said.



WHY FOLLOWERS OFTEN LOSE SIGHT OF THE LEADER

In their predictable attempts to follow our lead, our competitors have invariably lost their sense of direction. So when you first look at the new AGILE 6287, our competitors are precisely where you'd expect. Nowhere in sight.

Easily visible, however, are the engineering and design excellence of the AGILE 6287. If you are looking for an alternative to IBM's limited and expensive selection of printers for your 3270 system, attach the ASCII printer or plotter of your choice with an AGILE. The 6287 supports full-feature emulation of most IBM 3270 printer applications, including APL. With built-in diagnostics, internal power supply and fan cooling, the 6287 is backed by a full two-year warranty.

For plotters, laser printers, dot matrix, daisy wheel or high speed printers, the reasons to choose the AGILE 6287 are clear.

But if by chance you do look at our competitors, tell them we said hello.

We haven't seen them in years.

ORACLE

The portable version of IBM's DB2 and SQL/DS

COMPATIBILITY

The ORACLE relational database management system is fully compatible with IBM's SQL/DS and DB2. SQL/DS and DB2 represent IBM's latest generation of database management technology for IBM's largest computers. ORACLE's capabilities and user interface - the SQL language - are identical to those of SQL/DS and DB2. Programs written for SQL/DS and DB2 will run unmodified on ORACLE.

PORTABILITY

SQL/DS and DB2 run only on IBM mainframes; ORACLE runs on IBM mainframes, DEC, DG, AT&T, HP, STRATUS, and several other manufacturers' minicomputers, and on a wide range of microcomputers including the IBM PC/XT and PC/AT. All versions of ORACLE are identical and include a complete implementation of SQL – not a subset.

CONNECTABILITY

Having the same software running on your mainframe, minis, and micros greatly simplifies the task of connecting your machines into a network. ORACLE's network software allows microcomputer users to directly access data stored in the shared database on the mainframe or minicomputer, or copy that data into the database on their micros and operate independently.

Oracle introduced the first relational DBMS and the first implementation of SQL back in 1979. Today, eight of the ten largest U.S. companies use ORACLE. In fact, INC MAGAZINE ranks Oracle as the fastest-growing software company in the USA. Surprised? Don't be. ORACLE is the number one relational DBMS, with thousands of installations on IBM mainframes, DEC, DG, AT&T, HP, STRATUS and most other vendors' minis and micros. Even the IBM PC.

To attend the next free, half-day seminar in your area or receive additional information, write Oracle Corp., Dept. C4, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350. Following is the ORACLE seminar schedule:

ORACLE Seminar Schedule

Albuquerque	Nov 26
Austin	Oct 3
Boston	Oct 15, Nov 12, Dec 11

Relational Technology unveils Ingres for VM

vendor computing environments make better use of their existing hardware resources. According to Livingston, data base applications written in Ingres' fourth-generation language can run on all systems that support Ingres, including DEC VAXs and microcomputers that run Unix.

Beta site lauds portability

A spokesman for one beta site user of Ingres/CMS — the Federal Systems Group Information Services division of Nashua, N.H.-based Sanders Associates, Inc. — lauded that application's portability and said his organization intends to use the product in the future to bridge diverse machine environments.

Relational Technology's Livingston noted that Ingres/CMS provides an active data dictionary, a fourth-generation language, a query facility, implementations of IBM's SQL and Quel languages, a report writer, a facility with which to embed SQL or Quel statements within Ingres-developed applications and a screen painter. An optional graphics module is not yet available with Ingres/CMS, which is scheduled for production shipments in mid-October.

In addition, Ingres/CMS users will in the near future be able to use the Ingres/PCLink to browse Ingres data bases on the host and transfer data from a data base into popular micro packages, such as Lotus Development Corp.'s 1-2-3 and Microsoft Corp.'s Multiplan, with automatic data reformatting.

The relational DBMS is also said to use VM performance facilities such as block mode I/O and the Inter-User Communications Vehicle for Dasd I/O. Data from CMS files and OS sequential data sets can be transformed for Ingres/CMS data bases, the vendor said.

> *'Ingres saves us from the headaches of [IBM's] IMS and a hierarchical data base structure.'*
>
> — Dan Callahan
> Sanders Associates, Inc.

According to Dan Callahan, principal software engineer at Sanders Associates, the beta version of Ingres/CMS was installed in late May on an IBM 3083 running VM and MVS concurrently. Sanders was using Ingres on four VAXs, and Callahan said the company's recent porting of VAX-based Ingres applications and data bases to VM was something of a tedious chore but one that went smoothly.

Performed migration

Callahan said a Sanders team performed that migration by transferring files from a VAX to the IBM mainframe via DEC's Systems Network Architecture Gateway. The company plans to put Ingres/CMS and the systems developed for use with it during beta testing into production use in October. Both the VAX and VM versions of Ingres were selected, he said, because Sanders' engineering group was looking for productivity tools for both end users and programmers.

"Manufacturing and engineering systems really lend themselves to a relational system," Callahan said. "Ingres saves us from the headaches of [IBM's] IMS and a hierarchical data base structure. The major goal we have for Ingres is bridging the gap between machines so users do not have to worry where data resides."

Initial licenses cost $90,000 for Ingres/CMS for VM/CMS and $60,000 for VM/Entry. The Ingres/PCLink for Ingres/CMS will be available 90 days after production release of the VM version and will have an initial license fee of $12,000.

HP introduces IBM AT clone

nounced last week. The products were designed to tie into the company's Personal Productivity Center distributed processing concept.

According to Srinivas Sukumar, a program manager with HP's Personal Office Computer Division in Sunnyvale, the Office Share LAN conforms to the IEEE 802.3 communications standard and is compatible with Microsoft Corp.'s MS-Net software. The local networking product also enables work group members to use their micros to gain access to HP 3000 departmental processors, Sukumar said.

In an interview with *Computerworld* in New York, HP President John Young said the Vectra was not designed as a stand-alone competitor to the AT. "I wouldn't say we were set up as a company to do battle in the loose iron business; that's not what we're focused on at all." Vectra, and accompanying software, was designed as an upgrade path to the Personal Productivity Center office automation network concept, he said.

Vectra, like HP's existing Touchscreen personal computers, supports a version of Microsoft Corp.'s MS-DOS but is the first HP machine that can run off-the-shelf IBM PC-DOS applications without modification. HP is not offering a version of Microsoft's Xenix operating system as IBM is doing with the AT.

Unlike the Personal Computer AT, which incorporates a 6-MHz 80286, Vectra is built around an 8-MHz version of the 16-bit microprocessor, providing a 30% performance edge, Sukumar said.

Vectra is currently available in a choice of three models — the System 25, 35 and 45. An entry-level System 25 starts with 256K bytes of main memory and a 360K-byte floppy disk unit, while a System 45 can hold up to 3.64M bytes of central storage and a 40M-byte hard-disk module; the 40M-byte hard disk will not be available until early 1986.

A minimum System 25 configuration and a full-blown System 45 cost 20% less than and 60% less than, respectively, their IBM Personal Computer AT equivalents, Sukumar said. The Vectra Systems 25, 35 and 45 start at $3,199, $3,399 and $2,599, respectively.

When bundled with Advance Write in two configurations, with or without hard disk, the AT-compatible micro becomes a Vectra Office Workstation. Advance Write, jointly developed with Samna Corp., is available in three versions.

Advance Write supports IBM's Document Content Architecture and thus can coexist with industry-standard applications like Multimate Corp.'s Multimate and the IBM Displaywriter. Documents produced with Advance Write can be distributed to HP or IBM micros and then read but not revised under Multimate and Displaywriter, Sukumar said.

With the existing HP Access product, meanwhile, the word processing package can download data from an HP 3000, merge the material with a microcomputer-resident document and then return the information to its origin, he said.

The word processing software forms part of HP's Advance Net communications architecture, which allows different processor models to exchange files and programs across an entire organization.

Similarly, Office Share also fits within the Personal Productivity Center concept by permitting Vectras, HP Touchscreens and IBM micros to be networked locally. Also announced was HP Advance Link 2392 software, said to allow Vectra PCs and IBM Personal Computers to emulate the HP 2392 terminal and to communicate with the HP 3000 system through Office Share.

Advance Write versions are priced from $295 to $695; an Office Share starter kit for the Vectra PC costs roughly $2,300 for hardware and software. Prices start at $5,229 for the Vectra Office workstations. Advance Link 2392 is priced at $295.

FOLLOW THE LEADERS

For COBOL products chosen by IBM, AT&T and other leading corporations worldwide, go Micro Focus.

Micro Focus enhanced technology offers the highest performance and greatest portability across operating systems, plus the broadest range of tools.

As the first to offer High Level COBOL and GSA certification for microcomputers, and now the first ANSI '85 implementation, we know about technological excellence.

HP staffing moves, Apollo results show slump lingers

By Clinton Wilder

Adverse news from Hewlett-Packard Co. and Apollo Computer, Inc. last week did not bode well for expectations that the computer industry is emerging from its 1985 slump.

Apollo, the Chelmsford, Mass., vendor of 32-bit engineering workstations, laid off 300 employees and predicted an $18 million fourth-quarter loss — its first ever. HP extended its previously announced furlough program for U.S. employees.

Meanwhile, the U.S. Department of Commerce announced that July orders for office and computer equipment fell 11.3%, seasonally adjusted, from their June level. Shipments decreased by 14.1% while inventories remained flat.

"Things are still pretty sluggish; we are by no means out of the woods yet," said a spokesman for Apollo. The company projected an after-tax operating loss of $4 million and a one-time charge of $14 million as a result of the layoffs.

Apollo attributed the sluggish sales to cancellation and deferral of orders by engineering system OEMs, which make up the bulk of Apollo's market.

Sandra Gant, an industry analyst with Infocorp in Cupertino, Calif., said the slightly improved U.S. economic climate and weakened dollar have not sparked computer sales.

"There's been a lot of talk and hype from the vendors about networking and other pitches to the end user, but very few real solutions have been delivered," Gant said. "The major users decided to spend 1985 just thinking. It appears that they still are."

An additional squeeze on minicomputer profits, according to Gant, is the trend toward lower priced products such as the Digital Equipment Corp. Microvax II. "The Microvax II is selling, but you have to sell a lot of them to bring in a lot of dollars," she said.

In Palo Alto, Calif., HP announced that all non-sales offices in the U.S. will close for the entire weeks of the Thanksgiving and Christmas holidays, giving 45,000 employees a total of four unpaid vacation days. Employees will be required to take one paid vacation day in each week, in addition to the paid holidays of Nov. 28-29 and Dec. 24-25.

The announcement continued HP's ongoing plan of furloughs that was begun last July and is expected to continue at least through the end of January 1986.

"Our business picture remains about the same as it has been," said Dean O. Morton, HP's executive vice-president and chief operating officer, in a statement. "Overall business levels do not support the expense of a full work schedule."

The company also announced its worldwide hiring would be scaled back to a minimum, effective immediately.

Borland OKs site licensing

By Eric Bender

SCOTTS VALLEY, Calif. — Bowing to "a tremendous amount of requests from corporations," Borland International, Inc. last week unveiled site licensing options for its Sidekick and Superkey microcomputer packages, according to Sales Vice-President Spencer Leyton.

Under the new program, companies can purchase a Sidekick or a Superkey master disk and make up to 2,000 copies for $25,000 or an unlimited number of copies for $50,000. Alternatively, they can license the two products together at a price of $35,000 for up to 2,000 copies and $70,000 for unlimited quantities.

It is difficult to specify the effective discounts because of uncertainty about the number of users, Leyton pointed out.

No specialized support arrangements

Primary software upgrades, such as from Version 1 to 2, will be available for 30% of the site license fee, with secondary upgrades, such as from Version 1 to 1.5, costing 10% of that fee. Borland said it does not intend to offer specialized support arrangements beyond designating a specific technical person for the site license customer, Leyton said.

Companies that sign an up-to-2,000-copy agreement will be provided with 1,000 manuals, with additional copies priced at $5 each. Firms that buy unlimited licenses will probably receive 2,000 manuals.

Arthur Andersen & Co., a Big Eight accounting firm headquartered in Chicago, is one of the first Borland site licensees, signing an agreement for Sidekick, the best-selling desktop manager program.

Sunil Subbakrishna, a manager in computer aids for tax preparation at Arthur Andersen said the company has roughly 3,700 personal computers worldwide, and "we have the trouble of trying to keep track of where every program might go."

Site licenses offer the promise of reducing administrative overhead and help lead the way toward standardization, Subbakrishna said.

How $20 worth of system-development ideas can save you a bundle on programming and maintenance

The methods you use to analyze, design, and implement new systems can have a tremendous effect on programming and maintenance time in your shop.

For example, suppose a new system is already being programmed when you find you need a few more fields in a record...or you need another file. At the least, you have to recompile the finished programs with the new record formats. And you may be in for weeks or months of re-programming. That means productivity goes down and probably so does program reliability (you just can't revise a program as well as you write it in the first place). That, in turn, means future maintenance problems. All because of faulty file/database design.

Or suppose the system documentation is so long and complex that (1) it was never finished, (2) no one keeps it up-to-date, and (3) no one bothers using it because they can never find anything in it. Then, when a change has to be made, the maintenance programmer has a tough time correcting...or even pinpointing...all the affected programs. And it's likely that one change will lead to a new problem somewhere else. All because of bad systems methods, not bad programming.

What made the difference in our shop

If you cut problems like these to a minimum, you'll improve program development in your shop and save maintenance time and dollars. And you can cut down on these problems if you use the system-development ideas presented in a $20 book called *How to Design and Develop Business Systems.*

I know because we used these ideas to develop our inhouse system 2 years ago. Now, one person maintains about 600,000 lines of COBOL code in less than 2 days per month. And most of the maintenance would more properly be called program enhancement. As you can imagine, that frees up plenty of time for new program development, so we don't have a months-long backlog.

I'm convinced *How to Design and Develop Business Systems* will help you, too. Here's just some of what you'll learn in this practical book:

- an 8-phase development method that helps you make the critical decisions that affect the development time... and *reliability*...of your system the most
- how to use an *analysis data flow diagram* (DFD) to analyze an existing system in days or weeks...not months
- how to use a *model DFD* to logically design a new system in a fraction of the time you need using your current design methods
- why users can easily understand DFDs and point out mistakes in them...so you can correct problems long before programming starts
- how to use your model DFD to figure out what data elements you need in the new system
- how to use your model DFD to create a *system structure chart* that breaks the system down into logical functions
- how to use your system structure chart as an index to the system (each box on the chart is a program in the system, a menu in an interactive system, or a procedure)
- how to use your system structure chart to design procedures for: (1) time-dependent processing, (2) security, and (3) backup
- simplified data-dictionary notation that's easy to use and understand
- 6 steps for designing a system's database or files so you get rid of the late record-format changes that cause re-programming
- 13 tips for interactive screen design
- how to cut system, database, and program documentation to the essentials ...and package it so it's easy to use

You decide which ideas will work best for you

I'm sold on this method. It's the most sensible approach to system development I've seen yet. What I like best is that everything you do, every document you create, helps you get an effective system up and running. I've been delighted at how it's boosted productivity in our shop.

Even so, I know this method won't be the last word on system development. I also know many people can't...or won't want to...adopt it in its entirety.

So I suggest you treat this book as an idea book. Take the ideas you like (I *guarantee* you'll like some of them) and plug them into your own development method. I'm convinced they'll improve the quality of your systems and cut your development time.

FREE trial and 100% guarantee

So there's no risk to you, this book comes with my 100% guarantee. It must help you develop better systems faster, or send it back for a full refund...*no time limit*. But first, take up to 30 days to review it FREE of charge.

So get a copy TODAY. Find out how to create reliable, maintainable systems in less time than ever before!

Whiz kid, 22, runs Longman Group

for another job. As he was examining the "help wanted" section of the local newspaper, Stith noticed Longman Group's advertisement for a manager of computer operations.

In an effort to expand its business, Longman Group had begun acquiring companies with annual revenues of approximately $10 million. In conjunction with the changes, the company devised a three-year plan for integrating its subsidiaries' DP departments. The company needed someone to oversee hardware conversion.

Stith was very interested in becoming that someone. "I almost did not apply for the job because I was afraid I would not get it," he said.

Competition for the position was fierce, and Timothy Honaker, director of information resources at Longman Group, reported that there were at least three candidates suited for the job.

Stith's age and relative inexperience were deemed more of a benefit than a disadvantage. "Since he hadn't been working very long, he was not locked into a set pattern of doing things, which was important since we do not run a typical DP department," Honaker noted.

In September 1984, Stith joined Longman. Subsidiaries had worked with various brands of hardware, including NCR Corp. and Qantel Corp. systems. As manager of computer operations, Stith has overseen migration from that equipment to DEC VAX series superminis.

The position has had its challenges. "I don't get home as early as I should, and there are times when I am on the road longer than I planned," Stith related.

Honaker has been satisfied with Stith's performance but said that there are areas for improvement.

"Since he is so young, he has been taken advantage of," the director of information resources noted. Stith has trouble saying no to people, according to Honaker. Rather than concentrating on one item and seeing it through to completion, he tends to juggle a number of unfinished projects. Honaker said that this problem could be solved as Stith gains more experience.

As he gains more experience, other positions will become available to him. Eventually, Stith would like to move more into a management position and away from the day-to-day operations.

"I am gaining a lot of experience with items such as negotiating contracts with vendors," he noted. "That experience may become very beneficial to me later."

■

Firm realizing decentralization

CHICAGO — Decentralized data processing has been a pipe dream for many corporations. Longman Group U.S.A., Inc., primarily a publishing company, is realizing that dream with a distributed operation that connects six offices in four states.

Two years ago, Longman's parent company, Longman Group Ltd. in London, decided to increase its presence in the U.S. through a series of acquisitions. The purchases added company offices in New York; Washington, D.C.; Chicago; Naperville, Ill.; and Vernon, Conn.

With each acquisition came a computer system. Rather than supporting a number of different systems, the company decided to choose one standard piece of hardware. After examining a number of offerings, Longman decided to install Digital Equipment Corp. VAX superminicomputers in each office.

Timothy Honaker, director of information resources at Longman, listed two reasons for the choice: DEC's product line had software that could be run on large and small systems, and the VAX systems cost less than comparable Wang Laboratories, Inc. and IBM offerings.

Currently, at each location the VAX systems run payroll and general ledger applications written by Xenthom Corp., a Chicago consulting firm.

With the software and hardware chosen, Longman has embarked on a three-step plan to implement a distributed system. Converting the current payroll and general ledger applications to the DEC systems is the responsibility of Honaker's department, which consists of Honaker, a computer operations manager and a business analyst.

What makes the system truly distributed is that after the conversion, Honaker's group supplies only routine troubleshooting. Running the systems becomes the subsidiary's responsibility. If a subsidiary wants to alter its applications, it pays the consulting firm.

At most companies, a maintenance programming staff would make the changes. "We don't have any maintenance programmers today, and I don't think we will have any in the future," Honaker said.

The director of information resources said there are benefits to not supplying maintenance programmers. Because a subsidiary has to pay for changes, it is less likely to request minor, unnecessary changes.

Another benefit is that the consulting firm has experienced programmers. "We would not be able to afford the consultants on a full-time basis," Honaker noted.

In the next few years, Honaker's group will have more work. Longman said it plans to continue to add other companies to its fold.

The third step in the plan will link the subsidiaries in a synchronous network. Despite the increased work load, Honaker said he thinks that the staff will remain relatively small. "We want to work as company consultants and distribute data processing functions to the subsidiaries," he said.

When the third step has been completed, the dream of distributed data processing may be realized.

— Paul Korzeniowski

BE A COMPUTER ENTREPRENEUR

"The AMI Agent Program absolutely met all our expectations."
Glen W. Gordon,
Computer Resources International, Inc.
Monroe, LA

"We're an independent computer systems house, and over the past 20 years have evaluated just about every market and product for mini and microcomputers. Today's powerful microcomputers and the vertical market for accountants clearly hold the strongest potential for revenue. AMI's Agent Program lets us enter this lucrative market quickly and profitably."

AMI's Certified Agent Program is a unique opportunity for you to profit from the microcomputer revolution with only a small investment in the tools to get your business going. You'll sell powerful turnkey solutions including AMI's Software for Professionals™ and hardware like the IBM PC-AT. There's no franchise fee, inventory, nor accounts receivable to worry about. You're backed by extensive national advertising and AMI handles all customer support. Become a computer entrepreneur. Call or write today for your Opportunity for Professionals™ Pack.

Data flows despite earthquakes

Firms trade info by tape, courier

By James Martin

With the help of magnetic tape and courier services, U.S. corporations with DP operations in Mexico City have been able to continue trading information in the wake of two recent devastating earthquakes.

Although the quakes have been called the worst thing to happen since Hernan Cortes destroyed the ancient city in 1521, many industrial plants and offices were left practically unscathed. Two U.S. companies with Mexican operations said last week that subsidiaries south of the border suffered little damage.

But most communications links were down following the first quake, with reports that the situation will not return to normal for months. This has caused MIS and DP managers to find new ways for the home office to communicate with the Mexico City subsidiaries.

Hewlett-Packard Co.'s four offices in Mexico City received little structural damage, with computer systems continuing to operate after an initial power outage caused by the first quake, according to Sy Corenson, public relations manager for the Palo Alto, Calif.-based firm's intercontinental operations.

Two facilities unaffected

HP's two manufacturing facilities in Guadalajara, Mexico, were unaffected by the quake, Corenson said, and are now serving as communications links between Mexico and California. Users of the HP 3000 in Mexico City can store data and electronic mail on magnetic tape, which is then flown by commercial airline to Guadalajara and from there transmitted to California.

> ”
>
> *Most communications links were down following the first quake, with reports that the situation will not return to normal for months.*

Graphics and other hardcopy documents can be transmitted to Guadalajara via facsimile apparatus and flown to Mexico City.

E. I. du Pont de Nemours & Co. in Wilmington, Del., has continued to interface with the HP 3000 system in the corporate headquarters for its Mexican subsidiary by sending magnetic tape via overnight courier, according to Donald M. Breth, business analyst for Dupont in Wilmington.

Breth said Dupont's 14-story office tower in Mexico City was spared any major damages, and DP operations have remained in operation, although isolated. Financial data is stored on magnetic tape and mailed by overnight courier to Delaware, where it is batch processed into the headquarter's IBM mainframe environment.

Normally, Breth said, Mexico City and headquarters communicated electronically via Tymshare, Inc.'s Tymnet system and Telepac, Mexico's public net. But the Mexican link has been down since the quake and restoring the system could take months, he added.

Although this is not the ideal situation for communications, Breth said, the process of trading data has not been adversely slowed and business is still being conducted "pretty much as usual."

Storage Technology Corp., still in the reorganization process under Chapter 11 bankruptcy protection, announced last Thursday it will deliver its 8380 Model E dual-capacity disk drive two quarters ahead of schedule. The Louisville, Colo.-based firm said the storage device will be available at the end of the second quarter in 1986, instead of in the fourth quarter of 1986.

■

Amid the much-reported computer industry slump, transaction processing systems sales are booming. Owing largely to intense activity with automated teller services and automated factories, the transaction processing market will grow from $7 million in sales for 1984 to an estimated $12 billion-plus in 1990. **For more on transaction processing growth, see page 85.**

■

Representatives of 15 European leasing companies met late last week to determine a course of action against IBM because of alleged discriminatory marketing practices. Spokesmen for the group, called Eclat, declined to discuss details of the allegations, but they are thought to center on IBM's policy on bulk purchase discounts. The discounts, also called volume purchase agreements, are offered primarily by IBM to its largest European leasing customers and are alleged to be unfair to small users. Eclat has threatened to report the U.S. computer company to the European Trade Commission and to the Bundeskartellamt, the West German Office of Fair Trading.

Product said to tie varied units with single command set

By John Dix

QUINCY, Mass. — A product that enables micro, mini and mainframe computers to be tied together in a unified system with a single command set sounds like marketing hyperbole. But Command Technologies, Inc. claims its new architecture can do just that.

Command Technologies was cofounded in 1978 by Franco Vitaliano and Calvin Mooers to market products that melded Vitaliano's knowledge of neurology with inventions made by Mooers. Mooers' history in information processing dates back to 1945, when he worked at the U.S. Navy's labs with luminary John von Neumann on the development of a digital computer that preceded the Eniac computer built in 1946 at the University of Pennsylvania.

The first release of Command Technologies' Virtual Extended Machine (VXM) architecture, unveiled recently, includes hardware and software that enable systems based on AT&T's Unix, Microsoft Corp.'s MS-DOS and Xenix and Digital Research, Inc.'s CP/M operating systems to be interconnected, Vitaliano said in an interview with *Computerworld*. VXM handles file and transmission code conversions between these operating systems and provides the facility to create a common command set for all machines involved.

This is achieved by installing what Command Technologies calls software agents in the machines to be interconnected and creating an application to drive those agents using a hardware device called an Orchestrator. To date, Command Technologies only offers agents, which are written in C, for the Unix, MS/DOS, CP/M and Xenix operating systems.

Rolling out agents in a week

Vitaliano claims his company can roll out operating system-specific agents in a week, given access to the type of processor targeted. Written in C, these agents can be installed in any processor that supports a C compiler. Once installed, the user can create the application that provides the desired functionality. This is done with the Orchestrator.

The Orchestrator is built on a Multibus and contains a single-board computer with an Intel Corp. 80286 chip to process applications and an Intel 80186 to handle communications. It also contains from 1M to 4M bytes of random-access memory (RAM) and has three serial ports, a parallel port and an Ethernet local network controller and port.

The Orchestrator is used to create applications that drive the agents. Applications are written in the company's VXM Notation, an interpretive language tht Vitaliano describes as a powerful string processor. Applications are said to be machine independent and capable of running on any processor with an agent.

Besides performing the necessary conversions that enable different types of processors to communicate, the Orchestrator can be used to create a single command set. A terminal user on a Hewlett-Packard Co. HP 3000, for example, would be able to invoke an application on an attached Digital Equipment Corp. Microvax using the same user interface to which he is accustomed.

DEC, in fact, is one company interested in VXM. The minicomputer manufacturer is automating its factories and is looking for a system that will support control systems from various manufacturers, each of which has a different operating system and command structure, according to Piotr Chadzynski, principal software engineer with DEC's internal plant automation efforts.

VXM may provide the solution. Chadzynski said it performed well in a demonstration but that he would like to evaluate it more closely.

The technology is "clearly feasible," according to Roger Needham, a professor of computer systems with Cambridge University, England, admitting that he has no idea of how well it has been put to use by Command Technologies. "It might be too big or too slow. If you're selling flexibility and portability, these things have their price in size and performance," Needham explained. "It's not until you get down to the nitty-gritty that you know whether the price is worth paying."

An Orchestrator diskless workstation with 1M byte of RAM costs $14,900 and $17,900 with 4M bytes. Fault-tolerant versions of the same device cost $25,900 and $28,000, respectively. A Unix software agent for mini or host computers costs $15,900. Micro agents cost $495 for MS/DOS, $275 for CP/M and $995 for Xenix and Unix System V.

Command Technologies intends to release hardware agents for microcomputers that will enhance VXM by providing content addressability. This capability is based on a process Mooers patented called superimposed random coding.

This random coding technique makes it possible to characterize the contents of a 400M-byte optical disk attached to a micro by building a file, as small as 4K bytes, that is kept on the micro hardware agent. In this way, a network search can be done by polling each descriptor file, eliminating the need to check a large central directory or interrogate each node, Vitaliano said.

The Cipher

Who is Cipher?

One of the least known names in tape drives is also one of the best known names in tape drives. Cipher Data Products isn't exactly a household word. But among the top 10 OEMs, the company is known as the leading producer of streaming tape drives.

Cipher not only developed the first low-cost streaming tape drive, which eliminated the costly mechanics of earlier start-stop drives, but also the first patented auto-load tape drive.

Innovations like these are why virtually every major computer hardware manufacturer is a Cipher customer. So even if you've never heard of Cipher, you've probably used a system that had a Cipher drive integrated into it.

If you aren't aware of Cipher, you'll be hearing a lot more in the not-so-distant future. If you are familiar with Cipher, you know you can expect to see more of the kind of products that will set the pace for the industry.

How to backup faster.

The best way to get both high performance and low cost on a start-stop system is to switch to Cipher's ½-inch CacheTape.®

This plug-compatible streamer works with existing start-stop software. It costs 40% less than traditional start-stop drives, measures only 8¾" high, and stores up to 92 megabytes when operated at 3200 bpi. Because data can be transferred more quickly, operating costs are lower, too.

To learn why CacheTape is the streamer that makes sense in systems that can't stream, call 1-800-4-CIPHER, ext. 9.

Fluor Corporation chooses Cipher's 5210.

Fluor Corporation, one of the world's

Electronic privacy bill receives bipartisan support

By Mitch Betts

WASHINGTON, D.C. — The Electronic Communications Privacy Act of 1985, introduced recently by Sen. Patrick J. Leahy (D-Vt.) and Rep. Robert W. Kastenmeier (D-Wis.), has picked up additional support from key Republican lawmakers.

The legislation (S. 1667 and H.R. 3378) would make it a federal crime to intercept electronic communications, such as data communications or electronic mail, or to tamper with the computers in a data network [CW, Aug. 12].

Cosponsoring the legislation are Sen. Charles Mathias Jr. (R-Md.) and Rep. Carlos J. Moorhead (R-Calif.) who are senior Republicans on the House and Senate judiciary committees.

Because of this bipartisan support as well as help enlisted from the American Civil Liberties Union, the Electronic Mail Association and other interested parties, Sen. Leahy predicted that the legislation will be enacted by the 99th Congress.

However, the Leahy-Kastenmeier bill also competes for Congress' attention with two computer crime bills, one proposed by the U.S. Department of Justice [CW, Sept. 23] and the other sponsored by Rep. William J. Hughes (D-N.J.) [CW, June 3].

The privacy bill and the computer crime legislation overlap in their coverage of data stored in private computers. But P. Michael Nugent, Washington, D.C., counsel for Electronic Data Systems Corp., said that although the bills approach the issue from different perspectives and may proceed separately, eventually they could be joined together.

Nugent, who is chairman of the privacy committee of the Association of Data Processing Service Organizations, said he participated in the drafting of the Leahy-Kastenmeier bill and considers it "a very positive bill."

Sponsors said the legislation is needed to give data communications the same privacy protection given to the U.S. mail and telegrams. "We cannot let any American feel less confident in putting information into an electronic mail network than [he] would in putting it in an envelope and dropping it off at the post office," Leahy said.

Under federal statute

Under the federal wiretap statute, enacted in 1968, only voice communications are protected from interception. Mathias and Kastenmeier said that the lack of privacy protection may inhibit the growth of new information industries as well as erode privacy rights.

The bill would outlaw the interception of data and video communications on private networks and the unauthorized access of network computers if messages stored there are obtained or altered. It would be inconsistent to prohibit the interception of data transmissions and leave the data unprotected once it is stored in a network computer, sponsors said.

Under the bill, offenders could face penalties of up to $250,000 and one year in prison if the crime is committed for commercial gain or malicious reasons.

Also, law enforcement officials would have to get a court order to obtain electronic messages, and electronic mail services could not disclose the contents of messages without the authorization of the sender.

Files.

Number 1 in a series for MIS/DP professionals.

cipher

10101 Old Grove Road

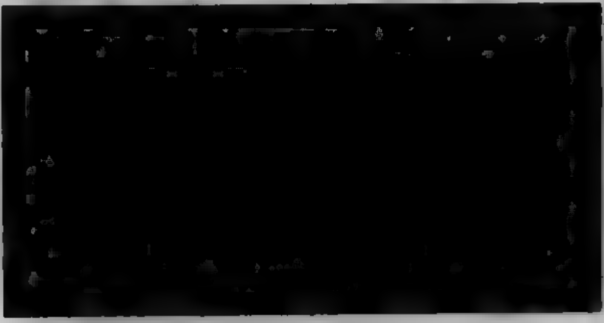
San Diego, CA 92138

largest engineering firms, now uses a Cipher 5210 ¼-Inch Tape Subsystem™ for backing up critical financial data that is processed on an IBM 3270®.

Before installing the 5210, data was extremely vulnerable to loss from operator error or equipment failure. Transferring data took hours, and used dozens of floppy disks.

With the 5210 in place, the company has transformed the backup process into a simple, 10-minute, unsupervised operation. To learn how the 5210 can increase your productivity, call 1-800-4-CIPHER, ext. 9.



Cipher introduces mainframe-to-PC connection.

If you have an IBM PC®, XT® or AT® you can now access 9-track tape. Just insert the tape into any Cipher Series 9000 ½-Inch Tape Subsystem.™ From there, you can upload and download data directly with your PC.

These subsystems act as low-cost, transportable links to large computers and tape libraries. They allow you to freely access and manipulate data, without accessing the mainframe.

Because they are tape devices, there are no expensive data communication costs, or the physical restrictions of micro-to-mainframe networking.

If you would like to access 9-track tape with your PC, call 1-800-4-CIPHER, ext. 9.

CacheTape, OCR CacheTape and PI Microstreamer are registered trademarks of Cipher Data Products, Inc. The Series 9000, 5210 Subsystem and FloppyTape are trademarks of Cipher Data Products, Inc. IBM PC, XT, AT and 3270 are registered trademarks of IBM.

Japan to create research center

By [illegible] Kondoh
Special to CW

TOKYO (CWN). — The Japanese government has approved the establishment of the nonprofit Center for Promoting Research for Basic Technologies. The center, which will be run jointly by the Ministry of International Trade and Industry (Miti) and Posts and Telecommunications, will start operation on Oct. 1.

Miti said it hopes the center will become the core of the government's efforts to promote research and development and application technologies by private industries in microelectronics, new materials and bioengineering.

According to Miti, the new organization, chaired by Federation of Economic Organizations leader Yoshihiro Inayama, will finance and extend loans to related private projects and assist firms to make use of government-run labs.

Kondoh is international editor/Asia for the CW Network.

Multimate upgrading Advantage word processing tool

By Charles Babcock

NEW YORK — Multimate International Corp. told a group of its users last week that it is enhancing its Multimate Advantage microcomputer word processing package and will soon ship hardware options.

In addition, Multimate is continuing to work on mainframe word processing software and expects to introduce a $1,800 to $2,200 package for the IBM System/36 in the first quarter of 1986. It will offer word processing to run under IBM's VM and MVS operating systems for larger mainframes later in 1986, said Bob Obuch, senior vice-president for sales with the East Hartford, Conn.-based company.

Multimate spokesmen told about 30 New York-based large-account users that the acquisition of the firm by Ashton-Tate is still on track and is expected to be completed by the end of the year. Security Exchange Commission approval must be given before the boards of the respective companies can vote to complete the deal.

Once the acquisition is completed, Multimate will examine the possibility of making files from the Ashton-Tate data base management systems — Dbase II and Dbase III — compatible with Multimate's word processing files, Obuch said. Multimate and Ashton-Tate share many corporate users, he noted.

Multimate is enhancing its top-of-the-line Advantage software by adding a thesaurus with 40,000 entries, to which a user may refer without exiting a document. In addition, the $595 Advantage package will include an option to create up to nine columns on a screen, each defined by the user, Obuch said.

Registered users will be able to upgrade to the package beginning in December for $60 if they update within two years of becoming an Advantage user, according to the vendor. Users of Multimate Executive Release 3.3 or earlier versions may update to Advantage for $80, again provided they do so within two years of becoming a Multimate user.

The software firm is now selling a $295 keyboard that makes the IBM Personal Computer more closely resemble a Wang Laboratories, Inc. dedicated word processor, spokesmen noted.

In October, Multimate also will be selling a $995 communications board and software that is said to permit document exchange between IBM Personal Computers using Multimate and Wang Office Information System, VS and Alliance word processors.

The company also will offer in October a $159 Graphlink package that reportedly allows a user to clip an illustration or graph and store it as a Multimate file.

IBM merging sales offices

By Clinton Wilder

ARMONK, N.Y. — IBM last week moved to trim its administrative costs by reorganizing its two main marketing divisions along regional lines, a move that will apparently have little effect on large customers.

Effective Jan. 1, Big Blue will eliminate its National Accounts and National Marketing divisions, replacing them with the White Plains, N.Y.-based North-Central Marketing Division and the Atlanta-based South-West Marketing Division. Sales offices will now differentiate customers by geographic locations, rather than by the size of the account.

"It's a ho-hum announcement, and our service won't change a whit because of it," said George DiNardo, senior vice-president of information management and research at Pittsburgh's Mellon Bank NA, a large IBM installation. "IBM is simply too smart an organization to do anything to change the way it handles national accounts. They will continue to serve us as they always have. It's been 15 years since I worried about an IBM reorganization."

DiNardo said the move could help IBM refocus its resources, which could have positive benefits for large users. "Combining their regional offices is long overdue," he said.

IBM officials said the move was a continuation of the company's major overhaul started in 1981, when it changed from a sales organization based on product lines to its current distinction between Fortune 100 accounts and smaller customers. That distinction still has created some overlap within regions.

The company's 25 current regional offices will be consolidated into 13, with six in the Northeast and northern Midwest and seven in the Southeast, Southwest and West Coast areas.

Frank Gens, an IBM analyst with International Data Corp., agreed with DiNardo that the change was overdue. "They have two offices in each region doing sales support and administration, one for national accounts and one for national marketing. Those will be consolidated into one."

Micropro offers net licensing, IBM conversion utility

Reports rise in profits, revenue for quarter

By Eric Bender

SAN RAFAEL, Calif. — In a move demonstrating increased attention to corporate users, Micropro International Corp. last week joined the ranks of vendors offering local-area network licensing and IBM Document Content Architecture (DCA) conversion capabilities for microcomputer word processing software products.

The network license program, available immediately, supports the IBM PC Network, 3Com Corp. Etherseries networks and Novell, Inc. Netware networks. It permits users who buy the standard Wordstar 2000 or Wordstar 2000 Plus packages to buy additional licenses at a lower price. A minimum of three licenses must be purchased, at a cost of $225 per workstation on nets with nine or fewer workstations and $195 per workstation for larger configurations.

Micropro President H. Glen Haney told *Computerworld* that it makes sense to offer pricing discounts for network software and said he expects that the new licensing scheme will reduce unauthorized copying of the package, which is not copy protected.

Micropro designed Wordstar 2000 to support basic network features such as resource sharing so a network-specific version is not required, said Bill Crowell, vice-president for development. The network license includes an installation guide for the selected network, and user documentation can be ordered at $30 for Wordstar 2000 and $35 for Wordstar 2000 Plus.

The DCA conversion utility, offered for all Micropro word processing packages, will aid users in transferring documents to and from IBM mainframes. "We've gotten a lot of feedback from corporate customers that they will require this capability," Crowell said.

Available by year end, the utility will provide bidirectional, revisable-form DCA capabilities. Pricing has not been set but will be less than $50, Haney said.

Unlike some of its competitors, Micropro has no intention of porting its word processing software to larger IBM systems, he added. For word processing, "the cost and performance of delivery on a personal computer are unbeatable," he maintained.

"Rather than develop products for large or mid-size mainframes, we are devoting our efforts to increasing functionality and interconnectivity," Haney declared. The network licensing, DCA product and forthcoming site licensing program "are all aimed at strengthening that," he said.

Upturn in revenue, profits

Separately, Haney noted that following five quarters of declining revenue and losses, Micropro has had "two quarters of upturn in revenue and a return of profitability."

The firm last week reported profits of $1.2 million on revenue of $10.7 million for the fourth quarter, ended Aug. 31. In the same quarter last year Micropro lost $756,000 on sales of $12.4 million.

For the year just ended, the company posted a profit of $207,000 on revenue of $42.6 million, compared with a year-earlier profit of $5.7 million on revenue of $66.9 million.

Haney denied industry rumors that Micropro has been searching for a buyer, saying instead that the firm is examining opportunities to acquire other firms in related markets.

He acknowledged that the overall micro software market "has not yet regained its equilibrium of sustained growth" but predicted significant industry growth this year. However, Haney also forecast a shakeout among word processing software suppliers. "We've counted over 200 companies, which is clearly an outrageous number," he remarked.

Ouch!

If you bought a computer system with a Unix™ operating system for business data processing, this is going to hurt. Nothing will serve your business needs better than the Ultimate™ operating system.

Sure, Unix is fine for scientific applications. After all, it was designed to serve scientific researchers—a technically sophisticated group of people. But the Ultimate operating system was designed specifically for business data processing. It's not only far easier to use—it's the most powerful tool your business can have.

But don't take our word for it. We invite you to take your business application and benchmark us against Unix or any other operating system. Odds are, we'll win every time. And for ease of use, flexibility, speed and efficiency, we always come out on top.

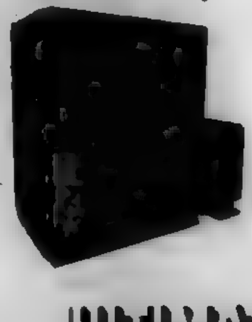
If that doesn't hurt enough, consider: this operating system is already in use on computers manufactured by 19 of the leading companies including IBM and DEC. Over 30,000 have been installed worldwide. And satisfaction levels are overwhelming.

Only the Ultimate operating system is implemented beyond the software—right in the hardware—to provide unmatched speed, efficiency and power. It conserves computer space and resources. It puts all the information you need for creative problem solving and decision making right at your fingertips.

Based on everyday English words and phrases, its proprietary language is a breeze for the beginner as well as the expert programmer. Its dictionary file system makes information instantly available and gives you exceptional flexibility in report writing. Unlike other systems where the reports in the system are the only reports you get, Ultimate lets you quickly design your own reports, assembling information into the form most useable for you.

The Ultimate Corp.'s powerful operating system and hardware easily meet the demands of complex applications involving timesharing, transaction processing and data base management—all running simultaneously. And, to add to your Unix pain, the Ultimate system is easily expandable, cost-effectively evolving with your changes and growth.

For those of you who just bought a Unix-based system for your business—our condolences. For those of you who have been considering it—it's not too late! Call us today at (201) 887-9222, ext. 324, and avoid the pain.



ULTIMATE

What Jobs hath wrought

When Steve Jobs and Steve Wozniak first holed up in a Silicon Valley garage in the mid-1970s to begin shuffling the components of what was to become the Apple microcomputer, they were launching an era that was to change the lives and work styles of computer professionals. A part of that era formally ended this month with Jobs' departure from Apple, and we would be remiss in not marking its passing.

The vision Jobs and Wozniak acted upon was one that foresaw computing power taken from the few and given to the many. The operative word here is *taken*. Theirs was not a gentle vision nor was its realization in corporate America a gentle process. Hundreds of corporations and thousands of careers had been snugly constructed upon the concept of centralized processing, and the notion of *personal* computing did not mesh well with this concept.

But Jobs and Wozniak had reaped a high-tech whirlwind. As with most great entrepreneurial success stories, Apple's growth was immeasurably aided by a confluence of factors far beyond the powers of its founders. In a 180-degree turn from the previous decade, the U.S. in the 1970s was becoming a business culture. Real estate, the saying went, was the marijuana of the '70s. Venture capitalists were the new American heroes. Business schools were standing room only, and *The Wall Street Journal* added a second section.

The phenomenon was fed by goal-oriented young tyros who quickly perceived the value of the personal computer in tapping data and data processing power previously accessible to only a select few. The Apple II gave them a competitive edge — a big competitive edge — and a machine originally thought to have modest potential in the home and education markets was suddenly an enormous hit among business customers. By the time the rest of the computer industry caught up, Apple was a Fortune 500 company, and Jobs and Wozniak were legends.

One problem with entrepreneurial legends is that they frequently do not fit in well with the day-to-day reality of corporate management. Here, Jobs was Exhibit 1A. Not only was Apple's internal management excessively cavalier and casual, but also externally Jobs failed to effect the kinds of external commercial liaisons with other market forces, specifically IBM, that would have broadened Apple's consumer base and product appeal. Other young computer entrepreneurs did do this, specifically William Gates of Microsoft Corp., and are prospering.

Regrettable though this turn of fate may be for Jobs, it should not dim the value and importance of the achievement to which he contributed: The redistribution of computing power sparked by the success of microcomputers, led by Apple, has changed the way that businesses gather and use their data.

Notes & observations

IBM reorganized its largest marketing divisions last week so that now each field office will be able to sell a completely integrated IBM product line. Good. We're all in favor of integration. Come to think of it, we think it would be a nice idea if IBM now got about the business of integrating its operating system architectures.

DON'T WORRY, THIS'LL JUST STIMULATE COMPETITION.

LETTERS TO THE EDITOR

Cost overrated, flexibility overlooked in making presentation graphics choices

The article, "Graphics users prefer transparencies to slides" [CW, Aug. 19], rightly focused on the preference for overheads over 35mm slides but left the erroneous impression that cost was the major factor in this selection.

As a consultant involved in generating both proposal materials and training courseware, I generate as many as 1,000 individual presentation pieces in a given year. I use a personal computer for most of this and combine word processing, spreadsheets, graphics and a data base in my efforts.

The main reasons that I prefer overheads are that they give me a much better delivery environment, and they allow me the flexibility of assembling a presentation from existing materials quickly and efficiently because I have the masters for my overheads stored and indexed in the computer. Also, I can make quick changes after a client walk-through or pilot run.

Finally, the article, in focusing on the cost issue, makes the characteristic mistake of looking at initial cost only. If one totals the cost in compromising the quality of a presentation by use of a basically unfriendly medium, 35mm, and one takes advantage of the truly friendly personal computer-oriented tools now easily available, the decision to use overheads becomes not one of accounting costs but of measuring effective impact for each dollar spent.

Computers in the workplace increase professionals' capabilities, efficiency

The In Depth article "White-collar computing: the professional as an artist" [CW, Sept. 2] calls for a reply. I have never read an article that contained so many assertions with which I disagreed.

First, computers effect more than two changes in the workplace. A significant effect that was not mentioned is that they open up new types of work that were not economically feasible on a manual basis. An increase in productivity is not merely a matter of doing the same thing faster. We also do it better through extended capabilities.

Second, although there may be a fascination with direct control of the computer at first, it is efficiency that keeps up usage. People will not use equipment that complicates their tasks. It is easier to develop a report with a good word processor than to write it on a pad.

It is also more efficient to complete a task when the professional's mind is on the subject than to get involved in proofreading and review of output after going on to other projects. Loss of accuracy from proofreading is offset by spelling checkers.

A third fallacy is the picture of "grammarless professionals" turning over control of their output to secretaries and the like. Most professionals have a strong interest in, and are held responsible for, the appearance of their reports.

The article overestimated the importance of documents in professional life. It is true that the appearance of reports is important in communicating the results of a professional's work. However, it is usually a small part of the total task.

Magnetic media security systems based on realistic probabilities, not theories

The article " 'Erased' tapes present potential security threat" [CW, Sept. 16] is quite accurate and informative. Unless it is completely read and understood, however, it could lead to the misconception that all used computer tapes and magnetic media should be degaussed and overwritten before disposition is made.

The U.S. Department of Defense has recognized the problem for many years and has required degaussing and overwriting of magnetic media containing sensitive data. Nevertheless, security programs must be built realistically on vulnerabilities and probabilities not on scientific theories.

The risk factor of retrieving data from an erased tape is quite low. Therefore, except for ultrasensitive data that would support the use of sophisticated technical equipment and valuable time of professionals in an attempt to retrieve information from an erased tape, degaussing and overwriting erased tapes would not be cost justifiable.

The expense of such a project would be better allocated to more practical security projects.

Pushing the limits of outmoded systems

THE DATA CENTER
John P. Murray

What is the average life of an application system? Is it six years, eight years, 10 years? The answer will vary from installation to installation, depending on several factors.

The original quality of the system obviously has a great deal to do with its longevity; good design and good code will last longer than poorly done work. The technology used also has an important bearing upon the length of time the system can be considered productive. The pace at which business functions change may have the most profound impact upon the ultimate life cycle of the particular system.

Some systems never get on-line, even after considerable time, expense and agony. Some do become operational but after a very short time are found to be ineffective and are eventually replaced. Conversely, there are systems 15 or more years old that are still serving organizations today.

The life cycles of systems are likely to become shorter as a result of two phenomena. The rapid advancement of information processing technology makes for vastly improved methods of meeting the needs of the organization. Not taking advantage of them is poor business judgment. Plus, partly as a consequence of the use of new technology, business operations are changing more rapidly than ever before.

New approaches allow greater flexibility and provide for the adoption of different methods. These methods can be used to address various business functions, which can in turn lead to expansion and growth for the organization. The resulting systems that may have been effective for a number of years and still operate correctly simply are no longer viable, given the changing competitive environment. So, although the practical life cycle of the system has not yet been exceeded, the pragmatic life cycle has.

This has serious consequences for information processing management, whose primary responsibility must be to help the organization stay at least reasonably current with the latest technology of information processing. Too often, managers become so engrossed with day-to-day operations that little, if any, thought is given to long-range issues.

Hands-on management style

Such a situation is often the mark of a hands-on management style — the apparent need to become involved in all the details of the function. Those with middle-level management responsibilities within the department are not allowed to act on their own, and all decisions are made by the senior manager. Usually such management is the result of insecurity on the part of the person in charge. No one is trusted because they may make mistakes, therefore, the senior manager must be involved in everything.

Given that particular management style, there is usually considerable comfort with the status quo. Although it may tend to prolong the life cycle of applications systems, in the long run, it is not in the best interests of the organization. In some organizations, it is considered an achievement to point to systems that have been in operation for considerable periods of time.

Who can say how much damage has been rendered to the organization because of continued forced reliance on these outmoded systems? Investigation probably would uncover a number of instances where requests for change or modification to the system have been denied as technically impractical because of the obsolescence of the technology.

Inadequacy to support actual needs

The real problem with the continuing use of old systems, even if they do operate reasonably well, is that they are probably increasingly inadequate to support the actual needs of the organization. This becomes not only an issue of technology but also of how that technology will be applied to help the organization move ahead.

Consider the current turmoil in the financial industry, particularly in banking and insurance. Not only is competition increasing, but changes in regulations and the manner in which these businesses operate mean that systems life cycles will be shortened considerably.

As business requirements expand, organizations find that information processing systems currently in place are inadequate. The information processing department must be sure that the organization's applications systems portfolio is not allowed to become obsolete. If appropriate attention is not devoted to the issue, the buildup of a large number of old systems presents a considerable risk to the organization.

The expense associated with the renovation of these systems is one serious problem. The negative impact on both the current business and new opportunities because of system inflexibility is yet another. Information processing departments must monitor the life cycles of their applications systems and take steps to replace the old ones within their organization.

Murray is director of management and information services for American Breeders Service, a DeForest, Wis., division of W. R. Grace & Co. and is the author of Management Information Systems as a Corporate Resource.

High-tech semantics mire microcomputer potential

READER'S PLATFORM
Jon R. David

Microcomputers, more properly their individual, group and corporate users, have been the subject of much bad-mouthing of late, and this strong criticism is frequently coming from learned sources. What have these marvels of technology done to engender such negative feelings? Very little, as their critics say, and that's the problem.

Individual microcomputer systems are often very powerful, capable of all those wonderful things associated with the mighty mini that captured the computer users' imagination only a few years ago. In addition, they can frequently support multiple users or at least the concurrent operation of multiple tasks.

They can work with other microcomputer systems in local networks providing capabilities beyond those offered in the original minis and have access to data bases with virtually every piece of information one could want. The problem, according to critics, is that they're neither viewed nor used in keeping with their potential.

Most microcomputers are used in stand-alone mode only, and they never access available data bases, couple with mainframes or participate in local networks. A great waste.

Furthermore, most micros are used infrequently, only on an as-needed basis, thereby adding more wasted potential. Microcomputer maligners tell of systems used only to get out a few letters or reports, to perform calendar functions or to respond to a few daily inquiries. Some say that certain people use them to play video games; let's hope we haven't sunk so low.

Let's look at these critics for a moment. Many, if not most, are in offices with extra chairs, have typewriters that aren't used a full eight hours per day and have telephones they frequently are not using. They frequently have telex or similar equipment that can go days without use. Those that use public transportation may even own cars just to take them to trains or buses. All that wasted potential and they pick on poor microcomputers. Why?

It's a problem of semantics. People don't go out to buy a microcomputer, they go out to buy a personal computer, a professional computer, a home computer or some other such name of a microcomputer. These devices are viewed as workstations in a business environment, and a workstation should be doing work; if it doesn't, something is wrong.

Minicomputers didn't have this problem when they first invaded the business community. They had previously been known as dedicated application computers before the press bestowed the mini label on them. People were used to minis being dedicated to single tasks that could cost-justify them. Even though today's microcomputer costs at least less than the minicomputer of a dozen years ago, the workstation designation seems to make us forget such things as cost-justification and convenience.

Humor is based on truth, and this truth is that names lead you to expect things. In this case, workstations mean work. They're so inexpensive that almost any application can cost-justify them, but their name makes otherwise reasonable people expect more than is necessary of them. The solution is obvious: change the name.

Renaming workstations as play stations

Workstations of all types should now and forever be known as play stations. Sure, it doesn't sound professional, but who cares? Wouldn't you rather get paid for using a play station than a workstation? How bad would it be if a tense employee played a video game on a play station? And, what employer or computer critic could complain about play stations being underused?

Workers, from clerks to executives, frequently have dolls, ornaments or games at their desks, sometimes even on top of their workstations. Work environments are not all somber. What would be better received by one and all than play stations?

Although many people may now resent the use of workstations, play stations would be welcome and would probably encourage users to learn more thoroughly how to use them. The use of play stations might even get some of the hackers into a business environment, and what company couldn't use the rare skills exhibited by hackers?

I don't disagree with those who point out that the vast majority of workstations are not being used anywhere near their potential. I must, however, point out that the majority of microcomputer users can cost-justify their systems. Continued criticism of all but utopian utilization makes potential users leery of becoming actual users, lest they become the focus of both internal and external critics.

The renaming of workstations to play stations should eliminate the fear of criticism, and, if they are ever used for more than the applications that cost-justified them, it would be an added bonus.

Vendors attempt to diagnose trade show debilities

By Jeffry Beeler

WEST COAST UPDATE

SAN FRANCISCO — Once again, vendors galore are working themselves into a tizzy over the alleged poor quality of many of the industry's largest and best known trade shows. In particular, the companies are fuming about the perceived inability of many trade show product exhibits to generate enough solid sales leads to justify their whopping costs.

And once again, the people who are bearing the brunt of the exhibitors' wrath are the conference organizers, who are often chastised for failing to make their gatherings sufficiently attractive to the right kind of visitors. The complaint that sponsors are ineffective in qualifying their trade show attendees is certainly nothing new.

Recently, however, the vendor griping has grown to unprecedented proportions. The reasons for the rising chorus of discontent are at least twofold. First, exhibitors are becoming increasingly sophisticated in trade show evaluation and thus are more conscious than ever of the events' shortcomings, according to Joyce McKee, senior consultant with B. R. Blackmarr & Associates, Inc., a Dallas-based consulting firm.

Second, the mushrooming price tag of trade show exhibitions has greatly increased the pressure on vendors to show a reasonable return on their investment. Just one exhibit nowadays can cost its owner up to $500,000 in booth space rental, travel expenses and other overhead items, according to Brian Blackmarr, the consulting company's founder.

Whatever the reasons for their collective dissatisfaction, a group of highly prominent vendors joined forces last November to figure out why their recent trade show experiences had been so disappointing and to devise some possible remedies. In their efforts, they received considerable support from Blackmarr and his colleagues.

Conducted research

"They [the companies] asked us to conduct research to determine what corporate decision makers want to see at a trade show and how the shows can be changed to encourage those people to attend," Blackmarr said.

During the 10 months that have passed since they first pooled their resources, the participating vendors have met repeatedly with Blackmarr's staff to review their latest research findings and discuss future directions for investigation. The first of the meetings coincided with the Office Automation Conference, which took place in February. Since then, the group members have gathered three other times, the latest of which came in July at the close of the National Computer Conference (NCC) in Chicago.

Additional meetings will almost certainly follow soon. But in the meantime, participants and interested bystanders continue to discuss the trade show issue casually at nearly every opportunity, one of the most recent of which came in San Francisco during the Information Technology Conference and Exposition (Intech).

"Our intent in conducting the research is to work hand in hand with the various organizers to compile the first accurate statistics about exactly who attends trade shows," McKee said during an Intech interview. "We're definitely not trying to use our study results to threaten the organizers in any way."

Although Blackmarr's research is still a long way from completion, it has already shed light on the important question of what motivates exhibitors to attend trade shows in the first place. The answer apparently has to do with peer pressure. "Companies figure that if IBM is exhibiting at a conference, they have an obligation to be there, too," Blackmarr said.

But the work also has profound implications for trade show organizers, who will have to redefine fundamentally their roles if they want their events to continue prospering indefinitely, Blackmarr said.

Sponsors of large, established industry gatherings like NCC need to increase their emphasis on practical education and improve the degree of integration between the events' product exhibits and their conference programs. "For those who attend them, big horizontal shows should become the equivalent of a mini degree in how to use high technology," Blackmarr said. "If NCC and other large established events don't make themselves more educational, they may eventually be replaced by smaller, more vertical shows," he warned.

Trade show organizers should also take an increasingly active role in advising exhibitors on how to attract qualified prospects and thus maximize their exhibition payoff, according to Robert Harar, president of National Trade Productions, Inc., Intech's sponsor.

But by no stretch of the imagination does the burden for optimizing trade show results fall entirely on the organizers. Exhibitors, too, need to accept a certain amount of responsibility for their own trade show fate. In particular, vendors have to improve their efforts at "boothmanship," self-promotion and sales-lead followup, Harar said.

One vendor that has particularly distinguished itself at both self-promotion and followup is Digital Equipment Corp., he added.

Global, NAS ink OEM pact

BOULDER, Colo. — Global-Ultimacc Systems, Inc. announced last week that it has reached an agreement to market IBM 4300-compatible processors that are manufactured by Hitachi Ltd.

Global-Ultimacc's OEM agreement was signed with National Advanced Systems Corp., the subsidiary of National Semiconductor Corp. that markets Hitachi systems in the U.S.

Announcement of the agreement came on the heels of Global-Ultimacc's divorce from troubled Storage Technology Corp. [CW, Sept. 23], which had owned almost 60% of the Boulder-based company.

The company will market the processors as more powerful models in its 50 series of 4300-compatible processors.

HANDS-ON TRAINING THAT ISN'T SECONDHAND

When you learn the UNIX™ System directly from AT&T, you learn it firsthand—from the people who develop it.

For over fifteen years, we've been teaching our people to use the UNIX System—which makes us the best trained to help you learn.

Whether you're a first-time user or a system developer, you'll get hands-on experience with courses that keep you up to date on the latest information. At AT&T Information Systems, you get your own terminal, teachers that can stay late at night, and *your* choice of training centers. Or center your training right around your own office.

So take your training from AT&T. And discover the power of UNIX System V—right from the source. **Call us today to reserve your seat or for a free catalog.**

How [illegible] finds [illegible] world.

INQUIRE®/Text:

Helps you find what's buried in your database.

No matter what new worlds you're trying to discover, you'll get there more easily if your software includes text management as well as the ability to combine numeric and textual data. Because as often as not, the information you need consists not of numbers, but of a few key phrases buried inside a mountain of written documents.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, the solution is easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a major discovery for most users—and a significant breakthrough in decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data, then output into up-to-date, integrated management reports.

No wonder INQUIRE/Text users include people on the frontiers of scientific exploration—not to mention lawyers, records managers, engineers, and librarians.

INFODATA®

And no wonder more and more organizations are seeing text management as an indispensable element in information systems design, especially considering IBM's directions regarding DISOSS and PROFS.

INQUIRE/Text. It'll broaden your horizons. And just possibly help you conquer a new world.

Sortland Yard warns against "Rafles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

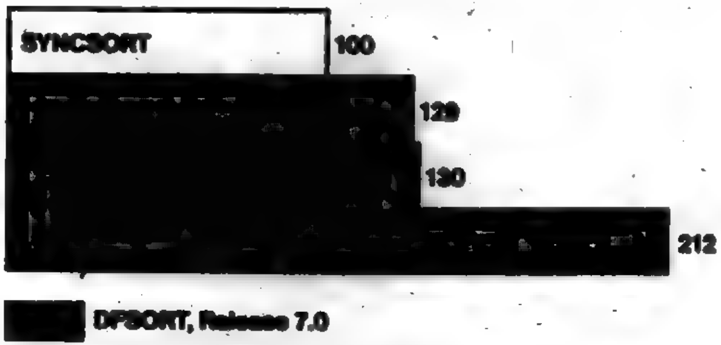
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied, "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

Ease-of-use issue stalls links' growth

Current tools inadequate for users' needs: speaker

By John Desmond

DALLAS — Micro-mainframe links may be a hot button in the industry, but the products so far fail to deliver on the ease-of-use promise that will make them practical for nontechnical end users.

So said two users at a session titled "The Micro-Mainframe Link" at the recent Software/Expo conference. The users, one from a Chicago hospital and the other from a New York-based advertising agency, described their continuing — often frustrating — efforts to implement micro-mainframe products as mainstream DP tools.

John C. Wade, director of information systems at Northwestern Memorial Hospital in Chicago, said, "I don't believe the products are in place today to allow a micro user to participate in an expanded network. I need something today that is easy and efficient for them to use. I am concerned that the end user cannot access that information without learning my business, which is DP."

Northwestern Memorial Hospital, which had $315 million in revenue last year, needs the micro-mainframe link to help keep treatment costs in line with federal reimbursement guidelines, Wade said. The hospital has recently been expanding its information systems and now has a DP budget of $8 million with 600 IBM 3270-type devices linked on-line to its mainframes. A total of 140 micros are installed in 67 departments. Wade characterized Northwestern as an information systems leader in the health care industry, which he said has lagged behind many other industries in exploiting high technology.

One-third of the hospital's planned information system growth will be in support of the micro-mainframe environment, Wade said. At present, four micro-mainframe pilot projects are ongoing, in the financial applications of budgeting and reimbursement diagnostics and in patient care applications of patient records and records evaluation, Wade said.

"The federal goverment reimburses hospitals by diagnosis today," Wade explained, noting there are 467 medical diagnosis categories. "A main reason we're anxious to support a micro-mainframe link

IBM adds planning module for manufacturing package

Among a series of software product announcements for manufacturing, engineering and office users, IBM recently announced the Capacity Requirements Planning (CRP) module for its Copics manufacturing software running in DOS/VSE and OS/VS environments.

CRP takes the materials plan produced by a Copics module and schedules it against available manufacturing resources, a spokesman said. The program calculates the expected load on each resource. Load profiles are produced for selected work centers to identify potentially overloaded areas.

The CRP module is meant to assist production planners in producing a balanced materials and capacity plan. CRP is priced at $18,000, a one-time charge, and is scheduled for fourth-quarter availability.

Other announcements include the following:

■ Release 1.2 of the Engineering/Scientific Support System (E/SS). A total of 14 programs have been replaced in Release 1.2 with either enhanced or new programs. E/SS is said to reduce the complexity of selecting, installing, administering and maintaining systems and applications software for engineering, scientific, business, office and data base applications. The program runs in VM/CMS environments.

E/SS offers users pretested configurations for IBM 4300 systems, including IBM 3370 and 3380 disk drives. The product is also said to simplify installation procedures and program maintenance.

Among the updated programs in E/SS are ISPF Version 2, Release 1 and ISPF/PPF Version 2, Release 1. Prices for all programs remain the same. The one-time charge for E/SS Productivity Facility, which provides dialogues and examples to assist users with E/SS facilities, is $2,000.

■ Release 2 of the APL2 language, which is said to provide DP profes-

Oracle announces portable version of IBM SQL/DS and DB2

Any application written for IBM's SQL/DS or DB2 relational database management systems will now run without modification on DEC, DG, AT&T, HP and several other manufacturers' minis, and a wide range of micros, including the IBM PC/XT and PC/AT.

Oracle Corporation introduced the first relational DBMS in 1979. Today ORACLE is the only relational database management system that is completely compatible with IBM's SQL/DS and DB2. Programs written for SQL/DS or DB2 will run unmodified on ORACLE.

Originally designed for IBM mainframes and DEC superminis, ORACLE is now available on a wide range of machines, from mainframes to PCs. And ORACLE includes an integrated set of 4th generation software tools not available with either SQL/DS or DB2.

■ Why not Cullinet, ADR or Focus? There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. Both ANSI and the US Government are in the process of adopting SQL as *the* standard database language. The Cullinet, ADR and FOCUS software packages each implement their own unique database language - each one painting the user into its own corner. Since its inception, Oracle Corporation has provided total IBM SQL compatibility.

Few shops nowadays run only IBM mainframes. Why, then, even consider a database solution that runs *only on IBM mainframes?* Applications written with ORACLE run identically on mainframes, minis, and PCs. Because all versions of ORACLE *are* identical.

FOCUS, Cullinet and ADR offer either a limited subset, a completely different product or nothing at all (respectively) for the PC. And none have minicomputer products.

■ Why not just go with DB2 or SQL/DS? A relational DBMS simplifies but does not by itself eliminate application programming. Additional tools are necessary if users are to create and maintain their own applications.

DB2 and SQL/DS are relational systems, period. ORACLE is a relational DBMS plus integrated 4th generation software tools for application generation, report writing, color graphics and network communications.

Furthermore, SQL/DS and DB2 run only on IBM mainframes (and are somewhat unlikely ever to run on another vendor's system). ORACLE runs on more IBM hardware and operating systems than do IBM's relational products.

■ What about Goldengate, dBase III, Symphony or Framework? PCs need more than PC software if they are to be usefully integrated with corporate data processing. Incompatibility with SQL, while serious, is not the only major problem with these micro packages. None provides an acceptable level of data security, integrity or recovery facilities. And their PC-to-mainframe links are functionally primitive and difficult to use.

To effectively link computers, all machines in the network should run the same software. Only ORACLE provides standard software on mainframes, minis and micros. Data and programs can then be shared among users of different machines, distributing the workload.

ORACLE is currently installed on over 1000 mainframe and supermini systems around the world, as well as on thousands of PCs. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and government agencies.

For further information, contact Oracle Corp., Dept. C2, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

Decision scenarios ensure info system meets business needs

SOFTLINE
Robert H. Reck

Communication between builders of management information and the managers they intend to serve is usually good. Thus, the systems built for the managers are always successful in meeting the managers' real business needs for information. Right? Wrong.

Experience at many firms indicates a number of problems in this communications link and, subsequently, in the usefulness of the resulting system. These problems fall on both sides of the systems/managerial fence.

Often, the manager abrogates the responsibility for building a meaningful system. The staff is supposed to be psychic in determining what the boss needs to know and providing it — no more and certainly no less.

However, overzealous information systems builders can drive business executives into a data-rich, information-poor situation, which is increasingly characteristic of many of today's businesses, by adding to the system data elements that may not be needed.

What can be done to improve the communication of management support needs and the delivery of the action-oriented systems a business can actually use?

Use decision scenarios

One answer, proven in many experiences, is the use of decision scenarios.

A decision scenario, as its name suggests, is the description of a particular business problem for which appropriate decisions must be made.

The business problem for a scenario is chosen by the business area manager during an interview with the company's systems analyst-builder.

Then the analyst-builder outlines and refines the decision scenario, a hypothetical situation rooted in the manager's functional area and tied to the part of the business that needs support.

The information that could help manage the particular business problem is postulated by both the manager and the analyst-builder, resulting in the development of management support systems that are effective and created with low risk.

A dynamic approach

This dynamic approach to management support systems development is in contrast to traditional, static approaches that develop a snapshot of the business situation merely through a functional specification. The decision scenario unfolds over a period of two weeks or months through careful, two-way communication between the developer and the "owner," or system user.

A decision scenario should not be confused with a critical success factor analysis or a prototype. A decision scenario is to be used as a link between the identified critical success factors and the actual prototype stage.

Recently, the decision scenario process was used at a major manufacturing company. The company determined that one of the major critical success factors requiring information support involved the timely purchase of raw materials. The vice-president of purchasing, identified as the owner of this critical business area, worked closely with the systems analyst-builder to create a hypothetical situation that would help identify what type of information and information systems were needed to manage this critical business area.

In their first meeting, the vice-president and the analyst-builder discussed the business of purchasing as it affected the manufacturing company. The vice-president of purchasing was highly skeptical that information technology could help him manage his responsibilities. He had always used manual techniques and maintained manual records in which he had a high degree of confidence. The analyst-builder assured him that the information and techniques he needed to manage his business would be developed independently of any technology considerations.

In the series of interviews that followed, they were able to construct the decision scenario by postulating a purchasing structure that included a listing of raw materials and their suppliers, projected inventory volumes, safety stocks for key customers, sales forecasts and actual volumes and costs.

Over the next few months, during each successive interview, more information was added to the scenario. Its complexity was steadily increased to reflect the full

ANNOUNCING THE FIRST BUSINESS MODELING SYSTEM WITH ARTIFICIAL INTELLIGENCE

INGOT is the first DSS which simulates decision making of a chief financial officer to minimize capital costs. INGOT takes into account daily financial events, corporate policies, interest rates, and your business forecasts. INGOT's CASHMOD command makes simultaneous equations obsolete.

Other standard capabilities in INGOT give you more for your DSS dollar, including:

- PERT project management with automatic calendaring.
- Times series forecasting and advanced statistical methods.
- Flexible graphics for floor plans, maps and diagrams.
- Data entry with automatic validation and user defined HELP files.
- Optimization with linear and integer programming.
- Built-in financial and manufacturing models as commands.
- 100% of reference manual on-line for easy use.

INGOT runs on IBM MVS/TSO, DEC VAX, Prime, Tandem, DG AOS/VS, Apollo, CDC/NOS-VE, HP 9000, Honeywell GCOS, and most UNIX systems. Ask us about any others.

Get the Facts. Call **800-323-7820** or in Illinois 312-869-5556.

Version 1.01 of Mobius integration system debuts

Allows transparent access to DEC hosts

Fel Computing in East Dover, Vt., has released Version 1.01 of Mobius, a microcomputer-to-mainframe integration system said to give IBM PC-DOS, Microsoft Corp. MS-DOS and Digital Research, Inc. CP/M users transparent access to the resources of Digital Equipment Corp. Decsystem-10, Decsystem-20 and VAX hosts.

Version 1.01 provides VT100 emulation for the DEC Rainbow, IBM Personal Computer and Personal Computer XT.

The VT100 emulator is compatible with such programs as DEC's All-In-One, EDT and TDMS on the VAX; DEC's Traffic-20 and Scope on the Decsystem-20; and similar programs on the Decsystem-10, according to Fel Computing.

The enhanced Mobius is said to generate all VT100 keyboard characters and escape sequences, including those produced by the keypad. VT100 line drawing, arrow keys, LED indicators and video attributes — reverse video, underline, bold and blinking characters — are also implemented, the vendor said.

Mobius also offers an Advanced Programmer's Interface that reportedly enables programs to access functions previously available only to users at the keyboard.

Pricing depends on the number of microcomputers supported. For example, the host Mobius program costs $5,000 for 10 simultaneous users.

Micro Mobius, the micro portion of Mobius, costs $250 in quantities of one to 19, the vendor said.

MARTIN MARIETTA

Looking for an information center system that handles just about anything they throw at you?

Trying to juggle end user demands without losing control?

Then you need Martin Marietta's RAMIS® II, the first information center system that's as good to you as it is to your end users.

RAMIS II is a comprehensive, integrated system. It enables your end users to develop everything from simple reports to complete personal applications without having to transfer data from one product to another. And it generates reports directly from VSAM, DB2 or almost any other file.

RAMIS II is the only product designed to support every level of user expertise. It offers a choice of a non-procedural language, easy-to-use menus and Artificial-Intelligence-based natural language processors for French or English.

What's more, with RAMIS II on the PC, you gain a stand-alone workstation or a seamless extension of your mainframe.

Now you can make end user computing effective in your company at last. With RAMIS II, another of Martin Marietta's Natural Selection® products: an interrelated family of products that work with an extraordinary variety of machines, environments, applications needs and degree of user sophistication.

If you thought you'd never find a way to balance your needs with those of your end users, you're in for a nice surprise.

It's ready now.

DPS 6 packages launched

Honeywell, Inc. of Waltham, Mass., has announced three programmer productivity packages for use with its DPS 6 small computer family under the Gcos 6 Mod 400 Release 3.1 operating system.

The packages are the Pro-IV fourth-generation application generator from Pro Computer Sciences, Inc., the System-80 Cobol program generator from Phoenix Systems, Inc. and a release of the Info data manager and fourth-generation language from Henco Software, Inc.

Pro-IV applications are developed on-line using menus, screens, on-line Help messages and system security and logic operations.

System-80 is a productivity tool that generates Ansi-74 Cobol programs through the use of data dictionaries and program generators controlled with menus, prompts, attribute screens and tutorials.

Info is a data file management system and fourth-generation language providing data entry, update and query language, along with report writing. Release 9.2 of Info boosts performance 30%, a spokesman said.

The Pro-IV development and execution systems cost up to $8,800. The System-80 initial license fee starts at $5,225. The Info Release 9.2 initial license fees start at $6,800. Info Release 9.2 requires the Gcos 6 Mod 400 Sort/Merge Utility, which costs $135 annually.

AT&T unwraps applications packages for 3B series

By Charles Babcock

MORRISTOWN, N.J. — AT&T Information Systems has introduced 13 applications programs for its 3B computer line, including an integrated office automation package, Prevail.

AT&T developed four of the packages and will market the remaining nine, which were developed by independent vendors. AT&T has certified each package will run under its Unix System V.

Prevail combines spreadsheet, word processing, data base management and communications functions into one program, company officials said. Developed by Inspiration Systems, Inc., it sells for $3,600 on the 3B2 and $7,200 on the 3B5.

The AT&T word processing product, Writers Workbench, has been issued in Collegiate and Professional editions. The $1,500 Collegiate edition runs on the 3B2 and will serve up to 12 users. The Professional edition sells for $795 on the 3B2 and $1,195 on the 3B5, AT&T said.

AT&T has developed a package for service businesses, called AT&T Service Solutions, to handle scheduling, dispatching, service requests, inventory and client billing. It retails for $40,000 to $60,000, spokesmen said. AT&T Dental Solution, a package of scheduling, billing and accounts receivable software developed by Wallaby Software of Ramsey, N.J., runs on the 3B2 and retails for $4,995, spokesmen said.

AT&T Time and Attendance is a time-keeping system for up to 40,000 employees and 500 clocks. It runs on the 3B5 for multiple locations and retails for $25,000. The Unify data base management system from Unify Corp. in Morristown, N.J., retails for $1,995 on the 3B2 and $4,900 on the 3B5, AT&T said.

Unibol is a commercial programming language compatible with Digital Equipment Corp.'s Dibol developed by Software Ireland. The compiler will retail for $2,400 on the 3B2 and $3,600 on the 3B5. Run-Time will retail for $1,200 on the 3B2 and $1,800 on the 3B5. M/ET, developed by Microfocus Ltd., is a Unix-based version of Cobol 74 for application programming. It comes in four modules priced between $400 and $2,000 for the 3B2 and $1,200 to $5,500 for the 3B5.

Visual Menu, developed by Cosi, is a system for visual construction of Unix systems. Its Development System retails for $1,495 on the 3B2 and $2,745 on the 3B5. Run-Time retails for $195 on the 3B2 and $995 on the 3B5. Supercalc3, developed by Sorcim/IUS Micro Software, a spreadsheet and data management package, retails for $795 on the 3B2 and $1,395 on the 3B5. Access Technology, Inc.'s 20/20, a spreadsheet and modeling package, retails for $950 on the 3B2 and $3,800 on the 3B5.

Integrated Compiler Products, developed by Advanced Computer Techniques Corp., provides programs to compile applications written in Cobol, Pascal, Basic or Fortran to run as Unix applications. Prices range from $1,000 to $2,500 on the 3B2 and $2,000 to $6,000 on the 3B5.

SYSTEMS SOFTWARE

• Radian Corp. has enhanced the user interface on its Rule Master expert systems development software.

The interface is said to provide a screen- and menu-handling feature, one editor for structuring applications and another editor for generating files of examples from which rules are induced.

Called Screem, the screen- and menu-handling feature offers a hier-

SOFTWARE & SERVICES

Continued from page 29

archical set of pop-down menus at every step in building an application. Once a pop-down menu is displayed, the user can select a function by using cursor keys or a control character or by typing the expert system development function name.

The structure editor enables a user to display and modify the modular structure of a Rule Master-based expert system by adding, deleting and moving modules.

The induction file editor lets users create and modify example sets from which rules are developed by Rule Master's Rule Maker facility. Rule Maker automatically induces procedural rules from real-life examples of those rules that have been entered into the system by a knowledge engineer. After inducing the rules, Rule Maker is said to generate code automatically in the Radial language.

The interface will be available for AT&T Unix-based systems in the fourth quarter. The price of Rule Master starts at $15,000.

Radian, 8501 Mo-Pac Blvd., P.O. Box 9948, Austin, Texas 78766.

■ Inference Corp. has enhanced its Automated Reasoning Tool (ART) expert system development environment.

The updated version includes color graphics, a graphics icon library, direct interactive and programmed interfaces to the knowledge base, support for mixed initiative processing, a "pseudo-natural language" syntax and separately compilable rule files.

The Artist graphics component has been extended to include color graphics and an icon library of predefined or user-created symbols that developers can use directly in an application, the vendor noted.

Upgrades to the ART Studio module include a browsing facility that shows graphical views of hierarchical relationships, such as structures on schemas and inferential derivations.

Other enhancements include the ability to query the knowledge base interactively using patterns to find specific data, the ability to add interactively or modify rules incrementally while executing an application and the ability to update dynamically the knowledge base.

A pseudo-natural language syntax option reportedly lets a user build a knowledge base in English-like syntax. In addition, support for mixed initiative processing enables an ART expert system to prompt users for information while also reacting to unanticipated, user-initiated responses, according to the vendor.

Priced at $85,000, the ART release is available for Symbolics, Inc., Lisp Machine, Inc. and Texas Instruments, Inc. Explorer workstations.

Inference, 5300 W. Century Blvd., Los Angeles, Calif. 90045.

■ Systems Designers Software, Inc. has announced an expert system environment shell, Envisage, that reportedly lets designers create applications using artificial intelligence techniques.

Envisage is said to handle three reasoning schemas: traditional logic, Bayesian inference and so-called fuzzy logic.

An English-like knowledge representation language consists of rules, facts, actions and questions that can either be free format or structured, according to a spokesman.

An additional facility enables users to suspend one line of questioning temporarily, reanswer any set of questions, compare results and then return to previous lines of questioning to complete the consultation, the spokesman added.

Priced at $20,000, Envisage runs on the Digital Equipment Corp. VAX computer under the VMS operating system.

Systems Designers Software, Suite 407, 444 Washington St., Woburn, Mass. 01801.

■ Software Research Associates has unveiled a Test Coverage Analysis Tool (Tcat) system test package for the C programming language.

Called S-Tcat/C, the software automates the S1 measure of system test coverage to provide a quantitative way to determine how much of a system's function call structure is measured, the vendor explained.

S1 measures the number

So you've been put in charge of making sure data flows smoothly to and from your company's remote offices.

You could continue the expensive practice of transmitting strictly by modem. (The phone company would like that very much.)

Or you can cut costs by cutting phone lines.

With Codex's complete line of statistical multiplexers.

You see; what a Codex mux does is take data that used to be transmitted over two, three, even sixteen lines and transmit it over just one. Doing this not only decreases phone line costs, but increases operating efficiency as well.

In fact, a Codex mux can save your company considerable time and money. Even if you're only networking as few as two terminals.

Later, when your needs expand, so can your network. Codex has muxes that can support anywhere from just a few terminals to several hundred. Whether they're graphics terminals, printers, pc's or CRT's.

A Codex applications expert will gladly tell you more about the advantages of taking away your computer's phones.

Get us on the line. For more information, Dial 800-426-1212. Extension 240. Or write Codex Corporation,

of function calls executed from a calling function as a percentage of the total number of calls. An S1 value of 100% for every calling function in a software system indicates a complete level of system test coverage, according to the vendor.

S-Tcat/C is available for AT&T Unix and IBM PC-DOS systems, starting at $875 for a single-user license. A site license under normal conditions costs $7,000.

Software Research Associates, 580 Market St., San Francisco, Calif. 94104.

APPLICATION PACKAGES

■ Tektronix, Inc. has announced the Tektronix Spectrum Analyzer Software (Tekspans) family of application software said to automate many measurements done by engineers and technicians.

The packages run on the IBM Personal Computer and compatibles, the Hewlett-Packard Co. 200 series controllers and the Tektronix 4041 controller.

The first Tekspans application to be announced is the General RF Applications Software Package (Grasp), a menu-driven package enabling an engineer to make spectrum analysis measurements automatically such as swept frequency, signal analysis, harmonic distortion, signal-to-noise ratio, amplitude modulation and frequency response, a spokesman said. The package also supports filter tests and signal search routines.

Grasp allows the user to graph, store, manipulate, analyze and compare data as well as record and plot results using a variety of manufacturers' equipment. Grasp is capable of remote monitoring over telephone lines using modems and of controlling multiple spectrum analyzers such as in a manufacturing environment.

The Grasp package costs $875 and is scheduled to be available Nov. 15.

Tektronix, P.O. Box 500, Beaverton, Ore. 97077.

■ Daly & Walcott, Inc. has enhanced its Customer Service/Shipped Order History marketing assistance program to run with IBM's Mapics II order entry and invoicing system on the IBM System/34 and 36.

The menu-driven package is said to enable users to retain a history for each order, sequenced by customer and item, as well as providing easy access to information on open orders.

The Customer Service/Shipped Order History program is also now available for IBM's DmasII Release 2 on the IBM System/34 and 36.

The package, including all source code, load and procedure members, documentation and hot line technical support, is priced at $750.

Daly & Walcott, 120 Lavan St., Warwick, R.I. 02888.

ON-LINE DATA BASES

■ Direct Connection, Inc. is offering a service that will enable end users of IBM and Digital Equipment Corp. equipment to buy and sell used hardware directly with each other, eliminating the need for a hardware broker or dealer.

Subscribers to Direct Connection may use the service as often as needed without a limit on the number of items that can be listed, the vendor said.

Subscribers will receive names and telephone numbers of potential buyers and sellers of the target equipment, according to a spokesman.

Equipment listings are reportedly submitted by mail, telephone or by on-line access to the data base via this service.

Listings are said to remain in the data base until a sale or purchase is made.

Service subscriptions are offered to end users at the rate of $200 per year.

Direct Connection, P.O. Box 4510, Rockville, Md. 20850.

Reach-Ware line gets message control system

Reach Intelligent Systems Corp. of Amesbury, Mass., has announced the addition of Messagetrieve to its Reach-Ware natural language software line. Messagetrieve is a message control system that provides voice messages over the telephone 24 hours daily.

The company also offers Employee-Trak, a management tool for maintaining and analyzing employee and group accidents, absenteeism, overtime, performance and other human resource measures; and Timetrieve, a scheduling system for the management of time, personnel, facilities, equipment and assets.

Features of Reach-Ware include a 1,000-word vocabulary and English translation routines, on-line user Help, real-time and multiuser applications, full screen editing, error reporting, automatic data base encryption, word processing and print queue handling.

Reach-Ware runs on Digital Equipment Corp. VAX machines, Reach Intelligent Systems said.

According to the vendor, the price for the three additional modules ranges from $3,000 to $17,000 each, depending on the CPU.

PROTOCOL-CONVERTER COMPETITION AGAINST WALL

	WALL DATA [illegible]	PCI 276	MICOM 74016	LOCAL DATA DataLynx/3274	RENEX TIM 74-16
MULTIPLE CONCURRENT PROTOCOLS OPTION	YES	NO	NO	NO	NO
CALLBACK SECURITY OPTION	YES	YES	NO	NO	NO
DOWNLOAD NEW PROTOCOLS	YES	NO	NO	NO	NO
REMOTE SW DIAGNOSTICS & LINE MONITORING	YES	NO	NO	NO	NO
$ PER LINE	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

If you're about to sign a purchase requisition for a non-Wall Data protocol converter, it would be in your best interest to throw your pen toward some non-populated area of the office. Trust us. You can retrieve it after you've read this ad.

You have all these ASCII minicomputer terminals and personal computers. Right? And you want them to be able to communicate to a host mainframe or a System 34/36/38, some perhaps over phone lines, in SNA/SDLC, BISYNC, etc. Right? And you've done your homework. Right?

Then ask yourself the same five questions your management and staff are guaranteed to ask you over the lifetime of the product. Over and over again:

1. Can you handle multiple, concurrent protocols to multiple hosts? Not unless your protocol converter is from Wall Data.
2. Is your data secure from unauthorized outsiders who dial in? If your protocol converter doesn't ask for a user's ID and then hang up and call back to the authorized phone number for that user, you're asking for trouble. Why not ask for Wall Data?
3. Can you just download protocol software when new protocols become available? Or when software enhancements are made? You can't with the others.
4. If you suspect there is a problem with either the system software or a data line, can you dial into the protocol converter's console port and do remote diagnostics? Yes, but only with Wall Data.
5. What is the price? Actually, it's quite high…if you aren't dealing with Wall Data. For all the above reasons. Plus the obvious fact that Wall protocol converters are the market price/performance leaders.

Now, about that pen you threw across the office. If someone asks you about it, just say you were conducting an experiment. Then ask them to kindly bring you your pen…and a blank requisition form. You can now conduct your experiment.

TRY ONE FOR TWO WEEKS, ON US

Now that you have that blank requisition form, call 206/883-4777 for help in filling it out. You can return the unit within two weeks without obligation. So far, we've shipped hundreds of units. We've gotten back two things: Prompt payment and stories of how our competitors have reacted to going up against…the Wall.

Info systems need decision scenarios

scale of anticipated or unanticipated problems in the business area by hypothesizing some information on paper charts using scales of unavoidable, acceptable and favorable.

Then, in a series of working sessions with the vice-president, the analyst-builder showed how obtaining and using the right information could help in purchasing raw materials on a timely basis.

Through simple, limited examples, the analyst-builder taught the vice-president to use both the information and the initial technology itself to improve company inventory and stock control, safety stock management service for customers and evaluation of stock offerings by suppliers.

The vice-president never knew that the "system" the analyst-builder was showing him was just a shell. Like the kind of stage sets used in western movies, the required data is visible, but the supporting structure is initially nonexistent.

This technique allows both parties to experiment with data needs and uses before the project becomes too costly to alter. Usually during this stage in the process, the scenario changes often.

After five working sessions, the decision scenario was well defined and close to the real business situation at the manufacturing company.

Prototyping began, and after using successive prototype versions of the system, the vice-president of purchasing's original skepticism was transformed into enthusiasm for both the project and technology use.

Through this dynamic process, the company created a valuable, low-risk, low-cost business tool that continues to be used and praised by senior management.

> ”
>
> *Overzealous information systems builders can drive executives into data-rich, information-poor situations.*

When building a management information system, critical success factors and prototyping alone are not enough.

As this manufacturing company discovered, the use of a decision scenario improves the communication of management support needs, thus facilitating the delivery of action-oriented systems.

Four key elements

To put decision scenarios to work in your company, keep in mind the four key elements followed by the manufacturing company in this example.

- Target your decision scenario on a critical area of the business after critical success factors have been determined.
- Construct your scenario around the business questions a manager poses and the key assumptions to be tracked in each critical business situation.
- Develop decision scenarios without considering the available data or technology that will be required. Focus on information content, not technology and data availability.
- Show the manager what information is really needed to manage the business area.

In 1975, Goal Systems created a VSE library management product called FLEE/XP. Ten years later, FLEE/XP took first place in the Data Decisions user survey with the highest score ever recorded. Now, with PDSMAN/XP we offer a product that provides MVS users with the same peace of mind FLEE/XP has been giving for a decade! One indication of that is PDSMAN/XP's recent reception of an ICP Million Dollar Award.

Attain the confidence of complete audit control over program development, and total security for program access . . . at the member level (PDSMAN/XP can be used with popular batch security products). PDSMAN/XP also reduces library compressions with a library space reuse facility. And best of all, PDSMAN/XP is from Goal Systems, the library management experts! So if you're an MVS user, or in the process of converting to MVS, try PDSMAN/XP.

FLEE/XP and PDSMAN/XP. Two of a kind from Goal Systems.

Ease-of-use issue stalls links' growth

is that it will have a direct financial impact on our organization," he said. Using the links, hospital staff members analyze ways to treat patients "more expeditiously and to discharge them more rapidly," Wade said.

Implementing the four pilot links has not been easy. More than 700 hours were spent finding out what data users wanted for the financial applications, and more than 400 hours went into developing the diagnostic applications. The data usually resided in different mainframe locations, so new files had to be created to service the links. Response time for the 600 on-line users could not be sacrificed, thus performance was a major consideration.

Micro-mainframe links are expected to help reduce the length of patient stays, and Wade said Northwest will continue to evaluate link products.

The hospital has found that the more transactions end users process per patient, the less time, on average, the patient stays in the hospital.

Peter F. deVaux, senior vice-president of finance and former MIS director at Young & Rubicam, Inc. of New York, said, "We'll be testing [micro-mainframe link products] for a long time and will not settle on anything for a while, because I don't think there is anything out there yet to settle on. We will continue to go through a period of uncertainty."

When his company began trying to integrate its micros with mainframe applications in 1983, deVaux said, "It was a lot tougher than we thought. We read in the magazines about how everyone was doing this, but we couldn't find anyone to talk to."

The advertising agency now has micro-mainframe experiments under way in 10 departments. Each department settled on a local-area network for its micros before testing a link.

"We expect ultimately, 10 or 15 years from now, to find ourselves with a hierarchical structure, only sharing data and applications that need to be shared at a level necessary to get the job done," he said.

Technical roadblocks to achieving that goal include linking diverse operating systems, communications software and data base management systems in place at the company, he said. Other issues include deciding who will have overall responsibility for the links, who will provide support and who will conduct training.

"The disciplines, controls, structures and planning for integration must be in place before we can achieve integration with the micro-mainframe links," deVaux said.

Vendor Gary Durbin, chairman of the San Francisco-based Tamarack Corp., which markets the Merlin/IDL micro-mainframe link, said, "I agree the link solution is not here yet" because unsophisticated users may have difficulty with the products. But the direction of his and other company's products, he said, will be for links to become more intelligent and ease interface problems for the user.

"The links have a tremendous responsibility to transform data, so the links have to become more intelligent," he said.

The Picture Perfect Information Center

SYSTEM 2000® DBMS AND THE SAS® SYSTEM

The Picture Of Practicality.

SYSTEM 2000 DBMS is the only full-function DBMS for your Information Center. It's powerful enough for production work, has fully integrated features and offers built-in flexibility. It's simple enough for end-user needs, powerful enough for applications programmers, and sophisticated enough to offer the integrity and security data base administrators need. And it's so flexible every department can use it...every day.

Perfectly Powerful.

Now, you can enjoy Information Management that's truly powerful. SYSTEM 2000 DBMS and the SAS System...combined. Thanks to a new interface built directly into SAS software. Select SYSTEM 2000 DBMS data from within a SAS session...and use a full-screen menu to do it. Or, retrieve SYSTEM 2000 DBMS data from within a SAS session just by entering query commands. With SYSTEM 2000 DBMS and the SAS System working together, you'll increase productivity, reduce your applications backlog, and put a full range of data analysis, reporting, graphics, and programming tools to work for you.

SYSTEM 2000 DBMS and the SAS System. The perfect picture of success. To discover how it can work for you, call (919)467-8000, ext. 7004.

Please send more information about the SYSTEM 2000 DBMS and the SAS System to:

IBM adds planning module for package

sionals with a productivity tool for prototyping and applications development. APL2 runs in MVS/370, MVS/XA, VM/High Performance Option or VM/SP environments and uses companion products DB2, SQL/Data System, VM/SP ISPF Dialog Manager and Graphical Data Display Manager.

Release 2 is said to provide calls to routines written in other languages, including Fortran and assembler, access to system editors such as Xedit and ISPF and language enhancements such as lowercase alphabetics in APL2 names. The one-time charge for Release 2 of APL2 is $14,000.

■ A series of enhancements to System/36 languages and utilities, including Basic, Cobol, Business Graphics Utility, PL/I, RPG-III and Office/36 Text Management.

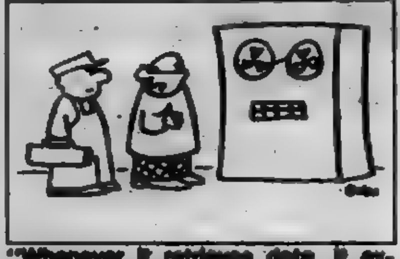
Enhancements to Basic include improved translator optimization said to enable users to specify whether the translator should take additional time to generate a more efficient object program. Additional mathematical functions supported in System/36 Basic include arc sine, arc cosine and cotangent.

Charges for all the programs remain the same.

■ IBM 8100/DPPX Case Processing System, offering support for case processing in the DPPX environment. The program is typically used for loan application processing and insurance claims processing and is priced at $4,260, a one-time charge.

■ Tape Automation for the Production Environment for VSE/SP 2.1, a tool for managing tape libraries in DOS/VSE shops. Standard and externally labeled tapes are supported. The program is priced at $2,200.

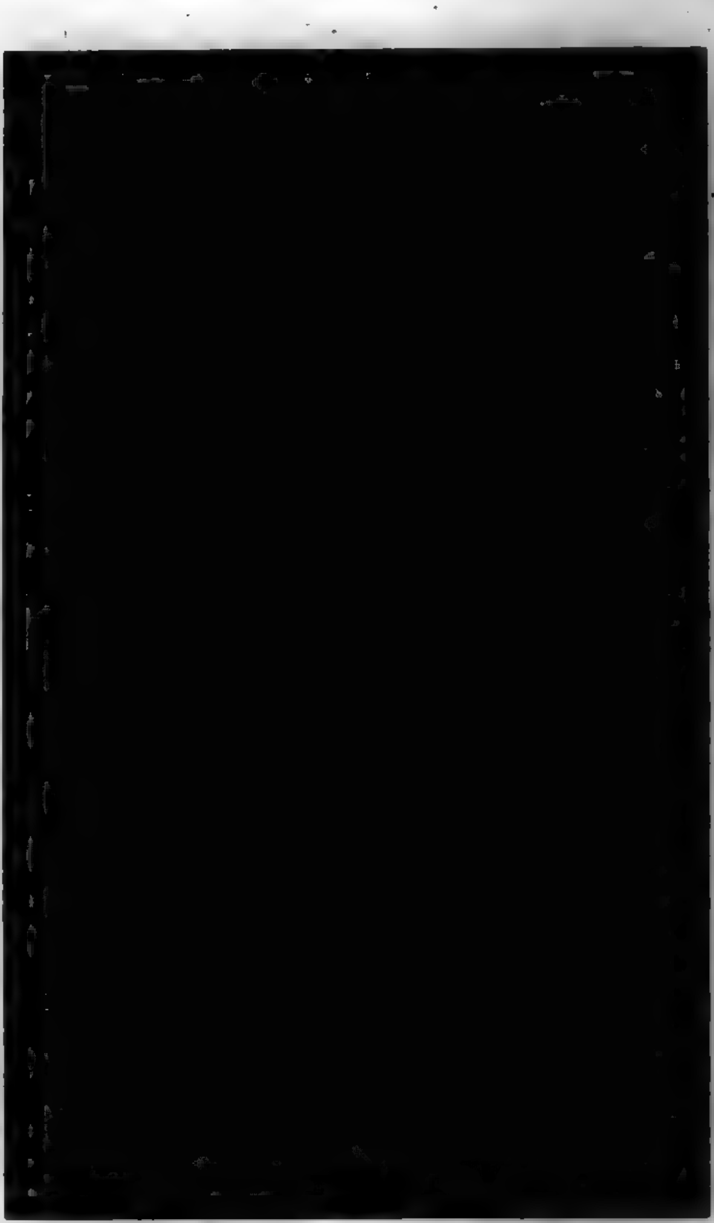
■ Data Base Migration Aid Utility, assisting IBM DB2 users and data base administrators in migrating data and data descriptions between DB2 systems. The product is priced at $4,000.



"Whenever it retrieves data, it expects a finder's fee."

Straight talk about application software packages.

"Most application software packages are functionally rich. The problem is, that's simply not enough."



While everyone agrees that packaged applications possess great potential to save time and money, you'll hear a lot of people—from MIS directors to operations managers—tell you the ones their companies have implemented fall somewhere short of satisfactory.

Typical limitations include the fact that the packages require such extensive modification that the savings they seemed to offer totally disappear. Another common complaint is that one application package fails to integrate with another. A third shortcoming, and perhaps the most common, is that packaged applications cannot be easily adapted to reflect the changing nature of the business.

You have only to look at the architecture of most of the applications currently in use to understand why these problems exist.

Many companies today depend on applications designed with technology from the 60's and 70's. Some are 2nd generation applications built without any reliance on database architecture. Others are 3rd generation applications that provide only a generalized *interface* to a database management system; in addition, many application vendors provide a common front end user interface to mask inefficient architecture. The result is that these 3rd generation applications realize only about 10% of the power of a DBMS. *And that's simply not enough.*

Without full use of the facilities of a superior DBMS, users of application software find it extremely difficult to adapt and extend an application package to their current as well as to their future business needs. And *only* when an application is built with advanced database technology can it provide the sharing of data that leads to functional integration between different application modules.

Ultimately, what's required is software that goes beyond the conventional packaged applications approach.

What's required is 4th generation applications software—software that's rich in functionality, and whose underlying architecture is built on, and takes full advantage of, advanced database technology.

Fourth generation application software is created using a comprehensive application development facility combining a fourth generation language and end user query and reporting facilities with an integrated data dictionary. Furthermore, fourth generation application packages are functionally integrated, sharing common data between independent modules. This creates an environment to easily adapt and extend an application package, and provides realtime access to all information.

Only fourth generation application software packages enable a company to realize the full potential of packaged applications.

It is clear, therefore, that all application packages of the future will be built using this technology... because it doesn't make sense any other way.

John J. Cullinane
Chairman of the Board

The only applications worth buying are 4th generation applications.

And only Cullinet offers 4th generation applications. Simply stated, our applications are a step beyond conventional applications packages because they meet these key requirements.

1. Functional Richness

Cullinet's complete line of applications delivers leading edge functionality in all areas. Whether it's our manufacturing control system, or integrated financial reporting and cost management applications, our human resource management system, or our relationship banking system, each Cullinet application is carefully designed by knowledgeable industry professionals who have a thorough understanding of application requirements. Our integrated closed-loop, net change manufacturing, financial reporting, and cost management applications provide complete multi-company capabilities accommodating the most demanding reporting and control requirements. Our human resource management system combines complete personnel reporting and payroll processing into a single system, and our relationship banking system provides a total customer information environment for today's business executive. You can be assured that a Cullinet solution can be put into production immediately to fulfill your most pressing business requirements.

2. Functionally Integrated

Businesses today demand applications to do more than address individual functions. Businesses today need applications that recognize the interdependencies within an organization—in short, applications that can share data. For example, efficient real-time, four-way matching of invoices with receiving, purchase and inspection documents can only be achieved through true sharing of data, and this sharing of data can only be achieved with an advanced database technology which delivers that integration. Redundancies are eliminated and productivity is increased when all applications dynamically reflect the operations of the organization. By sharing an architecture that provides for optimum use of an organization's information, Cullinet's manufacturing, financial, human resources and banking applications fulfill this need.

3. Easy to Tailor

Although many businesses appear on the surface to operate in a common fashion, each, in fact, is unique. Applications must therefore be built with an optimized set of tools that permits them to be adapted to a company's way of doing business, rather than having the company have to adapt to accommodate the software. Cullinet applications are designed to accommodate change. They provide the means to personalize screen layouts, capture new information, reformat reports, resequence transactions, and change messages without impacting the entire environment. Only Cullinet's applications can provide this environment for adaptability through their integration with advanced database technology. In this way, Cullinet applications give users the independence to adapt them—quickly and efficiently—to meet the unique requirements of the business.

4. Easy to Extend

As a business changes and grows, so do its needs and requirements. Cullinet provides easy to use, menu-driven facilities that permit functional extension of an application while preserving integration. An end user can quickly react to new requirements by prototyping an application functionally, developing new reports and performing ad hoc queries immediately. MIS can efficiently develop new, associated applications sharing common data and built utilizing the existing architecture. The Cullinet architecture segments the program logic, edit and validation criteria, as well as the security and recovery process, and therefore the complexity of creating new application functionality is significantly reduced.

5. Easy Access to Information

Access to all corporate information is key to any application. Because all pertinent data must be available to the analyst and decision maker, easy access to that data, *no matter where it resides*, is mandatory. Your need for information naturally crosses applications boundaries. The ability to associate detailed information about sales orders, finished goods status, and customer credit processing before release of shipments is a prime example. Only by means of Cullinet's applications, which are completely integrated with our Information Center Management System are you provided the opportunity to create an information center that is functionally complete, meeting the information needs of the company as a whole and meeting the specific needs of the operational units of the organization. Each center of functional activity within your organization is served by the system through your mainframe or PC with GOLDENGATE software. Each has access to all corporate information. Accessibility to all information—whether it's in your mainframe, in a departmental minicomputer system, or in your personal computer—makes it readily available to you for analysis through Cullinet's complete information environment.

The best policy is missing deadlines — sometimes

By Meilir Page-Jones

The story of the Afghan boots shows what happens when DP meets the user's project deadline but not the user's needs.

The term *deadline* is derived from a line in a prison beyond which a prisoner would be shot if he strayed. Given this context, it is hardly an appropriate term for the estimated completion date of a project.

But its derivation may account for the terror that deadlines instill in so many managers. Project deadlines have acquired almost mythical powers in the minds of project managers. Worse still, many project members feel that the deadlines assigned to them are unrealistic. A significant number of projects fail because of a manager's fanatical devotion to an unachievable deadline.

But realistically, I have yet to see anyone's world come to an end or any project canceled merely because of a missed deadline. Projects *are* canceled for patently failing to meet users' needs in a cost-effective way — not for being a month or two late in completion.

Satisfying users' requirements effectively must be the No. 1 priority. Today more than ever, a company's DP department and the quality of the systems it produces directly affect the entire company, no matter in what business that company is.

Unfortunately, the tremendous pressure to develop software systems more quickly has simply meant that more bad systems are being turned out. In DP no less than anywhere else, you get what you pay for — a lesson I learned only too well in another part of the world.

During my youth, I spent some time in Afghanistan. A custom in that part of the world dictates that you never pay the asking price for an article in a market or a shop. You are expected to haggle, much in the same way you negotiate the price of a used car in this country.

This haggling forms the basis of an elaborate social etiquette. For expensive articles, the process may last for several hours and involve much tea drinking and pipe smoking. After a while, I considered myself to be a skilled bargainer, often leaving a shop after an hour or two with the shopkeeper wringing his hands at the low price my adroitness had forced him to concede.

Afghanistan, and the capital city of Kabul especially, is noted for the craftmanship of its boot makers. Afghan boots are made from the finest leather and are adorned with exquisite stitching along their sides. A boot maker will even customize your boots to match your taste and your feet. After he has measured you and listened to your style specifications, he will quote you a price.

When I decided to order a pair for myself, I visited a boot maker in Kabul and he quoted me a price. Remembering the custom, I haggled with him over the amount. This particular boot maker seemed to be a pushover. Within a few minutes, I'd knocked the price to less than half the original amount. I stopped bargaining only to avoid punishing him further. I paid and left the shop, chuckling at what a shrewd customer I'd been.

Poor bargain

Two days later, I returned to collect my boots. They were atrocious. The leather was poor, the fit uncomfortable and the needlework uninspired and shoddy. I complained bitterly. The boot maker shrugged and pointed to the price of 400 afghans (about $7 at the time). Then he pointed to another, superbly crafted pair of boots with a price of 900 afghans.

I immediately understood: You can legitimately bargain for a product that already exists, but you cannot safely bargain for a service yet to be performed. You can name almost any price, but the provider of the service can simply lower his quality to meet your price.

We in DP are like custom boot makers to our end users. If they drive down our estimates for our services too much, we often reduce the quality of our work to match, either deliberately or otherwise. A computer system of low quality is unlikely to be much of a bargain either for our end users or for ourselves.

Page-Jones is president of Wayland Systems Development. He is the author of Practical Guide to Structured System Design *and* Practical Project Management, *on which this article is based.*

> ”
>
> *The wrong goals are being set implicitly for the overall good of the department. . . . Ironically, this approach actually increases costs — but in someone else's budget and in another fiscal year.*

In obeying the harsh dictates of an unrealistic deadline, a project manager is forced to sacrifice the care and effort that attends the development of a high-quality system. This dilemma is often ignored by DP personnel and end users alike. Indeed, at all levels of DP, an absurd notion holds that only sissies worry about quality, while "real" project managers can develop a system by any arbitrary deadline or for any arbitrary budget amount.

I recently witnessed a disturbing example of the dominance of the deadline. In a large aeronautical engineering shop, a software system was required to operate a complex piece of hardware. Because of poor planning by the general project manager, the software manager had a seemingly impossible deadline for the delivery of his system. Yet he not only succeeded in beating the deadline by a few days — he actually underspent his budget. Pleased, the project manager awarded the software manager a promotion and a large pay increase.

I asked the hardware manager what he thought of the software manager's feat. "That system's one of the worst pieces of garbage I've ever seen," he said. "It's badly designed, hastily coded, almost completely untested and inaccurately documented. I'm far from convinced that it even works correctly in all circumstances."

"Ho hum, just another poor piece of software," you think. "What's so disturbing about that?" What is so disturbing is that this particular piece of software is a component in our national defense system.

Why does a deadline so often take precedence over quality? Why is the cost of system development often considered more important than the quality of the final system, which is admittedly difficult to quantify but not hard to recognize?

Buy now, suffer later

The answer to these questions is that low-quality systems do not exact their high tolls until they are delivered and put into production. Only then is the horrendous expense of working with and maintaining such systems mainfested.

As a Swiss proverb says, "The bitterness of low quality remains long after the sweetness of low price is forgotten." Indeed, some deadline-constrained systems are so bad that it is cheaper to throw them away and start over.

Although some DP departments partition their budgetary accounting into separate cost areas, with developmental and operational costs charged back to the appropriate systems and departments, few DP shops allocate their maintenance costs correctly: In the worst cases, maintenance charges are made against a monolithic budget; priorities are settled by the user who yells loudest and most often; and no attempt is made to record the maintenance costs of individual systems.

Even in the best cases, where good financial data is available, rarely does anyone take the trouble to relate the cost of the maintenance effort to the quality of the original development work.

In short, the wrong goals are being set implicitly for the overall good of the department. If management tells you to minimize costs and tighten schedules, sadly enough the quickest way to achieve these ends is to lower the quality of the end product. Ironically, this approach actually increases costs — but in someone else's budget and in another fiscal year.

A poster I sometimes see on the walls of junior programmers' offices accurately, if cynically, acknowledges the above budgetary practice. It shows an obviously frantic person surrounded by listings, ringing phones and half-empty coffee cups. The caption reads, "There's no time to do it right, but there's always time to do it over."

Desperado

Some people make a career of satisfying short-term financial expediencies by delivering products that are on time but of poor quality. The following story describes the quick and dirty deeds of such a deadline desperado.

A contract programmer explained his views of the contract programming business to me. "I always take contracts that last three to six months," he said. "I also try to get jobs where I can code up a storm, hand over my listings right on the deadline, take the money and run. That way, if my programs blow up, I'm well away from the scene of the crime."

I replied that I didn't think it was very professional or even ethical to do a shoddy job and then abscond, leaving bug-ridden code for some ill-fated maintenance programmer to fix up. He countered that I obviously lacked the machismo to be a mercenary in the world of contract programming, with its rewards for meeting deadlines.

"Why We Went Relational."

In this Business, Timing is Everything.

"We needed a data base management system that could keep up. That could help us turn around an application program fast enough to satisfy our end users, to make information available to the people who need it when they need it, to make changes fast enough to accommodate current as well as anticipated needs.

"We needed a relational data base management system. *And we chose RELATE/3000.*™

"Since we've had RELATE, we've cut development time by 40%. We can go from specs to prototypes to full blown production programs within 60 days, sometimes less. And we can make most data base changes in minutes.

"Performance problems with relationals? Whoever has had them hasn't been using RELATE. We're able to do twice as much as we did before with no measurable performance impact."

RELATE/3000 – the relational data base management system for the HP3000.

The RELATE package features a full set of fourth generation tools including a report writer, application builder, menu interface, graphics and a data dictionary.

Four years later, I met this same programmer again quite by chance, and I noticed most of his earlier bravado was gone. He confessed that he had been migrating back and forth between California and New York to shake off his acquired reputation for poor work: If a company hired "Sloppy Joe" for three months, it would have to hire someone else for six months to patch his code. New York and Los Angeles, he had discovered, were really small towns in the world of DP.

The DP manager's duty, as Sloppy Joe eventually discovered, is to enforce standards of high quality so that everyone can benefit. Otherwise, everyone suffers sooner or later. In developing a system, of course, time is always an unwelcome pressure, but it's worth convincing management and end users that they shouldn't set an unreasonable deadline, since there will be plenty of time to do the job right if it doesn't have to be done over.

Unrealistic deadlines

There are four major origins of unrealistic deadlines. In order of increasing justifiability, they derive from wishful thinking, the preliminary project estimates, the creeping commitment and the value step.

A deadline caused by wishful thinking is usually based on nothing more scientific than the date by which the end users would like to have their system. Some Mr. Fantasy with enough authority in the organization dreams the impossible dream, and *voila!* a deadline is set. Never be overcome by such a desire to please your end users or your own managers that you acquiesce to this type of deadline.

If a deadline is impossible to achieve, it is also impossible to derive a workable project plan based on that deadline. Therefore, much can be deduced from the project manager's planning chart. In some cases, for example, all a project manager can do is leave the project as a giant monolith on his chart.

In Figure 1, for each task in the plan, the manager allows the shortest time in which that task could conceivably be executed, given ideal circumstances, and then allows no time between the tasks for review, revision or coordination. The result is a deadline that appears to be achievable, although only under the best conditions.

This type of wishful thinking is analogous to establishing that running a mile in four minutes is possible, and then calculating that if a marathon race course is 26 miles, it's therefore possible to run the distance in 105 minutes.

Workers may be able to keep up a breakneck speed for one or two weeks, but they will not be able to sustain such a speed for the whole project. They will tire, and time will be needed for meetings and reviews as well as for carrying out changes to intermediate products. The theoretically possible deadline can't be realized in the real world.

I cannot blame end users and DP managers for wishing that software developments would proceed faster.

MITCHELL J. [illegible]

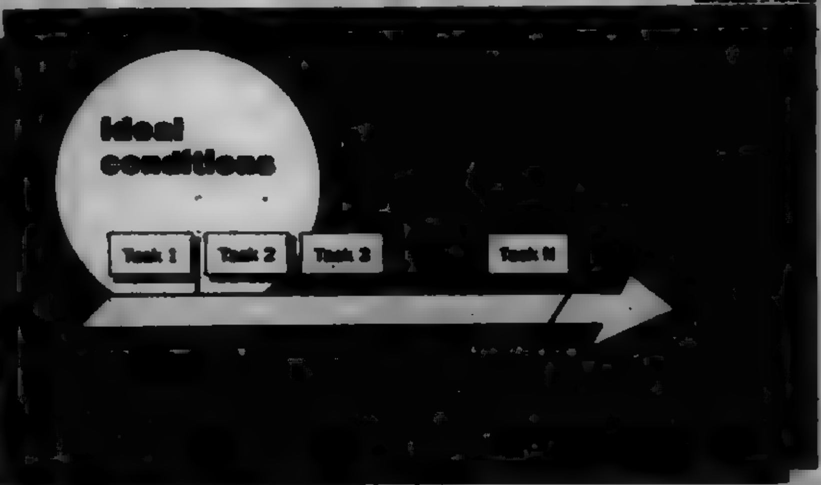

Figure 1

But there are no shortcuts to improving software development speed and productivity. The best ways to do so are to invest time and money in developing staff expertise, standardizing projects and assisting project members.

A second source of unrealistic deadlines is **the preliminary project estimate.** The earlier in the project an estimate is made, the less accurate the estimate is likely to be. A corollary to this rule says the earlier into the project an estimate is made, the more likely it is that someone will enshrine that estimate as a project deadline. Be forewarned: Mentioning a date, especially at the start of a project, with no explanation or cautions, may be regarded as an immutable, realistic goal.

The best procedure when deadlines are mentioned is to refer again to the project plan. This plan, with its dozens of task completion dates, immediately demonstrates the naivete of having a single completion date for a complex project, especially when that date is based upon only a premature estimate.

In addition, the project plan debunks a standard excuse for deadlines: that end users need them in order to prepare for installation. One trouble with a project deadline is that the end users believe they will have the system by that date and make their preparations accordingly.

If the deadline is missed, the users could be trapped between dismantling their old system and not having the new system to replace it. If the end users' needs for installation are integrated into the project plan,

Reach over 35,000 computer professionals in The Netherlands.

Advertise in CW Communications' publications in The Netherlands and sell your products directly to the fifth largest market in Western Europe for installed general purpose computers and ninth world-wide. According to figures from International Data Corporation (IDC), the world's leading information industry market research firm, total DP expenditures in 1984 were at $3.3 billion. IDC forecasts that by 1989 total DP expenditures will exceed $7.1 billion. CW Communications covers The Netherlands and Benelux countries market with two publications; *Computerworld Benelux* and *PC World Benelux*.

20,000 MIS/DP executives read *Computerworld Benelux* each week. *Computerworld Benelux* is modeled after its sister publication in the U.S., *Computerworld*. The editorial covers new products and services, current applications and industry trends.

PC World Benelux is published six times per year and is modeled after *PC World*, its sister publication in the U.S. *PC World Benelux* is read by more than 15,000 commercial users and prospective buyers of IBM and compatible computer equipment, and the key decision makers of small, medium, and large companies.

Introducing the

The best of both worlds.

For owners of IBM Personal Computers, combining personal productivity and business applications is now less of a leap than ever before.

There's a new IBM product that marries the IBM System/36 and the IBM Personal Computer to give you the best of both worlds.

Meet the newest member of the System/36 Family.

It's called the IBM System/36 PC. Very small but it opens up new worlds for your personal computer. Very affordable with a price starting at $5,995, yet capable of running System/36 programs that will help you run your business.

Even if you've never owned a computer before, this can be your first business system, instantly offering the capability of running your business right now and expanding it in the future.

Multiuser system.

System/36 PC can be a standalone computer for small companies or a departmental system or even part of a distributed network for larger companies, providing multiuser access to data.

The System/36 PC is made up of a 5364 Processor attached to an IBM PC, PC XT or PC AT. And you can connect up to three more of these personal computers. Or you can connect terminals such as System/36 printers or displays.

Flexibility.

Whether your business has two employees or more than 2,000, the System/36 PC can combine the personal productivity of your PC with the business applications of the System/36 Family.

The System/36 can handle all facets of your business—distribution, sales analysis and general ledger functions. Accounts payable, inventory control and payroll.

IBM System/36 PC.

And you can get traditional PC functions such as spreadsheets and word processing.

Software for the System/36 has been developed over the years and has proven invaluable in all kinds of businesses of all sizes. And with the thousands of programs written for both IBM PC and System/36, the sky's the limit for business and planning applications.

The System/36 PC even provides you with data security features so that the right data gets into the right hands.

Small yet powerful.

All of this processing power can sit right on a desk or under it—either horizontally or vertically. It measures a mere 21¼"x16¾" x6½"—about the size of a small suitcase.

Yet as small as it is, this little box has multiple processors, with main memory that can be dedicated to running your business functions. In plain English, this means you can get better response time. The System/36 PC comes with a 1.2 MB diskette drive and either 40 or 80 MB disk storage, depending on your information storage needs.

Easy to use.

The System/36 PC is easy to learn and to use. If you need assistance, it has over 2,800 "help" screens that take you step-by-step through any rough spots. You can merge data you've generated on your PC with information that's on your System/36 PC. And you can share information that is stored in the System/36 PC with other attached IBM Personal Computers or System/36 terminals.

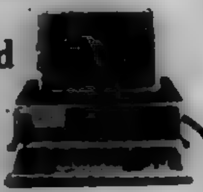
Compatibility is high so that you can keep on using many of the PC peripherals and programs you may already own.

Easy growth.

What happens when your small office becomes bigger?

That's what the System/36 Family is all about. No matter what size your business, there's a member of the System/36 Family that can help you do whatever you do, better.

As your needs become greater, there's the mid-sized 5362 processor that offers greater performance and can handle up to 22 personal computers or System/36 terminals.



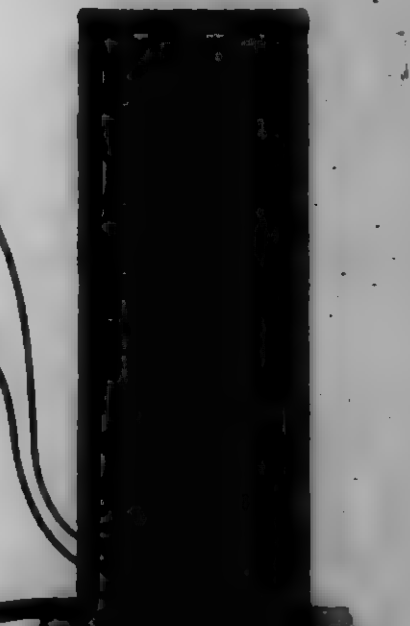
Then there's the original System/36—the 5360 processor—the largest member of the System/36 Family, which can handle up to 36 personal computers or System/36 terminals.

Any one of these processors can function as the central processor in your office. Each can communicate with PCs or larger systems, giving communication and connectivity new meaning by allowing departments to share data.

So if your dreams are big but your office is small, the new System/36 PC is the perfect step for you to take. You not only get the best of both worlds, you also get IBM product reliability. And authorized IBM on-site service is available anywhere in the U.S.A.

For a free brochure on the IBM System/36 PC or for information on product availability from participating IBM Product Centers, Authorized PC Dealers or Value Added Dealers, call 1 800 IBM-2468, ext. 90, LL. Or call your IBM marketing representative.

IBM



however, the details can be planned and scheduled fairly accurately as the installation date approaches.

Unrealistic deadlines can also derive from a process of incremental extortion known as creeping commitment. A user is fooled into committing to a large and expensive project by a deliberate understatement of the project's size and cost. By the time the user discovers the project's actual cost, he is past the point of no return. If he fails to come up with the extra money required to finish the project, he will lose the money he has already spent.

Obviously, creeping commitment is a devious political trick that must be kept secret from the end users in order for it to work. Often, even the project manager is not informed of the deliberate understatement of the project's cost and receives from his management an unrealistic deadline as a nonnegotiable imperative.

Creeping commitment is an infantile ploy that creates bad feelings between the DP department and the end users once the latter discover they've been duped. The correct way to win end users' commitment to a project is by showing them carefully detailed estimates of project costs and resources. Most end users, faced with an objective statement of reality, will make rational, mature decisions despite DP people's expectations.

A value step is a change, usually downward, in the value of a system on a certain date. For example, the federal government may decree that on Jan. 1, all banks shall withhold a certain portion of savers' interest for tax purposes. In this event, an automatic system for withholding interest will clearly be of more value if it is delivered on Dec. 31 than on Jan. 31. The change in the system's value on Jan. 1 is enough to make that date an irresistible candidate for a deadline.

Since a deadline based on the value step has some legitimacy, it cannot be trivially dismissed. It should not, however, be given so much sway that it imperils the conduct of the project or the quality of the project's deliverable goods. There are always alternatives.

In this case, the bank has several options other than the Jan. 1 installation of an automated system, such as persuading the government to delay or revoke its decision, using a cumbersome manual system until the automated system comes up or temporarily defying the rule and paying the subsequent fines.

Handling unrealistic deadlines

As a project manager, you are primarily responsible for debunking the mythical power of the deadline. If you find yourself saddled by your end users or managers with an impossible deadline, your duty is to minimize their harmful effects in two ways. The first is to protect your project team from destructive pressure; the second is to reflect the pressure caused by the unrealistic deadline back to those responsible for creating it.

To shield your staff from undue budgetary or scheduling pressures imposed on you, your motto should be "The buck stops here." Even if you feel such pressures, don't transmit those pressures to your staff.

Of course, this is a lot easier to say than to do. Being a DP project manager in many companies is like being inside a giant organizational nutcracker, where the pressures from above meet the pressures from below. You are stuck in the middle and would need a very thick shell to hold out in that spot for very long. In that position, many managers capitulate and force their staff members to work long hours, harangue them, blame them and generally give them a rough time in order to meet some arbitrary and impossible deadline.

Most people like to work regular hours the majority of the time, work hard some of the time and slacken off a small portion of the time. Normally, people are neither able nor willing to work in crisis mode indefinitely. A manager's pleading "crisis" too often becomes a poor motivator.

One manager who realized this effect doubled his efforts by circulating a memo: "Since the project is now in emergency mode, we must escalate our work hours until we meet the delivery date." His team did not meet the delivery date, but before the manager could find a more hysterical word than "emergency," many of his team members had asked for transfers.

Saying no

So what should you do with a ludicrous deadline if you cannot tyrannize your workers and if you yourself don't want to absorb all of the associated pressure? The only sane response for your own mental and physical well-being is to reflect the pressure back to whoever created the unrealistic deadline. That means saying no to your boss or end users whenever you are asked to agree to an unreasonable demand.

Say you've been granted 15 months to deliver a computer system that fulfills a certain set of requirements. Because of budgetary problems, your management tells you your revised deadline is 12 months, but the end users want the same system delivered and you'll get no additional staff members. The worst thing you can do at this point is to shrug your shoulders and put everyone on mandatory unpaid overtime. That's bad for team morale, bad for your own morale and bad for management, who must learn to respect reality — not to mention the effect on the quality of work produced.

When you learn of the budgetary cutback, you must look your boss squarely in the eye and say, "Only bank robbers and muggers can get something for nothing by simply demanding it. What features do you want me to cut out of the system?"

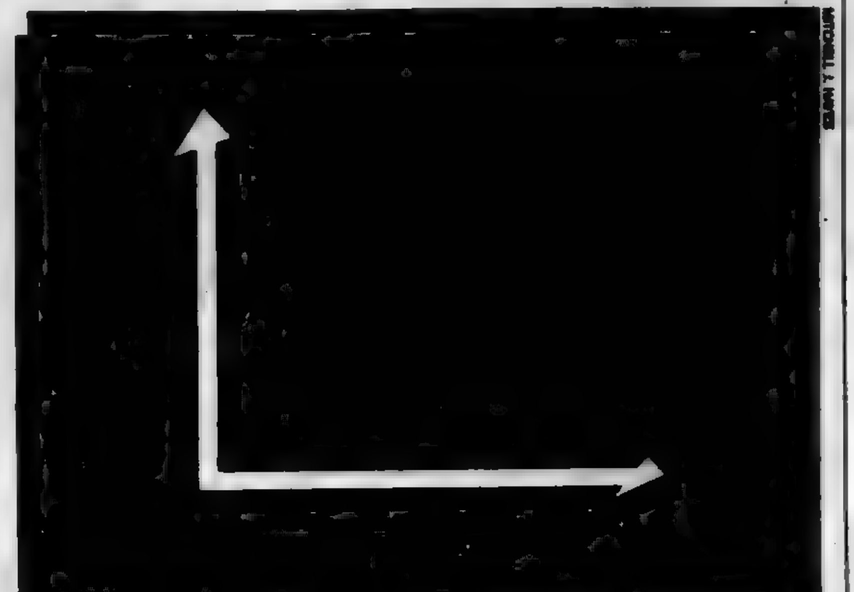

Figure 2

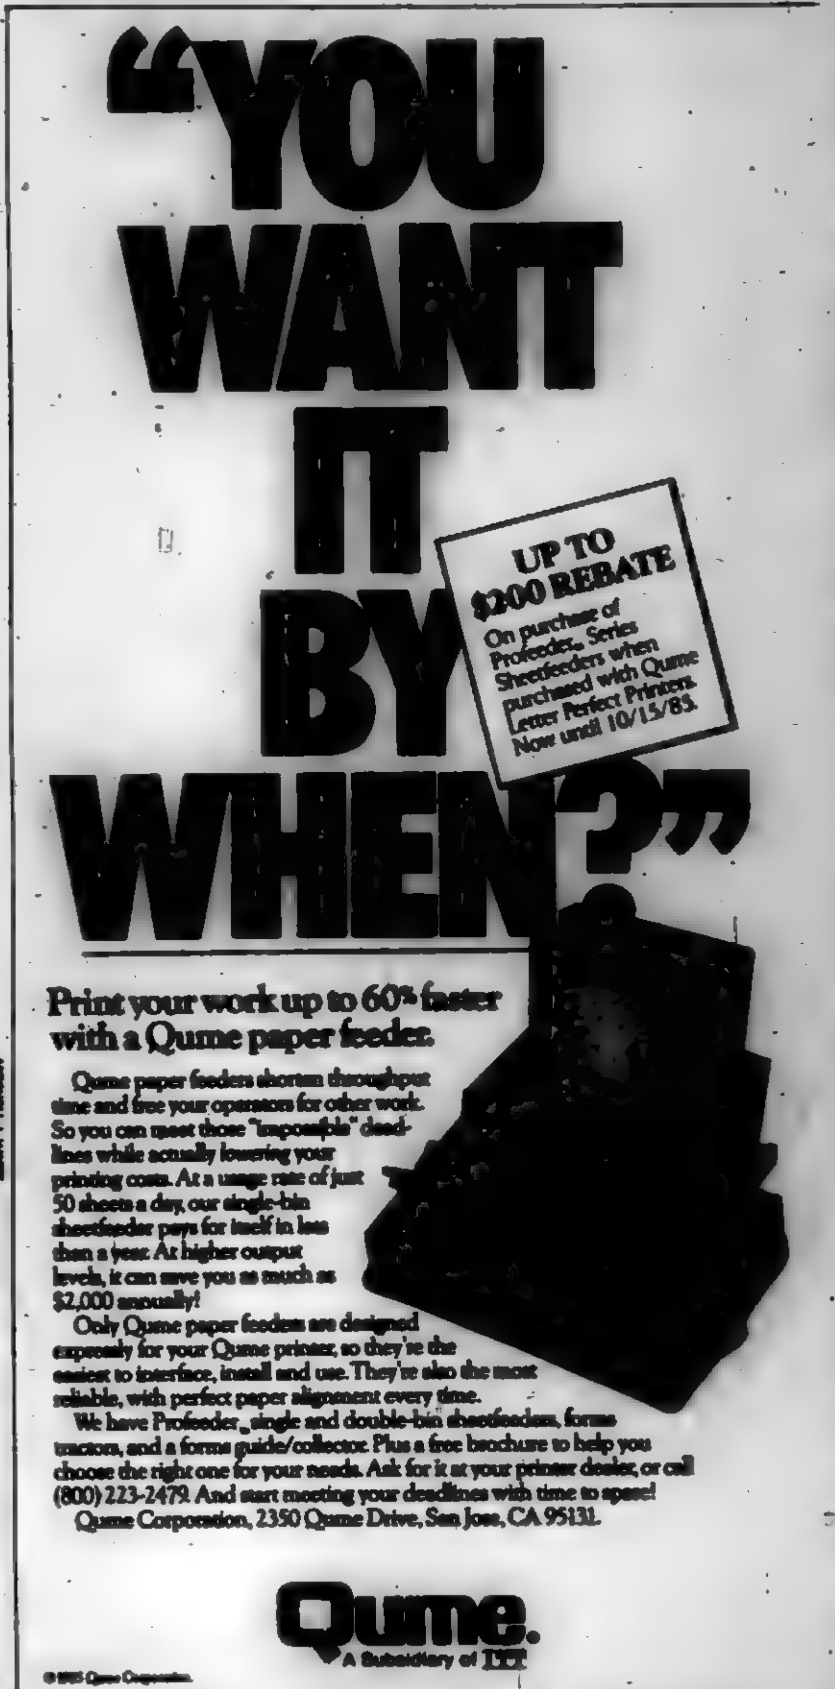

"YOU WANT IT BY WHEN?"

UP TO $200 REBATE
On purchase of Profeeder™ Series Sheetfeeders when purchased with Qume Letter Perfect Printers. Now until 10/15/85.

Print your work up to 60% faster with a Qume paper feeder.

Qume paper feeders shorten throughput time and free your operators for other work. So you can meet those "impossible" deadlines while actually lowering your printing costs. At a usage rate of just 50 sheets a day, our single-bin sheetfeeder pays for itself in less than a year. At higher output levels, it can save you as much as $2,000 annually!

Only Qume paper feeders are designed expressly for your Qume printer, so they're the easiest to interface, install and use. They're also the most reliable, with perfect paper alignment every time.

We have Profeeder™, single and double-bin sheetfeeders, forms tractors, and a forms guide/collector. Plus a free brochure to help you choose the right one for your needs. Ask for it at your printer dealer, or call (800) 223-2479. And start meeting your deadlines with time to spare!

Qume Corporation, 2350 Qume Drive, San Jose, CA 95131.

Three more firsts from the people who invented the wheel.
D-36 Diablo Printer.

XEROX

From day one, Xerox and Diablo have been known as the two best names in daisywheel printers. And now there are three more in the Xerox line to choose from.

The Xerox Advantage D-25 Diablo printer turns out letter quality documents quickly and quietly. And it does all that for the price of a dot-matrix printer.

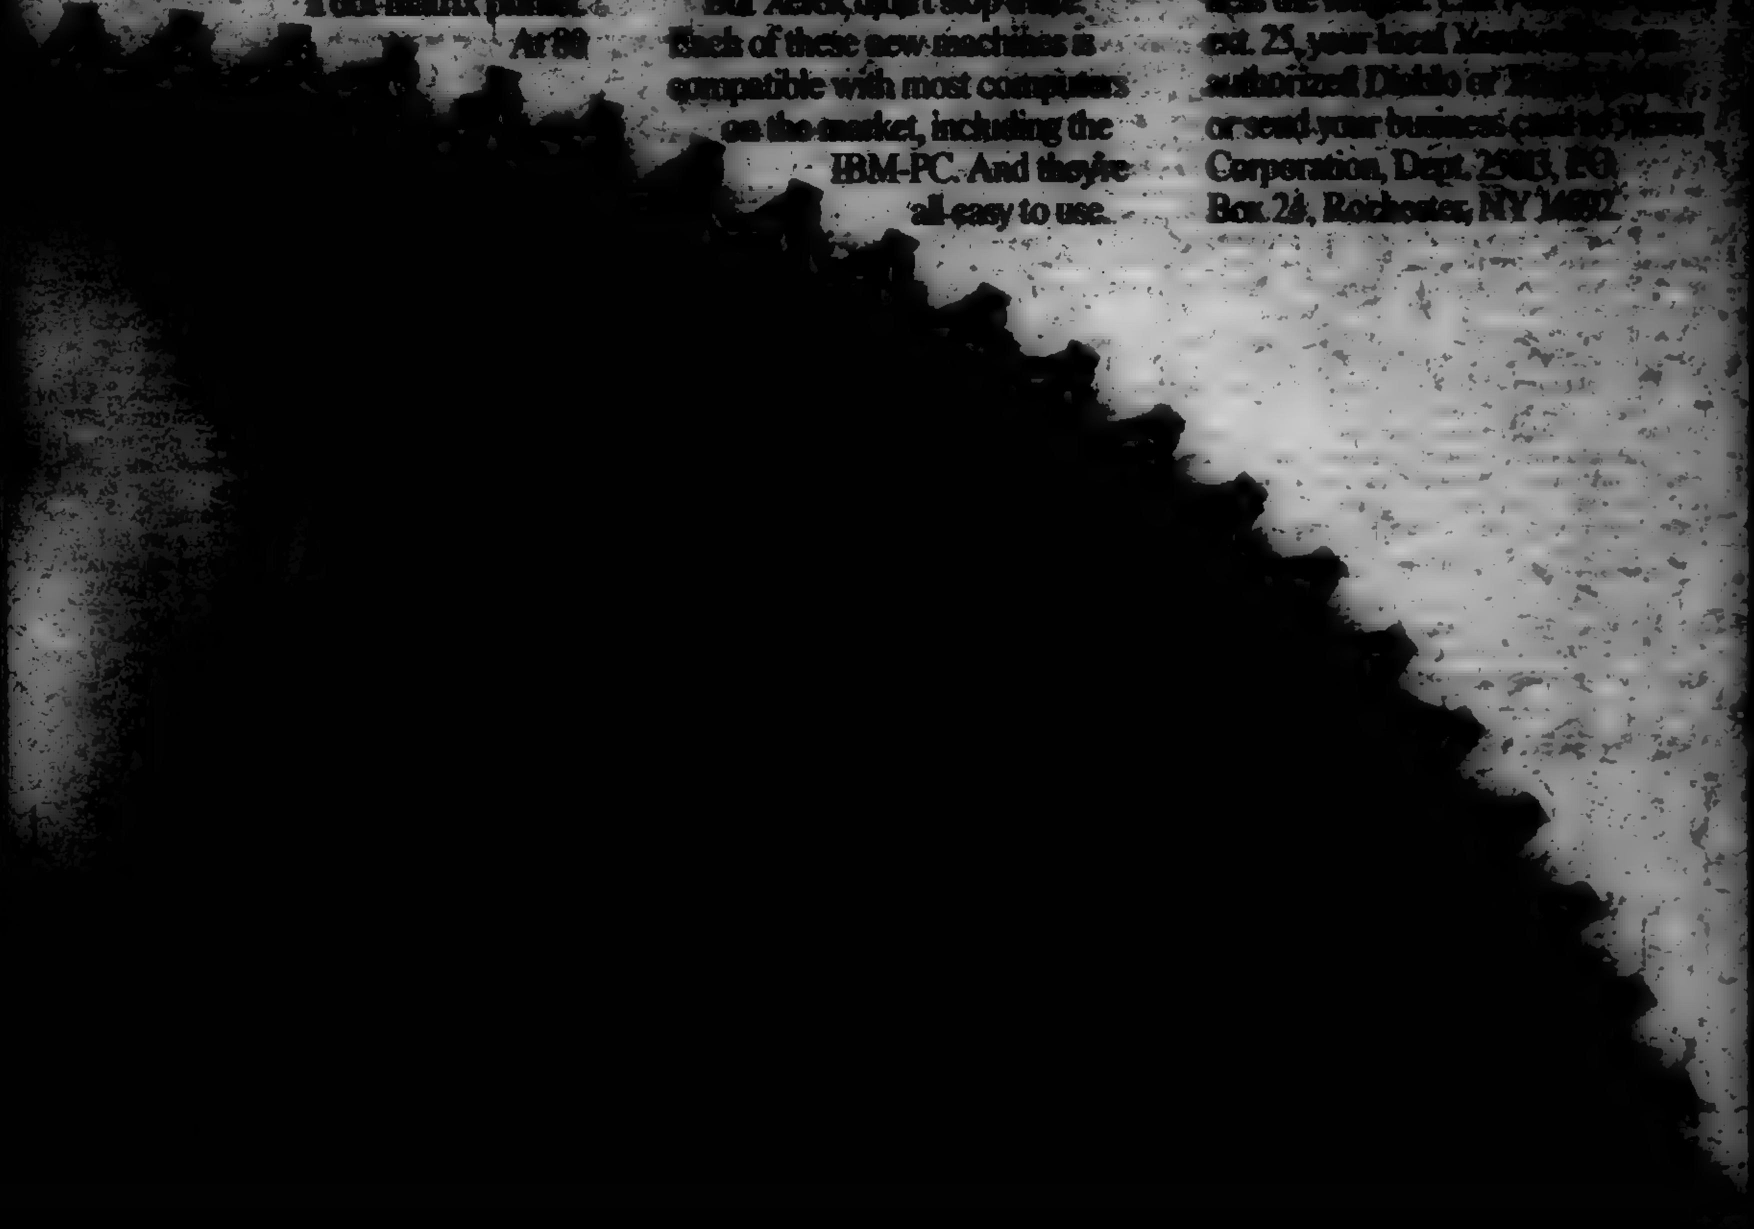
At 80 c.p.s., the D-80IF is the fastest daisywheel printer ever made by Xerox. It has a built-in double bin sheet feeder. As well as the capacity to handle up to 16 computers at once.

And the D-36 spells reliability. It averages 4,000 hours of printing between maintenance calls.

But Xerox didn't stop there. Each of these new machines is compatible with most computers on the market, including the IBM-PC. And they're all easy to use.

They're also a part of Team Xerox, so they can be serviced by the national Xerox service force and authorized [illegible] tions across [illegible]

So if you're [illegible] for the latest [illegible] wheel printing technology [illegible] the people who've [illegible] ness the longest. Call 1-[illegible] ext. 25, your local Xerox [illegible] an authorized Diablo or Xerox [illegible] or send your business card to Xerox Corporation, Dept. 2503, P.O. Box 24, Rochester, NY 14692.



Then pull out the list of system benefits that you made at the start of the project and put your boss on the spot to make a change. Get your boss to choose what to excise from the system, and negotiate with end users to reach a compromise.

If, after a new list of benefits is developed and a new cost estimate made, the system is not deemed a wise idea, only then can the project be canceled for a good reason. In addition, you won't have to make such an important decision unilaterally.

For whatever reason, if you are forced to accept an unrealistic deadline, consider asking to be reassigned to another project. Whenever one manager I know is in this situation, he says to his boss, "If you think the project can be done in half the time that I estimate, you may be a better person for this job."

At the very least, carefully and unemotionally document your views and underlying reasons to your management and explain the situation to your staff. Otherwise, you stand to lose the respect of your staff, your peers, your management and your end users.

Saying no to bosses or to end users takes a lot of moral strength and courage. But stand firm. The manager of one disastrous project told me that the catastrophe taught him an important lesson: A project manager must always stand up for what's realistic, despite the inevitable managerial inquisition that ensues.

Legitimate deadlines

Some deadlines are legitimate because they are based on the fact that a project completed before a certain date is worth considerably more than if it is completed some time later. The total lifetime value of any system to its users depends upon when it is delivered. The later the system is delivered, the less the total amount of benefit it will produce for the users over its working life.

However, this decline in total lifetime value is relatively slow. If you deliver a system to its end users in 1985, for example, it may save them $5 million over its lifetime, but the same system delivered in 1986 may save them only $4 million.

The concept of decreasing value is represented in Figure 2. One line in the figure represents the cost of building a system, which increases as a linear function of the time required to build the system. The other shows decreasing value over time.

As these lines indicate, you can't wait forever to deliver a system. Once the two lines in the graph cross, the system costs more than it is worth. However, even when a project reaches that point, canceling it may be foolish, since installing the partial system would presumably cut the end users' losses. Much depends on how near the project is to completion.

Incidentally, the effect of reducing the quality of a system is to decrease the value to the end users of the system over its lifetime. The value may sink because the system doesn't provide many functions, because it's difficult to use, because it's expensive to operate, because it's expensive to maintain or because of any other deficiencies. So, if you opt for lower quality, you are forced to complete the project quickly. You have less room to maneuver; the point where the lines cross approaches very soon.

MITCHELL J. HAYES

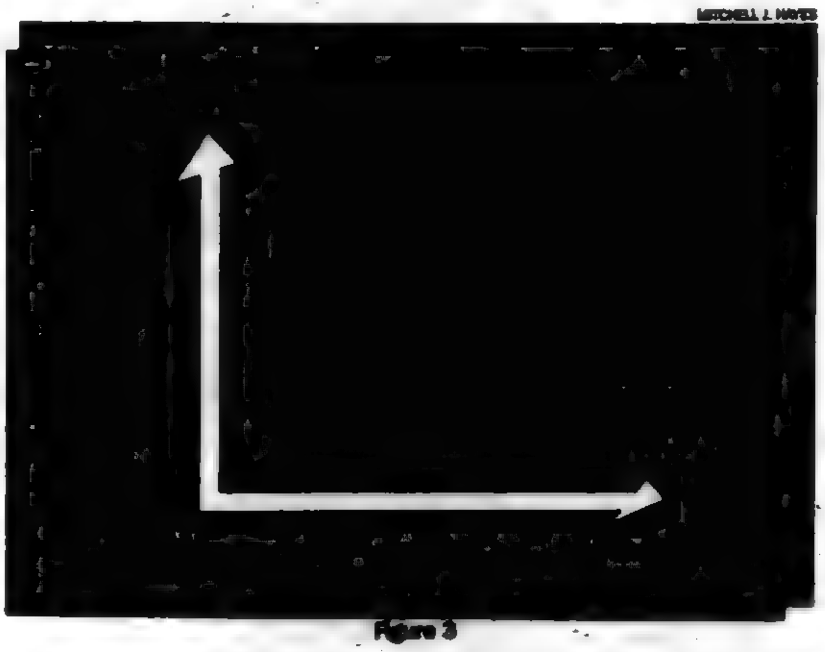

Figure 3

Although it makes little difference in the overall benefit of most systems whether they are delivered one day or the next, there are exceptions.

Horseshoes and hand grenades

One such system was an automated flood-warning system, dubbed Noah. The automated system would replace a fairly good manual system that consisted of many sensors placed in major rivers and their tributaries. These sensors measured river height, water volume per second, local rainfall and so on. The information from the sensors was used to predict possible flooding and to activate flood gates in the affected areas.

One problem with the manual system was that bad weather made it dangerous to read many of the sensors. Another was timing: Humans had trouble interpreting all the rain and river data in time to do anything useful.

The manual system typically provided four to six hours' warning to open certain flood gates and to evacuate designated areas. With the automated system, the information would be fed into a computer for quick analysis and then would give an expected eight to 12 hours' notice.

In the region of the country where Noah was to be installed, there were two primary flood seasons: one in November and December and the second in March and April. To gain the most benefit from the system, a deadline for installation of Nov. 1 was set. The project team installed the hardware by mid-October, had the hardware and software talking to each other during the last week of October and delivered the system on Nov. 1 as planned.

Natural test case

Unfortunately, there was no time to test it, except for the most straightforward test cases. About a month later, Mother Nature provided a boundary value test case by dumping three to five inches of rain in one day on the district covered by the sensors.

The system performed magnificently, indicating to the authorities which areas should be evacuated and when and advising the authorities to open the gates on river A to allow water to run off via river B. The authorities carried out the system's instructions with alacrity.

The first indication that something was amiss came from an old man who had lived his whole life on the banks of river B. He telephoned to say that the river was rising about a foot an hour and was already spilling over its levees in several places. He added that everything had been OK until "some darn fool opened the gates upriver." Fortunately, not much damage was done. The greatest expense was the evacuation of hundreds of families from areas untouched by floodwaters.

As you may have guessed, the system was close to being done but not quite close enough. The cause of the erroneous advice lay in program bugs. But these were bugs of the worst kind: They gave reasonable data that was dead wrong. The end users didn't trust the system fully for several more years, during which time a parallel manual system was also operated. How much money the automated system has cost the end users is not on record.

The value of this type of system can't be represented by a straight line, since the value falls sharply each year between the two flood seasons (Figure 3). But even in this case, setting any one of the steps on the value line as a deadline may prove to be a false goal. As always, the cost of a poor-quality system far exceeds the benefit of installing it before the apparent deadline of the flood season.

A compromise strategy

When such steps in the value line of a system occur, is there some way to take advantage of them without jeopardizing the quality and, hence, the benefits of the system? There is, since most systems are composed of subsystems that each have their own value and cost lines.

Implementing only part of a system is often a good way to avoid the full loss of system value on a certain date. If you identify a date as a possible deadline, first ascertain whether there is any significant advantage to delivering the system on or before that date. If there is an advantage, then determine the minimum portion of the system that can be implemented to accrue the maximum benefit.

Finally, plan a strategy whereby you can deliver the needed piece by the crucial date with the least possible risk to the project and to the final system. Four strategies can help develop the requisite pieces in time: incremental implementation, radical development, throwaway code and prototyping.

Incremental implementation

Incremental implementation simply means constructing a system gradually in pieces. First, a small working portion of the system is implemented; then the other pieces are added to the working portion, one by one, until the system is complete. Throughout its implementation, the system operates, and its functionality increases as pieces are added. Some versions of the growing system may even be useful enough to deliver to the end users.

To illustrate how you could exploit incremental implementation to deliver certain functions by a given date, let's return to the flood warning system. As the project manager, you might propose this as a feasible schedule:

Oct. 5 — Install rain gauges.

Oct. 17 — Install river sensors.

Oct. 20 — Connect gauges and sensors to the computer.

Oct. 26 — Add software to read and control gauges and sensors (call this subsystem one).

Nov. 5 — Conduct acceptance test of subsystem one.

Nov. 8 — Add software to predict flooding from river flow data (subsystem two).

Nov. 30 — Add software to predict river flow from rainfall (subsystem three).

Jan. 8 — Add software to compute best flood-relief tactics (subsystem four).

May 15 — Conduct acceptance tests of subsystems two, three and four.

This is not an ambitious schedule. By the beginning of the November/December flood season, only subsystem one is installed and tested.

In practice, each piece of software is not added all at once. Small pieces of code are added incrementally to the test system under a plan derived from the software design. In this way, system testing proceeds constantly on the gradually growing system.

Although this first piece of software is limited, it provides some advantages over the manual system. Much more data can be captured without personal risk, and the data can be continually checked for plausibility against some sample manual data.

While adding software subsystems two, three and four individually to the system, the project team tests them as thoroughly as possible. The objective of this testing is to detect errors in the design and programming of the software.

Acceptance testing doesn't take place until May 15, when a large amount of data can be compared with the actual fluctuations of the rivers over the period. In a system such as this one, the ultimate test of the acceptability of the system is whether its predictions are confirmed by reality.

This incremented implementation of the completed system doesn't seek to deliver as much software as possible, tested or not, by a certain deadline. Instead, it aims to deliver a system worth having, with some working parts in place at the beginning of flood season, even though the system cannot be accepted as reliable in its entirety until May at the earliest.

Radical development strategy

A second strategy to meet a deadline is radical development, which involves designing and implementing parts of a system without having completed the analysis of the whole system.

Radical development is a risky way to develop a system, because the analysis of the final portions of the system might require design and/or programming changes to the software already installed. Redoing work can be expensive.

There are three criteria for choosing when to use radical development:

- If there are functional pieces of the system that can be analyzed, designed and implemented reasonably by a certain date.
- If implementing those pieces of the system by that date brings substantial material gain.
- If enough analysis (in addition to that for the pieces being implemented) can be completed to minimize radical development because the method chosen is extremely difficult to manage and tends to reduce the quality of the system that is produced.

Other deadline strategies

Throwaway code is a third alternative: simply lash together some quick and dirty code as a temporary measure. This code could lack some desirable qualities, such as maintainability, but it must be correct. Of course, you should write as little of the dirty code as it takes to do the job, because this code will be replaced eventually by properly constructed code.

Prototyping, the fourth strategy, is similar to throwaway code as a solution to meeting deadlines in that it produces a temporary system. Prototypes are constructed from high-level languages, from data base query languages or by means of an application generator.

Such a system usually cannot be operated in production indefinitely because it may suffer from machine

> ”

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 198[illegible].)
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.
BIM-ODIS — Comprehensive problem analysis and display of operational CICS system. DOS and OS.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMWINDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
[illegible]DRV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMCNSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $[illegible], highest $[illegible]. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

Uptime

Provide 24 hour CICS access

CICS Dynamic File Allocation is a must for effective CICS scheduling. It is the gateway to non-stop, round-the-clock CICS systems. It eliminates batch update constraints. It guarantees bullet proof restarts. It allows you and your batch jobs to add and remove CICS files at will, without disrupting your user community. Site license $4,000.

Read JES Reports from CICS

Give your CICS terminals and PCs access to JES reports. Let end users (1) browse time critical reports, (2) control report distribution, and (3) schedule and submit their own jobs. The CICS Queue Command Facility (CQCF) is an efficient, cost effective tool for previewing and controlling JES II reports. Site license $3,000.

> *After a few months, nobody remembers if you made the deadline. But if you turn out a bad system, you keep getting phone calls from somebody who's mad at you.*

inefficiency, awkward dialogue, inconsistency with interfacing subsystems or poor long-term maintainability.

The third strategy, and the fourth to a lesser extent, need to be used with caution since each involves throwing something away. Unfortunately, "temporary" has a way of becoming "permanent," as in Europe, for instance, where temporary housing built shortly after World War II is still occupied.

It's the same way with code. Once the code is up and running, people tend to gloss over how bad it is in order to push on with the next pressing problem. The quick and dirty code becomes older and dirtier and becomes someone's nightmare in perpetuity. The only right way to install throwaway code is to have a plan that dictates how to develop its replacement and when to discard it.

Big risk, small payoff

The deadliness of deadlines takes effect in three ways: by destroying the project manager's control of his project; by ruining the quality of the project's deliverables; and by demotivating project staff.

But professionals continue to believe in the magical quality of deadlines. A talk that I once gave on abolishing deadlines was followed by silence punctuated by nervous shuffling of feet and embarrassed coughing. After all, I'd just proposed to demolish the one abiding custom for managers in this ever-changing world.

Eventually, a question was voiced: "Haven't you heard of Parkinson's Law, which states that work expands to fill the time available? If you take away the deadline, the project team will lose all incentive to work, and the project will go on forever."

In advocating the removal of monolithic deadlines, I'm certainly not proposing to remove every deadline and thus have every project expand infinitely. Nor do I recommend that a project be allowed to continue indefinitely in the futile promise of some forthcoming gem of perfection. A project must be conducted under the firm regimen of a project plan, with the staff completing tasks on time. If schedules for tasks slip, you must know the reasons why. If the reasons are valid and the delays unavoidable, let the schedule slip.

Obviously, you should try to minimise such slippage as much as you can. Since you shouldn't run a project like a leisure resort for team members, you're certainly justified in applying extra pressure occasionally to get the job done. But to take the rigid line that no project slippage beyond the deadline is permissible under any circumstances is ridiculous. You cannot simply ignore perturbing factors that change the project plan, and such managerial inflexibility results only in casualties to your project team and to the project itself.

Meeting a deadline for its own sake is often a gamble, with quality as the stake and precious little as the payoff. One of my seminar attendees put it well when she said, "After a few months, nobody remembers whether you made the deadline or not. But if you turn out a bad system, you get a phone call three times a week forever from somebody who's mad at you." Or as Thomas Jefferson said, "Delay is preferable to error."

Your network is much more than the sum of its parts. So Teltone offers you more than just parts of networks.

Multiplexers Configured to Your Applications

[illegible]

Multiplexers are rapidly becoming indispensable in today's data networks, so it's no wonder there are so many on the market. How does a network designer or manager decide which mux is best for what job? It's not easy—especially since the more powerful ones can be difficult to configure and install. May we offer our assistance? When you do business with Teltone, you'll get top quality products plus the applications assistance and service support you need. We don't just sell multiplexers, we engineer systems to work in your environment by providing hardware and software configuration, solutions to interfacing problems and more. We'll help you take full advantage of products like our M-86I packet switching mux, for example. Designed for use in both local and distributed networks, the M-86I is an economical and flexible way to link multiple terminals with multiple hosts at multiple sites. With an aggregate input rate of 307.2 Kbps, it works over voice grade lines, satellite and DDS circuits. Features include user-directed host selection, individual or group port contention, switched or permanent virtual circuits; BISYNC and SDLC/HDLC support and authorized access via any network connection. Used in combination with our M-860 statistical multiplexers and DCS-2 data/voice distribution system for local concentration, the M-86I can do a great deal to drive down the cost of communications. Want to hear more? Teltone has offices with applications support nationwide, and we'd welcome a chance to communicate with you.

Why you should never commit to a database management system without test driving the product.

There's only one way to evaluate the performance of a fourth generation language database management system. Test drive it. Put it to work developing applications for actual problems.

When you do, you'll find that no other 4GL/DBMS can beat NOMAD2. The power and richness of its language let you conquer the toughest applications with ease. And its ability to interface with your existing databases lets you read files as well as write data with barely an effort.

We're willing to run NOMAD2 through whatever obstacle course you care to set up. And against whatever products you select for comparison. Because in a comprehensive test drive situation, not only will NOMAD2 get applications up and running fast, it will leave the competition in the dust.

NOMAD2, which runs on your mainframe or ours, is another step in the NOMAD evolution that began in 1975. For information write Roger Cox, D&B Computing Services, 187 Danbury Rd., Wilton, CT 06897. Or call (203) 762-2511.

By Isaac Kong

3270 communications are in vogue among end users needing access to mainframe data. As DP management becomes more involved in the selection of links, solutions involving remote job entry may come out on top.

Micro-to-mainframe communications is a hot topic among end users throughout the industry these days. It is also an area gaining increased attention from data processing and MIS management, whether by choice or by "force" through rising end-user demand.

Newcomers to the field will quickly notice that in those installations where remote personal computers have already been linked to host systems, 3270 communications is the preferred method so far. In fact, the marketplace is currently bursting at the seams with emulation products that promise to turn the lonely personal computer into a communicating, file-transferring 3270 terminal stand-in.

To DP managers who have retained some perspective, it may seem strange that 3270 communications have gained an upper hand over remote job entry (RJE), the method originally developed by IBM to transfer bulk files between a host system and a remote device. Most people familiar with data communications from the mainframe end would agree that RJE is more efficient than the interactive 3270 protocol for file transfer applications.

So why has 3270 prevailed? A number of reasons apply, but most of them stem from the fact that the end-user community is most familiar with data communications from the terminal end. To date, the implementation of micro-to-mainframe communications have been driven by the end-user community, not by the DP shops, and historically, end users have preferred 3270. But by so doing, the most efficient way to transfer files has been somewhat neglected.

This situation is about to change, however. DP centers have always chosen RJE to transfer large amounts of data. As DP managers become more involved in evaluating and selecting micro-to-mainframe communications products, the tide is likely to shift toward RJE-implemented solutions. As increasingly sophisticated micro-to-mainframe applications are developed, RJE's advantages should become more evident.

Personal computer users currently prefer 3270 communications because so many of them are familiar with the protocol, having used 3270 terminals in the past for mainframe access. As long as current emulation products simply "turn a personal computer into a 3270 terminal" as the advertising says, there would seem to be no reason to change protocols.

However, there are good reasons to consider change. Micro-to-mainframe communications is an evolving applications area. The simple 3270 emulator is rapidly being replaced by micro-to-mainframe links that integrate the emulation function into the personal computer application itself. With these links, the actual communications process is transparent to the end user, who only interacts with his personal computer applications program.

Factors no longer apply

Thus, the primary factor for choosing the 3270 protocol — the fact that the user is familiar with the process — no longer applies. Once micro-to-mainframe communications become a user-transparent feature of the application, network implementers and designers will be free to use the most efficient file transfer mechanism available: RJE.

After all, the 3270 protocol was developed by IBM for on-line, interactive inquiries by a dumb terminal. Personal computers, of course, are intelligent devices that should not be demoted to dumb devices. Furthermore, if a micro application requires mainframe data, it typically needs to receive complete files, whereas 3270 communications were developed to send single pieces of information in answer to simple inquiries.

The historical context that has shaped the current evolutionary stage of personal computer communications illustrates the point even more clearly.

The 3270 protocol was initially designed by IBM for on-line, interactive mainframe communications with nonintelligent terminal devices. Local 3278 or 3279 terminals were hard-wired to the mainframe

---

Isaac Kong is president of Network Software Associates, Inc. in Irvine, Calif. In 1977 he became the first to implement SNA communications outside of IBM.

via a special controller. In addition, 3270 terminal clusters could be installed in remote locations and query the mainframe over telecommunications links.

Needed: more data

As users began expanding the applications for 3270 communications, requiring the transmission of greater amounts of data, the 3270 data stream proved inadequate to handle the increased requirements. Therefore, IBM gradually enhanced the data stream and eventually bypassed it altogether with a new 3270 feature called Structured Fields.

> ”
>
> *The 3270 protocol was deemed the solution to mainframe access needs — never mind that it was grossly inefficient at transferring large files.*

This feature lifted the limitations on how many control characters could be embedded in the data. A special character signaled that the characters that followed were more control characters, not data. Thus the terminal gained more control over the data it received and could operate more efficiently.

However, most 3270 emulators available today for personal computers do not use Structured Fields. They rely on the 3270 data stream to transfer files, which is something the protocol was never designed to do.

Moreover, to use the 3270 protocol at all for bulk data transfer, a separate mainframe program product must be purchased to run under CICS or TSO. Such software products are not part of the standard package. They are available from IBM and other suppliers, but incompatibility problems can arise with some of these outside alternatives.

The Personal Computer

When IBM developed the Personal Computer, it was a totally end-user-oriented product from the very start. It was even designed by an end-user-oriented development group in a totally new division — the Entry Systems Division (ESD).

Once the Personal Computer gained widespread acceptance by the end-user community and these end users began demanding access to centralized mainframe data, it is not surprising that 3270 communications was what came to mind first.

It should be noted that IBM offered both RJE and 3270 emulation for the Personal Computer. However, due to prior familiarity, 3270 was embraced by the end-user community, while RJE was not. The 3270 protocol was deemed the perfect solution to end users' mainframe access needs — never mind that it was grossly inefficient at transferring large files.

RJE, on the other hand, was designed by IBM to do exactly what most users really want from a micro-to-mainframe link: bulk data transfers.

The obstacle to RJE's acceptance at that point was a lack of visibility. After all, RJE was something that belonged in the domain of the DP department. Even though RJE was available for the Personal Computer, end users did not understand its benefits and opted for a 3270 solution.

To understand the underlying superiority of RJE, one needs to trace some additional history. In the early days of mainframe computers, all I/O to and from the mainframe was accomplished via punched cards and printer output. The system software drivers for card readers, card punchers, printers and so on were very slow because a lot of processing had to be done "on the fly."

System changes

Under the OS mainframe operating system, the Hasp subsystem was developed to spool these card and print images onto disk and thereby speed up the entire I/O process.

As an alternate solution to the I/O bottleneck, the Asymmetric Multiprocessing System (ASP) was developed to couple two or more mainframes together. One handled the I/O functions while the other or others handled the "number crunching."

OS underwent a number of

HOW TO

> *Under RJE, IBM provides everything required to implement the link from the mainframe side. A complete set of systems utilities enable the host to read files from a remote personal computer or to write files out to the remote device.*

changes and ultimately gave rise to the MVS operating system. Under MVS, Hasp evolved into a new product called JES2, while ASP evolved into JES3. Both expanded the concept of off-loading mainframe I/O functions.

In contrast to Hasp, which was a separate subsystem, JES2 and JES3 were integrated into MVS itself, taking over some of the system tasks normally performed by the operating system.

Under IBM's other mainframe operating system, DOS, the Power subsystem was developed to provide JES-like functions on DOS systems.

With the later introduction of IBM's Systems Network Architecture (SNA) and IBM's implementation thereof, called Vtam, support was provided for the remote entry of jobs, appropriately dubbed RJE by IBM. The concept of I/O off-loading had now spread to incorporate remote I/O devices.

RJE was initially used by such remote devices as the IBM 2780, the IBM 3780 and the IBM 3770, which were bulk card- and report-transfer devices. These terminals used RJE to communicate with JES2 or JES3 (under MVS) or with Power (under DOS).

Later, RJE was further enhanced to minimize transmission time. IBM added other features such as data compression and compaction to RJE, greatly increasing overall transmission throughput.

The net effect of this evolutionary process is that RJE has as its roots a batch process, not an interactive one, since the transfer of bulk files is a batch operation. It is important to understand that IBM essentially had two parallel evolving "product lines," 3270 for interactive applications and RJE for bulk transmissions.

Via JES2, JES3 or Power, bulk files can now be transferred from a remote personal computer to the host or vice versa. The personal computer must, of course, be equipped with an emulation package so that it appears to the host as a standard RJE workstation, just as a personal computer must emulate a 3270 device for 3270 communications.

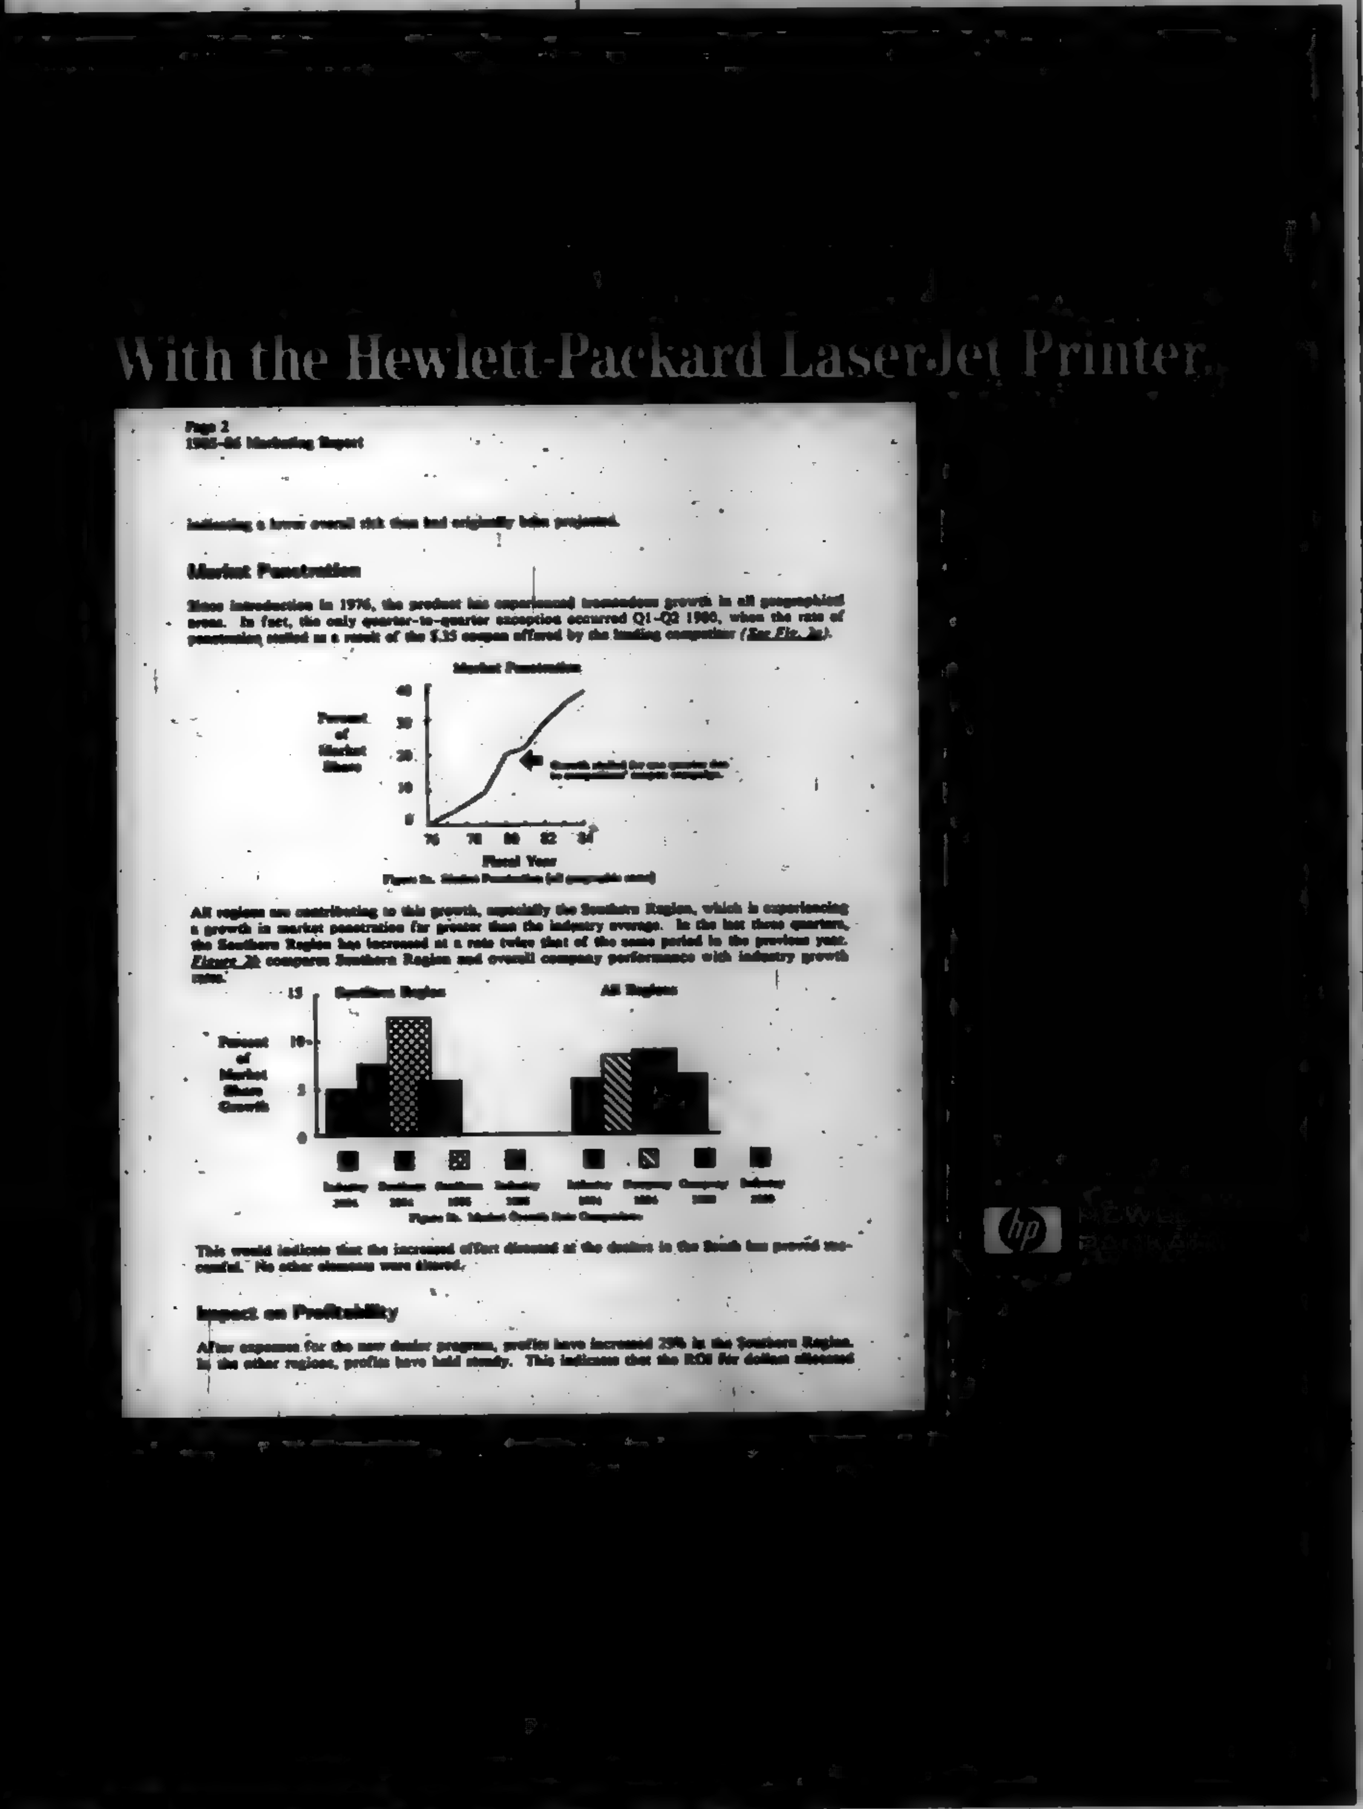
An important difference is that under RJE, IBM provides everything required to implement the link from the mainframe side. A complete set of systems utilities enable the host to read files from a remote personal computer or to write files out to the remote device. One example is the Iebgener utility, which will move a file from source to destination.

These utilities are available as standard features in most IBM mainframe installations. Under MVS, JES2 itself is a standard feature of the operating system, not an option. The 3270 file transfer requires optional program products on the host.

Mini-to-mainframe

It is interesting to note that in the area of minicomputer-to-mainframe communications, RJE solutions are more often used. IBM's 8100 and 4300 series, Series/1 and System/34, 36 and 38 are all set up to use RJE for mainframe communications tasks.

Within IBM, minicomputers fall under the Systems Products Division, which never has been allowed the freedom or entreprenurial orientation found in the heyday of ESD. ESD was allowed to go in its own direction, and hence the Personal Computer (and the third-party products developed for it) was driven by end-user demands rather than DP management demands or, for that matter, Big Blue's guiding hand.



With the Hewlett-Packard LaserJet Printer,

Page 2
1985-86 Marketing Report

Market Penetration

Impact on Profitability

> ”
>
> *More RJE emulation products will become available as micro-to-mainframe applications become more powerful and as DP departments take a more aggressive role in the evaluation and selection process.*

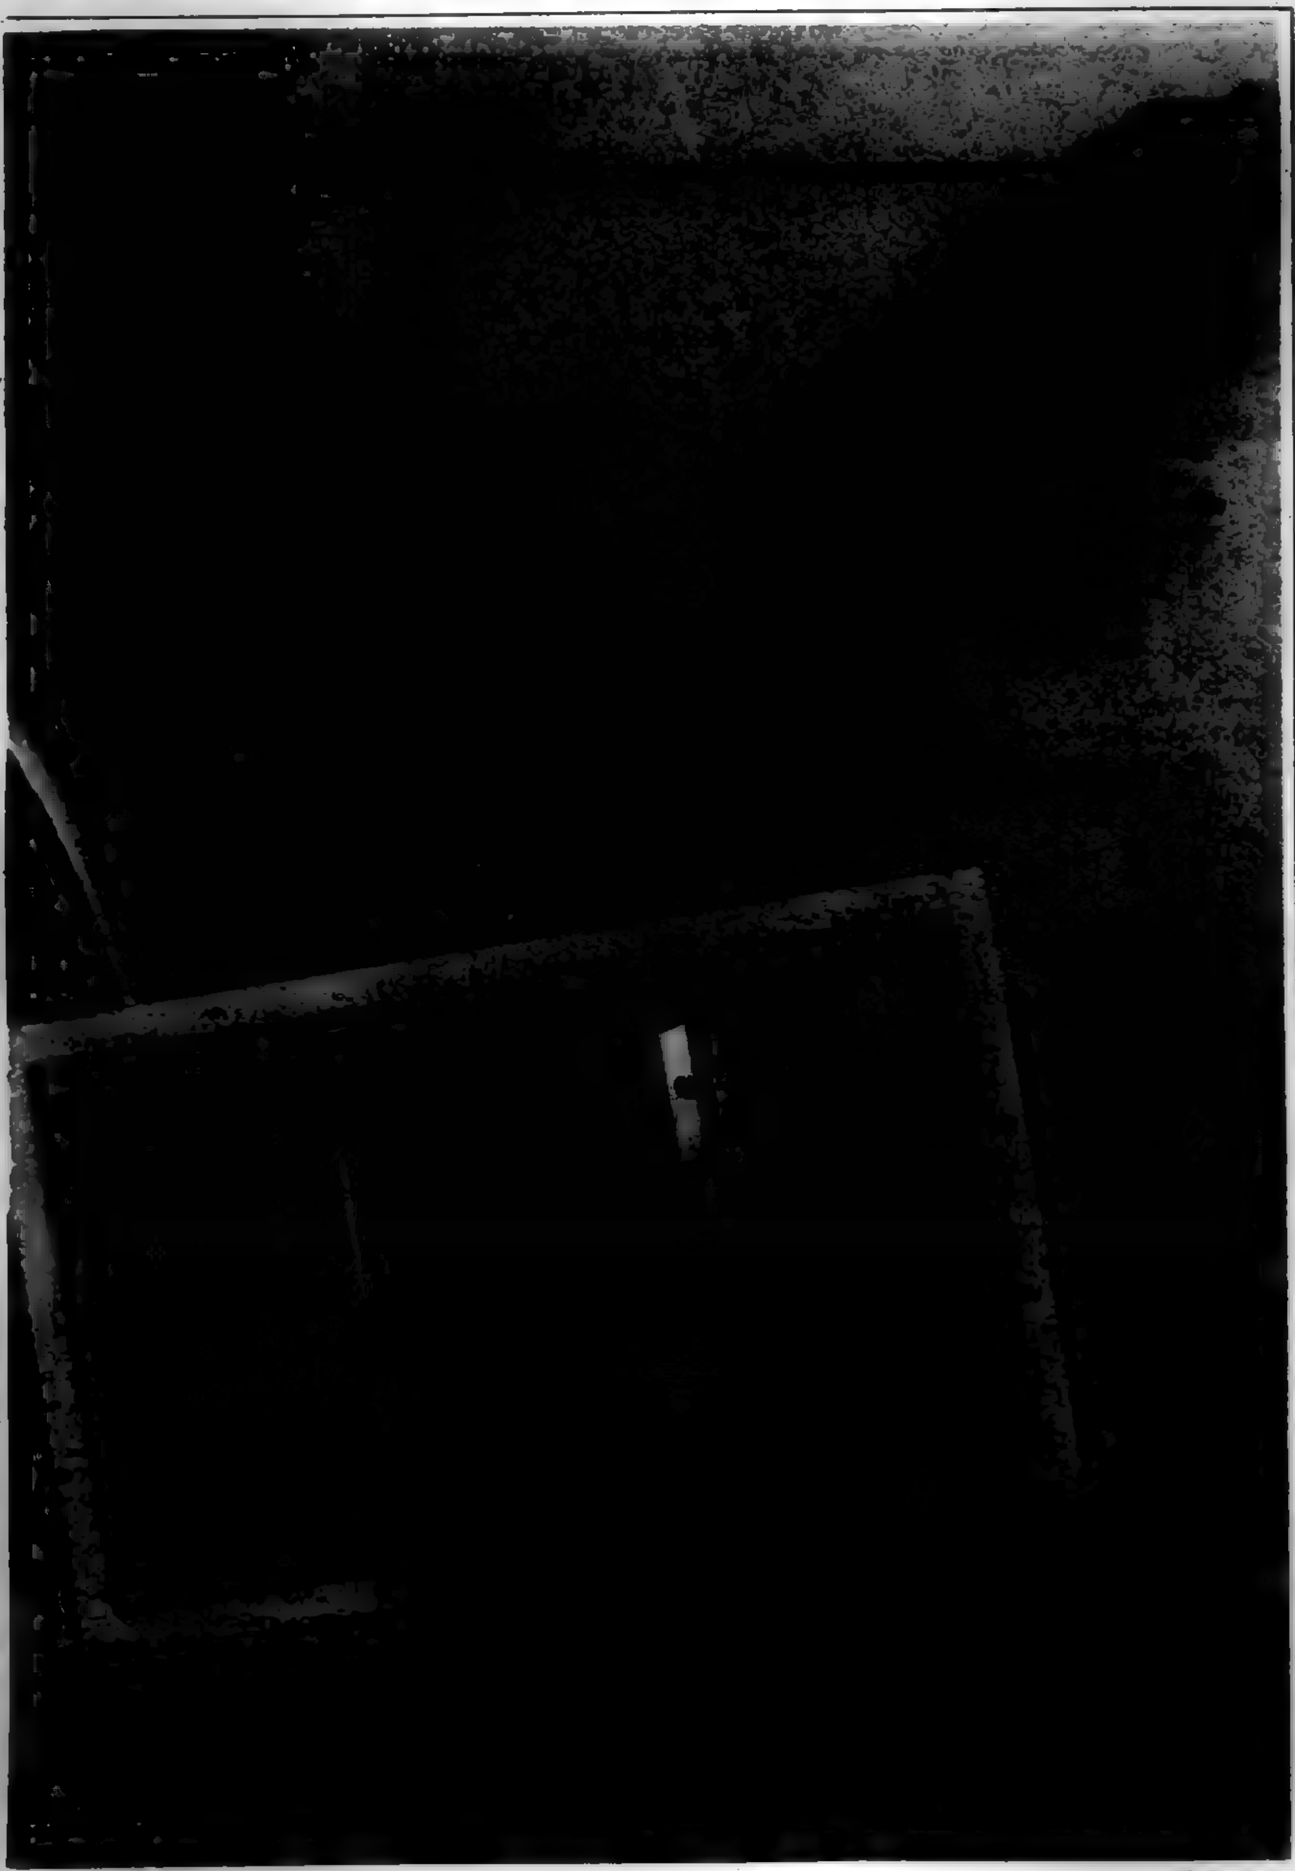
Therefore, minicomputers tend to communicate with the host via the RJE protocol that management prefers, while personal computers often use the 3270 protocol that end users demand.

As the Personal Computer family becomes more powerful and continues to take over applications traditionally reserved for minicomputers, it will increasingly take on a minicomputer's functions and characteristics. These traits include the minicomputer's method of communicating with a host installation, implying once again an overall swing toward RJE.

An important related development affecting the future of micro-to-mainframe communications lies in IBM's introduction of Logical Unit 6.2 (LU6.2). This SNA feature has received much press attention lately, but in terms of solving today's problems, it is not yet a viable alternative.

The LU6.2 specifications include the capability for a very high level of integration between the personal computer and the host in a micro-to-mainframe link. With LU6.2, a personal computer program will be able to exchange information with a host by updating or extracting only those data elements that are needed. Thus, the applications will no longer require complete file transfers.

Today, however, LU6.2 is only a pipeline between the host and the personal computer. The program products needed on each end of the pipeline to drive the extraction process are not yet available. Therefore, while DP management needs to plan toward LU6.2 solutions, all the pieces are not yet in place. Most industry experts predict that such program products are some time away from being generally available.



RJE solutions

In meeting today's challenges, then, it appears that DP management will increasingly look toward RJE solutions. Predictably, more and more RJE emulation products will become available for the Personal Computer family, as micro-to-mainframe applications become more powerful and complete and as DP departments take a more aggressive role in the evaluation and selection process.

As the awareness level concerning the need for more efficient file transfer capabilities continues to rise, vendors will undoubtedly develop ever more sophisticated RJE packages for personal computers. And this surely will help the personal computer live up to its potential as a powerful distributed processing machine.

Under RJE, personal computers remain peers in a network of intelligent devices, able to off-load the mainframe effectively. They are not reduced to merely emulated dumb terminals, contributing to the workload of the host while delivering little if any network functionality.

When this last evolutionary step occurs, the personal computer will finally become an organizational productivity tool in addition to its already proven abilities as a personal productivity tool.

Minicomputers adapting to users' needs

Size, ready-made components key to success

By Tom Henkel
Special to CW

Minicomputers have proven to be about as adaptable as the cockroach when it comes to surviving in a sometimes hostile environment. Said to have been bordering on extinction for at least five years now, minicomputers — even some of the traditional 16-bit variety — continue to thrive.

Perhaps two of the best examples of the ability of minicomputers to survive are the top-selling versions of the 16-bit genre of systems — IBM's Series/1 and Digital Equipment Corp.'s PDP-11 series. Both systems, still being manufactured, have been around for nearly 15 years. But a side-by-side comparison of the original PDP-11 and Series/1 models with those currently available from DEC and IBM would reveal that, from a design standpoint, the name tags are probably the only thing the machines have in common.

Miniaturization has allowed both IBM and DEC to reduce the size of the systems. Furthermore, both companies have been able to consolidate what used to occupy several CPU boards down to one CPU chip. Consequently, each manufacturer has been able to develop modern systems that take advantage of nearly 15 years' worth of software development and specialized peripherals.

Moving toward compatibility

A closer look at current minicomputer architectures will also reveal that vendors are placing more emphasis on compatibility with industry standards. Minicomputers grew out of the days when manufacturers strove to design unique system architectures that tended to lock the user into one product line. Today, most small systems manufacturers push for compatibility with as many industry standards as possible and try to use off-the-shelf components when possible.

While any salesman worth his salt will tell you this change was brought about by the vendor's concern for the user's migration path, the underlying reason is largely economic.

The research and development and manufacturing costs associated with a system using a unique CPU and operating system are prohibitive for most manufacturers — especially small systems makers concerned with keeping production costs to a minimum. However, the use of off-the-shelf components has become popular with larger manufacturers as well. Larger companies appear to be funneling development money for enhancement of larger systems, while acting, in essence, as systems integrators on smaller units. Again, this approach keeps development costs low, and the vendor can use the benefits of volume components purchases to reduce end-user costs. Basically, small systems have become a commodity to many manufacturers.

IBM, for example, has used this technique on the Personal Computer. There is little in the Personal Computer, other than IBM's expert marketing talent, that is homegrown. IBM instead has channeled its R&D efforts to larger, potentially more profitable projects such as the 3090 series of mainframes announced this past February. Burroughs Corp. has employed a similar technique. In the past year, Burroughs has staged an internally driven redevelopment of its upper end systems by announcing the A 3, A 9 and A 15 series of processors. But it relies heavily on Convergent Technologies, Inc. for its low-end systems.

This trend toward off-the-shelf components has, in a way, left minicomputer development in the dust. Microprocessors are so inexpensive, and lately, with powerful products like Motorola Corp.'s 68020 and National Semiconductor Corp.'s 32032, the need to stage an internal development at the low and mid range has become less profitable and therefore less desirable. But the trend has also opened a window for start-up companies.

Clearly, if IBM can buy microprocessors from Intel Corp., any number of smaller companies can do the same. Consequently, any successful small system produced by a major vendor is quickly followed by a slew of look-alikes from smaller companies. The end result seems to be a boom-or-bust sort of industry where in a relatively short time, perhaps a two- or three-year period, a product is announced, becomes successful and breeds a string of start-up companies making look-alike products. The market then becomes saturated with a given type of product and sales decline, forcing many companies out of business.

Henkel is a senior researcher at the Yankee Group, a Boston-based market research firm.

INDEX

Superminis are shifting away from their roots in science and engineering and expanding into office automation and distributed processing/SR/4

Pricing and software availability are helping to boost supermicrocomputers in minicomputer markets/SR/8

Multiprocessing and parallel processing are not one and the same but rather related steps in the evolution toward greater processing power/SR/10

Programmers who work for a Nasa contractor increased their efficiency and gave end users better response times after they began programming CICS mainframe applications on a minicomputer/SR/12

Software developers for a county agency switched their departmental computing from a traditional mini to a network of 32-bit processors to find the right host for their work/SR/14

A small Canadian college has configured and tested an impressive dual network of minis and processors that administrators hope will hold up under students' unusual demands/SR/14

When choosing a small business or departmental system, managers should closely compare supermicrocomputers and minicomputers/SR/18

IBM now faces the decision of how to balance its minicomputer and microcomputer lines, and as a large-scale player in both markets, its choices will not be easy to make/SR/20

In lieu of efficient micro-mainframe links, departmental minis can meet micro users' needs for access to CPU data/SR/22

A life jacket manufacturer kept up with 40% annual growth and improved its efficiency when it switched from manual to automated production tracking/SR/24

Ten trends are expected to emerge in the Unix marketplace as the operating system becomes an industry standard/SR/26

Third-party service organizations can help users solve the problems associated with maintaining mixed-vendor minicomputer configurations/SR/28

Judging maintenance needs and finding a firm to address them at the right price is a difficult goal/SR/31

A law firm uncovered guidelines for implementing automated systems as it brought up a Unix-based, multiuser system to replace its manual procedures/SR/32

WHY THE #1 COMPANIES HAVE CHOSEN THE #2 FAULT TOLERANT COMPUTER COMPANY.

America's largest car makers, banks, brokerages, and some of the U.S. government's key installations have chosen to depend on Stratus Computer, Inc. for their newest, most critical on-line applications. Even the world's largest computer companies have put their names on Stratus fault tolerant computers.

Why was Stratus picked over its larger fault tolerant competitor? It is because Stratus has quickly proven that its hardware-based fault tolerance is the superior approach to reliability. It is because Stratus computers have demonstrated outstanding throughput and expandability for large-scale networks. It is because of Stratus' ease of programmability, its range of software, its innovative service technology, its customer education.

It is for many reasons that all center around one word–reliability. Because after all, when you want to be known for reliability, you have to excel in everything you do.

As we move into an age of greater and greater computer dependency, many of the giants of business and industry are lining up with the one they have decided is better, Stratus. Apparently they prefer to do their thinking for themselves. Perhaps that's how you *get* to be a giant. For information call Peter Kastner in Massachusetts at (617) 460-2192, or toll-free at 1-800-752-4826. For a copy of our annual report, write: Marketing Communications, Stratus Computer, Inc., 55 Fairbanks Blvd., Marlboro, MA 01752.

CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

Superminis: Dynamic machines evolving to new uses

Moving into OA, distributed DP areas

By James Connolly

No one can say with certainty who coined the word "superminicomputer" and to what systems he meant it to apply, but a consensus is emerging that a supermini is nothing more than a minicomputer — a high-end mini, but a mini nonetheless.

A 32-bit architecture was a key qualification for supermini status back around 1977, when companies such as Digital Equipment Corp., Prime Computer, Inc. and Data General Corp. were introducing their first superminis. That architecture gave superminis more than twice the processing power of 12-bit and 16-bit machines.

"But supermini classification isn't a discontinuous event, just the high end of the market. It's a continuous process," according to Peter G. Jessel, director of business group planning for DG.

'Permeate the entire spectrum'

"If you were to use the 32-bit standard as the definition for a supermini today," he said, "it would permeate the entire spectrum of computers, from $10,000 to $300,000 or $400,000."

The supermini field — the world of high-end minicomputers — touches on the 32-bit supermicro class at its low end and reaches up toward the IBM mainframe world at the top. It is a constantly changing area. Supermini vendors have taken the lead, for example, in breaking out with new technologies such as parallel processing.

The market remains dynamic, despite the onset of industrywide consolidation, with new vendors introducing new systems and with superminis shifting away from their roots in the scientific and engineering fields and toward a future in office automation and distributed processing.

Office automation applications are the fastest growing in the superminicomputer field, according to a recent report by International Data Corp. (IDC), a Framingham, Mass., research firm. The IDC report, "Supermini User Software Trends: Past, Present and Future," said 21% of the supermini sites surveyed supported some type of integrated office automation in 1984. IDC expects that figure to rise to 40% by the end of 1985.

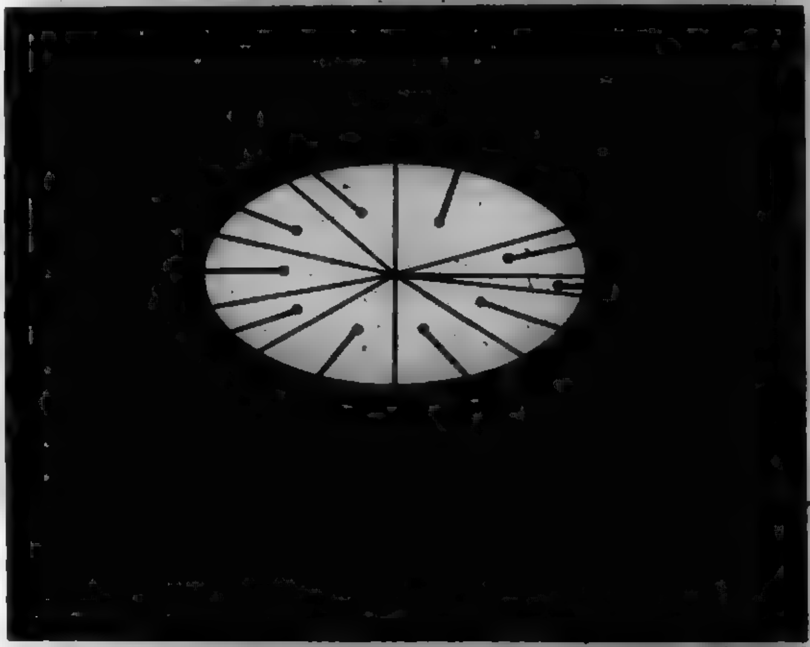
Accounting applications most common

In the study, IDC also found that the most commonly mentioned application running on superminis was accounting — cited by 20% of the respondents — followed by software development, word processing and industry-specific applications.

Most respondents also reported that they ran data base management packages on their superminis. The report noted that the spread of those packages may be the result of a trend toward bundling the software with the machines. Scientific and engineering programs, a prime market for the early superminis, were mentioned by only 10% of the respondents.

"Over the past few years the supermini market has pushed beyond its traditional boundaries," the report stated. "At one time, superminis were predominantly found in scientific environments; today, they also have a strong presence in the corporate world. With their increased power and flexibility, superminis are taking on the general business applications once handled by mainframes or minicomputers."

Jessel concurred that the supermini is no longer considered a strictly scientific or engineering machine. Examining DG's own plans, he said the three hot markets for superminis are distributed data processing, office automation and engineering. Even when a supermini is used as a high-performance workstation for engineers, he said, it runs office automation packages that support applications such as electronic mail and electronic calendars.



The most common application among supermini users is accounting, followed closely by software development, word processing and industry-specific tasks.

DG sees the distributed data processing and office automation fields as areas where companies can install superminis on local-area networks. Jessel said the superminis would act as file servers and host processors, with much of the processing power migrated to intelligent terminals and personal computers out on the network.

He compared that type of network, not yet common in the commercial data processing market, to the kind of networks technical users have relied on throughout the 1980s; engineers have been running complex calculations and simulations on supermini hosts while handling most of their preliminary work and input at the terminal level. Jessel added that many engineers still do not have high-performance intelligent workstations, which leaves a market open for companies like his.

Jessel parted ways with the IDC report, however, on the future of superminis as replacements for corporate mainframes. He conceded the large, centralized data base to the IBM world and said companies such as DG have their greatest potential where an organization can be defined hierarchically, with depart-

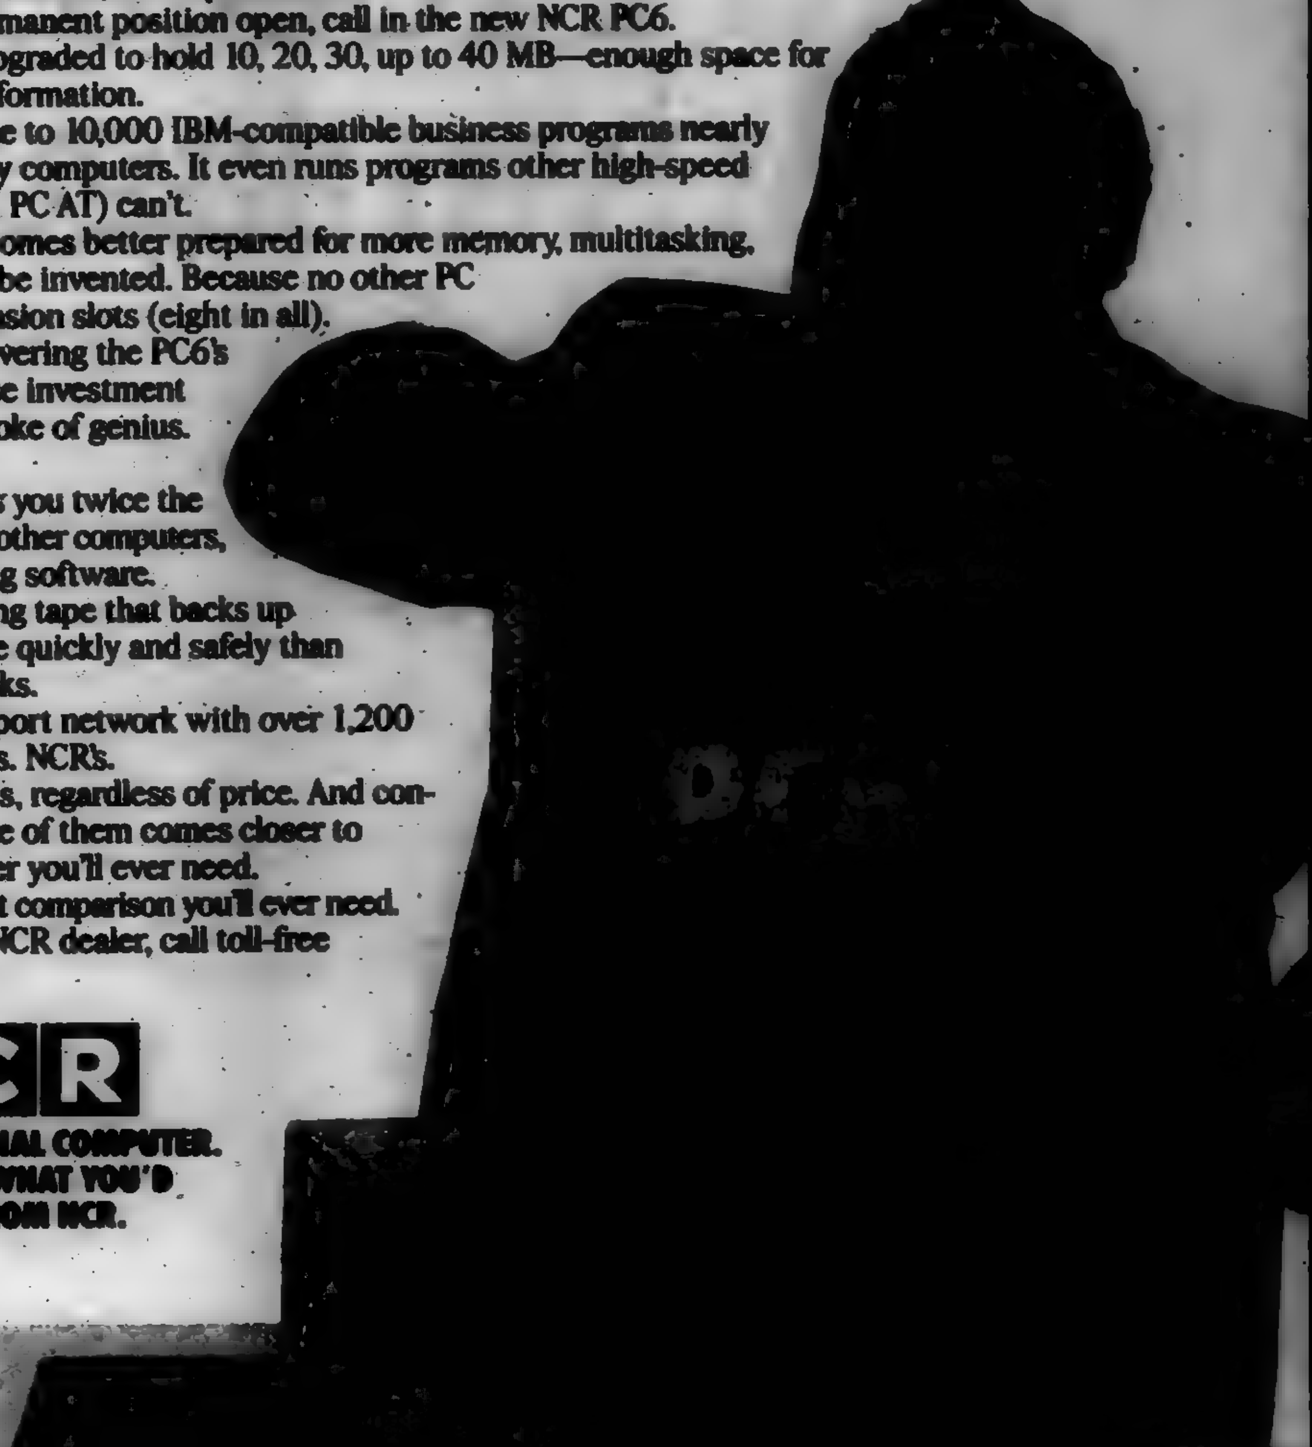
INTRODUCING THE ONLY COMPUTER YOU MAY EVER NEED.



The new NCR PC6.

NCR believes computers shouldn't be short-lived office machines, but long-term business partners. Expandable, not expendable.

If you've got a permanent position open, call in the new NCR PC6.

The PC6 can be upgraded to hold 10, 20, 30, up to 40 MB—enough space for 7,575 typed pages of information.

The PC6 runs close to 10,000 IBM-compatible business programs nearly twice as fast as ordinary computers. It even runs programs other high-speed machines (like the IBM PC AT) can't.

And no other PC comes better prepared for more memory, multitasking, and applications yet to be invented. Because no other PC comes with more expansion slots (eight in all).

As you keep discovering the PC6's qualifications, your wise investment keeps looking like a stroke of genius. To wit:

A screen that gives you twice the sharpness and clarity of other computers, even with all the leading software.

A built-in streaming tape that backs up important data far more quickly and safely than conventional floppy disks.

And a service support network with over 1,200 offices in 120 countries. NCR's.

Examine other PCs, regardless of price. And convince yourself that none of them comes closer to being the only computer you'll ever need.

It should be the last comparison you'll ever need.

For your nearest NCR dealer, call toll-free 1-800-544-3333.*

NCR

**A BETTER PERSONAL COMPUTER.
IT'S EXACTLY WHAT YOU'D
EXPECT FROM NCR.**

MULTIMATE® TECHNICAL REPORT

Nine Ways To Get The Word Processing Advantage.

2.

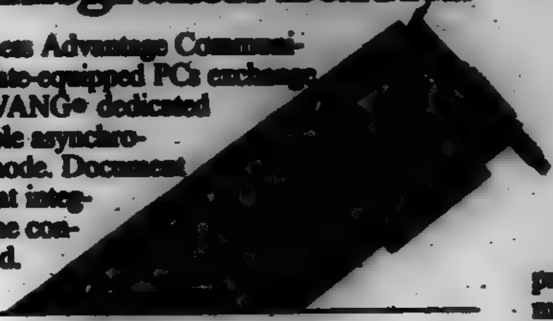
Make Keying Practically Effortless.

The MultiMate Business Advantage Keyboard brings the features of a dedicated word processing keyboard to your PC. Color-coded keys labeled with MultiMate commands. 22 additional programmable function keys for key procedures or text recall. Separate cursor controls and numeric keypad. The keyboard layout preferred by touch typists.

3.

Cross The Integration Barrier.

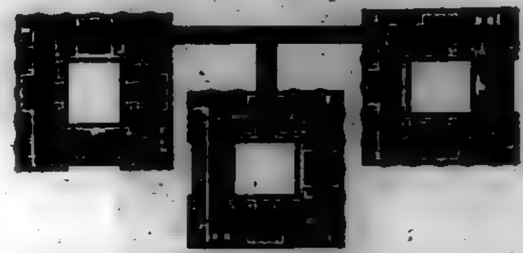
The MultiMate Business Advantage Communications Board lets MultiMate-equipped PCs exchange documents directly with WANG® dedicated word processors. Switchable asynchronous and bisynchronous mode. Document interchange with full format integrity and error checking. The conversion software is included.

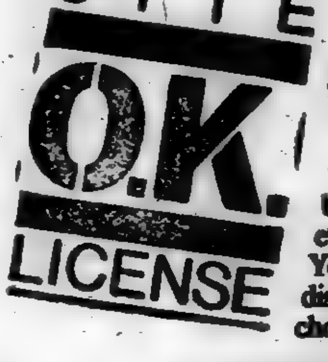


4.

Take Advantage Of Local Area Networks.

LAN versions of MultiMate Advantage and MultiMate 3.3 Series bring word processing to every desk. Hardware specific versions enhance IBM PC Net, 3Com™ and Novell/Netware 86™ LANs. Universal LAN version also available.





5.

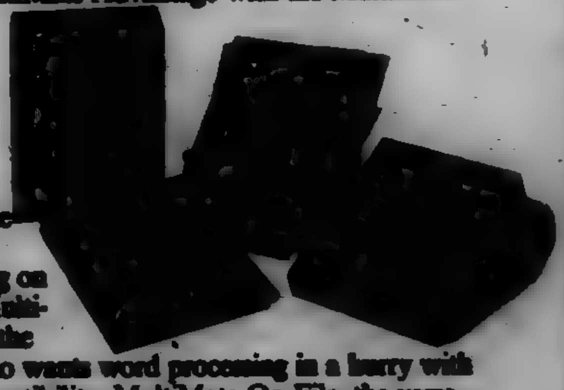
Save With Site Licensing.

For large scale users, site licensing brings MultiMate convenience to every desk at substantially lower cost. You can even duplicate your own diskettes and documentation if you choose.

6.

Pick The Total Solution.

Multimate has products for nearly all word processing needs. Combine MultiMate Advantage with the Multimate keyboard and communications board, and you've got a word processing system that's hard to beat. Or choose MultiMate 3.3 Series for heavy duty word processing on 256K computers. MultiMate Executive for the corporate leader who wants word processing in a hurry with full MultiMate compatibility. MultiMate On-File, the versatile information manager that handles almost any filing need. And Just Write,™ the word processor for the occasional user.



7.

Look To The Future.

MultiMate is moving up with word processing for the IBM System 36 and mainframes. And MultiMate for minis—all coming soon.

8.

Look For Excellent Support.

MultiMate's technical support is the best in the industry with on-line assistance available every business day. User newsletters and training programs, too.

9.

Call 800-842-8676 ext. 902

You'll get the good word on MultiMate products and services. Or send some words of your own to: MultiMate International Corporation, 52 Oakland Ave., East Hartford, CT 06108. In Connecticut call (203) 522-2116, ext. 902

Special Report

Supermicros sail into small-scale systems market

Pricing, software seen as advantageous

By James Connolly

Pricing and software availability are key advantages that supermicrocomputers — small, 16- and 32-bit multiuser systems — enjoy as they make inroads into the minicomputer market.

Those advantages are helping to squeeze the minicomputer from the low end, with superminicomputers applying pressure from the top. But while supermicro vendors steadily gain market share, even traditional minicomputer manufacturers have introduced their own supermicros, low-end minicomputers are still in use and still selling.

"Many applications are going to supermicros and machines like the [IBM Personal Computer AT] that used to go to the [Digital Equipment Corp.] PDP-11 type of machines. But, DEC still sells some PDP-11s," noted David Wilson, manager of the product research division for Future Computing, Inc., a Richardson, Texas, market research firm.

Another market research firm, International Data Corp. (IDC) of Framingham, Mass., estimated that the minicomputer and the supermicro will split the small-scale computer market for 1985, with the balance steadily shifting from traditional minis to supermicros until supermicros own 79.6% of the market in 1990.

IDC said the pricing battle in the early supermicro market appears over. "In the future, supermicros will move up dramatically in capability. The capability of future microprocessors will let systems support up to 16 users in a truly interactive environment," said the company in a recent report titled, "Supermicrocomputer Market."

Future Computing identified 100 supermicros in a recent study and defined them as having prices higher than $15,000 with hard-disk capacities ranging to 2M bytes and supporting up to 32 users.

Wilson said that a company looking for a new system to support eight to 16 users would find comparable performances between minicomputers and supermicros but that the cost advantages in supermicros do not always justify junking an existing minicomputer. That decision will depend on the individual company's situation, he said.

According to Wilson, the second major reason for the projected growth of supermicros is "software availability — there is a miniscule amount of software for minis because the manufacturers, for whatever reason, never adopted the types of standards that have been adopted in the micro world. The minicomputer vendors kept their proprietary operating systems and software." He noted that AT&T Unix is one of the few standards in the minicomputer market, and even that can be ported to supermicros.

Microprocessors aid market share

Wilson and the IDC report concurred that the development of new microprocessors will boost the supermicro market share by increasing the number of users that the supermicros can support.

"If you are talking about four or eight or 12 users, most of those 100 products out there are fairly potent systems and can handle that many users, though perhaps not 32 users. Keep in mind that this is the $15,000-and-up category. Even one step below, at the $10,000 level, the systems might handle 16, though not 25 users," he added.

The introduction of the Motorola, Inc. 68020 microprocessor, with its 32-bit input and 32-bit processing power, allows the supermicrocomputer to get closer to full 32-user support, Wilson noted.

He said another trend to watch for is a move toward networking intelligent workstations such as personal computers around "some kind of file server based on a supermicro architecture," and away from systems where a supermicro serves a handful of dumb terminals. He recommended that a minicomputer user now planning a local-area network should ensure that the network architecture will allow them to swap hosts if they shift to a supermicro in the next few years.

The IDC report observed that traditional minicomputer vendors such as DEC, Data General Corp. and Hewlett-Packard Co. are implementing their larger system processor technology in chip-level form to push into the supermicro market.

The report said, "At present, the newer supermicro vendors' [Altos Computer Systems, Inc. and Fortune Systems Corp.] offerings are more cost effective in less than four-user configurations. Yet, the upgrade path is limited. For the customer that chooses the established mini vendors' offerings, the initial small configuration cost is higher, but the migration path is available. Unix is supposed to eliminate this problem for the user, but that is still a fairy tale."

Distinction exists between parallel, multiprocessing

But both serve as stages in evolution

By George Weiss
Special to CW

Multiprocessing and parallel processing are often spoken of in the same breath, with little or no distinction made between them. This state of affairs has led to confusion, and the record needs to be set straight.

Multiprocessing is, in the most general sense, a division of labor: a way of partitioning user and system tasks among multiple processing elements. Within such an architecture, several jobs can run at the same time — each on a separate processor.

Parallel processing specifically addresses one feature of multiprocessing that reduces instruction execution time by allocating different portions of a single program to various processors. When programs run concurrently, portions of different programs share the same processor.

Both multiple and parallel processing are emerging as mechanisms for achieving substantial performance improvements over traditional uniprocessing, and they can be best understood as stages in an evolution toward that end.

Uniprocessors, which put the major burden of performance on a single engine, are rapidly approaching performance limitations imposed by an architecture that has not changed appreciably for the past 20 years. Most of the performance increases in the past five years have come from fine-tuning existing machinery rather than from making major changes to it.

To counter the architectural constraint, traditional minicomputer vendors have selected from a variety of performance acceleration options — pipelined instruction execution, cache memory and the like — that have gradually pushed performance ratings into the range of 5 million to 7 million instructions per second (Mips).

One reason for the gradual approach is to protect users' software investments. But the performance enhancement techniques are mainly defensive strategies. They allow entrenched vendors to buy time and maintain user loyalty until developers work out designs and prototypes for a new generation of machines that will not debut for another five years.

Meanwhile, multiprocessing designs — the first solid step in an evolution toward significant increases in processing power — have begun to appear in the commercial market. The primary thrust behind them has come mainly from start-up ventures, young firms that are not bound by the constraints of an existing family of products.

By 1990, nearly all superminicomputers will have multiprocessing architectures. By binding together several and possibly thousands of CPUs in a cooperative system, mini vendors will offer performance that approaches the power of today's mainframes without imposing the environmental, physical and power constraints of the large machines.

> *Multiple and parallel processing can be best understood as stages in an evolution toward substantial performance improvements.*

There are limits, however, to the performance increases simple multiprocessing can bring. Processing power does increase linearly as a function of the number of linked processing elements; despite the claims vendors seem to be making, an eight-processor complex of 4-Mips CPUs will not multiply into a 32-Mips system.

This constraint will affect future advances in processing power. Because complexity tends to be compounded as more and more processing elements are added, the most likely scenario for the next decade will be an evolution in stages of multiprocessor design.

The first stage of the evolution will feature small processor complexes. These complexes will manage work loads that are independently allocated among multiple CPUs.

The next stage will involve breaking existing applications programs into parallel portions that can run concurrently. This will be done using compiler optimization, precompilers and hardware configurations and will most likely take place initially in the fields of scientific computation, numerical analysis and signal processing.

Later, at the most advanced stage of development, highly innovative architectures such as data flow will emerge. These architectures will require new functional programming languages, languages that evaluate expressions rather than rely on sequential mathematical algorithms.

BECOME A CICS CONSULTANT IN JUST TWO WEEKENDS.

We know that it's tough for consultants to fit a weekday course into their hectic schedules. That's why SysEd offers special CICS training courses for consultants that you can complete in only two weekends.

Our intensive weekend courses in Command Level, Macro Level, Internals, Application Design and VSAM are designed to make even non-CICS programmers immediately productive in a CICS environment. Each SysEd course provides a true-to-life learning experience with "hands-on" use of the computer; up-to-date, practical information; a solid foundation in CICS fundamentals and insights into advanced materials; and individual attention from highly qualified instructors.

SysEd's special weekend courses for consultants are held regularly at our classroom/computer facilities in New York City, Chicago, San Francisco and Dallas. Because class size is limited, applications are on a first come, first served basis.

ments and divisions branching off to manage their own data processing rather than having a single data center serving the entire corporation with mainframes.

But Boston-based consultant and DEC specialist Sonny Monosson, owner of Monosson Technology Enterprises, said the future for the supermini rests in the IBM world. Whereas Jessel conceded the large, central data base to IBM, Monosson emphasized the importance of connecting to IBM.

"I think the machines will move in the direction of the [DEC] 8600s, which you can network together," Monosson said, pointing out IBM's substantial installed base.

"So I suppose if I were DEC, I would make sure the 8600s and other systems could talk to IBM's machines. . . . There is definitely going to be a consolidation, as we are starting to see, and only the strongest are going to survive," he said.

The Solution.

Dial-Up 3270

Advanced CPU architectures demand MIS foresight

The use of multiprocessor and parallel systems will place additional demands on the MIS department, which must strategically plan how to apply these architectural concepts.

Planning must take place across the board because parallelism will bring change at the individual, departmental and corporate levels.

At the individual level, parallelism and the advent of voice and video integration will enable two or more workstation users to work on separate parts of a problem. The users will then communicate audio and graphics information to synthesize a final outcome.

At the departmental level, minis will become functionally specialized to provide data base management services, transaction processors and expert system decision makers.

At the corporate level, multiprocessor mainframes will handle companywide resources such as network and terminal management schemes, knowledge bases and training services.

Because of these advances, MIS directors will be faced with a number of questions. Some of the most important follow:

- Where are the organization's major applications bottlenecks, and what is the best way to distribute resources for coverage?
- What is the trade-off in implementing highly distributed parallel resources rather than continuing with centralized management and control?
- Which applications are most amenable to conversion to parallel code, and which applications are likely to become obsolete?
- Will the organization require a new operating system? If so, who will provide support for it? Will the organization have to hire new staff members?
- Will standards emerge to protect the organization's investments?
- What strategies is the organization's current vendor planning for the near future? Will the vendor take the organization's needs into account and help the organization work toward its goals?
- What problems have other organizations encountered in their experiences with multiprocessing?

The risk inherent in innovative new technologies is that if too much complexity is attempted at once, users may never get out of the technology wave and into the applications phase. Organizations should be prepared to wait through a reassuring period of evolution before they take the bold steps that the future will require.

— [illegible]

THE TRUE TEST OF A 34/36/38 PRINTER IS HOW IT HANDLES THE CURVES.

It's easy to see how Datasouth printers deliver better throughput than their IBM competitors. Just look at these throughput curves. Then look at the prices. Better yet, look at the printers.

You're probably already familiar with the IBM printers. That's good, because it will help you appreciate the Datasouth printers.

Both Datasouth printers are more than fast. They're full of welcome features. Like compressed print. Expanded print. Plus a cable-through/terminate capability, an option that costs hundreds on the IBM printers.

And a parallel interface so the printer will work with an IBM PC, a feature not available on the IBM printers at any price.

Plus all kinds of other things we can tell you about if you call us, toll-free.

We'll even send you the complete throughput report behind the curves we show here.

How you handle that test is up to you.

Nasa contractor develops mainframe programs on mini

HUNTSVILLE, Ala. — Programmers who work for a National Aeronautics and Space Administration contractor are using a minicomputer to develop CICS applications for IBM mainframes.

The development environment at McDonnell Douglas Technical Services Co. was born of necessity rather than choice, according to systems analyst James Tate, and it has some drawbacks. But programs written on the minicomputer for the mainframe have proven themselves easier to develop and more efficient to use than those written on the mainframe itself.

McDonnell Douglas integrates various vendors' hardware and software and tests the resultant systems to see that they will work aboard Nasa's Spacelab, a laboratory that travels in the cargo bay during some space shuttle missions. McDonnell Douglas farms out all software development for the Nasa project to subcontractors but maintains a small programming staff to support its business operations.

This spring the firm began developing those applications with Netron, Inc.'s Computer Automated Programming (CAP) code generator on a 4M-byte Wang Laboratories, Inc. VS 100, after more traditionally developed programs brought on severe response time problems.

> *Development time for both of the completed applications was a fraction of what it would have been under SQL.*

McDonnell Douglas' programmers had developed and run the applications with SQL on a 4M-byte IBM 4331. Because of the 4331's limited resources and SQL's high overhead, users had to wait as long as 10 minutes for the results of certain calls to the data base.

"We were kind of lucky about it, because most of the users who had response times like that didn't know that you were supposed to have [them] any faster," Tate said. But the lags affected development as well, and as soon as the programmers came across a better approach, they tried it.

One programmer in McDonnell Douglas' shop used CAP on the VS 100 to develop Cobol programs for that machine. Because that programmer got amazing results, Tate said, when Netron offered a mainframe programming product, the firm decided to buy it.

The ability to program on the mini for the mainframe depends on CAP's processor, software that pulls together frames of source code, generates code to fill them, surrounds the source with JCL and sends the code via RJE lines to a mainframe compiler. McDonnell Douglas compiles programs written with CAP on a 16M-byte IBM 4341 and tests them on that machine. Once the applications are completed, they can run them on the 4331 or the 4341.

In conjunction with the implementation of CAP on the Wang mini and the use of the 4341 along with the 4331, McDonnell Douglas began using Vsam rather than SQL as the data base environment for all new applications on the two IBM machines. The combined efficiencies of the faster mainframe, the new data base environment and the generated code have brought users' response times into a more desirable range.

Tate said he could not calculate the exact benefits of the moves because every application has changed somewhat with the switch in environments. He said, however, that users were

Spacelab rests in Columbia's cargo bay during 1983 mission.

satisfied with the speedier response times. "User relationships are much better than they were," he added.

Since the firm began using the generator, programmers have used it to develop two applications — an inventory management system and a spreadsheet program. A third application is under way.

Development time for both of the completed applications was a fraction of what it would have been under SQL. The programmer for the inventory system, who has since left the firm, said she accomplished in four weeks more than she could have in six months with SQL. Tate, who developed the spreadsheet, claimed similar results.

The generator was not much faster than SQL would have been for initial development, he said. He had to design most of the frames for the application, and the job took him three weeks, about the same amount of time an SQL application would require.

But for postdevelopment changes brought on by users' initial oversights, the code generator paid off handsomely. Users had requested the application in haste, Tate said, "and they really didn't have any idea what they wanted, which is typical." In turn, they requested about five changes after the spreadsheet had been designed and tested.

Tate said he would have needed about two days to hand code each change and apply it to each affected program. But with the code generator, each change took only a few hours.

He explained that to make a change, he simply altered parameters within the appropriate frame and recompiled the application; a change to a given frame altered code in every relevant program.

Although development with the code generator on the mini has helped McDonnell Douglas' programmers, Tate said he would prefer a development environment that did not depend on linkage between the Wang and IBM machines.

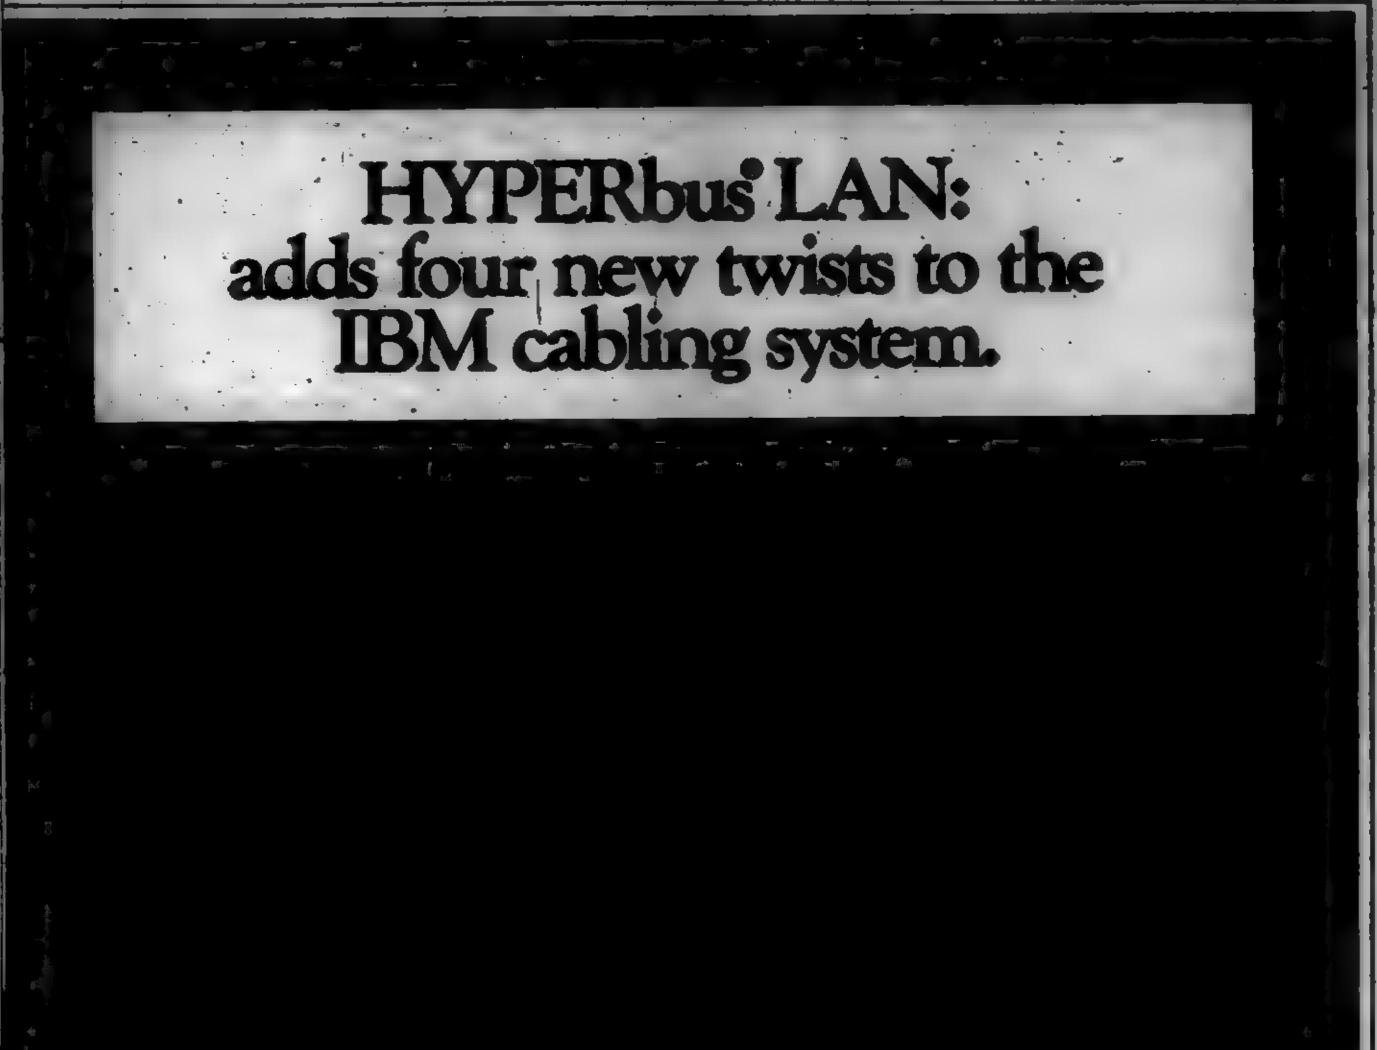
"I would be much more thrilled with CAP if it [ran] on an IBM system," he said, "because most of the problems that we have had with the system have been with the Wang-IBM interface."

Tate said he would have needed two days to hand code each change. But with the code generator, each change took a few hours.

Specifically, he said, McDonnell Douglas has had trouble keeping its RJE lines up. Netron has indicated it may make a CAP version available for use on IBM mainframes sometime next year, Tate said, and McDonnell Douglas has offered to serve as a beta test site if the vendor releases such a product.

Until then, the firm has little interest in seeking out a different code generator that already works with IBM machines. "There [are] not that many code generators around," Tate said, "and we kind of like the CAP processor."

Netron's president, Alex F. Kisin, said he could neither confirm nor deny the likelihood of a CAP release for IBM machines.



One means, two ends: Net setup satisfies needs of two users

USER REPORT

HENNEPIN COUNTY BUREAU OF PUBLIC SERVICE

Problem:
Sharing CPU with other users groups limits developers' resources.

Solution:
Network of 32-bit processors.

Benefits:
Lower processing costs, guaranteed access to processing power.

HOPKINS, Minn. — Over the past nine years, software developers at a county agency have moved their departmental computing across three system environments. They started with a traditional minicomputer, switched to an IBM mainframe and finally went with a local-area network of 32-bit processors.

Programmers at the Hennepin County Bureau of Public Service relied on each system to support development of a software package called Ultimap, an interactive mapping and civil engineering graphics system.

Ultimap development began in 1976 on a Digital Equipment Corp. PDP-11/70. Developers switched to an IBM 3033 in 1979 and upgraded to a 3081 in 1982. In February 1984, the team acquired a network of Apollo Computer, Inc. 32-bit workstations and associated software.

According to Ted Lachinski, technical supervisor for the bureau's systems division, the setup based on the 32-bit processors has been the best. System features such as a distributed data base, a series of graphics routines and on-line debugging capabilities "just make the development effort much easier to do," Lachinski said.

Hennepin County brought in the microprocessor network in response to limitations of the IBM configuration. Developers had been designing Ultimap to run under IBM's IMS on the 3081, a 32M-byte machine that served as the county's central CPU. They worked with vector-refresh graphics terminals attached to the host. Both the terminals and the host limited the development group's efforts.

Lachinski said the terminals, which had been state of the art when the county purchased them in 1980, could not match the capabilities of newer raster-refresh models and fell short of the Ultimap developers' desires.

The Ultimap team wanted to give end users the capabilities to display at least 3,000 graphics entities in one map and to make changes to these entities without enduring lengthy response times. The terminals, however, could only handle about 500 entities. Under this limitation, end users could not access and update mapping data for an entire city but would have to proceed area by area.

The mainframe environment limited them further. Lachinski said the Ultimap developers faced problems concerning data base capabilities, system resources and processing costs.

Data base capabilities. Programmers working on Ultimap wanted to develop a system that nontechnical users could understand, according to Lachinski. The development team was also concerned that end users would not be able to create their own data bases and generate their own reports with IMS. "We decided we wanted a more flexible data base management system to run Ultimap," he said.

IMS also fell short as a development environment, especially in its inability to support on-line debugging. Because program updates ran one at a time in batch mode, productivity was limited. Lachinski said different developers could submit updates simultaneously, but each had to wait for his job's turn to run.

System resources. Because Ultimap developers shared the county's host with other users groups, the developers had to vie for resources and work under some processing restrictions. They were limited, for example, to using 4M bytes of virtual memory.

In addition, the team had suffered from response time problems before the upgrade from the 3033, and Lachinski said he worried that the situation would reoccur as the 3081 took on increased processing loads.

Processing cost. Although Hennepin County did not impose chargeback on its user departments, it did monitor users groups' processing costs. Lachinski said the Ultimap team, because of its computer-intensive work, incurred high costs that were difficult to justify in relation to more pressing jobs that required fewer resources.

Since the county installed the microprocessor network, the Ultimap team has begun to overcome the limitations.

- Each of the 17 workstations on the network — 12 in the county's offices, five in the city of Minneapolis' offices — uses raster-refresh technology. In benchmarks with Ultimap running on these workstations, programmers have been able to display maps with 25 times more graphics entities than possible with vector-refresh terminals and IBM host. Lachinski said the Ultimap team hopes to increase the display capabilities even more by the time the system goes into pro-

Computing environment falls behind the times.

Solution:
Network of 32-bit processors.

Benefits:
Student access to Unix, increased processing power at low cost.

SARNIA, Ontario — When the fall term started early this month, a small college threw two state-of-the-art Ethernet networks of 32-bit workstations and traditional minis to the lions.

The networks, installed over a year's time and tested under controlled conditions this summer, seemed to have met Lambton College of Allied Arts and Technology's goals of interconnecting dissimilar machines and transferring files among them. During the summer tests, the networks performed as planned, and the college expects them to do the same now that they are in full use.

But according to Art Boyd, director of computer services, "That's all theory so far." He said only time will tell whether or not the equipment will hold up in the quirky environment for which it was intended — that of student computing.

Lambton College brought up its network as part of an ongoing effort to pull itself out of computing's dark ages and into the present, Boyd said. The effort began less than two years ago, when Lambton's only CPU was an 8M-byte Digital Equipment Corp. VAX-11/780 that supported 96 terminals.

Today, with the network installation completed, Lambton has 16 CPUs: the original mini, a 6M-byte DEC VAX-11/750 and 14 Cadmus Computer Systems, Inc. 9000 32-bit workstations, each with 1.5M bytes of memory. Together, the CPUs support 185 CRTs, eight full-color computer-aided design workstations, 27 printers and one plotter.

The machines are connected by two Ethernet networks, running in underground cable. One network, based on the TCP/IP protocol, supports the two VAX machines and six of the Cadmus 9000s. The other, based on Cadmus' Unison, supports nine of the Cadmus processors. Two of the Cadmus 9000s are on both nets; these machines provide gateways for file transfer between one network and the other.

"For a college of 1,500 students," Boyd said, "we're closer to the state of the art than anyone." The up-to-date network evolved from the three following goals the school set at the beginning of the modernization:

- To bring in as much processing power as budgets would allow.
- To introduce students to the AT&T Unix operating system.
- To stay flexible and keep the school from being tied to any one vendor.

According to Boyd, the current configuration has gone much of the way toward meeting each goal.

Processing power. Boyd said Lambton College sorely needed additional power when the project began. He asked DEC to determine how many of its machines the school would need to support about 100 additional terminals. The vendor, which had not yet introduced its 8600, recommended the addition of four VAX-11/750s.

The combined cost of the single 11/750 and the 14 Cadmus machines that Lambton bought instead was lower than that of the recommended four VAX processors, according to Boyd. Together, the 11/750 and the Cadmus machines support about 140 terminals.

The Cadmus machines are not true 32-bit processors; they have a 32-bit internal capacity and 16-bit data transfer. But, Boyd said, they meet the school's needs well.

Unix availability. With Unix gaining importance in the business world, Boyd said, Lambton College wanted to introduce its computer science students to it. He wanted to keep the DEC VMS operating system, however, because the school had invested in a software base for the VMS environment and because Unix software offerings are not yet extensive.

The new network supports both the VMS-based DEC machines and the Unix-based Cadmus 9000s, he said, so students will have the opportunity to learn both operating systems.

Flexibility. Boyd said he did not want to tie the school to any one vendor's technology, lest Lambton get locked out of future technical advances. Support for two vendors' processors has worked well, he said, and the network should allow the school to add other manufacturers' equipment if needed.

The fulfillment of the three goals did not come without its problems. Before Boyd saw the network in place, he had to wait out a deep freeze, which prevented workers from laying the underground cable for the network, and a faculty strike, which further delayed the project.

More pressing, though, was a traffic problem that surfaced during initial testing last winter. Boyd had hoped to use one Ethernet network rather than two, and his staff had been testing the single-net configuration.

Honeywell has better office integration than Wang or IBM.

That's right.

Introducing The Honeywell Office

Honeywell is about to change the way you think about office automation.

Because standalone and non-compatible product lines aren't enough to provide the most dramatic increases in productivity and corporate profitability.

The biggest increases in performance can only come from office automation capabilities like integration and networking that allow all systems to "talk" to each other—which is why we designed The Honeywell Office.

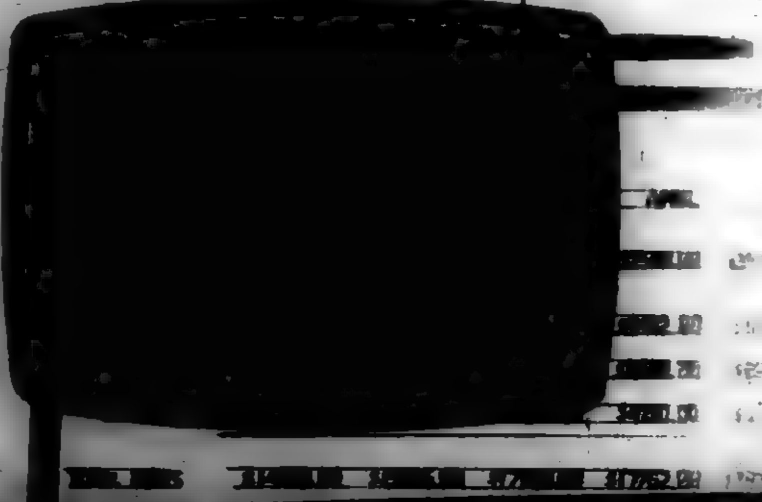
The Honeywell Office integrates office processing, data processing, networking and communications, and distributes these resources across a single, compatible product line of micros, minis, and superminis.

It's the reason why one customer credited our approach to office integration with helping to increase sales by 50%.

Here's how The Honeywell Office can help you manage and direct your information resources more efficiently.

Unsurpassed Office Processing

We started with competitive word processing in virtually every area and developed superiority in the crucial area of file management.



INFOCALC, our three dimensional spreadsheet, lets you merge financial data and text.

Honeywell ties PC processing and terminals into one departmental system.

But we didn't stop there.

We integrated decision support tools and distributed networking capabilities so that your departments can transfer, share, and combine office and data processing information with simple commands. Without unnecessary steps. Without costly duplication of efforts.

InfoCalc, our integrated spreadsheet, lets managers access information from the department across the country as easily as the sales office from across the corridor.

There is also a database management capability that allows professionals to set up their own departmental databases.

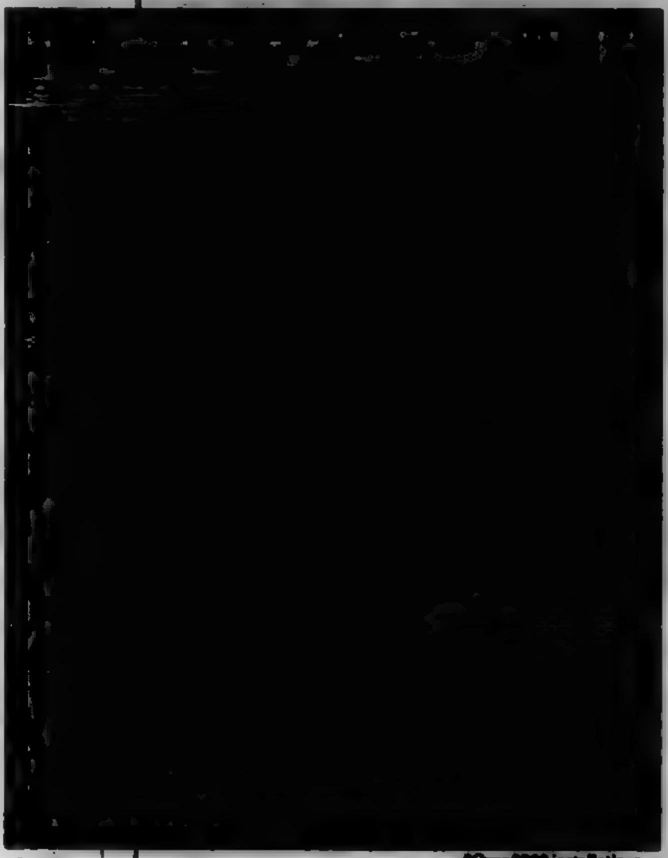
And that's only half of it. The other half is how *well* it integrates the office side of your business with the data processing side.

Flexible Data Processing

No word processing vendor can integrate the extensive array of data processing products you'll find with The Honeywell Office.

The Honeywell Office provides unrivaled flexibility by combining office and data processing into one distributed, departmental system. It supplies integrated transaction processing, database management, program development tools, query and report, data entry and specialized industry applications.

So now your accounting, marketing, and other departments can access and control their information.



*Over 2000 installations.

And when it comes to writing new applications, we offer a full complement of programming languages that include BASIC, COBOL, FORTRAN, ASSEMBLY, ADA, C, RPG, and PASCAL.

Quite simply, The Honeywell Office gives you a better growth path, stronger database management, and greater systems flexibility than our competitors.

Honeywell.

Advanced networking lets you connect all your departments.

Integrated Networking and Communications

Honeywell expertise in networking and communications helped the Metropolitan Life Insurance Company create one of the largest distributed branch office networks of its kind.

Over 1300 Met Life district sales offices in North America are automated using our DPS 6 minicomputers, linked through an SNA network that supplies reliable branch office-to-IBM host communications.

Unlike competitors who require mainframes for network control, we aren't limited to creating star networks. Our ISO based Distributed Systems Architecture (DSA), gives you the flexibility to configure ring, mesh, peer-to-peer, and other styles of networks.

For local and remote user-to-user communications, our integrated electronic mail helps minimize network costs by letting you route your mail and documents in economical quantities, and prioritizes transmission by time of day.

Finally, The Honeywell Office lets you access network services such as CompuServe, Dow Jones, The Source and Westlaw right from your desktop.

Complete Micro to Mini to Supermini Compatibility

From the very beginning, The Honeywell Office was designed for complete compatibility from top to bottom. Compatible hardware. Compatible software. And compatible communications facilities.

One consistent interface is presented to all systems, small and large, permitting the virtually limitless exchange of information. Standard menus and prompts provide major user training benefits. Upgrade options are more flexible and economical because all systems can be linked together.

Honeywell's complete micro to supermini compatibility means flexible, economic growth.

Service and Support that Make All Systems Go

The Honeywell Office is backed by TotalCare,™ our comprehensive nationwide support program.

Uptime, after all, is everything, and TotalCare™ provides everything you need in programs and services that can be tailored to help meet your requirements.

The Honeywell Office The Smarter Choice

The Honeywell Office reflects a strong commitment and adherence to a standard interface, state-of-the-art technology, and a modular, open ended design, so that your office can grow as your needs do.

Strengths of supermicros, minis vary with application

Systems must satisfy user and storage needs

By Constance A. Knapp
Special to CW

Small business or departmental system users who are in the market for a new multiuser system should carefully weigh the qualities of both supermicrocomputers and traditional minicomputers. Although supermicros and minis are both multiuser machines, the systems have markedly different strengths depending on the application.

As in choosing any system, the user needs to know what business needs the system must satisfy. In choosing between a supermicro and a mini, the two following areas need to be examined carefully:

- The number of users on the system at any one time.
- The storage requirements, including access and transaction activity.

When determining how many users will be on the system at one time, it is also important to consider what their usage patterns will be. Will four users be on at four different times of the day, performing four different functions, or will four users be on at the same time, performing two different functions? Will eight or 10 people need access to information at peak periods, and if so, is response time important? Answers to these kinds of questions will help determine whether or not a minicomputer is required.

Generally, a supermicro can comfortably handle eight to 10 users, although specific machines should be examined very carefully; some can handle more, some less. A minicomputer can support many more devices, with some handling as many as 100 terminals and printers.

The operating systems of most minicomputers are truly multiuser-oriented and can control usage and access by more than one terminal. At this point in the development of supermicros, some of the multiuser operating software is merely an extension of Microsoft Corp.'s MS-DOS or Digital Research, Inc.'s CP/M, without some of the functions, such as update control, that are needed in a multiple access environment.

Again, the specific operating system or equipment being considered needs to be examined carefully.

Determining the storage requirements of a new multiuser system requires a close look at applications, how they are to be accessed and how sensitive the data is. Placing a large (10,000-record) customer file on a supermicro and expecting four users to retrieve the data from four workstations at the same time with no degradation in response time is unrealistic. So is the expectation that this file can be easily backed up each night.

On the other hand, a budget system allowing eight departments to enter weekly budget information for 100 expense codes, with a central department creating summary budgets, will usually work well on a supermicro. The difference between these examples is the amount of data, the access pattern and the backup requirements.

As a general rule, sensitive data that must be backed up and stored to satisfy regulatory requirements or company policies should not be stored on a supermicrocomputer (or a microcomputer, for that matter). Data can disappear from hard disks too easily and backup procedures are too cumbersome to provide the level of data security required for sensitive information.

Management information, such as budgets, or information that can be re-created if the need arises are likely candidates for supermicrocomputer storage.

Keep in mind that the storage media for supermicrocomputers is still floppy disks, hard disks or cassette cartridges.

While each has its advantages, none allows the simple and speedy backup and recovery that a disk pack and/or tape drive provides a minicomputer.

A question of finances

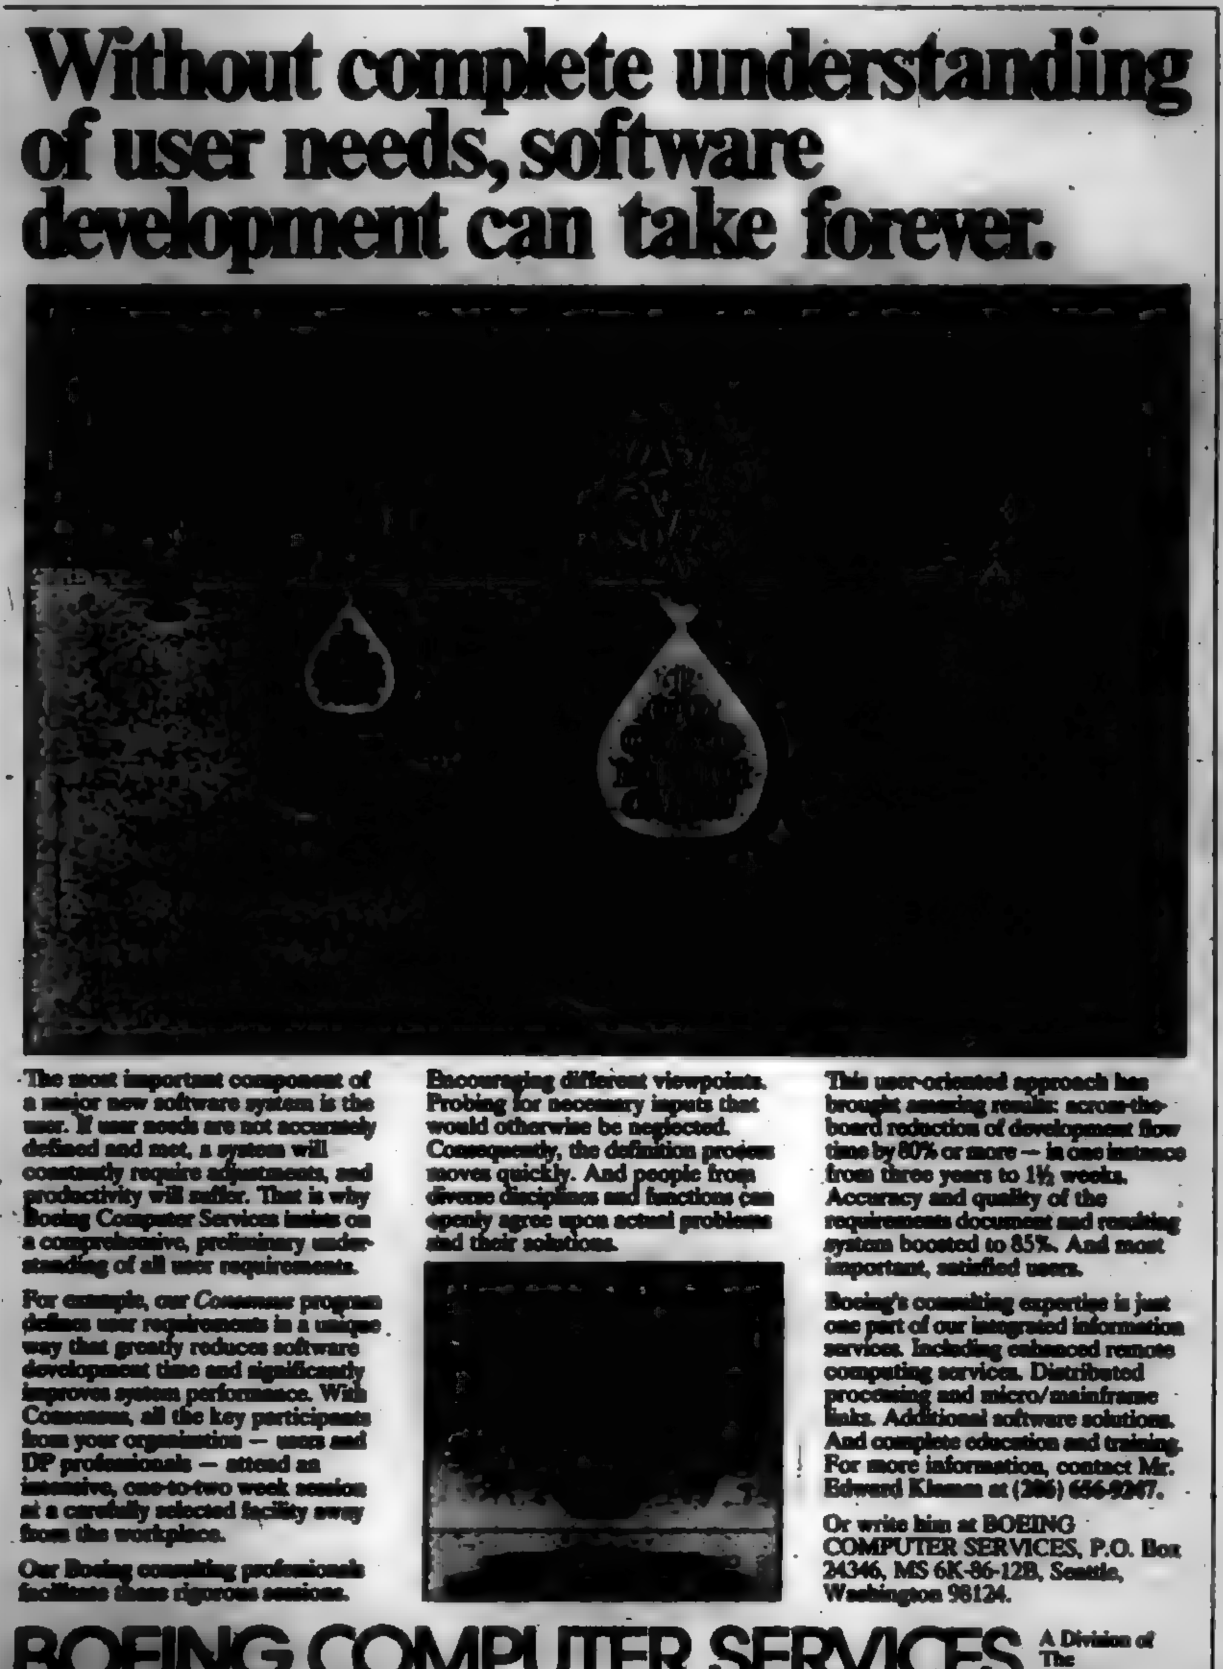
As with any other investment, the cost of the equipment needs to be considered in light of the benefits expected.

A minicomputer, with peripherals and software, could represent an $80,000 investment, while a supermicro may cost only one quarter of that amount.

However, data as a company investment must be protected. If the company's books are kept on a supermicro that proves impractical for data security, and data is destroyed or lost, the cost of recreating the data, as well as any damages, may

See VARY SR/29

Knapp is a New York-based computer consultant, specializing in the selection and installation of financial software. She is a member of the Independent Computer Consultants Association and a lecturer at Pace University in New York.



Without complete understanding of user needs, software development can take forever.

The most important component of a major new software system is the user. If user needs are not accurately defined and met, a system will constantly require adjustments, and productivity will suffer. That is why Boeing Computer Services insists on a comprehensive, preliminary understanding of all user requirements.

For example, our *Consensus* program defines user requirements in a unique way that greatly reduces software development time and significantly improves system performance. With Consensus, all the key participants from your organization — users and DP professionals — attend an intensive, one-to-two week session at a carefully selected facility away from the workplace.

Our Boeing consulting professionals facilitate these rigorous sessions. Encouraging different viewpoints. Probing for necessary inputs that would otherwise be neglected. Consequently, the definition process moves quickly. And people from diverse disciplines and functions can openly agree upon actual problems and their solutions.

This user-oriented approach has brought amazing results: across-the-board reduction of development flow time by 80% or more — in one instance from three years to 1½ weeks. Accuracy and quality of the requirements document and resulting system boosted to 85%. And most important, satisfied users.

Boeing's consulting expertise is just one part of our integrated information services. Including enhanced remote computing services. Distributed processing and micro/mainframe links. Additional software solutions. And complete education and training. For more information, contact Mr. Edward Klamm at (206) 656-9247.

Or write him at BOEING COMPUTER SERVICES, P.O. Box 24346, MS 6K-86-12B, Seattle, Washington 98124.

OPEN WINDOWS BETWEEN 3270 AND ASYNC HOSTS WITHOUT A PC.

Introducing the Lee Data 1221 Open Window Display. And MORE LEEWAY™ for your growing Information System.

The Lee Data 1221 Open Window display shatters all your old window pains.

Now, for the first time, you can open windows to 4 concurrent host sessions.

And transfer information from window to window, host to host, and 3270 to Async in any combination.

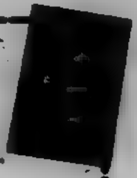
And zoom any window to full screen in your choice of 4 standard IBM screen sizes, including 132 columns.

All without the expense of PC's you may not need.

But the Lee Data 1221 Open Window display is only one way we give you MORE LEEWAY for less money . . .

Our Lee Data Passport booklet is filled with other cost-saving products you should know about too.

Do you have your Passport yet?



Call 1-800-LEE-DATA or (612) 828-0300 for our FREE booklet, MORE LEEWAY: Passport for MIS Planners. Or write to Lee Data Marketing Services, 7075 Flying Cloud Drive, Eden Prairie, Minnesota 55344.

IBM's high-end micros encroaching on mini territory

Major player in both marts faces dilemma

By Brian Jeffery
Special to CW

Like many minicomputer vendors, IBM is facing the difficult decision of how to balance its minicomputer and microcomputer lines. The impact the microcomputer is making on the minicomputer market cannot be ignored. As microcomputers move to adopt more powerful 32-bit microprocessors, they begin to undercut conventional minicomputer architectures, offering equivalent or even superior performance for radically reduced prices.

For IBM, however, the problem is greater than for most vendor companies. It is the only major computer firm to be a large-scale player in both the minicomputer and microcomputer markets.

> ”
>
> *In the long term, IBM will shift much of its mid-range business to micro-based systems rather than conventional minicomputers.*

It has been in the minicomputer business since the early 1970s; in 1985 its various mid-range lines are likely to contribute close to $5.64 billion in revenue. Yet its microcomputer business has been even more successful.

Since entering the personal computer market in 1981, IBM's line of Intel Corp.-based micros has grown to be a $5.8 billion business in 1985. The installed base of these units will have grown to close to three million units by the end of this year, with a worldwide base of more than 12,000 applications software products and 4,500 dealers and distributors.

IBM has already moved from the Intel 8088-based CPU to the more powerful 80286-based CPU used in IBM's Personal Computer AT. The company has indicated that it is moving onto the full 32-bit 80386. Many IBM Personal Computer distributors are starting to offer the AT as a small business, multiuser system or as a scientific and engineering system.

IBM's dilemma is that if it lets the Personal Computer momentum continue and moves to more powerful CPUs, it will be undercutting its own low-end minis such as the System/36, 8100 series and Series/1 and, in the longer term, even the more powerful 4300 series and System/38.

IBM appears to have solved the problem by a classic exercise in contention management. While continuing to pursue the minicomputer business aggressively, it has also given the green light for its Entry Systems Division to start moving the Personal Computer line up into minicomputer territory.

The result is going to be some strenuous internal competition and, in the long term, a shift of much of IBM's business in the mid-range systems bracket to micro-based systems rather than to conventional minicomputers.

Although they have been generally missed by the industry, three key indicators confirm that IBM is adopting this approach:

- **IBM's developmental directions with the Personal Computer line.** In August 1984, IBM introduced its Topview multitasking operating environment for the Personal Computer line, a PC-DOS-compatible product that was poorly received but which rapidly proved to have some curious features. The features included a built-in Systems Network Architecture (SNA) interface and the potential for addressing up to 16M bytes of virtual memory.

It is now becoming clear that IBM's development has proceeded to expand this basic concept into a full-blown virtual memory multitasking operating system for the Intel microprocessor architecture, with additional processing power and support for AT&T Unix operating systems provided by 32-bit coprocessors.

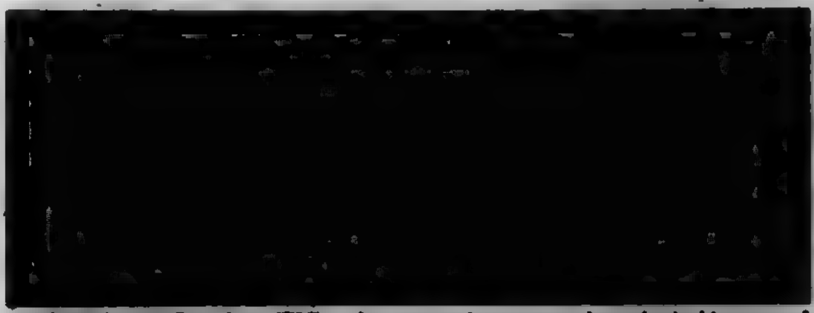
While IBM's current focus for this effort appears to be scientific and engineering applications, the ultimate direction looks as if it will result in two major sets of applications.

One set of applications would be a multiuser system for departments of large organizations, with built-in SNA support providing a better fit with the overall IBM office automation scenario than products such as the System/36 currently provide.

The second set would be a multiuser system for small business and remote-site applications that would

Jeffery is director of research for International Technology Group, Inc. of Palo Alto, Calif.

According to Guinness, printer set a new world's



In 1985, for the first time, IBM's microcomputer revenue is projected to exceed its minicomputer revenue.

allow the more than one million small Personal Computer users to upgrade to more powerful, compatible solutions.

■ **IBM's various minicomputer developments.** To date, IBM has introduced desktop versions of its Series/1 and System/36 minis, although these have proved to be mini-micro hybrids rather than true microcomputers.

Micro versions of the 4300 series and an in-house reduced instruction set computer mini, the 801, are on the way, although the machines seem to be targeted at specialized scientific and engineering applications rather than mainstream business use.

More interesting is that IBM implemented, then dropped, a Motorola, Inc. 68000-based version of the System/36. Apparently it was felt that such a system would seriously undercut IBM's business with its existing System/36 minis.

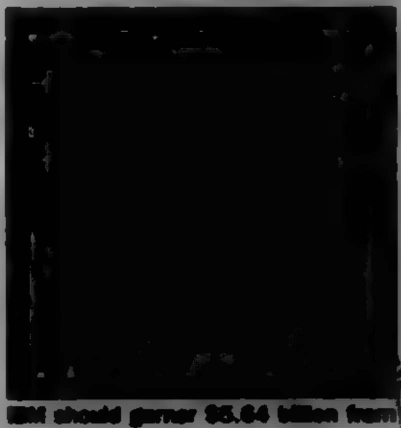
Overall, it is clear that IBM is not seeking to move its minis down to the micro level but rather the reverse.

In adopting this approach, IBM is dooming its minicomputers to mounting competition and ultimate replacement by upward extensions of the Personal Computer line.

■ **The 1984 ousting of the Systems Products Division from the Information Systems and Communications Group.** The little-noticed IBM reorganization in December 1984, which affected the company's Systems Products Division, is another key to deciphering IBM's strategy. The Systems Products Division is the IBM unit with responsibility for the System/36, System/38, Series/1, 8100 series and 4361 minicomputers. The division was moved from IBM's Information Systems and Communications Group and transferred to a new organization, the Information Systems and Products Group.

This move was curious because the Information Systems and Communications Group is generally regarded within IBM as the home of the company's key growth product lines.

The group's members include the Communications Products Division (SNA, communications equipment), Entry Systems Division (Personal Computers) and Office Systems (office automation software). In addition, the Computer-Aided Design and Manufacturing and Industrial Systems Divisions are placed there, and the Telecommunications Products Division (Rolm Corp., local-area networks) was added at the same time the Systems Products Division moved out.



IBM should garner $5.64 billion from its mid-range systems in 1985.

By contrast, the Systems Products Division's new home is shared by such illustrious IBM operations as the Boulder, Colo., and Lexington, Ky., business units. Out of these two units come 8-in. storage products, copiers, typewriters and supplies.

The move was scarcely a resounding vote of confidence, and it was notable that even the supposedly strategic System/36 was now out of the mainstream of IBM product strategy.

IBM reorganizations have always been a key indicator of company strategy. IBM does not change things that work properly. Taken with the other indicators, it is difficult to resist the conclusion that IBM approved competition between its minicomputer and microcomputer lines with an outcome that can be in little doubt.

Overall, what we seem to be dealing with is a long-term strategic shift of IBM minicomputer and microcomputer products. IBM appears to recognize that in the long term, micro-based systems will take over much of the bracket currently occupied by at least its low-end minis.

Even the System/36, a system that has proved to be the bane of its competitors, may prove to be a curtain raiser for IBM's real thrust in this market.

a Mannesmann Tally record before it stopped.

According to our engineers, it should still be going.

For our engineers, it was a bittersweet experience.

Yes, the printer set a new world's record in less than half the previous time.

But was that enough? Not for these engineers.

Admittedly, it was a pretty good start. But when the old record was decisively shattered, the printer was simply turned off.

A failure, the engineers maintain, of the human element.

Coming from them, that's no surprise.

It's simply one more demonstration of the dedication to long lasting, rock-solid performance they apply to every Mannesmann Tally printer.

The latest example? The $1995, 400 cps MT490.

It's the latest generation 400 series: a serial printer with unequaled throughput and workload capacity in its price range.

It's fully IBM compatible. And noise levels drop down to 57 dB(A).

You have modular interfaces that snap in and out quickly. Fewer friction points in paper handling. And an 18-needle print head instead of 9.

The smaller needles improve print resolution. So NLQ is up to 150 cps in one pass. That's three times faster than the average daisy wheel.

Still, the best thing about the MT490 is that it's a Mannesmann Tally.

Because you know that somewhere, somehow, even a MT490 is going to stop.

But our engineers never will.

The new MT490 from Mannesmann Tally $1995

Departmental minis bridge micro-mainframe gap

By Naomi Karten
Special to CW

The use of departmental minicomputers to help bridge the gap between micro users' needs for mainframe data and their access to that data has not picked up enough momentum to be viewed as a trend, but it is a strategy some MIS departments and information centers are beginning to assess.

The strategy makes particular sense in light of concerns about micro-mainframe links. Justifiably or not, users see the micro-mainframe connection as something that many people are talking about but few organizations are implementing on a large scale.

> ”
>
> *The micro-mainframe connection is something that many people are talking about but few organizations are implementing on a large scale.*

In many organizations, micros are underutilized, and users are frustrated. Both problems stem from a lack of access to data that is stashed away in mainframe data bases. Departmental minicomputers can provide the means for MIS to satisfy some groups of frustrated users, those that have a cyclical need for access to the same sets of corporate data.

The strategy for use of the minis works this way: On an agreed-upon schedule and under MIS control, mainframe data is extracted and transferred to the mini. Users can then beat the data to death using mini-based software or can download it to departmental micros for manipulation with packages like Ashton-Tate's Dbase or Lotus Development Corp.'s 1-2-3.

MIS departments can gain the following three main benefits from this approach:

- A decrease in the demands that end users' queries make on the mainframe.
- An increase in control over access to mainframe data.
- An improved ability to meet users' specific needs.

Decreased demand on the mainframe. This is a solution to the problem brought on by the popularity of fourth-generation languages. Many of these languages are resource intensive, a situation of concern to MIS managers who are on the line to deliver new production systems and who have little inclination to compete with users for computer power.

At its present rate of acceleration, end-user computing will dominate corporate computing within a decade. With this growing stream of users, even the most efficient user-oriented software is likely to give a finite computer resource a run for its money.

MIS executives, whose capital budgets are unlikely to reach fantastic proportions, need an alternative to forced growth in mainframe capacity. Fortunately, an extensive base of user-oriented query and analysis software — including several traditionally mainframe products — is available for minicomputers.

SAS Institute, Inc.'s SAS, for example, runs on Digital Equipment Corp., Prime Computer, Inc. and Data General Corp. equipment. Applications written with Oracle Corp.'s Oracle and Seed Software Corp.'s Seed run in a wide variety of mainframe and mini environments and on the IBM Personal Computer. Intellect, from Artificial Intelligence Corp., is being ported to the DEC VAX.

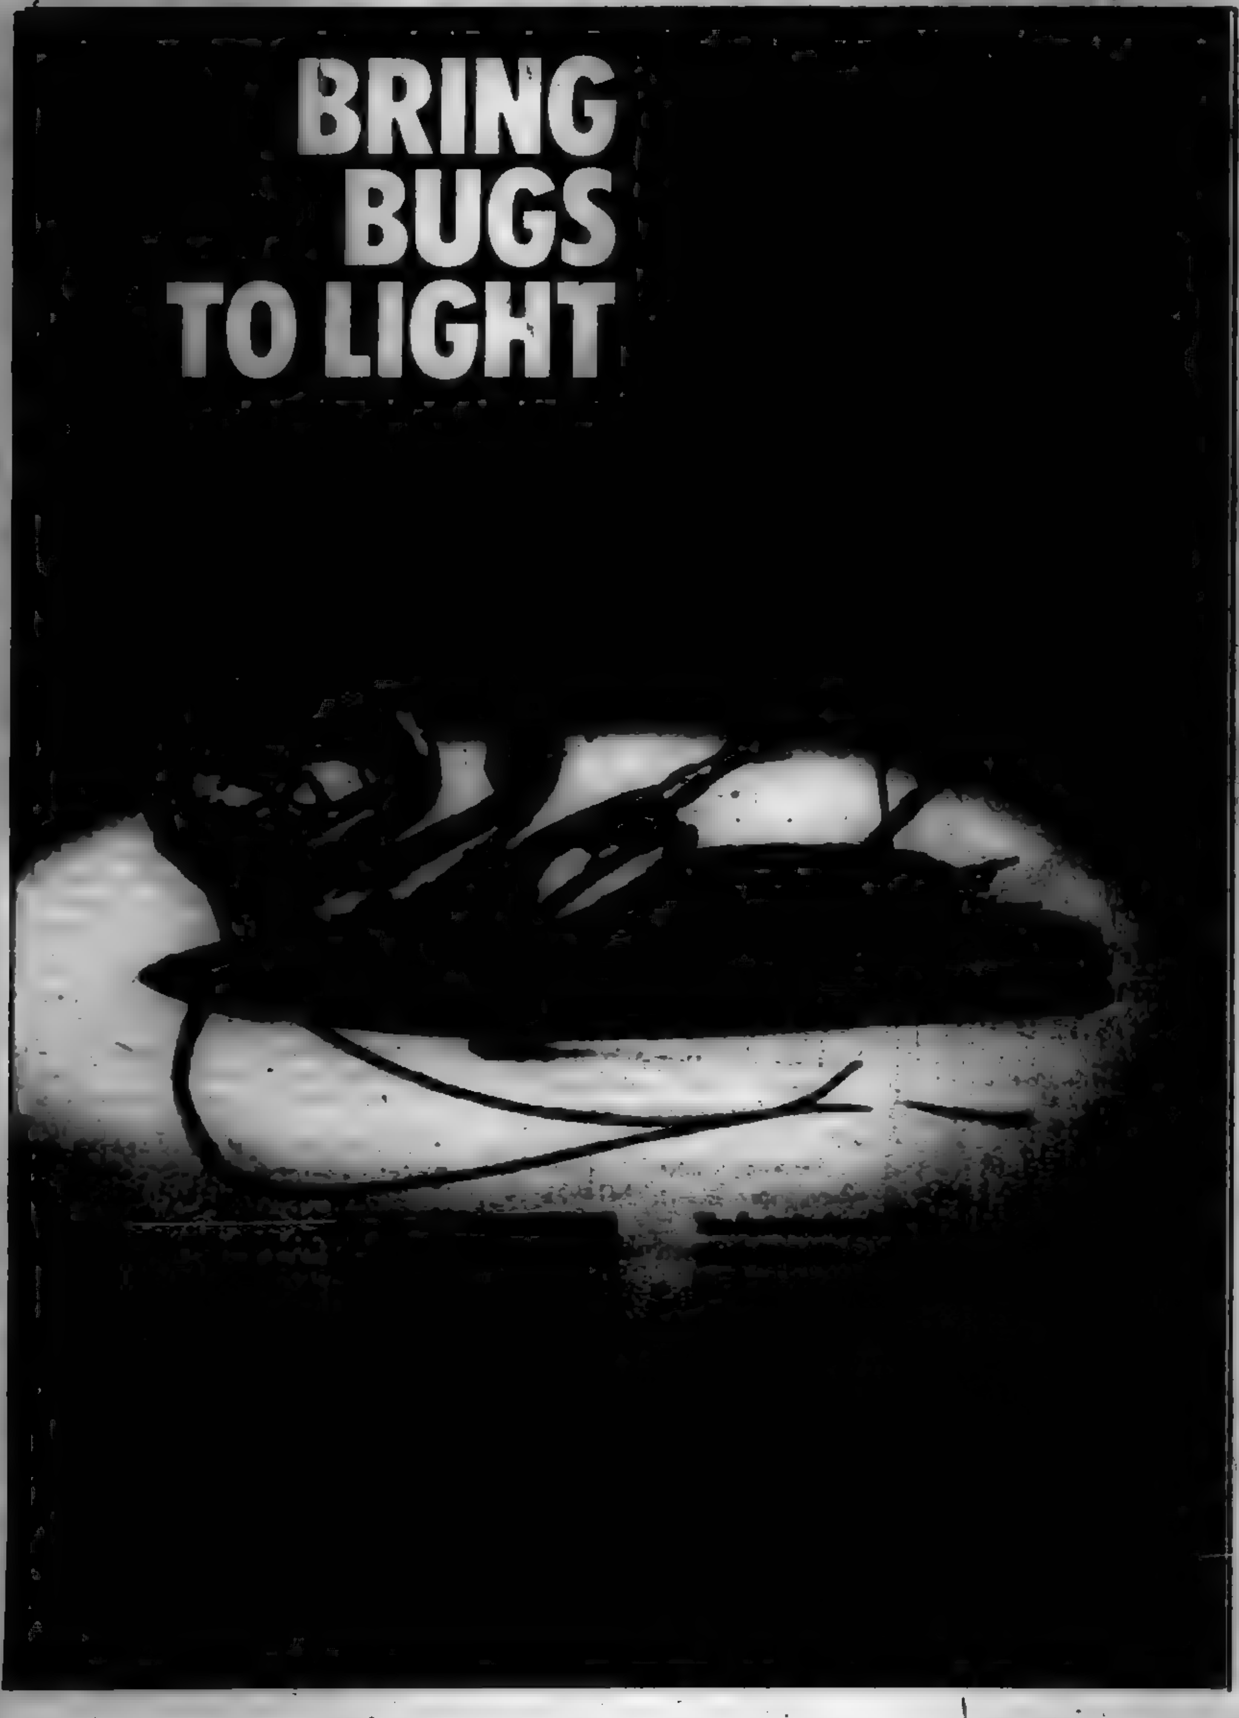
Several other vendors are beginning to view the minicomputer environment as a strategically astute base of support for information center goals. Certainly, retraining for experienced users of these vendors' products will be minimal.

Increased control over access. Loss of security is one of the predominant concerns associated with downloading capability and is one of the major impediments to its implementation. With a little aid from the fearmongers among us, MIS executives are lying awake at night worrying about which people are getting at what data and what they are doing with it.

The last is not an issue: An MIS manager can no more control how users juggle computer-generated data than he can control how they churn data from production reports

See CONTROL SR/29

Karten, president of the consulting firm of Karten Associates in Randolph, Mass., writes and lectures on information centers and the management of corporate personal computing.



EVOLVE from SR/10

Moving from multiprocessing to advanced parallel processing will require a series of breakthroughs. There is a host of difficulties that must be overcome:

- Interprocessor communications, which becomes more and more complex as more and more processors are added, must be improved so that every processing element can send information to and receive information from every other element.
- Because no one architecture is optimal for every application, each of these must be weighed against each other.

Developers of computer-aided design systems, for example, must consider the advantages and disadvantages of array processing against the advantages and disadvantages of processing individual pixels.

- Because a great number of resources will be available to the user, the operating system's role will expand; the changes that will enable that expansion will be difficult to make.

Designers will have to modify the Unix kernel to handle multiple processing resources simultaneously, for example, without ruining the integrity of applications portability.

- Designers must develop a programmer's interface that is transparent with respect to the allocation of resources.

Without such an interface, programmers would have to construct parallelism manually, a process that would require several man-years of work for large programs.

- If programmer transparency is to be maintained, processor assignment and scheduling become critical system variables; idle resources can substantially degrade performance. Designers will need to synchronize the results produced by many elements and synthesize these pieces into a whole. Such synchronization and synthesis, however, is still in the sphere of academic research.
- Unless an organization's applications are written with a highly parallel structure (that is, more than 90%), its users will accrue only nominal gains in performance regardless of additional processing elements that are collected. Developers will have to implement multiple resource handling capabilities together with program concurrency that fully taxes the hardware.
- The introduction of many processing elements implies that programs can run in separate hardware partitions and in no particular sequence. In these situations, problem determination becomes highly complex; parallelism adds to the probability of inaccurate results. Developers must provide some degree of fault tolerance before users are willing to rely on a system.
- DP managers want to protect their investments in the software they have installed and the programs they have scheduled for development. They accept the need to replace hardware every five to seven years but expect their software resources to last longer. Vendors will have to address users' concerns and somehow bridge the gap between multiprocessing and parallel processing software.

TRENDS from SR/11

ment and exploitation of new technologies and architectures.

- End users continue to demand higher performance, and they have come to expect this from vendors.
- The new applications environments that are emerging for artificial intelligence and expert systems require high performance and parallel processing as prerequisites for success.
- High-resolution, high-performance workstations need very high-performance computational and data base processors as hosts.

If you buy a TI 855 printer now, you won't have to upgrade to one later.

Don't tack just any printer on your new PC for now, thinking that you'll get what you really need later. Start with the best, a TI 855 or TI 865 printer. That way you can put the money you'd have spent on a needless upgrade on some other smart investment.

You see, our OMNI 800™ Model 855 is actually three printers in one. For word processing, it delivers letter-quality printing that rivals the best daisy wheel printers around. For data processing, it prints at 150 characters per second. And for your graphics, it reproduces screen or monitor images in the finest detail.

Of course, these advantages are all true of our TI 865 wide-carriage printer, too.

What's more, since our printers are among the easiest to use, you can utilize all the capabilities built into your PC and software right from the start. Instead of sometime later. You even have a choice of over 30 different plug-in type fonts, any three of which can be printed on the same page without ever stopping the printer! Just touch the control panel and it happens. Simple. So every document looks just the way you want it to. Professional.

As for reliability, TI printers are legendary. Just ask any major airline.

So don't downgrade your PC's performance with a printer you'll outgrow in a month. Get yourself a TI 855 or TI 865 printer now. It's easy. Just call 1-800-527-3500, ext. 801, for the TI Dealer near you.

Automation preserves life jacket maker's growth

MIAMI — Production tracking problems threatened to swamp business growth for a life jacket manufacturer until the firm installed an automated manufacturing system.

At Extrasport, Inc., four administrators relied on manual procedures to keep track of production and sales. But sales increases of between 25% and 40% annually from 1980 to 1984 began to overwhelm them.

"As you might imagine, I had to enlist grandmothers and siblings to work nights and weekends to maintain this operation," said Alex Khamamirian, Extrasport's president. "I enlisted anyone I could to help with record keeping."

Even with the extra help, Khamamirian was spending too much time keeping up with current sales to focus on his main aim: expanding his business. "We soon saw that we couldn't keep both our manual systems and our 40% yearly growth. So we decided to streamline, to automate our operations wherever feasible."

In February 1984, Extrasport purchased a Digital Equipment Corp. Decmate II with 10M bytes of disk storage and installed Exceptional Business Solutions' Manufacturing System software. Khamamirian worked nights at home setting up the system's five modules — inventory management, bills of materials, production planning, order entry/invoicing and accounts receivable — so they reflected his firm's production process.

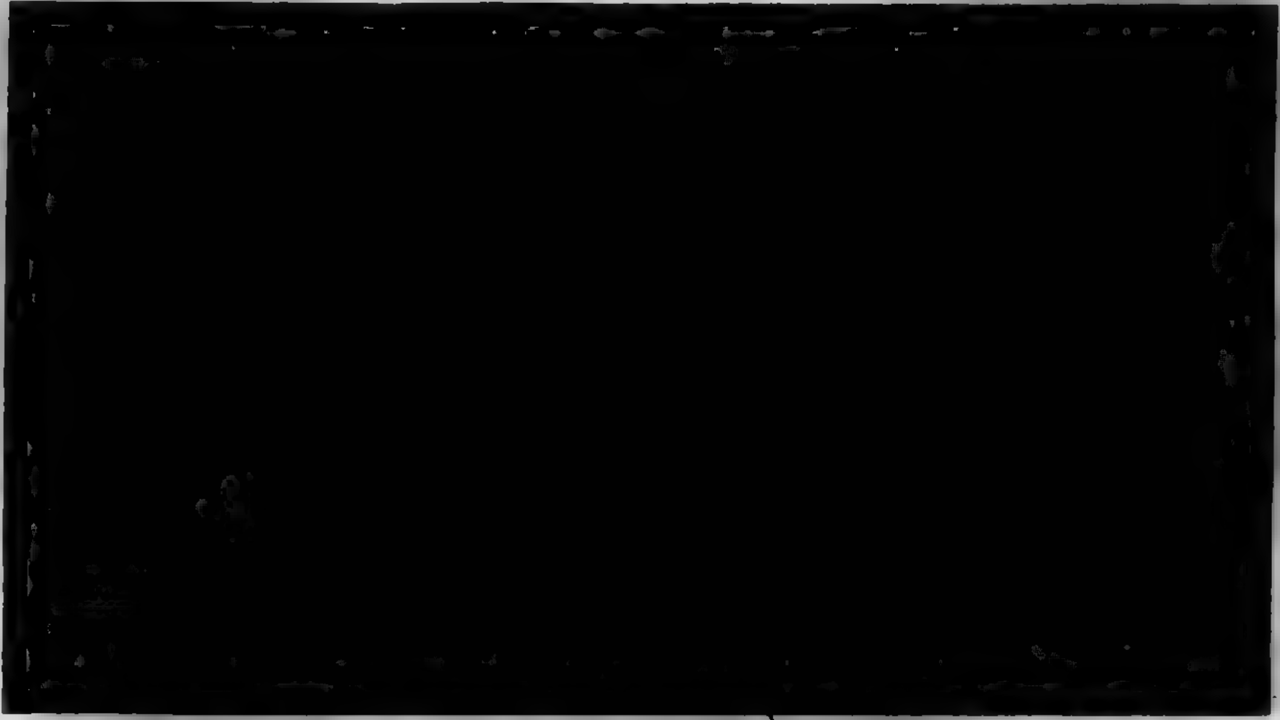
He first defined the inventory items he wanted to track, then listed all the raw materials, interim components and production stages that went into making each item. He assigned all the stages their own inventory item numbers so the system could track them. "Since we had defined production stages as separate inventory items, the computer could plan and schedule stages as well as finished products," he said.

The system, which went live last October, takes information from customer orders and explodes it into bills of materials, cost estimates, materials allocations and production schedules. When an operator generates an order, the system updates back orders, open orders, inventory files and customers' buying history files.

Extrasport, Inc.'s president, Alex Khamamirian, keeps tight stock of the firm's life jacket inventory.

"It eliminates a lot of repetitive hand work," Khamamirian said. "When you have entered an invoice, you have updated everything you can possibly imagine." He said having the system to handle posting, updating and tracking has given him and his fellow administrators more time to run the firm.

In addition, he said, the system has alleviated some production and quality control problems special to Extrasport. Most of the firm's 750 active customers are wilderness provisioners such as L. L. Bean, Inc. and Eastern Mountain Sports, Inc. that buy erratically and in small quantities. "By the time they order, they are often low on stock," he said, "so delivery has to be fast."



COME TO A DECISION NOW. FOR IMPROVED S/34/36/38 WORK STATION PRODUCTIVITY.

It's time to stop talking about more work per dollar and do something about it. By installing cost-effective Decision Data work stations for your IBM System/34/36/38 right now.

Decision Data has developed a whole family of economical work stations with improvements that increase productivity and add operator comfort. Models with glare-free green or amber screens that tilt or swivel for easier viewing and reduced fatigue. Palm rests to keep hands from getting tired. And other details that have been thought through for convenience, such as highly visible status indicators, and as obvious as it may seem, an on/off switch that's placed up front for easy access.

In short, Decision Data gives you more of the features, comforts and capabilities you need, at prices that are more attractive, backed by nationwide and worldwide service that makes you feel more comfortable.

It's easy to understand why Decision Data makes and sells more peripherals compatible with the most popular IBM business-computer systems than any other company. Including the CWS, a display work station that also operates as a compatible Personal Computer, plus the rest of our family of printers and other productive peripherals.

But they can't do you any good until you install them. It's your decision. The sooner the better.

Decision Data Computer Corporation

DECIDEDLY BETTER

Before it installed the automated system, Extrasport had problems meeting such orders, Khamamirian explained. Administrators had to estimate what raw materials they had on hand, look at orders that had already been scheduled and try to fit in the extra work.

With the automated system, Extrasport can prepare in advance for seasons during which its customers typically place most of their orders. Based on information from past seasons, the system forecasts material needs, predicts required cash flow and recommends any necessary hiring, Khamamirian said.

"Also, it will look at our material suppliers' delivery times and will reorder if materials [on] hand can't meet projected usage, so we don't spend money on supplies too early, and we don't reorder too late," he said.

An indirect benefit of the system has been tighter shop-floor quality control. "This has been a real boon, because life jacket quality can't be left to chance," Khamamirian said. Quality is also one of the features that helps Extrasport sell its life jackets — specialized products that cost between $36 and $65. The firm's production workers assemble the jackets by hand; its managers and executives inspect production personally.

With the manufacturing system handling other tasks, Khamamirian and his managers have been able to spend more time inspecting jacket assembly, which has enabled them to implement new and more frequent product tests. The firm's life jackets regularly go through more than 22 quality tests.

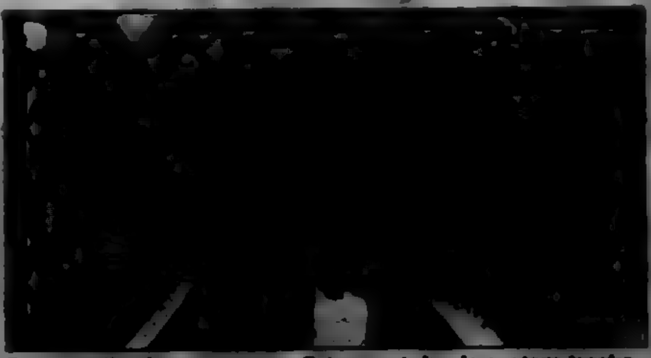
Checks cover materials and construction, stitching density, seams, buoyancy and the dimensions of foam inserts. "The computer doesn't perform these tests," Khamamirian said. "However, it has given my managers more usable time per day."

Khamamirian uses some of his time to scan the system's production reports for quality signals, which can alert him to life jackets made with too much or too little fabric or foam. When the computer generates a production order, for example, it also specifies how much fabric will be required, based on past experience.

Extrasport's production workers cut material or foam for the order based on the computer's specification, Khamamirian said. "At the end of a production run, if we fall short or have too much left over, we know something's wrong."

Employees at the firm access the system through one CRT terminal. Because the software system dictates procedures, Khamamirian said, the firm's managers can delegate administrative tasks with confidence that everyone will perform them the same way.

Khamamirian said he hopes to get report formatting capabilities for the system this year. Currently, Extrasport must use formats that are written into the software and cannot choose to report by combinations of variables other than those that have been defined.



Foam cutting is one process Extrasport, Inc.'s system tracks.

Introducing the TI 880 AT Printer.
Because you need a multi-user printer that works overtime.

The last thing you need is the wrong printer. A printer that quits when your work is nonstop. Or one that burns out from overwork.

Let's say you have a typical multi-user environment or a local area network. It includes IBM Personal Computer ATs, PC/XTs or compatibles. What you need now is a printer that can handle your system's entire workload. A printer you can trust your business to.

You need a high-speed printer that's software compatible with PC industry standards and capable of sustaining 300cps. It should have straight paper paths to eliminate jams, changeable fonts and enhanced print modes to take care of draft, correspondence and graphics. Its design should be rugged, durable and as reliable as you've come to expect from TI printers.

The OMNI 800™ Model 880 AT Printer from TI fits this description.

The printer that works overtime.

Because business doesn't stop just because your printer did.

Find out about the new TI 880 AT Printer and how it can help solve your multi-user printing problems. Call 1-800-527-3500 ext. 809, in Canada 416-884-9181.

Introducing Smart Alec.

IRMA's reliable new way to connect PCs to IBM System 34s, 36s and 38s.

He comes from the IRMA™ family, the people who have linked more than 150,000 PCs to mainframes.

He's Smart Alec™, the new interface board that's now opening lines of communication between IBM® PCs and System 34s, 36s and 38s.

Smart Alec's hot key lets PC users switch back and forth from the personal computer to the host computer quickly and easily.

Smart Alec includes his own fast file transfer software for both uploading and downloading data into popular application packages like Lotus 1-2-3® and WordStar.®

He's so smart that he can handle three host sessions simultaneously.

And he's fully compatible with twinax cables.

What's more, an optional file transfer program gives you additional security and record-selection capabilities you just can't get from IBM.

So if you want your IBM PC, XT or AT to emulate a 5251 Model 11, 5291 or 5292 terminal—and your PC printer to emulate an IBM 5256 System printer—don't worry. It's so easy, a kid can do it.

To find out more about Smart Alec, call us at 1-800-241-IRMA. Or write Digital Communications Associates, Inc., 1000 Alderman Drive, Alpharetta, Georgia 30201.

Unix standardization loosening constraints in mini mart

Emerging trends improving wares

By James E. Clark
Special to CW

The emergence of Unix as a standard, hardware-independent operating system carries one heavy implication for the general minicomputer market: Users will no longer be held hostage to any particular vendor's operating environment or applications software.

Less far-reaching but equally important trends are emerging within the Unix marketplace itself. Ten of these trends follow.

1. Performance. Many Unix system users have found that their hardware lacks the computational performance to run their applications with acceptable throughput or response time. In turn, vendors have begun to design machines that will make Unix run faster.

Vendors of scientific and engineering superminis especially will benefit from this trend because their development and marketing efforts have traditionally focused on users who need to process large volumes of data at very high speeds. Users can expect these vendors to leverage their hardware's performance and enter new markets — those outside the usual realm of real-time processing.

> ”
>
> *Minicomputer vendors will be forced to adhere to standard forms of Unix, lest they risk shooting themselves in the foot.*

2. Operating environment. Unix is becoming standardized. Today, only two real variants exist: AT&T's System V and the University of California at Berkeley's 4.2. Any versions that deviate from these two are quickly being brought into line. In addition, the efforts of the Institute of Electrical and Electronics Engineers, Inc. will yield a standard baseline for the future.

Vendors will be forced to adhere to standard forms of Unix, lest they risk shooting themselves in the foot. Within these standard forms, however, vendors will distinguish themselves by adding features and enhancements such as increased security measures, fault tolerance, real-time processing and multiprocessor support.

3. Compliance with both standards. The existence of two major Unix variants has led to the advent of multiple operating system strategies. Different vendors take slightly different technical approaches, but they all provide the same basic functionality — compatibility with both dominant Unix implementations.

Within two to three years, today's compatibility issues will be worked out. Nearly every vendor will accommodate both the Berkeley 4.2 and the AT&T System V environments by implementing some mechanism to combine the two.

4. Convergence. Eventually, the two Unix versions will converge into one. This will happen less because of the efforts of any one vendor than because of marketplace demand. Users will call for an implementation of Unix that has the benefits of being the standard and of offering high performance and full functionality.

If the purveyors of Unix are to survive, they will need such unity to combat their true competitors: IBM (with whatever opearting system it chooses) and Digital Equipment Corp. (with VMS).

5. Availability of software. The advent of a standard operating system naturally prompts a wide range of software applications. In the Unix marketplace, vendors are rapidly expanding their offerings. Because Unix is machine independent, these applications are portable across a wide spectrum of micro, mini and mainframe hardware from a variety of manufacturers.

6. Hosting other environments. Recently, vendors have begun to promote environments "on top of" Unix. (A good example of this is Vipark Computer, Inc.'s implementation of Pick Systems' Pick environment on Unix machines.) This trend makes hundreds of additional software applications available to Unix system users.

7. Workstations. In the general market, the trend is toward workstations that focus on general-purpose, scientific or administrative applications. More specifically, manufacturers are expending effort to connect these workstations to Unix machines.

Clark is director of Unix systems marketing for the computer systems division of Gould, Inc., a Unix supermini vendor based in Fort Lauderdale, Fla.

The #1 3270 alternative for people who want flexibility.

CH

The need for a 3270 alternative shouldn't replace the need for keeping your terminal system flexible, your options open. That's why the #1 choice is Telex.

Look to Telex, and there's a lot to look at. In fact, next to IBM nobody sells more 3270 displays, printers, controllers and intelligent workstations than Telex. And for maximum flexibility Telex's wide range of terminals plug directly into Telex or IBM controllers. There's a choice of high-speed matrix or letter-quality output devices and easy-to-use, low-cost display printers, too.

But product selection isn't the only choice. Telex displays offer features like color graphics, monochrome or color monitors, and ergonomic tilt/swivel design. There's a selection of keyboards,

Future Unix workstations will feature icons, discipline-specific user interfaces and bit-mapped support for windows. The operating system's malleability makes all these possible.

8. Computational servers and file servers. The trend in both is toward greater performance and higher I/O capacities.

- Computational servers. Most computational engines now use some amount of cache memory. Unix-based systems are being developed with added hardware assists, including special floating-point arithmetic, multiplication and vector processing.
- File servers. The focus here is I/O bandwidth. Faster disk controllers that support new, high-performance disk drives are making their way to Unix-based systems.

9. Networking. At the system level, the trend is toward integration with a form of distributed Unix. To date, there are three common approaches to distributed computing.

- Network file systems.
- Newcastle connections.
- Streams.

10. Business arrangements. The ease of integration with Unix systems has led some large companies to take on the role of integrator. In many cases, these companies do not have the technology in place to address the product needs of Unix system users. The companies do, however, have the marketing savvy, sales forces and distribution channels to make significant Unix-based sales.

Traditional manufacturers' needs for Unix-based systems — coupled with these firms' inability to produce such systems quickly — provide a perfect scenario for the rise of start-up companies. With $5 million to $20 million, a start-up company can quickly develop and manufacture some initial products. It can then sell these products on an OEM basis to a larger, slower moving company better equipped for marketing.

> ❞

> *Traditional manufacturers' needs for Unix-based systems provide a perfect scenario for the rise of start-up companies.*

VARY

from SR/18

well exceed the cost of the larger investment in a more suitable system.

Making the right choice

How can any user be sure that the right equipment is being purchased? As with anything else, evaluating equipment and software will be an easier task if the user can clearly define and write down what a system must do, how it will be used and the growth that can be expected.

Two more options that can help when evaluting systems are vendor product demonstrations and contacting current users of the systems being considered. If a vendor promises a certain function, have him demonstrate it. Vendors can also provide lists of current users. If you have contacted a vendor for such a list, do not let it choose only satisfied customers. Unhappy customers can be helpful; what makes one user very unhappy can make a second user praise a system.

A clear perspective of the computer industry will help anyone in selecting a supermicro or a minicomputer. Future technological enhancements may make the supermicro work more like a mini, just as the mini may begin to work more like a mainframe.

In this environment, the best defense is a good offense — be very sure of what the system is expected to do today and maybe even as far ahead as next year, but expect your investment in equipment to be obsolete in about a year. Considering the possible replacement factor in your cost/benefit analysis will protect you from any nasty surprises.

CONTROL

from SR/22

through a calculator.

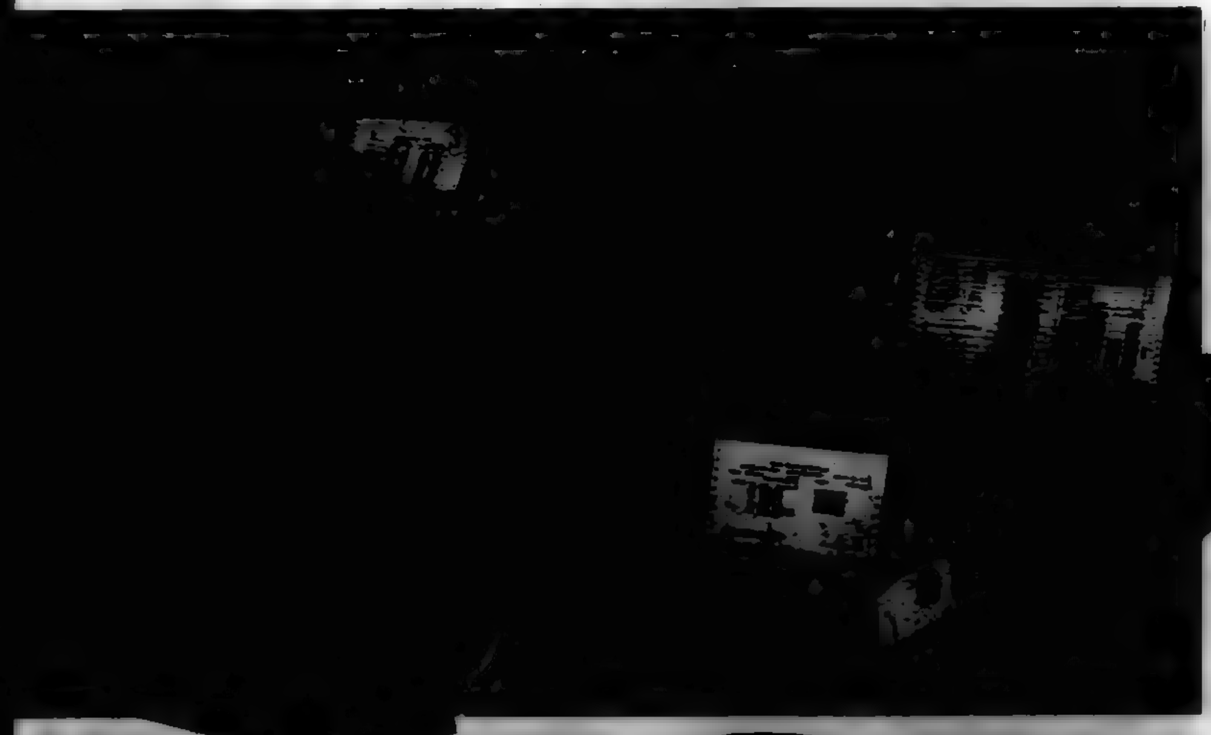
But the first concern — the matter of who is getting at what data — can be centrally controlled through the departmental mini strategy. In accordance with a specific user group's requirements, MIS can devise a series of extracts that offload corporate data, manipulate it into a format that is conducive to efficient access and relocate it to the user department's mini.

Because the nature and timing of the extracts is under MIS control, user-submitted, round-the-clock extracts no longer present a problem. In addition, each extract can be certified — against MIS-defined and MIS-controlled checks and balances — to have executed accurately.

Improvement in meeting users' needs. Within this departmental mini strategy, users get access to data that is suited to their unique needs. The benefit to users is obvious, but the MIS department fares equally well.

Different areas of a company typically need data in different formats. Designing an all-purpose data base that meets everyone's needs is a task and a half, even with products flexible enough to accommodate a variety of data access needs.

If the MIS department prepares and delivers data to departmental minis, giving each user group a format that suits specialized requirements, it eliminates the need to obtain a corporate concensus on a mainframe solution.



HOICE

too. Plus extended highlighting and light pen capability. Telex also offers controllers that support local print buffering, format storage and dual host communications.

There's a choice of service plans, too. Backed by over 2,000 Telex-dedicated service and support people worldwide.

No wonder more and more companies are making Telex their 3270 alternative . . . It's the #1 choice.

For more information, contact John Hawkins, 6422 E. 41st Street, Tulsa, OK 74135/1-800-331-2623.

TELEX COMPUTER PRODUCTS, INC.

Third-party service keeps multivendor systems on-line

Users find offerings convenient, objective and comprehensive

By Rudy Thibodeau
Special to CW

Minicomputers have become the target for independent maintenance companies, largely because multivendor hardware configurations have proliferated and because minicomputer vendors have not offered substantial maintenance for such mixed-vendor systems.

A minicomputer vendor's maintenance warranty, for example, is not likely to cover a user's entire configuration unless that configuration consists wholly of the vendor's equipment.

If the vendor's mini is connected to another vendor's printer or tape subsystem, the mini vendor — in extreme cases — may even refuse to perform warranted work until the user disconnects the peripherals.

At the least bothersome end of the spectrum, a user site that contains equipment from several manufacturers will be forced to rely on multiple service sources, an arrangement that complicates maintenance and leads to problems. With multiple service sources, the user's maintenance and administrative costs increase, and the availability of prompt, on-demand service decreases.

Third-party maintenance companies alleviate the problems of multivendor equipment servicing. These companies have the capability to service mixed-vendor equipment, and they can easily tailor maintenance service to the requirements of each user's specific configuration.

Because of the advantages they offer, third-party maintenance services are gaining in importance and popularity. Users, in increasing numbers, are welcoming independent service companies as an effective alternative to other maintenance options.

In a 1983 report, "Third-Party Maintenance of Computers and Data Terminals," Frost & Sullivan, Inc. concluded that most users rated third-party companies' services as highly as or higher than the services provided by equipment manufacturers.

Users also reported that, often, third-party companies were more responsive than equipment vendors and provided more cost-effective service.

The benefits of third-party maintenance fall into three general categories:

- Convenience.
- Objectivity.
- Comprehensiveness.

Convenience. Third-party maintenance companies offer one-stop shopping that can significantly reduce a user's administrative workload. Having one source for maintenance eliminates the problems associated with calling, paying and relying on several different manufacturers.

As an added convenience, many third-party maintenance companies are well suited to service remotely located offices and facilities. These companies can usually provide geographic coverage at least as well as equipment manufacturers can.

> ❞
>
> *Users reported that, often, third-party companies were more responsive than equipment vendors and provided more cost-effective service.*

Most third-party maintenance companies are organized much as a manufacturer's field service force: They consist of a national network of local field offices staffed with service and customer engineering personnel; these local representatives are supported by regional and national technical and engineering staffs.

Objectivity. Independent maintenance companies do not benefit from passing the buck or blaming other vendors' components for a system malfunction, as is often the case with manufacturers' maintenance.

Because of this, third-party maintenance provides users with an objective, thorough approach to equipment service. When a company is responsible for an entire system, it must service the entire system equally; it cannot merely focus on a single system component.

Independent maintenance companies can also provide objective opin-

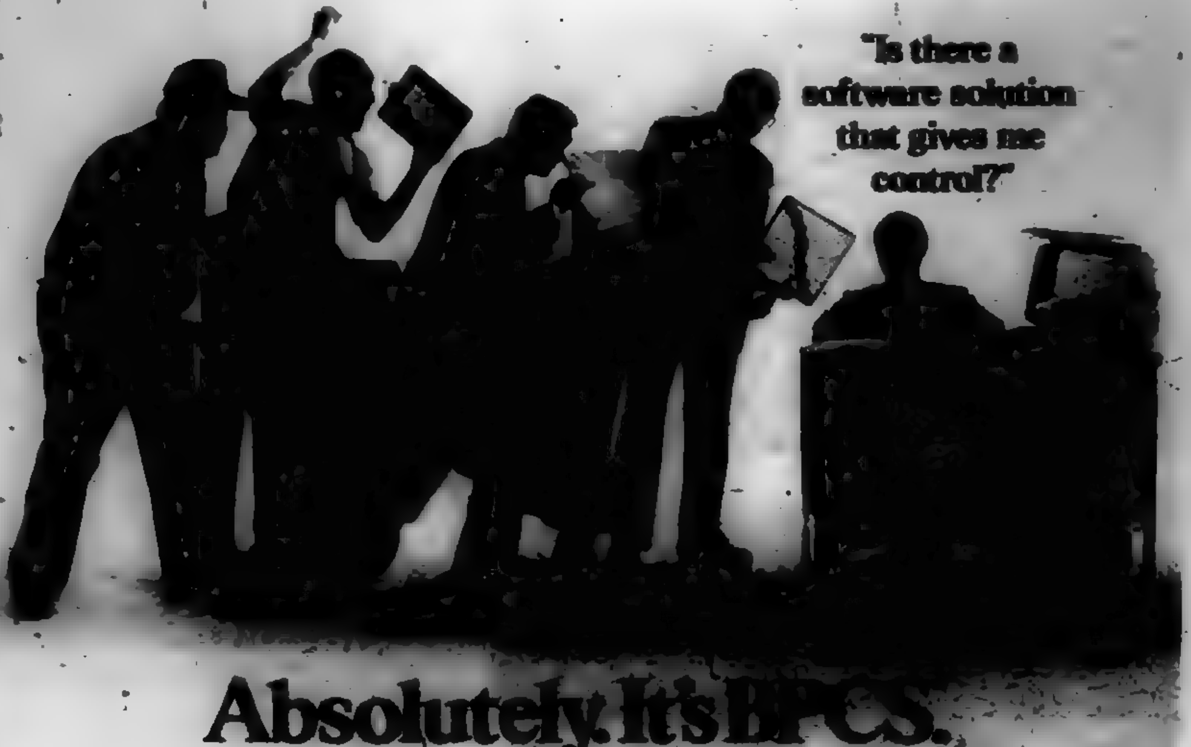
Thibodeau is national account marketing manager for Control Data Corp.'s Engineering Services Division, which is based in Minnetonka, Minn.



"Is there a software solution that gives me control?"

Absolutely. It's BPCS.

Business Planning and Control System

BPCS is the solution. It gives your company firm control of its entire manufacturing/distribution operation. From inventory management and order entry to shop floor control and full financial reporting, BPCS coordinates every operational function... with ease!

BPCS is written in native code to maximize IBM's System/38 architecture. So with BPCS you get the power to take control of your entire operation today. And the flexibility you'll need to grow along with your business tomorrow.

Local BPCS affiliates provide technical support for easy installation and implementation. The affiliate network, composed of 43 professional consulting organizations in 22 countries worldwide, guarantees you a trusted partner in the search for a real solution.

BPCS is indeed that real solution. It's designed to accommodate the broadest scope of business operations but can be tailored to meet each individual user's needs. BPCS affirms your control in the most demanding situations.

Over 700 worldwide users attest to BPCS quality. Get the complete software solution designed to coordinate all your information needs. Get BPCS.

Users must match needs to service firms' capabilities

Keeping mixed-vendor minicomputer systems up and running is no small undertaking, and obtaining the right kind of service at the optimum cost is a difficult goal to achieve.

A logical approach to saving money and eliminating unnecessary downtime lies in determining the specific maintenance requirements of all facilities and in finding an organization that can effectively address these needs.

Once a shop's requirements have been identified, the manager should ask maintenance organizations to supply written proposals that fully describe service capabilities.

Specifically, the proposals should address the type of equipment the organization services, the response time a user can expect, the maintenance organization's normal working hours and the cost of service after normal working hours.

Three key resources

In a general sense, users can judge maintenance organizations according to the strength of three key resources: people, parts and depth of service.

People. The geographic distribution coupled with the availability of qualified customer service personnel are prime considerations.

Although some maintenance organizations service a wide geographic area, many do not have enough available personnel to service any given area properly.

The service a user would receive from an enormous national field service organization, for example, would be inadequate if that organization only employed one or two technicians in the user's city.

Equally important to the quality of service is the extent to which the maintenance organization trains its field engineers. Because of the rapidly changing computer market and the need to upgrade parts and replace outdated technology, the user must demand that the maintenance organization continually train its customer engineers.

> "
>
> *In a general sense, users can judge maintenance organizations according to the strength of three key resources: people, parts and depth of service.*

Parts. The availability of needed parts or components is another important factor.

A maintenance company cannot possibly stock all possible parts for each customer. It can, however, maintain a reasonable parts inventory that guarantees a high level of customer satisfaction.

Depth of service. The depth of service is also a major concern. A user can gauge a maintenance organization's commitment according to whether the organization offers the following two services:

■ A hot line. The hot line should ensure speedy responses for emergency calls and should provide a day-to-day source of assistance for less pressing maintenance and technical problems.

■ Remote diagnosis. Remote diagnosis is becoming popular as a viable means of troubleshooting; it can eliminate many service calls and cut maintenance costs.

A user should try to find a maintenance organization that provides the service most suited to the needs of the computer system.

— Rudy Thibodeau

SERVICE

from SR/30

ions on equipment acquisitions. An outside service organization will not profit from recommending one manufacturer's equipment over another's. Rather, it will tend to offer more neutral advice than an equipment manufacturer will.

Comprehensiveness. Major third-party services usually have an extensive spare parts supply and a distribution system that is large enough to meet a wide variety of minicomputer and peripheral hardware requirements.

The main services these companies offer fall into three categories:

■ Preventive maintenance — periodic and planned services, such as replacement of air filters and disk drives.

■ Predictable maintenance — replacement of assemblies with known failure rates.

■ Remedial maintenance — diagnosis, isolation and repair of malfunctions.

Additional services may include installing equipment, preparing documentation and user training.

Law firm weighs evidence in choosing OA system

FREDONIA, N.Y. — Careful research led one of the partners at a small law firm toward the verdict that a successful office automation project must be constructed piece by piece around useful software.

Peter Clark, the partner in charge of automating the law firm of Brandt, Laughlin, Schaack, Whipple & Clark, P. C., began his project with little knowledge of computers. "My kids probably know more than I do," he said. But after reading articles about office automation in American Bar Association (ABA) journals and visiting an ABA conference that featured some automated systems in use, Clark had a solid idea of how to begin his search.

"From all I'd read . . . the software was very important," he said. His research convinced him that Brandt Laughlin would be best served by a Unix-based system with components for word processing, accounting and client record keeping. Unix was the only operating system that Clark thought would provide the multiuser capabilities the firm required.

Brandt Laughlin has six attorneys and 10 clerical employees who work out of three offices — the firm's Fredonia headquarters and two branch offices in nearby towns. In its two branch offices, the firm uses dedicated word processing systems. In its headquarters, however, it wanted to integrate word processing and other company tasks on a micro-based system.

Clark chose Unilaw legal software from Guardian Automated Systems, Inc., a Unix software development company, as the basis for the firm's system. The software included a component for time and billing and one for trust accounting and had an interface with word processing.

Clark then looked for hardware on which to run the software. After he considered Unix-based micros from IBM, AT&T and NCR Corp. and dismissed them because of their prices or unavailability, Clark chose a Fortune Systems Corp. XP 30 with a 30M-byte hard disk.

Brandt Laughlin ordered additional software from Guardian, including a University of California at Berkeley 4.3 Unix-like operating system and software packages for word processing, spreadsheets, terminal emulation and payroll.

The system was installed in August 1984. Since then the firm has installed a general ledger package and has subscribed to an on-line legal data base.

The firm followed a similar plan with its hardware and software. It bought basic components and will add to them as needs arise, as employees become comfortable with technology and as money becomes available, he said.

He outlined other attitudes and methods that he said helped Brandt Laughlin make a smooth transition from manual to automated document production and accounting.

- **The clerical staff wanted it.** Clark said one secretary had worked with a word processor at another firm and that the others liked the system because it saved them time on repetitive tasks.
- **The firm did not try to deal with too much data at once.** Rather than try to put all of its documents onto the system right away, the firm entered forms as it needed to use them. For example, Brandt Laughlin started using the time and billing programs only for clients who were billed hourly. Later, it phased in their use for clients who were billed on a flat rate and those who were billed on a contingency basis.
- **Automation was presented not as a replacement for all old methods but as a supplement.** The on-line research service, for example, is being used in conjunction with periodicals and other traditional research tools.
- **The firm's organization remained intact.** The secretary primarily responsible for documents related to matrimonials still worked on them. The people who handled the accounts payable continued to do so.
- **Good financial planning permitted the firm to absorb the costs of automating.** The equipment and software purchases were modest — totaling only about $30,000 — rather than extravagant. Additional components will be added when needed.
- **The firm automated only its headquarters.** It plans to link its two branch offices later. That way, Clark said, employees from the Fredonia office can train clerical people at the other sites.

Introducing the Ultimate 3-in-One™ Printer Toshiba P351

Now ideas look as great in print as they do on the screen!

Toshiba's finest 3-in-One™ printer, the advanced P351 really enhances a professional image. With letter-quality work far faster than daisy wheels. Qume Sprint II emulation for elegant word processing. Faithfully reproduced dot-addressable graphics. Drafts at a blazing 288 cps. Paper saving condensed print. Even international characters for a world of communication possibilities. And an unlimited selection of downloadable fonts on both disk and plug-in cartridges.

Erin is also the source for Toshiba Model P1340—the most economical way to take full advantage of Toshiba's exclusive 3-in-One printing. The remarkable P1340 with 10" carriage turns out perfectly formed characters 50% faster than a daisy wheel. Handles drafts even quicker and delivers superb graphics at 180 x 180 dots per inch. Advanced features include software-selectable fonts, pitches, line spacing and more.

For more information on the full line of Toshiba printers, call Erin today. You'll like the way Toshiba 3-in-One printers help great ideas take shape. And you'll like the way Erin backs them up with full service support.

Erin is a leading distributor of personal computers and PC-related products. Our complete services [illegible] in the selection of the most cost-effective products, maintaining full inventories for rapid delivery and providing favorable financing. At Erin our goal is to establish an enduring business relationship with you, our customer. That's why we say, "Service is our most important product".

ERIN

ONCE FAIRCHILD REPUBLIC CHOSE AT&T, ALL SYSTEMS WERE GO.

The people at Fairchild Republic are experts at designing and developing custom flight systems for air and space travel. When they needed a custom system of their own to manage their communications and information here on earth, they turned to another expert—AT&T.

The problem was to link seventeen different plant and office buildings spread out over eighty acres, and provide them with fast, cost-efficient voice and data communications.

AT&T had the answer. Our Premises Distribution System, AT&T's unique universal wiring scheme, serves as the link. It can unite not only our own communications systems, local area networks, and computers, but also those of other major vendors.

The communications system they chose is AT&T System 85, equipped with a wealth of features to speed and improve the voice and data flow throughout plant and office.

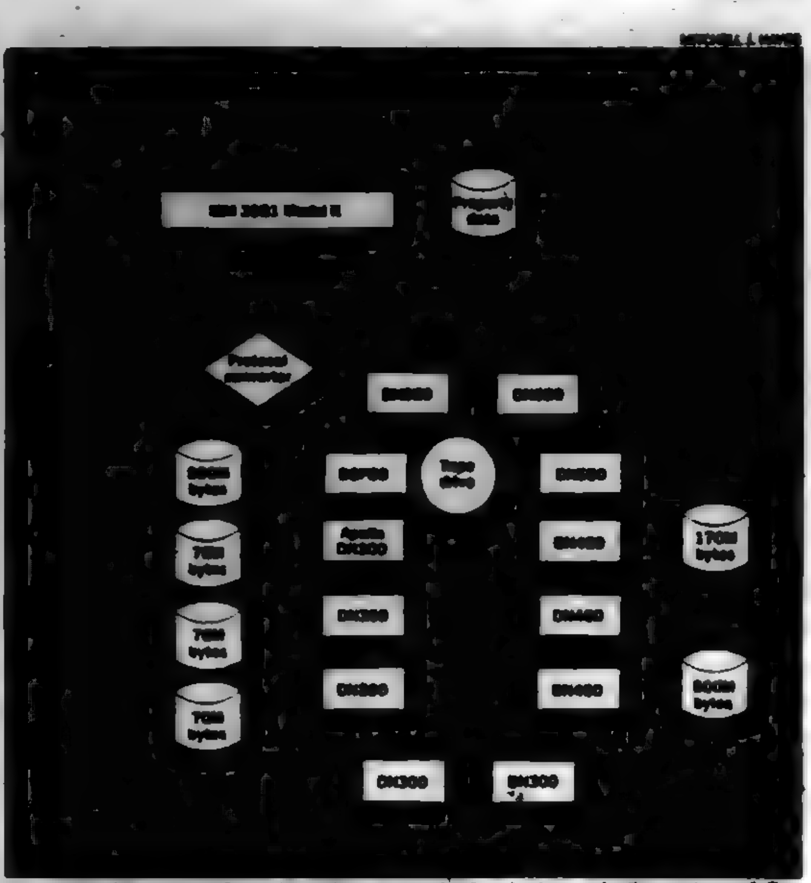
Beyond fulfilling all of Fairchild Republic's needs today, this fully integrated system is packed with capabilities waiting to be tapped as they continue to grow in the future.

What does the future hold for Fairchild Republic? In their business, not even the sky's the limit. AT&T has the technology, products, service and support to see them through.

To find out why AT&T is the right choice to help your business meet its long-term needs and goals, call your Information Systems Account Executive or 1 800 247-1212, Ext. 536.

AT&T

The right choice.



Hennepin County's 12-workstation network ties in to a similar setup of five processors in Minneapolis city offices.

HENNEPIN from SR/14

duction. With the new system, users can display a map of the entire city of Minneapolis and zoom in to inspect and update details as minute as street signs. Lachinski said users can process a change to a large map within a few seconds — about the same response time required for a change to a small map using the old configuration.

- The network's data base, Apollo's Domain DSM, allows programmers to compile programs on-line, and jobs submitted by different programmers can run simultaneously. Associated graphics routines, components of Apollo's Graphics Metafile Resource, let developers integrate graphics, text and data into interactive applications. Lachinski said DSM also features fourth-generation capabilities that will help end users work with the completed Ultimap system.

- Because each workstation on the network now has its own processor, programmers do not have to compete with other users for CPU resources. Lachinski said the microprocessors have less raw power than the mainframe did but can handle the same development processing load because they are dedicated workstations.

- Processing costs are so low, compared with those from the IBM mainframe, that Hennepin County expects the Apollo workstations to pay for themselves in less than one year once they begin running Ultimap in production, according to Lachinski. Because of this, he said, developers can concentrate less on costs and more on designing efficient systems.

Want to optimize user productivity

"With 32-bit microprocessor workstations, CPU cost is less of a consideration [than it is with mainframes], so the emphasis has shifted to optimizing user productivity," Lachinski said.

Hennepin County's Ultimap programmers are currently converting the mapping system software from IBM's IMS to Apollo's Domain environment. The 3081 stores graphics data, which programmers download to the Apollo network for conversion then upload back to the mainframe. They transfer files between the two configurations via a protocol converter.

According to Lachinski, the development team expects to take one-half of its work off the IBM mainframe by the end of this year and to complete the conversion six months after that.

LAMBTON from SR/14

But when staff members began simulating student usage with about 10 machines, they bogged down the network. The current dual-network setup arose as a result. Boyd said he split the network in two so that traffic tie-ups on one network would not impede transmissions on the other.

Cannot handle students' whims

The single network would probably be able to meet business users' demands, he said, but it could not handle the whims of students. "They're not disciplined at all," he explained. "They will sit for hours and just play, and they will try to bring the system down. They feel it's part of their learning process."

This perception of student habits also forced the school to abandon another planned network feature. When Boyd ordered the Cadmus equipment, he said he had hoped to use it as part of a file-serving scheme. Students would download files from a VAX processor, work with the data on the Cadmus machines and transfer the files back to the VAX for storage.

But the winter tests convinced him such a setup could be disasterous if too many students decided to transfer all their data at the same time. As the network stands now, each student is assigned a home workstation. Each workstation has its own disk drive, with either 60M or 140M bytes of storage, so each student can store data at his home base.

This way, Boyd said, students will transfer themselves across campus to their home workstations instead of transferring data across the network to whatever workstation they want.

With the dual network and local storage, Lambton's computing resource should hold up to the demands of its users, according to Boyd. But until the network survives two semesters of use, especially term-end cramming, he will continue to fear the worst. "I have my fingers crossed," he said.

Reach 66,000 Danish computer professionals.

Advertise in CW Communications' Danish publications and sell your products directly to Denmark's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, total data processing expenditures in Denmark for 1985 are expected to reach $1.8 billion. CW Communications covers the Danish market with three publications; *Computerworld Danmark, PC World Danmark* and *Run*.

Computerworld/Danmark serves 20,000 key EDP decision-makers throughout the Danish computer community. Each week *Computerworld/Danmark* covers new products and services, current applications and industry trends.

PC World Danmark is the monthly magazine that targets 12,000 IBM PC and compatible users and supplies them with first-hand information on the Danish PC market.

Run reaches 34,000 Commodore owners and potential owners in Denmark. Commodore is expected to grow at 40% per year through 1989. *Run* addresses the Commodore market with timely updates on hardware, software, and programs.

CW International Marketing Services makes advertising your products in Denmark, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

MICROCOMPUTERS

SMALL TALK
Edward Warner
CW International Editor

Many thanks to CW readers

As I leave the microcomputer beat at *Computerworld* to become the paper's International Editor, I want to say goodbye — at least for now — to a number of people who have, in time of need, given me good story ideas or quotes. In many cases they had no self-serving reason to call. Others have spent much valuable time on the phone with me in an interview. Sometimes, they even risked their jobs.

I would also, however, like to say an "ungoodbye" to those few who infest the otherwise-respectable field of public relations, denigrating its image while giving me a headache.

But first the good news.

An example of the helpfulness of our readership — especially those microcomputer managers and users out there — comes in response to a recent column that I wrote about my unfruitful search for business users of the AT&T Unix PC. At the end of that column, I asked the readers to call me if they knew of anyone using the machine. I received more than 30 phone calls. True, some were from dealers, but most appeared to have come from readers who had nothing to gain — except the good feeling of having lent a hand.

Another example comes to mind: A microcomputer manager with an oil company recently called to tell me his thoughts on site licensing of personal computer software and how his firm has just concluded such an agreement. A good story resulted, one that may have benefited other microcomputer managers.

Unfortunately, I have since heard that the kind soul who gave me the

DSS sidesteps DP logjam

Tools boost users' power; ease of use called crucial

By John Desmond

DALLAS — Decision support software (DSS) is becoming known for its ability to enable personal computer users to perform a variety of analyses using simple programs, while skirting the central MIS waiting line for applications. This is the consensus reached by two speakers at a session on DSS at the Software/Expo conference earlier this month.

But for DSS software to make it on personal computers, DSS products must be easy to use as well as effective, one speaker noted. "The financial modeling capability of this type of system depends on its ease of use," said Jeffrey A. Schackor, director of financial and business analysis for Healthone Corp. of Minneapolis.

Schackor addressed how a DSS system is being developed at Healthone, a health care conglomerate with four hospitals, health maintenance organizations, a home health organization and an ambulance service. The firm had a revenue of $180 million in 1984.

At Healthone, Schackor said, a financial modeling program is being developed because, "We need to know our financial situation at any point in time. We want a system to project financial performance for three to five years."

If a health maintenance organization approaches his organization about using a Healthone hospital for its members, Schackor said, "You have no idea what that means unless you can model the impact on the whole system. And I can't afford to a have a 50-man analysis department. We need a program that can produce reports quickly."

A final decision has yet to be made, but Schackor said he is leaning toward a personal computer-based DSS for Healthone.

Rusty Luhring, president of Ferox Microsystems, Inc., presented five examples of how DSS is being used on personal computers. Ferox markets a DSS application development system dubbed Encore.

Microsoft enhances Multiplan

Microsoft Corp. has unveiled an enhanced version of its IBM Personal Computer spreadsheet, Multiplan, shipping about the same time as Version 2 of Lotus Development Corp.'s 1-2-3.

Microsoft also announced Cobol Tools, its first productivity software package for Cobol programmers. The software, available for Microsoft MS-DOS or Xenix environments, will be shipped in October.

Multiplan Version 2, which will be available next month from Bellevue, Wash.-based Microsoft, is said to offer faster calculation speed by supporting the Intel Corp. 8087 and 80287 math coprocessor chips. Other reported enhancements to Microsoft's software are larger work sheet size, capability for keyboard macros, mouse support and the ability to read and write to files created with 1-2-3.

Like the new version of 1-2-3, Multiplan Version 2 uses a sparse cell memory management scheme to allocate memory only to work sheet cells that are filled. The more efficient use of memory allows Multiplan to accommodate spreadsheets with up to 4,096 rows and 255 columns.

The new version also prioritizes recalculations to handle the calculation of the on-screen cells first for greater speed.

Multiplan's compatibility with spreadsheet market leader 1-2-3, a first for the Microsoft package, will reportedly allow users to transfer values as well as formulas between the two spreadsheets. The new version also links with Microsoft Chart to provide real-time changes in the graphics presentation software when Multiplan figures are changed.

The keyboard macros in Multiplan 2 can be used for common procedures such as work sheet printing or more complex tasks such as creating customized applications.

WHO IS THE WORLD LEADER IN IBM/38-36 BACKLOG REDUCTION?

FUSION

The world's most successful companies have made Fusion Products International the leading supplier of query/report-processor, PC interface and spreadsheet software for the IBM System/34/36/38.

Why is Fusion number 1, worldwide? Because we fully support the PC. Because we're one of the few S/38-36 vendors who actually answer their customer-service telephones. Because we offer on-site training. Because *easy-to-use* means never having to read your manual. Because selected Fusion products are available in many languages. Even Japanese.

That's why the leading software company in Japan selected Fusion as their *only* S/38-36 report processor. The *best and brightest*, everywhere, choose to spend their valuable time on business issues, not on computer issues.

You probably know our name. Isn't it time you made a most important phone call? Isn't it time you used Fusion power to obliterate your backlog?

FUSION.

Fusion Products International 900 Larkspur L.C. Suite 295 Larkspur, California 94939 Telephone 415 461-4760 Telex [illegible]. Also in New York and Newport Beach.

Future to bring price erosion to micro software mart

Management control expected to diminish

By Susan Blakeney

MIAMI — The short-term future will bring tremendous price erosion in the personal computer software market and, in the longer term, a loss of control for DP managers over end-user computing.

Those were some of the predictions voiced earlier this month by industry experts at Link Resources Corp.'s "Marketing The New Technologies" conference. Link, a New York-based market research firm specializing in telecommunications technologies, is a subsidiary of International Data Corp.

During one session a panel of microcomputer industry personalities expressed their opinions on upcoming changes in data processing. One change, according to Stewart Alsop, publisher of "P.C. Letter," a biweekly newsletter on the personal computer industry, will be that "large computer centers will evolve to service departments. They will be transparent to users. End users will not be controlled by them."

The personal computer user of the future will likely use an Apple Computer, Inc. Macintosh, Alsop said. "IBM [Personal Computers] are just too complicated; they give the user too many choices," he said. "That's why the Macintosh is successful. It's operating environment is so easy to use."

Alsop said products and trends to watch for include Microsoft, Inc.'s Excel spreadsheet, which runs on Apple Computer, Inc.'s Macintosh. "Excell will give Lotus Development Corp. problems," Alsop said.

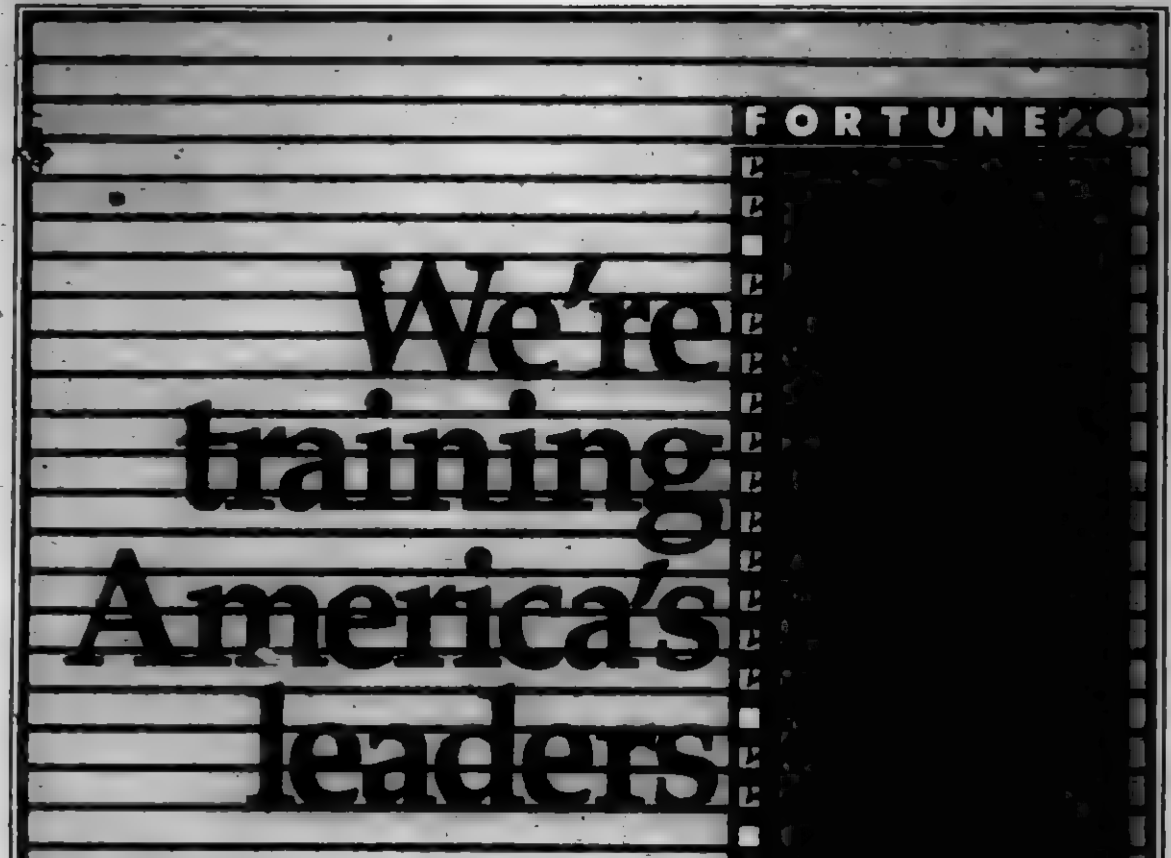
Other products Alsop said to look for include data base and file managers from Symantec Corp. and Ansa Corp. for the IBM Personal Computer and a package called Ready from Living Videotext, also aimed at Personal Computer users, that will be released at the end of the month. Ready, a memory-resident desk accessory, produces outlines for the user, Alsop said.

He also told his audience to watch for personal productivity packages that are task specific and will include drafting, typography and melding functions. Alsop said he expected laser printers to come down in price before anything major happens in word processing.

Eric Bedell, product marketing manager for Lotus' Jazz, maintained that the gloom and doom prevailing in the industry is really a "moment of digestion." Bedell, however, predicted coming challenges in the distribution arena and said presales seminars for users will be more widely practiced.

Bedell also compared the future of personal computer software to frozen food: each emphasizes speed, personal productivity, easy access and, last but not least, content.

Jim Johnson, president of Human Edge Software Corp., said "tremendous price erosion will occur during the next few years" thanks to agressive companies like Borland International and DAC Software, Inc. He warned, however, that pricing on Lotus' 1-2-3 along with Ashton-Tate's Dbase III would remain high because nobody appears able to offer a comparable product.



Facts tell the story. And here are the facts. [illegible] of Fortune magazine's top twenty firms use Crwth CBT [illegible].

With a complete curriculum, designed by CBT industry leader Gary DeWard Brown, it's no wonder that Crwth is the choice of the trainers at America's top companies. They know the power of interactive CBT when it comes to training thousands of users.

Crwth's curriculum teaches end users [illegible] and [illegible] fourth generation languages.

Pick to launch system versions for IBM micro

Pick Systems, located in Irvine, Calif., is scheduled to introduce next month two versions of its Pick operating system for the IBM Personal Computer AT.

One version reportedly will support up to three users, and the second will work with up to six users. The Pick operating system, in use on 27 different computers from low-end mainframes to the IBM Personal Computer XT, will include in its AT version a bridge to the IBM PC-DOS operating system, permitting users to move files between the two operating systems, according to Frank Petyak, Pick national marketing manager.

Other features of the Pick Personal Computer AT System include support for a streaming cartridge backup system, a bundled applications generator and compatibility with all other Pick systems. The latter feature means that users will be able to take "an application on an [IBM] 4300 and run it on the AT," according to Petyak.

Multiport cards supported

To gain the extra serial ports needed to support additional users, the Pick Personal Computer AT System will support multiport cards from AST Research, Inc.; Arnet Controls, Inc.; and Digigraphics, Inc., Petyak reported.

The three-user support version of Pick for the AT is priced at $795, and the six-user support version is priced at $995.

Both will debut in mid-October, Petyak said.

Intel introduces supermicro, board-level products

Intel Corp. of Santa Clara, Calif., has announced a new supermicrocomputer and several board-level products that are based on an 8-MHz version of the Intel 80286 microprocessor.

The products consist of two CPU boards and four memory expansion boards, feature immediate memory access and operate with the vendor's Irmx 286 operating system.

With the addition of the real-time Irmx 286, supporting up to 16M bytes of memory, the System 310AP is targeted for industrial and communications applications such as process control, data acquisition, robotics, protocol conversion and automated testing.

Memory, speed improvements

The System 310AP supermicro is said to offer substantial memory and speed improvements over the Intel 310, with performance comparable to the Digital Equipment Corp. VAX-11/780 mini. The 310AP supports applications previously written for Irmx 86 running on the 310.

The basic configuration includes the Multibus I bus architecture (IEEE Standard 796); the Intel 8-MHz, 80287 math coprocessor; a 320K-byte, 5¼-in. floppy disk drive; support for a 60M-byte, ¼-in. streaming tape drive; two serial ports; and one parallel port.

The 310AP line includes systems with up to 16M bytes of random-access memory (RAM); up to 420M bytes of unformatted hard-disk storage in increments of 19M bytes, 40M bytes and 140M bytes; and up to 16 ports.

The basic configuration is priced at $8,125.

The ISBC 286/10A CPU board includes an 8-MHz 80286 and a socket for an Intel 80287 coprocessor, 512K bytes of local memory and 128K bytes of dual-port memory. It is intended for erasable programmable read-only memory applications and sells for $2,600.

The ISBC 286/12, intended for RAM applications, contains 1M byte of dual-port, immediate-access RAM. The board also includes the 8-MHz 80286 and a socket for the 80287, as well as a socket for the Intel 82258 advanced direct memory access microcontroller. It costs $4,715.

Both CPU boards can reportedly be configured to gain access to memory through the ILBX local bus extension or through a synchronous bus interface.

The EX series of memory boards offers access memory transfer through a new synchronous bus and supports byte parity-error detection. The top of the line, the ISBC 040/EX, priced at $7,500, is said to be the first Multibus I board to offer 4M-byte capacity.

The other boards are the 500K-byte 012/EX for $1,800, the 1M-byte 010/EX for $2,700 and the 2M-byte 020/EX for $4,335.

Isdos micro tool debuts

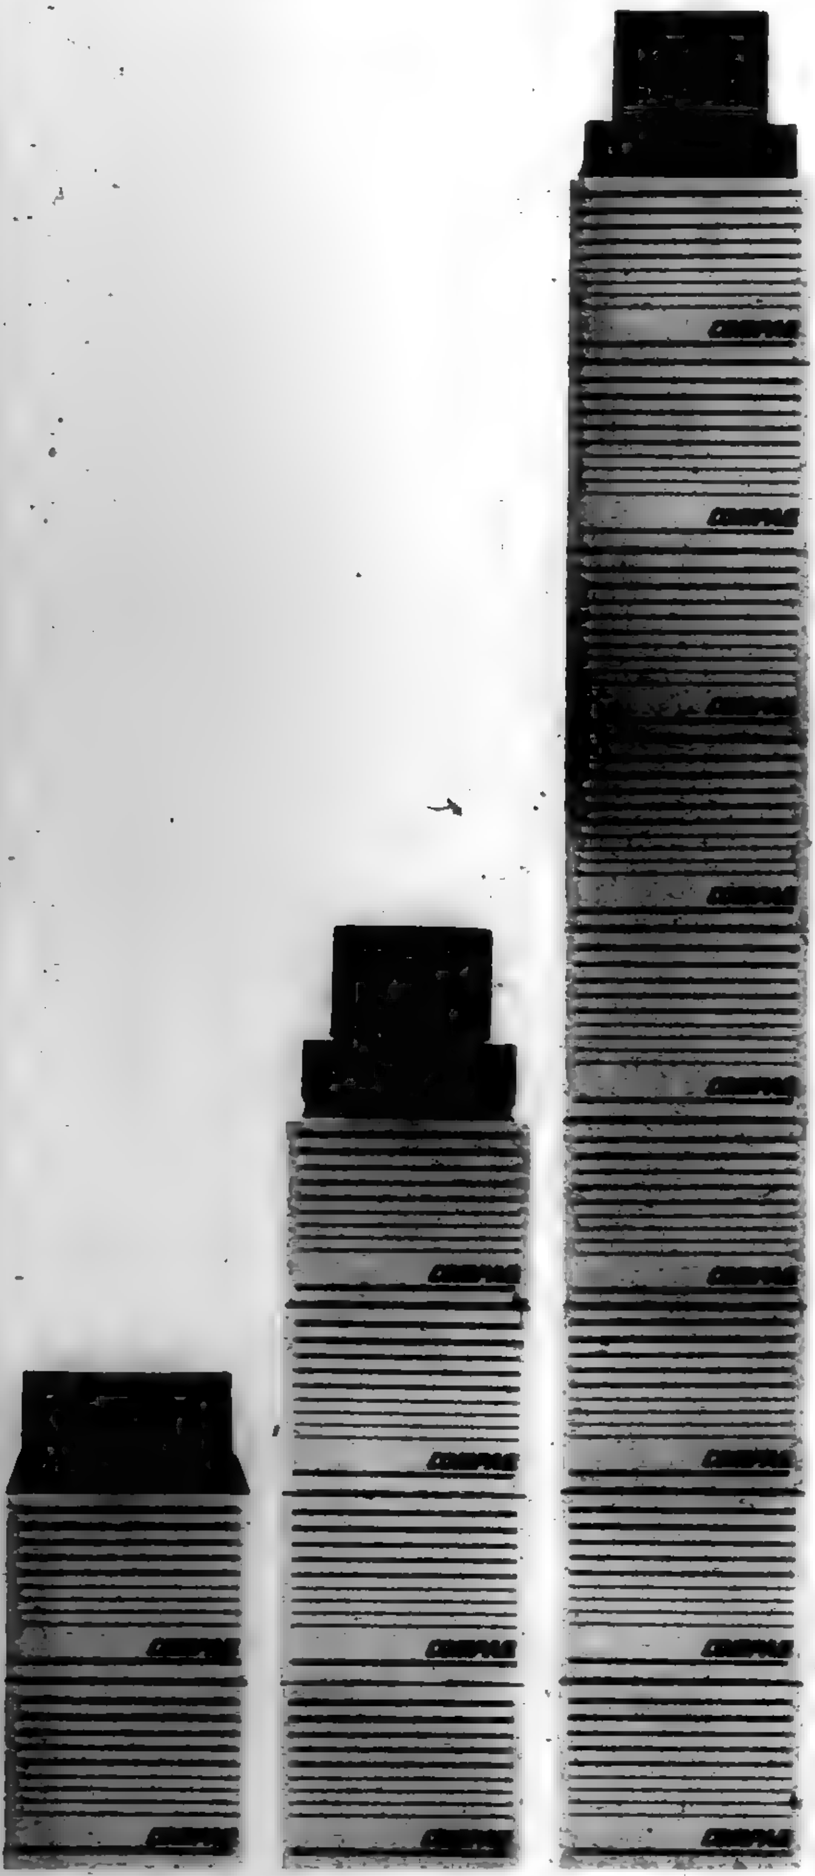
Isdos, Inc. of Ann Arbor, Mich., has introduced a software program that automates the Yourdon/Demarco system development methodology of structured analysis, which programmers and analysts often use.

Structured Architect features graphics representations of data flow diagrams and the validation and verification of analyst models. The package's data dictionary documents interface flows and data stored in data flow diagrams and specific processes represented in the data flow diagram.

The software runs on an IBM Personal Computer with 256K bytes of random-access memory and IBM's PC-DOS operating system. The package supports graphics boards from a number of manufacturers including IBM and Tecmar, Inc.

Structured Architect costs $3,500.

It's not that COMPAQ is the fastest growing computer company in the world...



It's why.

In 1983, COMPAQ* Computer Corporation had the most successful first year in the history of American business. Last year, our sales grew over 196%, making COMPAQ the world's fastest growing computer company.* And this year we're setting more records.

The reason is simple. Our computers simply work better.

For example: Most manufacturers mount disk drives in a rigid manner that could destroy data if the computer is bumped, but COMPAQ protects all disk drives (and their data) with shock mounts. Not just in our portables, but in our desktops, too.

We probably don't have to go to these lengths. But we do. In every detail.

Our exclusive internal tape backup system can protect Megabytes of data in minutes instead of hours.

Our computers can run the world's largest library of business software.

And now our two newest products, the COMPAQ PORTABLE 286™ and COMPAQ DESKPRO 286,™ offer more speed, more storage, and more memory than ever.

Our refusal to compromise is why COMPAQ computers are rated so highly by industry trade publications and over 300,000 satisfied users.

Visit an Authorized COMPAQ Dealer near you and you'll see what has become apparent to buyers all over the world: COMPAQ computers simply work better.

For a free brochure or the location of your nearest Authorized Dealer, call toll-free 1-800-231-0900 (in Canada 416-449-8741) and ask for operator 8.

It simply works better.

Motorola expansion card bows

Motorola Semiconductor Products, Inc. of Phoenix has introduced an expansion card that reportedly allows an IBM Personal Computer with a 10M-byte hard disk to serve as a multiprocessor host for AT&T Unix-like applications.

The plug-in module, PC/68000, is based on the Motorola, Inc. MC68000 microprocessor.

It is said to run Motorola's Unix-like System V/68 operating system and provide transfer capabilities between that system and IBM's PC-DOS.

The product reportedly supplies an IBM microcomputer with development capabilities similar to those for Motorola HDS-200 or HDS-300 development workstations.

Buffering and cache memory reportedly allow the 68000 processor to run independently of the I/O functions of the Intel Corp. 8088 or 80286 chip within the IBM Personal Computer.

The user can switch between the System V/68 and PC-DOS with two keystrokes, the company said.

The PC/68000 includes the 10-MHz MC68000, cache memory, 2M-byte dual-ported random-access memory and the System V/68 software.

The module is available for $4,500, according to the vendor.

Ashton-Tate on-line data support out

Ashton-Tate of Culver City, Calif., has become the first software company to offer on-line technical support services to its customers via One Point, a Walnut Creek, Calif., on-line data base vendor.

Ashton-Tate has furnished the One Point data base with product descriptions, reference notes, product upgrades, samples and product announcements.

Questions that cannot be answered by the data base information can be sent to Ashton-Tate via electronic mail for a quick reply.

Users access the information through the One Point Computer Information Network that runs on Tymshare, Inc.'s Tymnet.

Usage fees for the service are $40 per hour.

Timelock unveils IBM micro security system

Timelock Software, Inc. in Huntington Station, N.Y., has introduced its Timelock Security System for use on IBM Personal Computers with attached hard-disk storage units.

Timelock, a hardware/software product, includes a business-card-size plug that must be inserted into the computer's external parallel port, in line with the printer cable, before users can boot the computer from the hard disk.

The product's software, meanwhile, resides on the computer's hard disk. The software limits access to the computer to those who have the correct password.

After three attempts, an alarm sounds and the computer locks out any further attempts to access it, Timelock said.

A corporate version of the product is also available. The software in that version is reportedly custom written for each corporate customer. Also included in the corporate version are skeleton keys, plugs that can access all of the customer's hard disks, permitting a security officer to boot a hard disk-equipped computer for a user who has forgotten his plug.

The Timelock Security System, available now, has a retail price of $350. Its corporate version is priced at $14,050 and includes two skeleton key plugs, 100 software licenses, 25 security plugs and documentation.

Rumor has it you're moving up to T1.

Come back.

T1 speed.

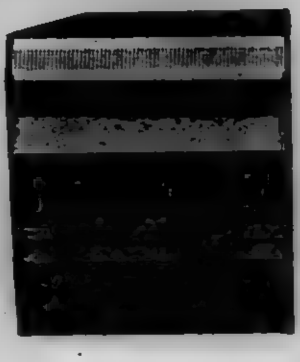
It doesn't have to be as scary a project as everyone thinks. Fact is, installing T1 can be a fairly simple chore.

We're Infotron.

We design, build, and install communications networks. Reliable. Compatible. Sophisticated T1 networks that support data and compressed digital voice.

Our newest system, InfoStream™, introduces an open architecture to T1 networking based on Infotron's long-established strengths in multiplexing and switching.

We'll take care of you every step of the way. Before. During. And after the sale.



Calm down.

Dust yourself off. Then call: 800-345-4636.

SEMINAR.

Human resource system out for IBM, AT&T micros

Nardoni Associates, Inc. of Whitehouse Station, N.J., has unwrapped the Microcomputer Personnel System, a stand-alone human resource information system that runs under IBM PC-DOS 2 on the IBM Personal Computer AT, XT, AT&T PC 6300 and any IBM-compatible microcomputer with a hard disk drive.

The Microcomputer Personnel System's data base design features include more than 650 unique data elements, 20 expansion fields related to personnel functions, 40 reference tables, more than 70 display screens, 25 personnel management reports and a two-level report generator, according to the vendor.

Reports are said to cover such areas as salary and wage issues, applicant flow, tuition refunds, medical claims, labor relations, employee benefits, attendance control, skills utilization, management selection, education and training, appraisals and employee history.

Security feature controls access

A security feature controls system access by signon, menu and data element read-and-write limitations controlled by the personnel department, according to a Nardoni Associates spokesman.

The Microcomputer Personnel System can interface to word processing packages and can be configured with optional communications modules that make the microcomputer function as a terminal workstation for communication between other microcomputers or mainframes, the spokesman added.

A single-user license costs $9,500.

BOARD-LEVEL DEVICES

■ **Bit 3 Computer Corp. has introduced The Adapter, which reportedly allows the IBM Personal Computer AT to appear as another processor on systems using the Intel Corp. Multibus.**

The product, which consists of two cards interconnected by cables, is said to provide the full resources of the Personal Computer AT for use as a bus master in Multibus applications. This configuration allows the AT to use a variety of graphics, array processors, large disks and high-performance processors compatible with Multibus, the vendor said.

In Multibus applications using The Adapter, the AT reportedly can function as a pre-, post- or coprocessor.

The Adapter is priced at $1,175.

Bit 3 Computer, 8120 Penn Ave. S., Minneapolis, Minn. 55431.

■ **STB Systems, Inc. has introduced a memory expansion board for use with the Lotus Development Corp. and Intel Corp. Expanded Memory Specification.**

The Memory Companion/PC will give the IBM Personal Computer XT and compatibles access to up to 2M bytes of additional memory. Up to four Memory Companion/PC boards can be installed in a system for a maximum of 8M bytes of memory, the vendor said.

The board reportedly is compatible with Lotus' Symphony 1.1 release.

The 64K-byte Memory Companion/PC costs $349. The 256K-byte version costs $395.

STB Systems, Suite 125, 601 N. Glenville, Richardson, Texas 75081.

■ **Ideassociates, Inc. has announced a multifunction add-on board for the IBM Personal Computer AT.**

The Idea Supermax reportedly includes two serial ports, one parallel port and memory expansion capabili-

DSS sidesteps DP logjam

DSS is commonly used today for financial modeling and budgeting, often to help make decisions on whether to go forward with a project or acquisition or even to hire or promote personnel, Luhring said. DSS on the personal computer allows the evaluation of more alternatives more quickly than mainframe modeling programs typically allow, he said.

In addition, "The ability to change the format of the information for an analysis is put directly into the hands of the decision maker," he said.

Bicks Pickles of Scarborough, Ont., Canada, which has captured 54% of the Canadian pickle market with more than 300 products, needed a modeling program to project profits. The firm's MIS department said the necessary application would take two years to develop, and they recommended not doing it on a personal computer. The DSS proponents ignored the advice and developed the application on a Compaq Computer Corp. micro with a 10M-byte hard disk. The application was developed in about six months, Luhring said.

The First National Bank of Chicago, the 10th largest U.S. bank, was experiencing a high rate of loan defaults and was looking for a system to help evaluate credit risks. The company made an initial decision to go with a personal computer-based DSS project, putting nearly 7,000 historical financial statements on five micros, each with a 30M-byte hard disk. Loan officer support teams can now perform analyses without special expertise using the modeling program, Luhring said.

Western Digital Corp., a Silicon Valley electronics manufacturer, wanted management reports from its general ledger software running on a Hewlett-Packard Co. 3000 minicomputer. "But it took two weeks to get charts" after a request was submitted, Luhring said. So a team wrote a program to extract needed data from the HP 3000 and download it to a personal computer. Now, the company gets 48 monthly report graphs in an hour and a half, he said.

The World Bank/ International Finance Corp. in Washington, D.C., which makes loans for development projects worldwide, was either performing its number crunching in the field or bringing data back to Washington, D.C., for processing. Because the central DP department was "very bureaucratic and strongly centralized," Luhring said, the bank developed a DSS program for personal computers. Now, World Bank financial analysts carry their micros with them to perform analyses on site.

The American Express Co.'s Travelers Cheque's division, which issues checks for use anywhere in the world, developed a DSS application to analyze quickly the impact of daily changes in currency values. Data from around the world is sent to the company's mainframe in New York, from which it is downloaded to a personal computer where the information is consolidated and the currency conversions are performed, Luhring said.

PROFESSIONALISM IS A COMMITMENT
CERTIFICATION IS THE TEST
ICCP
The Institute for Certification of Computer Professionals (ICCP) has scheduled the second 1985 examination for the Certificate in Data Processing (CDP) and Certificate in Computer Programming (CCP) for Saturday, Dec. 7, 1985, at test centers throughout the world.
The CDP Examination is designed for business-oriented DP practitioners at the management or supervisory level. The CCP Examination for experienced programmers is constructed so that each area of specialization—business, scientific, systems programming—includes five general computer programming sections and a sixth section in candidate's area.
Application deadline is Friday, Nov. 8, 1985 for December exams.
NOTICE
This is the last year you can sit for the CDP and CCP without recertifying. In 1986, successful candidates will be required to recertify every three years!
For a copy of either the CDP or CCP "1985 Examination Announcement and Application," check the appropriate box below. The brochure includes an Application, Test Site List, Exam Content and Codes of Ethics, Conduct and Good Practice.
☐ CDP ☐ CCP
Official Study Guides for both the CDP and CCP exams are available. Study Guides may be purchased directly from the ICCP, Executive Office, 2200 East Devon Ave., Suite 268, Des Plaines, IL 60018. Make checks payable to ICCP.
☐ CDP Study Guide $14.00 per copy includes postage/handling
☐ CCP Study Guide $11.[illegible] per copy includes postage/handling

MICROCOMPUTERS

Continued from page 69

ty up to 4M bytes. The basic Supermax "bare board" can be expanded to 1.5M bytes with 64K-bit random-access memory (RAM) chip and to 4M bytes with 256K-bit RAM chips and an additional piggyback board.

Cost of the Idea Supermax ranges from $495 for a bare board to $3,795 for a board with 4M bytes of memory.

Ideassociates, 35 Dunham Road, Billerica, Mass. 01821.

■ Micray Electronics Ltd. has announced a package that reportedly increases the performance of an IBM Personal Computer AT equipped with Intel Corp. 80286 and 80287 microprocessors by up to 40%.

The package features an automatic self-optimizing clock that drives an 80287 at its maximum speed, increasing the coprocessor's performance by up to 75%, the vendor said. The product consists of a printed circuit card that fits into an 80287 socket.

AT Booster, which includes operating and diagnostic software, costs $349.

Micray Electronics, Bay 1, 4001A 19th St. N.E., Calgary, Alta., Canada T2E 6X8.

■ Earth Computers has unveiled Turboaccel-286, an expansion board that provides an IBM Personal Computer with an Intel Corp. 80286 microprocessor.

The board features 512K bytes of random-access memory, an optional 80287 coprocessor and the ability to switch to an Intel 8088 microprocessor.

The product uses a custom very large-scale integration chip that emulates 8088 signals and is software transparent, according to the vendor.

With the product, an 80286 microprocessor can directly execute a Personal Computer's Bios and PC-DOS operating system.

Turboaccel-286 costs $995.

Earth Computers, Box 8067, Fountain Valley, Calif. 92728.

■ Checkmate Technology has unveiled a 16-bit microprocessor-based expansion card for the Apple Computer, Inc. Apple II series computers.

The Multiram CX contains Motorola, Inc.'s 16-bit 65C816 microprocessor chip and the Micro Magic, Inc. MAX-OS operating system, which offers multiuser, multitasking capabilities.

The Multiram CX is said to select automatically the proper microprocessor for each Apple software application, allowing use of both 8-bit- and 16-bit-based software. The board contains 256K bytes of random-access memory.

The Multiram CX card for the IIc plugs into a socket on the motherboard after removal of the microchip. The card plugs into an expansion slot in the IIe.

The card, including the MAX-OS software, is priced at $329.95. A 16-bit CX kit option, which contains the operating system in disk version, sells for $149.95.

Checkmate Technology, 509 S. Rockford Drive, Tempe, Ariz. 85821.

AUXILIARY EQUIPMENT

■ Dialogic Corp. has added software support to its voice I/O systems to enable IBM Personal Computer, Personal Computer XT, AT and 3270 Personal Computers to record, play back, send and receive voice messages over an IBM Personal Services network running Distributed Office Support Systems.

Users can record or play back messages using a standard microphone and loudspeaker or by interfacing to the handset of a modular telephone with a Dialogic THI-1 telephone handset interface, the vendor said.

The Personal Voice Messenger software provides an audio services menu and function-key-driven facilities for recording, playing back, sending and receiving messages. Voice files appear in a window.

Priced at $25 for a single-user license, Personal Voice Messenger software runs with one of the vendor's voice I/O systems.

They are Dialog/1, Dialog/2 and Dialog/3, which cost $295, $495 and $595, respectively. The THI-1 telephone handset interface sells for $30.

Dialogic, 60 Baldwin Road, Parsippany, N.J. 07054.

Many thanks to CW readers

story idea is now in hot water with his employer for having talked with the press — even though no proprietary information was revealed. He, like many others, had no need to help me, but, in doing so, he helped many. I hope his employer goes easy on him.

Now for the bad news

As for the bad news, well, there is thankfully less of it, though some equals in its outrageousness the helpfulness and courage of some of my sources.

Certainly *Computerworld* gets more phone calls from public relations professionals than it does from its readers. When PR people call from out of the blue, they most often call to sell us on something: a story idea about their employer or client. The irony of this is that when I call these same people for a comment on a story which they didn't ask me to do — some news about a bad fourth quarter — they often slither into the woodwork and escape with "I'll have to get back to you on this." For them, tomorrow apparently never comes.

Also a number of calls regard the most insignificant things — "Did you receive our press release on our new agreement to sell diskettes in Alabama retail stores?" — and they come on the two days of the week that are our busiest — Tuesday and Wednesday.

Prefer calling to writing

The fact that many public relations people prefer to call, rather than write a letter, leads me to wonder if they really don't want to put in writing what they could later deny having said.

Typical of this is the situation that developed with a new Cambridge, Mass.-based software vendor, which was, according to its PR agency, giving a "de facto introduction" of its much-awaited first product. The vendor's in-house spokeswoman had a slightly different story: She said the product was not really being introduced at all; it was "being trickled out" to members of the press in one-on-one demonstrations.

I got a demo but afterward was treated to a bit of hucksterism that would have made P. T. Barnum flinch. The product isn't being introduced, I was told, but we want you to write about it now, without mentioning the words "introduced" or "announced" in your story. That way, they figured, they could get even more press when the product was actually "introduced" later this year. I would have expected such tactics were I shopping for a used car; I didn't expect them from so-called professionals.

If I get outraged at the way in which some public relations workers play loose with the truth, it's only because I've been pampered by some sources who have always leveled with me, even when they were busy with a thousand other matters. To them I say, "Thanks."

As for those members of the public relations trade who check their scruples at the office door, I have a big "no comment."

From page 61

Microsoft enhances Multiplan

Another capability, model consolidation, allows the user to combine multiple worksheets into a separate summary one at a time or in batches.

The software requires DOS 1.1 or higher, 128K bytes of random-access memory (RAM) and one double-sided disk drive. Use of the optional Microsoft Mouse supported by the Multiplan Version 2 also requires Microsoft Mouse Version 2 or higher.

Multiplan Version 2 is priced at $195. Upgrades for current users of Microsoft Multiplan 1.2, IBM Multiplan or Texas Instruments, Inc. Multiplan cost $50.

The MS-DOS version of Cobol Tools requires the new version of Microsoft's MS-DOS-based Cobol Compiler, Version 2.1, also to be shipped in October. The Xenix version runs with Xenix Cobol.

Both versions are reportedly source code compatible, allowing users to port Cobol applications between MS-DOS and Xenix.

MS-DOS Cobol Tools requires 256K bytes of RAM, MS-DOS 2 or higher, one double-sided disk drive and the vendor's Cobol Compiler 2.1, which requires 192K bytes of RAM.

Xenix Cobol Tools requires Xenix 1286, Xenix Cobol, a 256K-byte RAM and one double-sided disk drive.

MS-DOS Cobol Tools sells for $350, and Cobol Compiler 2.1 costs $750. The upgrade cost is $50 for users of Cobol Compiler 2.1 and $150 for owners of earlier versions. Xenix Cobol Tools costs $450 and Xenix Cobol costs $950.

Microcomputer directory out

Data Decisions, Inc. of Cherry Hill, N.J., has published a directory of 145 multiuser micros from 65 vendors.

The directory includes a chart that reportedly offers at-a-glance comparative information on systems, including their CPUs, number of users supported, base configurations and price ranges.

The 42-page directory also describes each product in detail, including the product's type, systems and applications software, pricing, support and availability. It costs $29.

LETTER PERFECT

The P351 printed this headline letter-perfectly

In this competitive business world, only letter-quality dot matrix printers are good enough for your business clients.

So it should come as good news that Toshiba now offers three letter-perfect matrix printers. Three times as many as our nearest competitor.

No matter which Toshiba your customers choose, it'll deliver: 1. Letter-quality 24-pin printing. 2. Perfectly translated graphics. 3. Speed. The three things everybody wants. Which is why they're called 3-in-One™ printers.

What's more, 3-in-One printers come with downloadable type fonts, plug-in type font cartridges, IBM-compatibility, a worldwide reputation for quality and extensive, reliable service support. Not to mention some of the highest margins in the industry.

And now, with the new P341 priced competitively between our other 3-in-One printers, Toshiba has your business clients covered. They're the customers, by the way, who will do your business the most good. So it would pay you to find out more about our three 3-in-Ones. From the perfect spokesman. Your Toshiba regional manager.

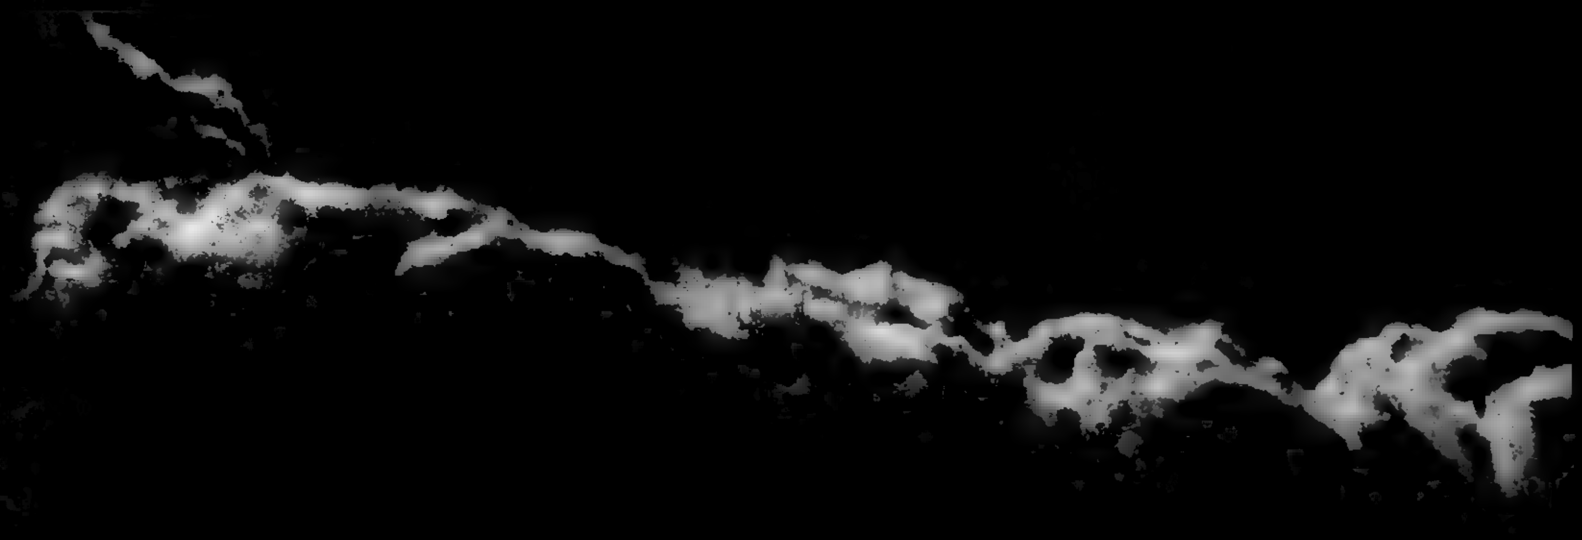
In Touch with Tomorrow
TOSHIBA
TOSHIBA AMERICA, INC. Information Systems Division



With a Control Data Computer System you'll always be free.

[illegible] hardware, software [illegible] With Control Data you'll always be free.

Free to grow. Because there's always room to grow, from supermini to super-high, the Control Data CYBER 180 line is the broadest in business.

Free to change. The entire CYBER 180 line is binary compatible for total portability of software when you upgrade.

Free to [illegible]. The CYBER 180 line has a [illegible] performance range — the longest compatible growth path in the industry. One that bypasses the landlocked technology of clustering.

But more than anything, with CYBER 180 Computer Systems you have access to Control Data thinking.

It's not bound by convention and conformity. It doesn't stop at the edge of tomorrow. It's always looking beyond. So you'll always be free.

Learn all about the freedom the proven technologies of Control Data can bring. Call your local Control Data sales office or 800-253-4004 Ext. 573 for complete information.

Then feel free to travel outward. Into the 1990s and beyond.

CONTROL DATA

Why the time has never been better to get your own subscription to Computerworld.

FREE CLOCK WITH YOUR SUBSCRIPTION

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desk-top piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld.*

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld.* So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld.* So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld.*

UNIX is a trademark of AT & T Bell Laboratories.

☐ **Yes!** Please send me *Computerworld* for one year at $39 (that's $5 off the annual subscription rate of $44) plus all 10 COMPUTERWORLD FOCUS issues at no extra charge. I understand that my satisfaction is guaranteed and that I may cancel at any time and request a refund on the unused portion of my subscription.

PBXs, nets not key in terminal support

But survey reveals more users considering idea

By John Dix

Few companies today are supporting terminals with local networks or telecommunications switches, according to a *Computerworld* survey, but this is the area where most users seem to be focusing their attention.

The survey, sent with a dollar incentive to a random sampling of 1,000 *Computerworld* subecribers in July, was answered by 425 readers. Nearly half of these readers — most of them MIS/DP managers — represented companies with revenues of $50 million or more, and another 25% took in between $10 and $50 million in 1984.

Companies represented in the survey were concentrated in three major areas: manufacturing firms (22%), finance/insurance/real estate (22%) and education/medicine/law (17%).

The survey results were not specific enough to segment how terminals are supported in each industry sector, but, taken together, they inferred that most users still support terminals with direct point-to-point links. Nearly 60% of the respondents said they do not use local networks or private branch exchanges to support terminals.

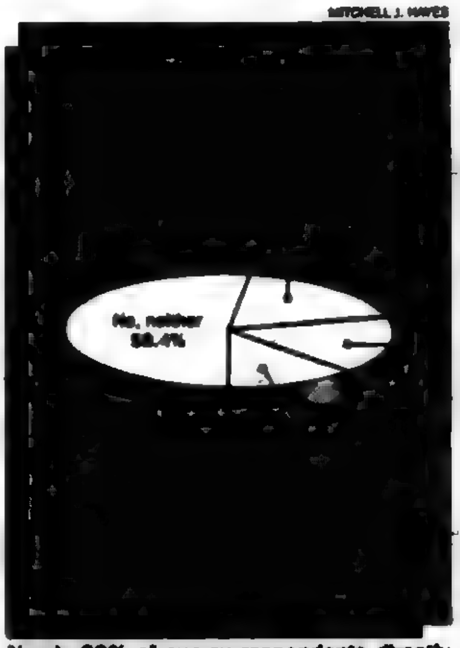
Of the 40% of respondents remaining, roughly 16% said they use their PBXs to support terminals, nearly 12% said they use local nets, and 13% said they support some of their terminals with a combination of the methods.

The actual number of terminals being supported by users of local nets and PBXs is a small percentage of the total number of terminals owned by these roughly 180 respondents.

For example, 24% of the respondents using local networks to support terminals said they have less than one-tenth of their displays connected to the network. Another 14% said they support less than one-fifth of their terminals on their networks, 10% support almost half, and 12% reported they have all of their tubes connected

Continued on page 82

MITCHELL J. HAYES



Nearly 60% of survey respondents directly wire their terminals.

INSIDE

Multiplexers/Modems/79
Local-Area Networks/83
Network Services/83

AT&T unveils modems, net control, muxes

AT&T unleashed a barrage of products at the recent Telecommunications Association's annual meeting in San Diego, including modems, multiplexers and network control units.

The products included two 4.8K bit/sec. modems for dial-up and leased line use; a diagnostic unit for a new switched network modem; a 14.4K bit/sec. six-port modem/multiplexer; and an enhanced multiplexer/packet switch.

Also announced was a system control software package that, when combined with the necessary hardware, costs $40,000 less than the previous model.

The 4.8K bit/sec. modems include the Dataphone II 2248A and the 2048T. The 2248A is a dial-up device, but it can be adopted for analog private lines, after which it will also provide automatic dial backup. The diagnostic modem supports full-duplex (with a half-duplex emulation option), synchronous or asynchronous transmissions. At 4.8K bit/sec., the 2248A is said to be compatible with CCITT recommendation V.32. With a 32-number autodialer option, the modem costs $3,195 or $2,995 without the option. It will be available in April 1986.

The Dataphone II 2048T is a 4.8K bit/sec. full-duplex synchronous modem designed for use with unconditioned four-wire analog leased lines. Designed for use in point-to-point or multidrop applications, the 2048T is said to be line compatible with the 2048A and 2048C modems and capable of responding to tests and commands from Dataphone II control systems. The 2048T will be available in mid-October for $2,600.

For lower speed applications, the 2224E is a 2,400 bit/sec. asynchronous, full-duplex diagnostic dial-up modem. It will be

Continued on page 82

Dama lowers network rates

Dama Telecommunications Corp. has announced a 38% overall price cut for its lower speed switched data rates.

The rate reductions affect the Damanet Integrated Voice/Data Network service, a software-defined virtual private network. The reductions were made possible by increased network use, lowering the company's own transmission costs.

New charges for the on-demand services, which range from 2,400 bit/sec. to 512K bit/sec., include a 78% reduction for 2,400 bit/sec. circuits, from 16 cents per minute to about 4 cents per minute; a reduction for 9.6K bit/sec. facilities from 20 cents per minute to about 14 cents per minute; and a reduction for 19.2K bit/sec. facilities from 35 cents per minute to 28 cents per minute. Damanet's 6-sec. incremental billing structure has been retained.

The rate reductions also include Damanet's maximum transmission rates. The monthly maximum fee for a 2,400 bit/sec. circuit for transmission between New York and Philadelphia, for example, is $64, $224 less than the previous $288 charge. A 9.6K bit/sec. circuit between Chicago and San Francisco is reduced by $343, from $1,200 to $857.

The restructured rates set a $4,000 per month minimum billing requirement for each of Damanet's proprietary communications processors used in a customer's network. The fee applies to cumulative voice, data and video transmission charges. The cost to activate a voice port on a Damanet communications processor has been reduced from $75 to $25.

Dama Telecommunications is authorized by the Federal Communications Commission to operate as a common carrier for Digital Electronic Message Services.

IBM replacement multiplexer debuts

Bundled with its recent introduction of protocol converters, IBM unveiled a replacement model for its 3299 terminal multiplexer.

When used with the IBM Cabling System, the 3299 Model 2 extends the maximum permissible distance between 3274 cluster controllers and category A display terminals from 4,000 to 6,000 ft.

The 3299 attaches with a single coaxial cable to a 3274, which is outfitted with a multiplexer adapter. The 3299, in turn, can support up to eight display terminals with coaxial cable connections or with the IBM Cabling System.

When standard coaxial is used, the 3299 Model 2 provides the same functional capabilities as Model 1.

With the IBM Cabling system, the maximum permissible distance between the terminal multiplexer and its controller is now 3,280 ft., with terminals supported at up to 3,280 ft. Baluns are not required on the host side.

The new model will be available later this month for $1,175.

BMC Software's VM/Optimizer out

A systems software product that enhances IBM's VM operating system to provide compression of 3270 data streams has been added by BMC Software to its family of similar products for IBM's CICS and IMS.

The Sugar Land, Texas, company's 3270 Optimizer/VM, which has hooks into VM, uses an algorithm to remove redundant characters and otherwise compress 3270 data being sent to remote display terminals, a spokeswoman explained.

Using the 3270 Optimizer, a normal 1,920-char. data stream used to fill the screen of a 3270 device is compressed by 30% to 35%.

The product is said to be particularly effective in reducing network load and response time bottlenecks in IBM's Professional Office System (Profs) environments. The 3270 Optimizer/VM is transparent to VM, Profs and other applications, the company reported.

The 3270 Optimizer/VM is available now at an introductory price of $9,750 for a perpetual license on the first CPU. Next year, the price will be $12,500.

Equinox muxes, switch out

Expanding on its product family of intrafacility data communications devices, Equinox Systems of Miami recently announced a low-end data switch, a high-end local multiplexer and a board version of that multiplexer for use with the switch.

The Equinox DS-5 data switch, reportedly smaller than an IBM Personal Computer in its smallest configuration, has a minimum of 24 RS-232 ports and a maximum of 120. Said to be fully nonblocking, the DS-5 enables a port user to connect to any other port through menu selection.

A 120-line DS-5 costs $120 per port. The entry-level DS-5, which costs $7,500, has 24 ports. Growth is accomplished with the addition of 24-port cards that cost $1,800 each. Using LM-48 local multiplexers, the DS-5 can support a total of 1,320 lines.

The LM-48 is a local multiplexer that concentrates 48 RS-232 channels, each operating at speeds up to 9.6K bit/sec., over a single cable at distances up to 2,500 feet.

While the LM-48 can be used back-to-back to solve wiring problems, it can also be used with the DS-5 when the data switch is outfitted with the board version of the multiplexer, the 1-Line-X48.

Available 45 days after receipt of order, as is the DS-5, the LM-48 costs $3,100, and the 1-Line-X48 costs $1,000.

Codex local network gives asynch devices link to host

Codex Corp. of Mansfield, Mass., has unveiled a local-area network designed to provide asynchronous devices with host computer connections.

The Codex Async LAN is a new development, according to Ralph Rio, Codex's senior product manager, and not connected to Codex's first-generation product, a prototype of the Ungermann-Bass, Inc. Net/One product.

The heart of the asynchronous network is the Codex 4020 Entryway, a four-port device that uses a Codex-designed and -developed very large-scale integration chip and a Motorola, Inc. microprocessor. Attached devices can communicate through the 4020's four RS-232 asynchronous ports or with devices supported by other 4020s that are interconnected via a baseband Ethernet net.

Terminals supported by the 4020 contend for host ports, enabling access to any minicomputer connected to the network. The Entryway can transmit data at speeds from 50 bit/sec. up to 38.4K bit/sec.

Codex said the price of the 4020 is $249 per port or $410 for the average configured system. One Entryway would cost approximately $1,000.

Also announced was the Codex 4820 LAN Manager, a network management package that is composed of an IBM Personal Computer XT hardware system and multitasking operating software system. This software provides performance monitoring, including fault management, and administration functions that simplify changes to the network.

Pricing of the 4820 was set at $11,605, Codex said.

Western Union E-mail service ties U.S., UK

Western Union Co. has announced what is reportedly the first intercontinental connection for a U.S. electronic mail service. Users of Western Union's Easylink will be able to send messages to subscribers of the UK's version of Easylink, which is offered by Cable & Wireless Easylink, Ltd.

The service does not require any special codes or messages, only the address of an Easylink subscriber. The cost of sending a message to a UK subscriber is 25 cents per 1,000 characters plus a fee of 40 cents per message and a long-distance dialing charge. There are no off-peak discounts.

Sending a message from the UK to the U.S. costs approximately 40 cents plus 9 cents per 1,000 characters. Off-peak hour rates are 31 cents and 7 cents respectively.

The cost of transmitting a Telex is 25 cents per 100 characters during peak hours and 21 cents during off-peak hours. Sending a Mailgram costs $6.75 for the first page and approximately $2.70 for each succeeding page.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. More than 9,000,000 computer-involved people around the world rely on us for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

We'll help you increase your market penetration. We have publications in all of the following countries: Argentina, Australia, Asia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, South Africa, Southeast Asia, Spain, Sweden, Switzerland, The Netherlands, United Kingdom, Venezuela and West Germany.

Call Diana La Muraglia. She'll be happy to send you rate cards for any of our publications or any of our series of market fact brochures on specific countries. You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

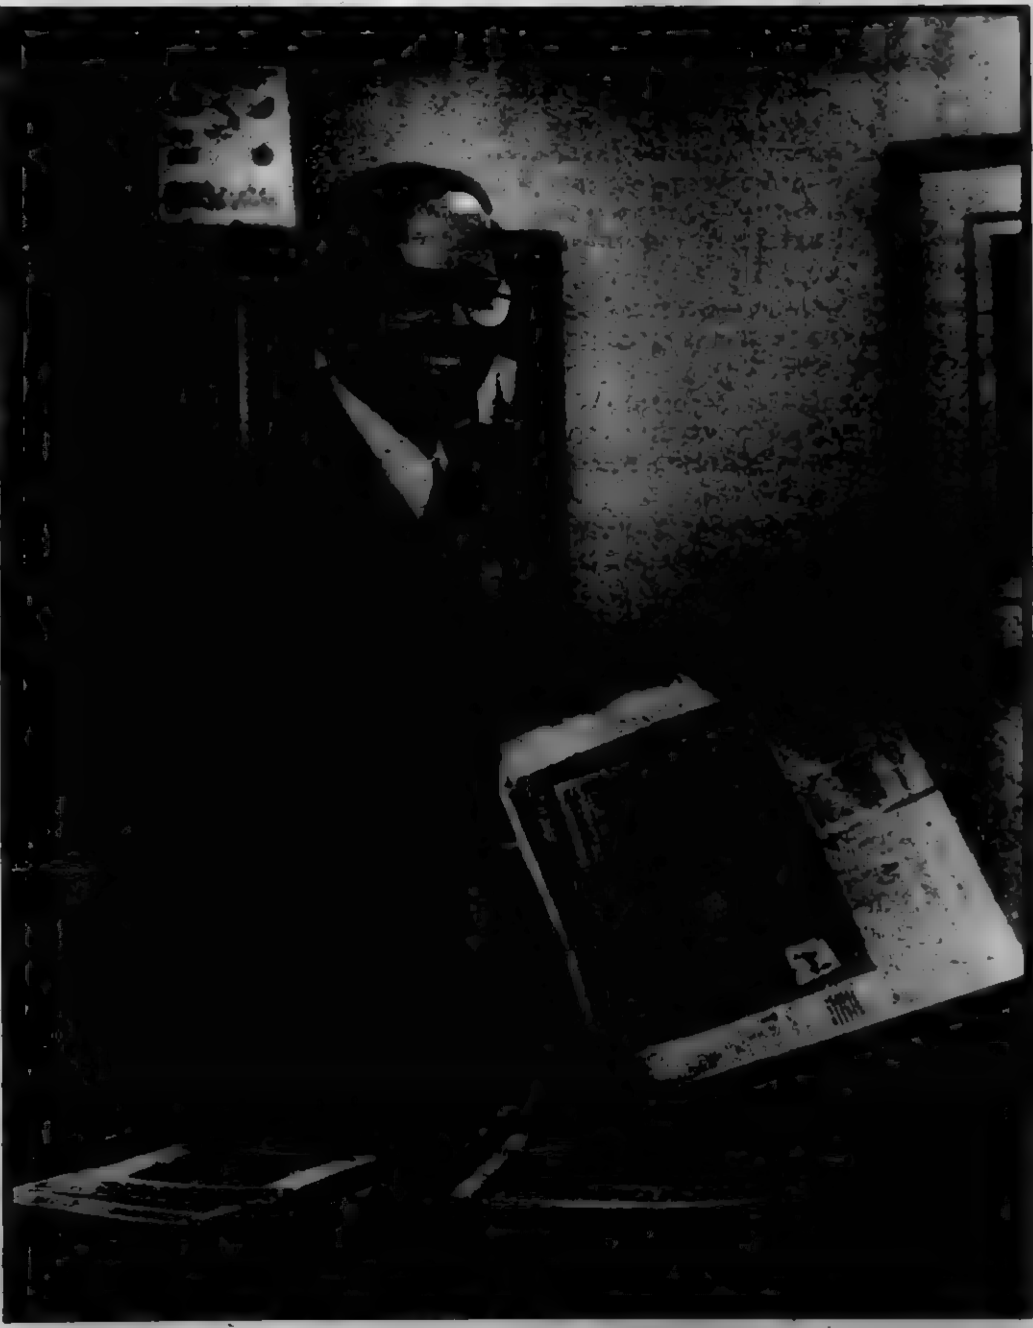
“Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect.”



EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is “. . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC.”

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, “. . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment.”

The results? “*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate.”

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing,
Enertronics Research, Inc., St. Louis, Missouri.

COMPUTERWORLD FOCUS

Boston: (617) 879-0700/Chicago: (312) 827-4433/New York: (201) 967-1350/Atlanta: (404) 394-0758/Dallas: (214) 991-8366/San Francisco: (415) 421-7330/Los Angeles: (714) 261-1230

Micros: The big picture.

In November's *Computerworld Focus,* we put micros under the scope.

Since the last year has been so wild and unpredictable, we're not only going to take a look at microcomputer hardware in our November 20th issue, but we're also going to broaden our view to try to get a handle on the micro market in general.

We'll have a special section on hardware—what's available and what's expected to come. And the changing relationship of micros and the 3270 terminal.

We'll also dissect the entire industry—one aspect at a time. Among user companies, we'll tell you who's buying and who's *not* buying—and why. And look at the reasons in great depth.

Then we'll dig deep into the industry shakeout. Discover who's got the edge and who doesn't. Who's expected to survive. And how that will mold the future.

We'll see how the slowdown is affecting the way user organizations are planning. Whether they're simply making do with what they've got until the shakeout is over. Or if they've actually satisfied their needs.

But that's not all. We'll also take a look at how communications and networking are coming along. And the developing trends in printer technology including the laser printers. And what's happening in the portables and lap size micros.

And of course, we'll deliver all this information to the people who use it most. Our 129,000 paid *Computerworld* subscribers. Thousands of passalong readers. Plus attendees at Comdex in the fall in Las Vegas.

So if micros are a big part of your business picture, our **November 20th** issue of *Computerworld Focus* should be a big part of your advertising picture. But hurry, the closing is **October 11th.**

To reserve space, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*, 375 Cochituate Rd., Framingham, MA 01701, (617) 879-0700. Or call your local sales office listed below.

GTE Skystar service to join net, satellite

GTE Corp. said last week that it will offer a hybrid business data transmission service that integrates its Spacenet Ku-Band satellite transmission capabilities with its packet-switched Telenet network.

The network service will be called Skystar and will be compatible with most data communications protocols, including IBM's Systems Network Architecture/Synchronous Data Link Control and Binary Synchronous Control protocols, the company reported. GTE said Skystar will also perform protocol conversion from remote sites.

James T. Broadhead, president of the GTE Communications Services group, said the linking of the two existing systems will help address the diverse data communications requirements that are found. "Spacenet's Skystar network, for example, serves very high-speed transmission requirements in a centralized environment — many remote locations to one central host."

In a related matter, GTE was dealt a blow recently when a French rocket carrying a Spacenet satellite aloft went off course and had to be destroyed.

MULTIPLEXERS/ MODEMS

■ Racal-Vadic, Inc. has introduced a 2,400 bit/sec. modem that is compatible with IBM's Binary Synchronous Communications protocol.

The 2400PA-S is a full-duplex, synchronous modem with automatic dialing capabilities. It can be used for unattended communication with IBM 2780/3780 remote job entry applications.

The modem automatically selects pulse or tone dialing and matches the speed of host computers at speeds of 1,200 or 2,400 bit/sec. Call progress information is displayed so that a user can monitor a connection. A tandem dialing feature permits dialing through private branch exchange to long-distance carriers.

The modem's diagnostic capabilities include automatic self-testing, analog loop-back, local digital loop-back, remote digital loop-back and a built-in test pattern generator.

Configuration options include Electronic Industries Association (EIA) signal timings that customize EIA interfaces for use with multiplexers and port contenders.

The 2400PA-S sells for $795.

Racal-Vadic, 1525 McCarthy Blvd., Milpitas, Calif. 95035.

■ Lantel Corp., a manufacturer of broadband voice and data modem products, has added two items to its product line.

Lantel 500A Broadband Asynchronous Data Modem is a narrow-band, asynchronous modem that operates at speeds of up to 9.6K bit/sec. The product is designed for point-to-point

Continued on page 82

SBS reduces rates for data transmission

Satellite Business Systems (SBS) in McLean, Va., said it will adopt a new rate structure for its dedicated or switched high-speed digital data transmission services and implement off-peak pricing discounts.

The rate restructuring applies to switched and dedicated 56K bit/sec. and 1.54M bit/sec. data transmission services and will reduce port charges for both speeds by half.

For usage-sensitive switched 56K bit/sec. service, the monthly port charge has been lowered from $770 to $300. The maximum monthly charge is $1,500 per port.

For 1.54M bit/sec. switched service, the monthly port charge has been reduced from $3,000 to $1,500. Monthly usage charges are capped at $15,000 per port.

SBS said it has introduced a non-business-hour usage charge of $60 per hour for transmission during evenings, weekends and holidays, compared with the regular business hour rate of $300.

The company also said that it has reduced its mileage band rates for circuit-switched 56K bit/sec. service to $1,450 per month for the first 500 miles and to $1,000 per month plus 90 cents per mile for greater distances.

For dedicated circuits, SBS said the charge for a 1.54M bit/sec. circuit is $25,000 per month during the business day, which will save an estimated $4,000 to $27,000, depending on circuit length.

In another matter, SBS said it will be the first common carrier to encrypt satellite data and voice transmissions, using the Data Encryption Standard developed by the National Bureau of Standards. The service will be available for SBS' Skyline Wats customers in January. The service will carry a one-time port charge of $35 plus a usage charge of 1.2 cents per call minute.

SBS is a joint venture of IBM and Aetna Life & Casualty Co. IBM and MCI Communications Corp. have reached an agreement in principle to merge the SBS system into MCI's network.

FUJITSU BAND PRINTERS
The Numbers are Right.

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

6000 *Hours MTBF is a Long Time without Failure.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. For additional information, contact Fujitsu at 3055 Orchard Drive, San Jose, CA 95134, or give us a call. Our number is (800) 626-4686.

55 *Decibels is a Quiet Machine.*

ONLY A NETWORK THIS MANAGEABLE

Are you in control of your data network? Or a slave to it? Locked into hardware that limits your options? Overburdened by maintenance? And trapped by multiple systems you can't manage?

The Information Systems Network from AT&T lets you take command. It's the only data network that allows you to integrate and manage your terminals, workstations, PCs, minis and mainframes as a single corporate-wide data network. It's the only network you can completely control.

You've got the whole network in your hands.

ISN's hierarchical star topology centralizes system administration and maintenance. The hub of the system is a fast-switching Packet Controller. It's linked to all data devices and manages all network functions. So, if one device goes down, the Packet Controller keeps your network up and running.

A System Control Console taps right into the Packet Controller. From this terminal, you can manage the network using simple English commands. You can add or move equipment, monitor network performance, track down faults and take corrective action—without disrupting network operations.

With a special password, you can perform maintenance functions from any asynchronous terminal in the system. And you have the option of remote maintenance from one of our service centers. ISN gives you multiple points of control.

You've got plenty of flexibility.

ISN links the devices in your network with twisted copper wire and fiber optics. It uses our Premises Distribution System wiring scheme which allows easy modular growth.

ISN is flexible and open to change. Start with as few as 50 devices and let it grow. ISN's open architecture allows you to easily add on new devices and new technologies as they emerge. ISN can take things as they come.

Linking multiple Packet Controllers lets you expand ISN to any size network. You can grow across one premise or across the country. And no matter how large your network gets, you choose the means of control—centralized or distributed. With ISN you're the boss.

You can bridge the communications gap.

What happens to your PBX? PC networks? Data processing systems? And all that hardware from Big Blue? ISN gets them all on speaking terms.

You can link ISN with the AT&T System 85 or AT&T System 75 PBXs. Whatever you have—data processing equipment and office

LETS YOU BE MASTER OF YOUR [illegible]

automation equipment; isolated Ethernets,™ AT&T's STARLAN PC Network and 3B Net; smart and dumb—ISN gets it all working together. All sharing the same resources. With you in total control.

And what about those IBM 3270s? ISN makes them work even harder. Now your 3270 terminals can access multiple IBM hosts. And low-cost dumb terminals can do the same. Asynchronous and synchronous traffic can travel through your network with the same speed and efficiency.

You can handle heavy traffic.

ISN maintains a high end-to-end transmission speed of 8.64 mbps, and a high throughput rate even when traffic is at its peak.

Long messages or bursty transmissions—ISN's been engineered to handle it all. A unique centralized short bus and perfect scheduling access method permit messages to travel through the network almost instantaneously. And arrive with their integrity intact. So there's no waiting. No bottlenecks. No retransmitting data.

You've made the right connection.

AT&T has a long history of solving complicated networking problems with clear-cut, intelligent solutions. We know how to tie it all together.

And we know how to work with you. Our professional sales and service people are with you every step of the way—planning, designing and maintaining a network that will meet your business needs today and tomorrow.

ISN reflects AT&T's better approach to office automation. To learn why it's the right choice for your business, call your AT&T Information Systems Account Executive, or 1 800 247-1212.

or multidrop applications on a two-way broadband network. It reportedly features a bit error-rate of 10^{9}.

Lantel 500S operates in either synchronous or asynchronous mode and supports transmission speeds of up to 19.2K bit/sec.

Both modems can operate in either half-duplex or full duplex mode and can use frequency shift keying modulation.

Lantel 500A sells for $595, and Lantel 500S costs $895.

Lantel, Suite 180, 6410 Atlantic Blvd., Norcross, Ga. 30071.

■ **Avanti Communications Corp.** has enhanced its Ultramux T1 multiplexer so it operates with AT&T Communications' Digital Access Cross-Connect Switching (Dacs) under Customer Controlled Reconfiguration (CCR).

Avanti's Flexible Dacs Access enables a user to segment a T1 line into groups of channels and, under AT&T's CCR tariff, switch them independently to different locations. The Ultramux product allows sublevel voice and data channels to be routed with the bundles.

A user could reduce the cost of local access channels by combining bundles destined for multiple locations over a single T1 local access channel and then routing them via Dacs, Avanti claimed.

Prices for the Ultramux range from $14,000 to $100,000. Prices for the Flexible Dacs option range from $800 to $3,500.

Avanti Communications, Aquidneck Industrial Park, Newport, R.I. 02840.

■ **Gandalf Data, Inc. has introduced a 2,400 bit/sec. intelligent dial modem.**

The first model in the Access Series 248 is a large-scale, integration-based modem with features that include Hayes Microcomputer Products, Inc. command compatibility; multiple-number recall; automatic redial and alternate number dial; automatic logon; and three-wire interface support.

The modem is compatible with CCITT V.22 bisynchronous modems, AT&T 212A and AT&T 103 modems. It provides full duplex two-wire data transmission at 2,400 bit/sec., 1,200 bit/sec. or 300 bit/sec., either asynchronously or synchronously.

The unit costs $650.

Gandalf Data, 1020 S. Noel Ave., Wheeling, Ill. 60090.

Continued on page 63

From page 75

AT&T unveils modems, net control, muxes

available in March next year for $1,265 or $1,395 with an autodial option. For diagnostic control, the 2224E has to be used in conjunction with the new SDU 24A shared diagnostic unit. This device works as a translator between a 2224E modem and Dataphone II diagnostic control devices like the Diagnostic Console, Network Controller or System Controller. The $975 SDU 24A emulates a private-line control modem with eight tributary modems. It will also be available in March 1986.

While not new, AT&T's 735 T-Mux has been enhanced to support 56K bit/sec. links as well as standard T1 1.54M bit/sec. facilities. It is also available now with an RS-422/Mil-spec 188B-114 data channel interface option for secure applications. In minimum configuration, the enhancement costs $1,350.

New to the line is the 724 T-Mux, a small-chassis version of the 735. It supports up to 16 channels and uses adaptive differential pulse code modulation voice digitization at 64K or 32K bit/sec. Either device can reportedly support extended or standard DS-1, T1 signaling formats. The 724 will be available in November for $6,725.

The AT&T 719 Networker, a combined packet-switching statistical multiplexer and computer port concentrator, has been enhanced with an optional X.25 gateway. The enhancement includes a new processor card with X.25 firmware and a new data-link interface card with four ports. The Networker configured with the option costs $12,000 and will be available in November.

Network control of these and existing Dataphone II products is now possible using a new version of AT&T's Level IV System Controller Model 300, a real-time network management software package that runs on an AT&T 3B2-300 computer. Model 300 replaces the former Level IV System controller, which consisted of an Application Processor 16 and cost $96,000 in minimum configuration. The Model 300 costs $56,000 in minimum configuration, while providing the same capabilities as the Level IV controller.

From page 75

PBXs, nets not seen key for terminal support

on networks. These users represent the majority (60%) of the respondents; the rest varied widely as to how many of their terminals were attached to local nets.

The same holds true for users who said they use their PBXs to support terminals — most use PBX links to support a relatively small percentage of their installed terminals. Of these respondents, 20% use their PBXs to support less than one-tenth of their terminals; 9% support roughly one-fifth of their tubes; 10% support nearly one-third; 8% support almost half; and 6% support all their terminals in this manner.

Interestingly, while nearly 60% of the users surveyed do not use local nets or PBXs to support terminals, these were the two items mentioned most frequently in terms of significant communications plans scheduled for next year.

Meet the ISI 468

A fully integrated, plug-compatible replacement for the IBM 3268-2C and 3287-2C, the ISI 468 is the only non-IBM color printer to support Programmed Symbols and APL/TEXT. What's more, it's the only 3270 printer, from IBM or elsewhere, that prints seven colors. Its other advantages include:

Color printing without color displays • NLQ • Bar coding • Solid-formed large-character label printing • 10, 12, or 16.67 CPI • Dual 3270/PC compatibility • Immediate access to printed forms without waste • Optional sheet and envelope feeder • Full support for GDDM, SAS, and PS-4A.

Faster Throughput

The ISI 468 prints at 400 CPS, compared to 340 CPS for the IBM 3268-2C and 120 CPS for the 3287-2C.

the ISI 468's high-speed advantages in a lower-priced, non-color-printing (but upgradable) version.

Tabletop Convenience

The ISI 468 offers easy portability while taking up less space than the floor-standing 3268-2C. Plus, with its top-loading design, there's no need to crouch under a bulky cabinet to load forms.

A Lower Price

Even with all of its added features, the ISI 468 costs significantly less than its IBM counterparts.

For more information, please call 1-800-544-4072 (in Michigan, 313/769-5900). Or write to Interface Systems, Inc., 5855 Interface Drive, Ann Arbor, Michigan 48103. Telex: 810-223-6058.

Interface Systems, Inc.

The Right Printers for the Right Computer Systems

Multiplexers/Modems

■ **Codex Corp. has announced the Codex 2606 Eight Modem Nest that supports up to eight Codex 2600 series modems with a bus architecture. Up to five of these nests can be stacked in a 72-in. rack.**

The product can be fully configured with any combination of Codex 2600 series modems, including the 2660, 2640 and 2620, plus four- or six-channel multiplexers. The modems can be configured both before and after installation.

The price of the Eight Modem Nest varies by configuration, ranging from $4,000 to $12,000 per modem.

Codex, 20 Cabot Blvd., Mansfield, Mass. 02048.

■ **Networx has released a modem protector that provides surge protection for modem devices.**

The Modem Protector is said to prevent voltage damage to telecommunications equipment. The device works in two stages. The first stage consists of a gas discharge arrestor that can handle a maximum pulse of 5,000A and handles the bulk of the surge. The second stage consists of silicon surge suppressors that are said to clamp the sharp leading spike within 1 nsec.

The unit costs $21.95.

Networx, 203 Harrison Place, Brooklyn, N. Y. 11237.

■ **Spectrum Digital Corp. has introduced its Spectramux Net 1.5 bit-interleaved multiplexer that is said to concentrate more than 500 voice, data and video channels on eight T1 aggregates.**

The Net 1.5 features Adaptive Differential Pulse Code Modulation (ADPCM) voice, automatic alternate routing with priority bumping, D-4 channel bank compatibility and programmable channel speed selection. Each ADPCM card supports 72 voice channels at 24K bit/sec. with fallback to 32K bit/sec., which provides 48 voice channels, the vendor said.

The unit supports AT&T standards, including Dataphone Digital Service, Accunet, M-44, M-24, D-4 and Digital Multiplexed Interface.

The cost of the Spectramux Net 1.5 multiplexer starts at $25,000, depending on the number of channels in the system.

Spectrum Digital, 7650 Old Springhouse Road, McLean, Va. 22102.

■ **Digital Communications Associates, Inc. (DCA) is offering a fast poll, CCITT V.29-compatible modem for use in four-wire, leased-line, point-to-point or multipoint applications at speeds up to 9.6K bit/sec.**

Called the DCA 932, the full duplex modem can be used with unconditioned lines, permitting serial data transmission at 9.6K, 7.2K, 4.8K and 2,400 bit/sec., the vendor stated.

An automatic adaptive equaliser reportedly uses phase tracking circuitry to respond to changing transmission line conditions on a continuous basis.

An integral test pattern generator and bit error-rate detector are said to perform network bit error-rate testing without external equipment or remote operators.

The DCA 932 costs $2,695.

DCA, 1000 Alderman Drive, Alpharetta, Ga. 30201.

LOCAL-AREA NETWORKS

■ **Hanson Data, Inc. has announced a device that enables data to be transmitted over standard ac power lines within a building at rates that range from 300 bit/sec. to 19.2K bit/sec.**

Data terminal equipment plugs into the Power Line Coupler, which plugs into a wall socket and acts like a modem. The coupler and accompanying software enable up to 32 devices to be interconnected over a building's power wire at distances up to 1,000 ft.

The coupler costs $395.

Hanson Data, 18732 142nd Ave. N.E., Woodinville, Wash. 98072.

■ **General Electric Co. plans to ship early next year Genet Factory LAN, a broadband token bus local-area network compatible with General Motors Corp.'s Manufacturing Automation Protocol that operates at speeds of up to 10M bit/sec.**

The network will consist of a bus-interface unit, head-end remodulator, Workmaster network management console and software. Industrial Networking, Inc., a joint venture between GE and Ungermann-Bass, Inc., is supplying the network, GE said.

GE, One River Road, Schenectady, N.Y. 12345.

NETWORK SERVICES

■ **Satellite Business Systems (SBS) recently announced it has restructured its pricing and extended its Skyline Wats service.**

Skyline Wats customers can call Hawaii from all SBS Network metropolitan areas, and a Wats connection to Alaska is now available from 14 metropolitan areas.

The price restructuring applies the Skyline Wats Tier I rate to calls terminating in a Tier I city Local Access and Transport Area and not just the immediate metropolitan area. The change is expected to save customers up to 4%, the vendor said.

SBS, 8283 Greensboro Drive, McLean, Va., 22102.

■ **AT&T Communications has purchased a 60-mile, fiber-optic digital transmission system from Philips/CSD, Inc., located in Piscataway, N.J. The system links AT&T facilities in New York.**

The system works with a multilevel bit-rate reduction scheme and maintains a bit error-rate of 10-13, Philips/CSD reported. The DS-3-compatible system supplies a capacity of up to 8,064 telephone trunks, is modularly upgradable and can supply 1G bit/sec. transmission rates.

AT&T Communications, 295 N. Maple Ave., Basking Ridge, N.J. 07920.

Reach over 60,000 computer professionals in Sweden.

Your ad in CW Communications' Swedish publications will introduce your company to 63,000 computer professionals in Sweden's flourishing market. According to International Data Corporation (IDC), the world's leading information industry research firm, Sweden's total data processing expenditures are expected to soar from $2.3 billion in 1983 to $6.3 billion by 1989.

Computer Sweden, the only Swedish MIS/DP publication, reaches 15,000 readers each week. Every Monday DP professionals turn to *Computer Sweden* for updates on the latest developments in hardware, software, terminals and supply products.

Svenska PC World is the magazine 12,000 IBM PC users rely on twice each month for timely information on program reviews, user reports, new products, tests and recommendations. IBM has the largest market penetration in Sweden with revenues for 1983 of nearly half a million dollars.

MikroDatorn is written specifically for the Swedish microcomputer market which, according to IDC, is growing at an annual rate of 44%. *MikroDatorn* is the monthly magazine that reaches 36,000 business/professional and home/hobby micro users with up-to-date industry information.

CW International Marketing Services makes advertising your products in Sweden, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.

Transaction systems: no comparison

Lack of standards seen confusing to customers

By James Connolly

Banks have boosted automated teller services, and Fortune 500 industrials have moved into computer-automated factories, creating a booming market for established computer companies such as IBM and nondescript start-ups.

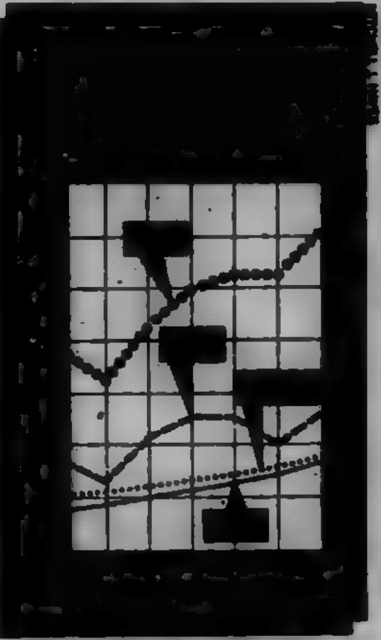
Market researchers predict that new applications in banks, factories, government agencies and other user organizations will drive the transaction processing market from $7 billion in 1984 sales to more than $12 billion in sales and 119,000 unit shipments in 1990.

For all of that growth, however, there remains a danger — the inability of customers to compare various vendors' products. Key transaction processing vendors agree that, like other specialized processing areas such as supercomputing, transaction processing performance cannot be measured the way batch processing is measured — the fallible but commonly used million instructions per second (Mips) rating.

Twenty years after major corporations started using large computers to process transactions immediately, interviews with vendors and users show they still are unable to agree on benchmarks. It is difficult to judge transaction processors and the systems that grow up about them, systems that may include dozens of superminicomputers in a string and remote terminals spread over thousands of square miles. Even where there is a desire for benchmarks, there is no consensus on how to build them.

"Having a standard obviously would make it easier to measure the relative performance of transaction systems. From the vendors' perspective, I'm not sure it's in [their] best interest to have a standard measurement. As it is, using Mips works to their advantage and confuses the customer. From a customer perspective, it would be good, but I'm not sure one benchmark ever will become a standard," observed Bob Good, senior systems designer for Bankamerica Corp. in San Francisco.

Good was one of 24 users and vendor representatives who coauthored a technical report on transaction processing for the Institute of Electrical and Electronics Engineers, Inc. (IEEE) last year. The paper suggested three possible benchmarks: Debit Credit, a banking transaction that interacts with a block-mode terminal via X.25, debiting a bank account and doing a double-entry bookkeeping transaction; Scan, a minibatch Cobol transaction that updates 1,000 records; and Sort, a disk sort of one million records.



Sales to rise from $7 billion in 1984 to $12 billion in 1990.

However, those 24 authors noted that their paper failed to capture the performance bugs in their systems, such as recovery from a crash or start-up of new software. Almost a year after the group began work there is no formal activity in connection with benchmarking, Good noted.

One of the originators of the IEEE paper and a transaction processing analyst is Omri Serlin, princi-

Continued on page 89

Transaction system sales to mushroom

The need for mainframe-based systems and on-line applications will fuel an almost 80% growth in shipments of transaction processing computers by the end of 1990 (see chart above), according to a recent report by International Data Corp. (IDC), a Framingham, Mass.-based market research firm.

In its first research study of the transaction processing market, IDC listed more than 50 typical transaction-oriented applications in fields as diverse as finance, medicine, education, government, transportation and industry.

Looking at the next five years, the report, "The Transaction Processing Market," cited the following:

- A general movement to more transaction-oriented applications as a result of the changing nature of MIS groups. "The need to do more retrieval and updating of data bases will be important," it said.
- The existence of applications that are entirely transaction oriented. "Good examples include [automatic teller machine] networks in banks, retail points-of-sale and new inventory measures to support just-in-time manufacturing."

The move to transaction processing

General Dynamics offers departmental systems line

By Mitch Betts

WASHINGTON, D.C. — General Dynamics Corp.'s Electronics Division, based in San Diego, recently announced it will market a line of departmental systems loaded with data base management software for use by U.S. government agencies and their contractors.

The announcement at the recent Federal Computer Conference marks the first time the major defense contractor, which had $7.8 billion in revenue last year, has offered what it calls a departmental mainframe, according to Ravi Bhola, program manager of advanced systems. He said the move is part of a strategy to meet the needs of military and intelligence computer users and does not mean General Dynamics plans to enter the broad commercial computer market.

The Model 5000 departmental mainframe, with a distributed architecture based on a 32-bit CPU, is IBM compatible and was licensed from Canaan Computer Corp. of Trumbull, Conn., Bhola said.

At the Federal Computer Conference, General Dynamics and Cambridge, Mass.-based Computer Corp. of America (CCA) announced a joint marketing agreement. Under the terms of the agreement, General Dynamics will distribute and support the Model 5000 running CCA's Model 204 data base management system.

Mentor Graphics launches parallel processing engine

By Donna Raimondi

BEAVERTON, Ore. — A company that has focused on computer-aided engineering software tools has jumped into the computer hardware business with a plug-in, parallel processing accelerator engine for engineering workstations.

Mentor Graphics Corp. has unwrapped its Compute Engine — a general-purpose accelerator that is said to employ parallel processing techniques with reduced instruction set computer (Risc) processors — as a plug-in addition to Apollo Computer, Inc.'s DN550 and DN560 workstations. The unit will be available in the first quarter of 1986.

The two-board Compute Engine is said to increase throughput on all modes of simulation, placement, routing, design rule checking and data formatting. Performance reaches up to 200,000 gate evaluations per second using the company's Quickparts parts models to speeds approaching 100 gate evaluations per second for conventional parts, the vendor said.

The Compute Engine runs a standard version of Spice, the University of California at Berkeley's computer-aided engineering software package, at five times the performance of Spice running on the Apollo workstation without the engine, according to Mentor Graphics.

Computer Consoles introduces 16-bit, 16-user mini

Introducing an entry-level system targeted at small businesses and networked applications, Computer Consoles, Inc. of Rochester, N.Y., has announced a 16-user, 16-bit minicomputer that uses the same memory management techniques as its Power 6/32 superminicomputers.

The Power 5/32 is based on a Motorola, Inc. MC68010 microprocessor and the AT&T Unix operating system. It is intended for use in office automation, in standalone configurations for eight to 16 users and in networked environments running Computer Consoles' Officepower office system.

Computer Consoles Chairman and Chief Executive Officer John F. Cunningham reported that the U.S. Air Force Office of Public Affairs has contracted to purchase the first Power 5/32 systems under a $4.4 million contract.

According to Computer Consoles, the Power 5/32 was designed as the entry-level unit and the most compact of the Power/32 series, weighing less than 50 lb and measuring 6½ by 18 by 22 in.

The company claimed that the hardware-intensive memory management scheme originally created for the Power 6/32 provides the Power 5/32 with the flexibility of a larger virtual memory machine and allows the CPU to operate at 12½ MHz with zero-wait states.

Computer Consoles also announced its Powerterminal II, designed for use with the Power 5/32 and other members of the Power family and with Computer Consoles' PTNet local-area net. The terminal is said to feature a 307K bit/sec. communications capability and local intelligence based on a Motorola MC68008 microprocessor.

The company said that the Power 5/32 features a storage subsystem including a Motorola MC68000 microprocessor and 128K bytes of local dynamic random-access memory. It supports one or two 5¼-in., 85M-byte disks and a 45M- to 60M-byte streaming tape drive.

A typical Power 5/32 configuration — with 2M bytes of memory, 170M bytes of disk storage, a 45M-byte tape system, the Unix operating system, Officepower software and eight Powerterminal II workstations — costs $38,350 and will be generally available during the fourth quarter of 1985. A comparable 16-user configuration costs $59,200. The single-unit Powerterminal II with the local-area network connector costs $1,795.

Flex/32 series out

Flexible Computer Corp. of Dallas has announced three series of configurations for its Flex/32 multicomputer parallel processing systems for end users and OEMs.

The Series 2000, Series 3000 and Series 6000 use a parallel multiple-bus architecture and concurrent software. Each series was designed to be upwardly compatible with the next.

The Series 2000 includes from four to 10 32-bit Flex/32 superminicomputers capable of parallel operations. Memories range from 4M to 40M bytes of random-access memory, and the I/O bandwidth ranges from 40M byte/sec. to 100M byte/sec. A four-processor Series 2000 starts at $150,000.

The Series 3000 features six to 20 Flex/32 processors, 6M to 85M bytes of memory and an I/O bandwidth ranging from 60M byte/sec. to 200M byte/sec. A six-computer configuration starts at $230,000.

The Series 6000 includes 30 or 40 Flex/32 processors, 46M to 169M bytes of memory and an I/O speed from 300M to 400M byte/sec. A 30-processor configuration starts at $1 million.

Flexible said the Flex/32 is a parallel multicomputer environment with up to 20 directly programmable superminis per cabinet.

"Why doesn't somebody make a graphics terminal you can change to fit different jobs?"

Perkin-Elmer revamps 3200 series to optimize Xelos

Adds processor for network link

By Charles Babcock

NEW YORK — Perkin-Elmer Corp. of Oceanport, N.J., has reconfigured its 3200 series processor to optimize its AT&T Unix-based Xelos operating system for a 10% improvement in performance.

In addition, PE announced a front-end communications processor capable of connecting the 3200 series of superminicomputers and high-end Xelos systems to IBM Systems Network Architecture (SNA) and other network environments.

Xelos is PE's operating system based on AT&T's Unix System V, Release 2 with enhancements from the University of California at Berkeley Software Division's Version 4.2, company officials said. Xelos has been available on the 3200 series along with OS/32, Perkin-Elmer's proprietary operating system.

The three basic systems and two enhanced versions in the Xelos processor line were developed by reworking three of the five CPU boards in the 3200 and reconfiguring the microcode to optimize Xelos, said Dennis Tinley, product manager for the Xelos line.

Like the 3200 series, the XF or Xelos series is based on Motorola, Inc.'s 68000 microprocessor, according to officials.

The Xelos line includes the XF/200 supermicrocomputer at the low end with 1M to 3M bytes of memory, 320K bytes of floppy disk storage, 51M bytes of hard-disk capacity, four ports and a graphics controller. A minimum configuration costs $10,150.

The XF/210 is an enhanced version of the XF/200 with six ports, up to 4M bytes of memory and up to 75M bytes of hard-disk storage. It sells for $10,500.

The mid-range processor is the XF/400, a supermini with eight to 16 ports, 2M to 4M bytes of memory and 51M to 170M bytes of hard-disk storage. Its list price is $21,995.

The XF/600 offers 16 to 64 ports, with up to 16M bytes of main memory and 1K byte of direct-mapped cache memory. System options include a 51M- to 2.4G-byte hard-disk system and battery backup for automatic memory retention. Tinley claimed that benchmark tests on the XF/600 indicate its performance is equal to Digital Equipment Corp.'s VAX-11/780. A minimum configuration costs $27,000.

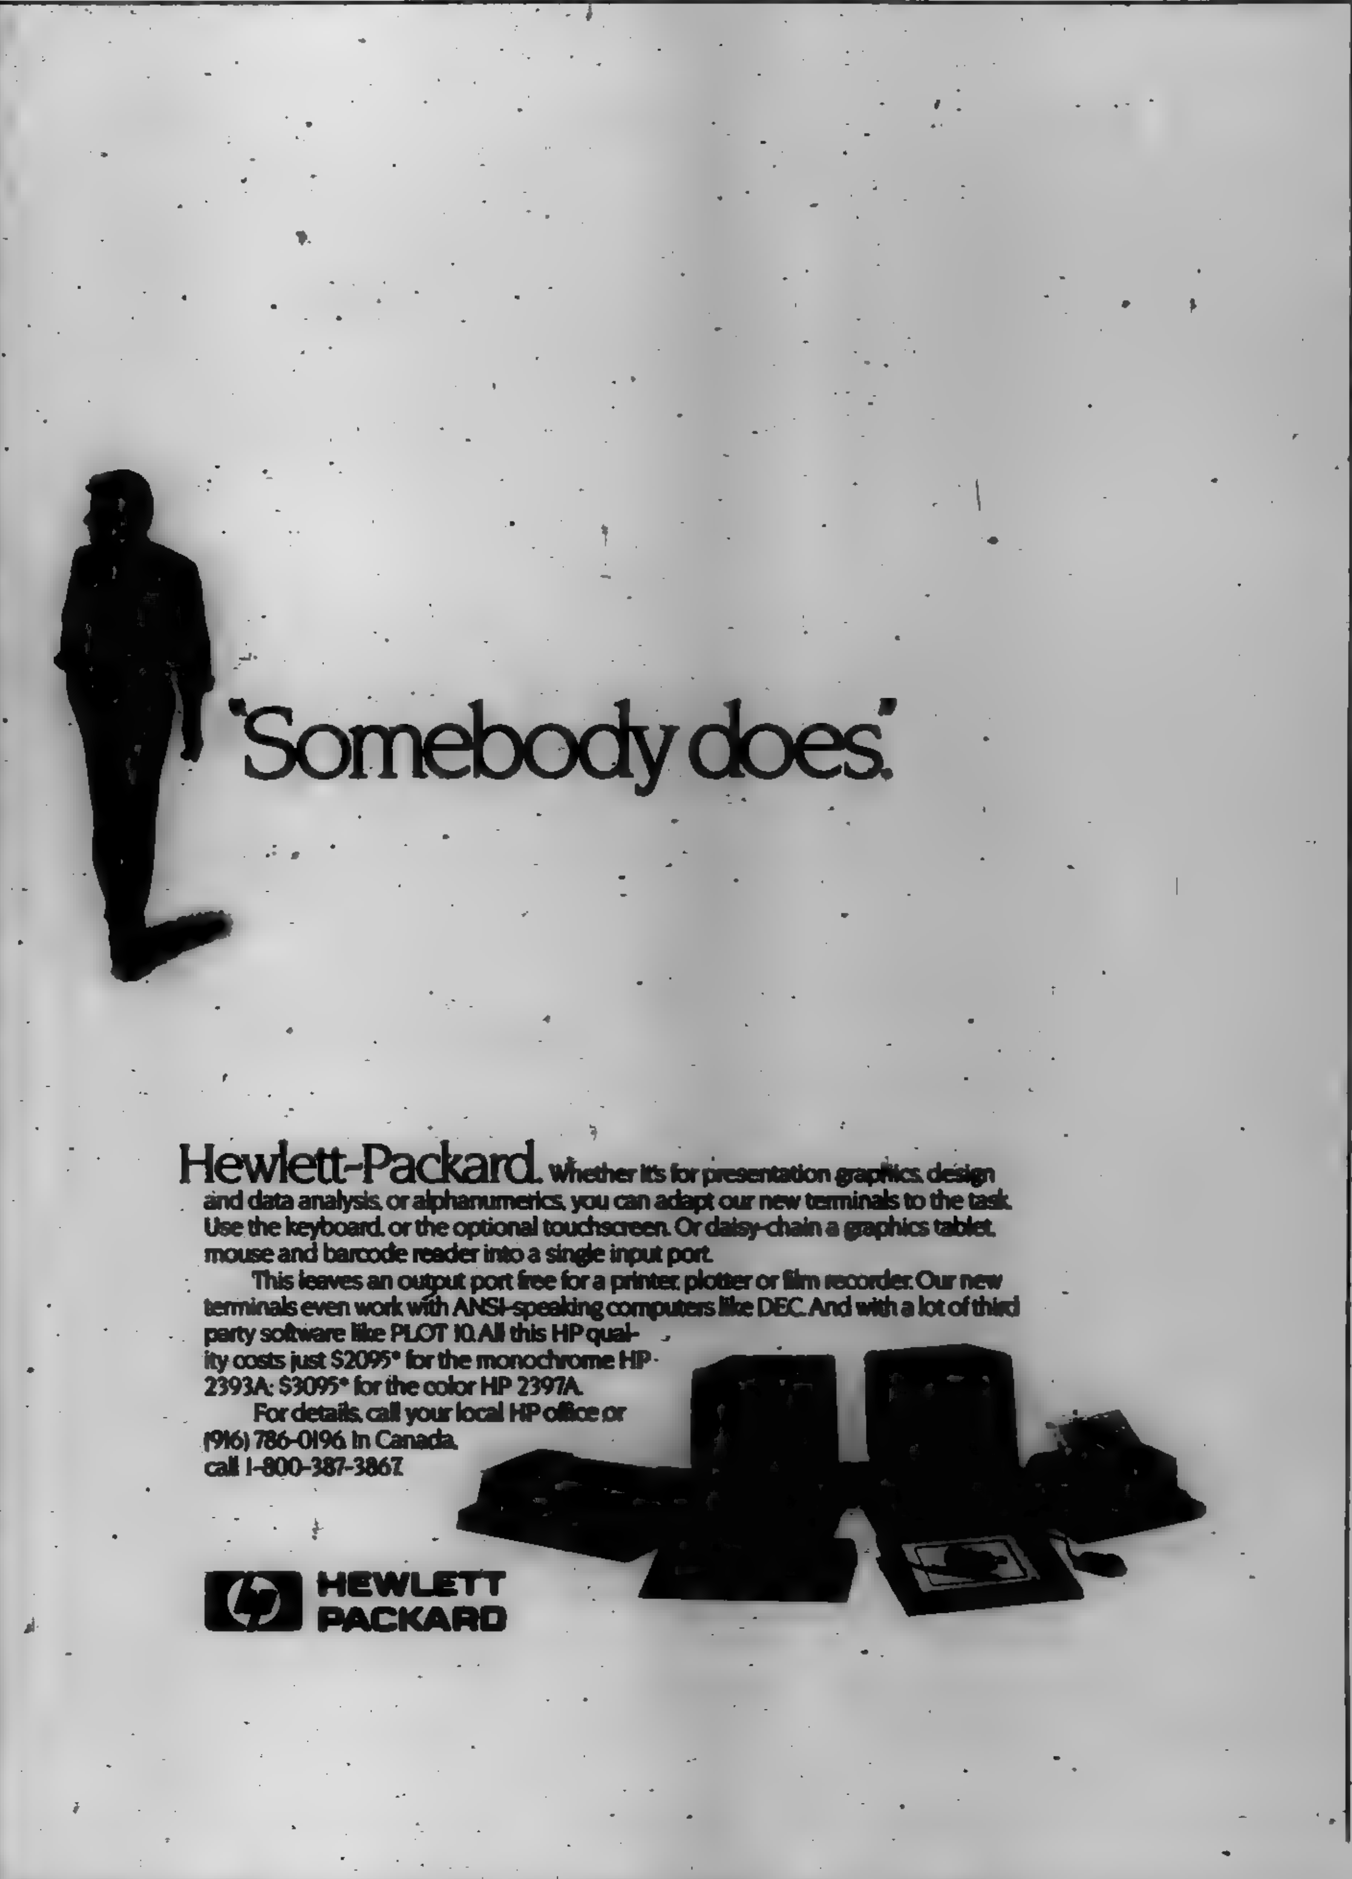
An enhanced version, the XF/610, features an intelligent I/O handler. With a standard configuration of 32 ports and 4M bytes of memory, it will sell for $45,000.

The processors will be available in October, PE said.

Perkin-Elmer officials said they would introduce in January a multiprocessor version of the XF/600 — the XF/800 — with greater performance characteristics. It also said it plans to fill out the low end of the line with an XF/300 in November.

PE has been offering Unix-based systems since 1979. It has an installed base of 300 Unix systems, spokesmen said. The firm will continue to offer the 3200 series, which comes with the PE OS/32 operating system and supports Xelos.

The communications processor, the 3200-CP, is capable of serving as an interface to IBM's SNA, bisynchronous, X.25 and Ethernet. The $13,000 communications processor comes with software options ranging in price from $1,000 to $5,000.



Hewlett-Packard. Whether it's for presentation graphics, design and data analysis, or alphanumerics, you can adapt our new terminals to the task. Use the keyboard, or the optional touchscreen. Or daisy-chain a graphics tablet, mouse and barcode reader into a single input port.

This leaves an output port free for a printer, plotter or film recorder. Our new terminals even work with ANSI-speaking computers like DEC. And with a lot of third party software like PLOT 10. All this HP quality costs just $2095* for the monochrome HP 2393A; $3095* for the color HP 2397A.

For details, call your local HP office or (916) 786-0196. In Canada, call 1-800-387-3867.

HEWLETT PACKARD

"... expansion board!"

From page 85

Mentor Graphics processor out

The engine executes compiled high-level C language source code so it can deal with simulations above the gate level. The process is said to be transparent to the Apollo workstation user. The compiler is said to accept standard, nonparallel source code and convert it to object code that capitalizes on the parallel architecture. It also produces symbol file information used in symbolic debugging.

Different from other products

The product is different from other acceleration engines on the market, said Vicky Brown, computer-aided design and manufacturing analyst at International Data Corp., in that it speeds the entire range of engineering tasks.

Other hardware accelerators are designed to speed the simulation process only, she added.

Brown took issue with Mentor's claim to have a Risc system, saying that the instruction set is still large and not a true Risc system. But Mentor's use of parallel processing techniques at a primitive level, analyzing code as it comes in and breaking it into primitive operations such as basic arithmetic operations, is a first in the computer-aided engineering field, she said.

The system is targeted at single users, the vendor said.

Program development tools include a linker which supports overlaying of code/data segments and dynamic binding.

Other tools available

Also available is an Object Librarian for organizing and maintaining libraries of related object modules and an Image Librarian for defining dynamic binding execution environments.

The $27,900 Compute Engine consists of a CPU board and a 4M-byte memory board. A 10M-byte version costs $31,900. Both packages include one software upgrade.

Additional Mentor Graphics software costs $5,000 per application. Customers may port their own application software to the Compute Engine by licensing the product's C compiler and associated program development tools for $150,000.

From page 85

General Dynamics system offered

The agreement states that both firms will sell the systems.

Terry Straeter, vice-president of General Dynamics' electronics division, called the Model 5000 an intermediate-level mainframe for resource-intensive applications such as modeling and simulation and said it maintains full file compatibility and access to IBM VM/CMS hosts.

The firm also announced a Model 5000T, which has Tempest features that prevent emissions of electrical signals, for intelligence agencies. The Tempest version is being tested for certification by the National Security Agency.

The Model 5000 and 5000T support up to 4M bytes of main memory (16M bytes of virtual memory), four user terminals, two high-resolution graphics terminals and peripherals. Both systems include dual 85M-byte Winchester disk drives and an IBM-compatible 9-track tape drive, the vendor said.

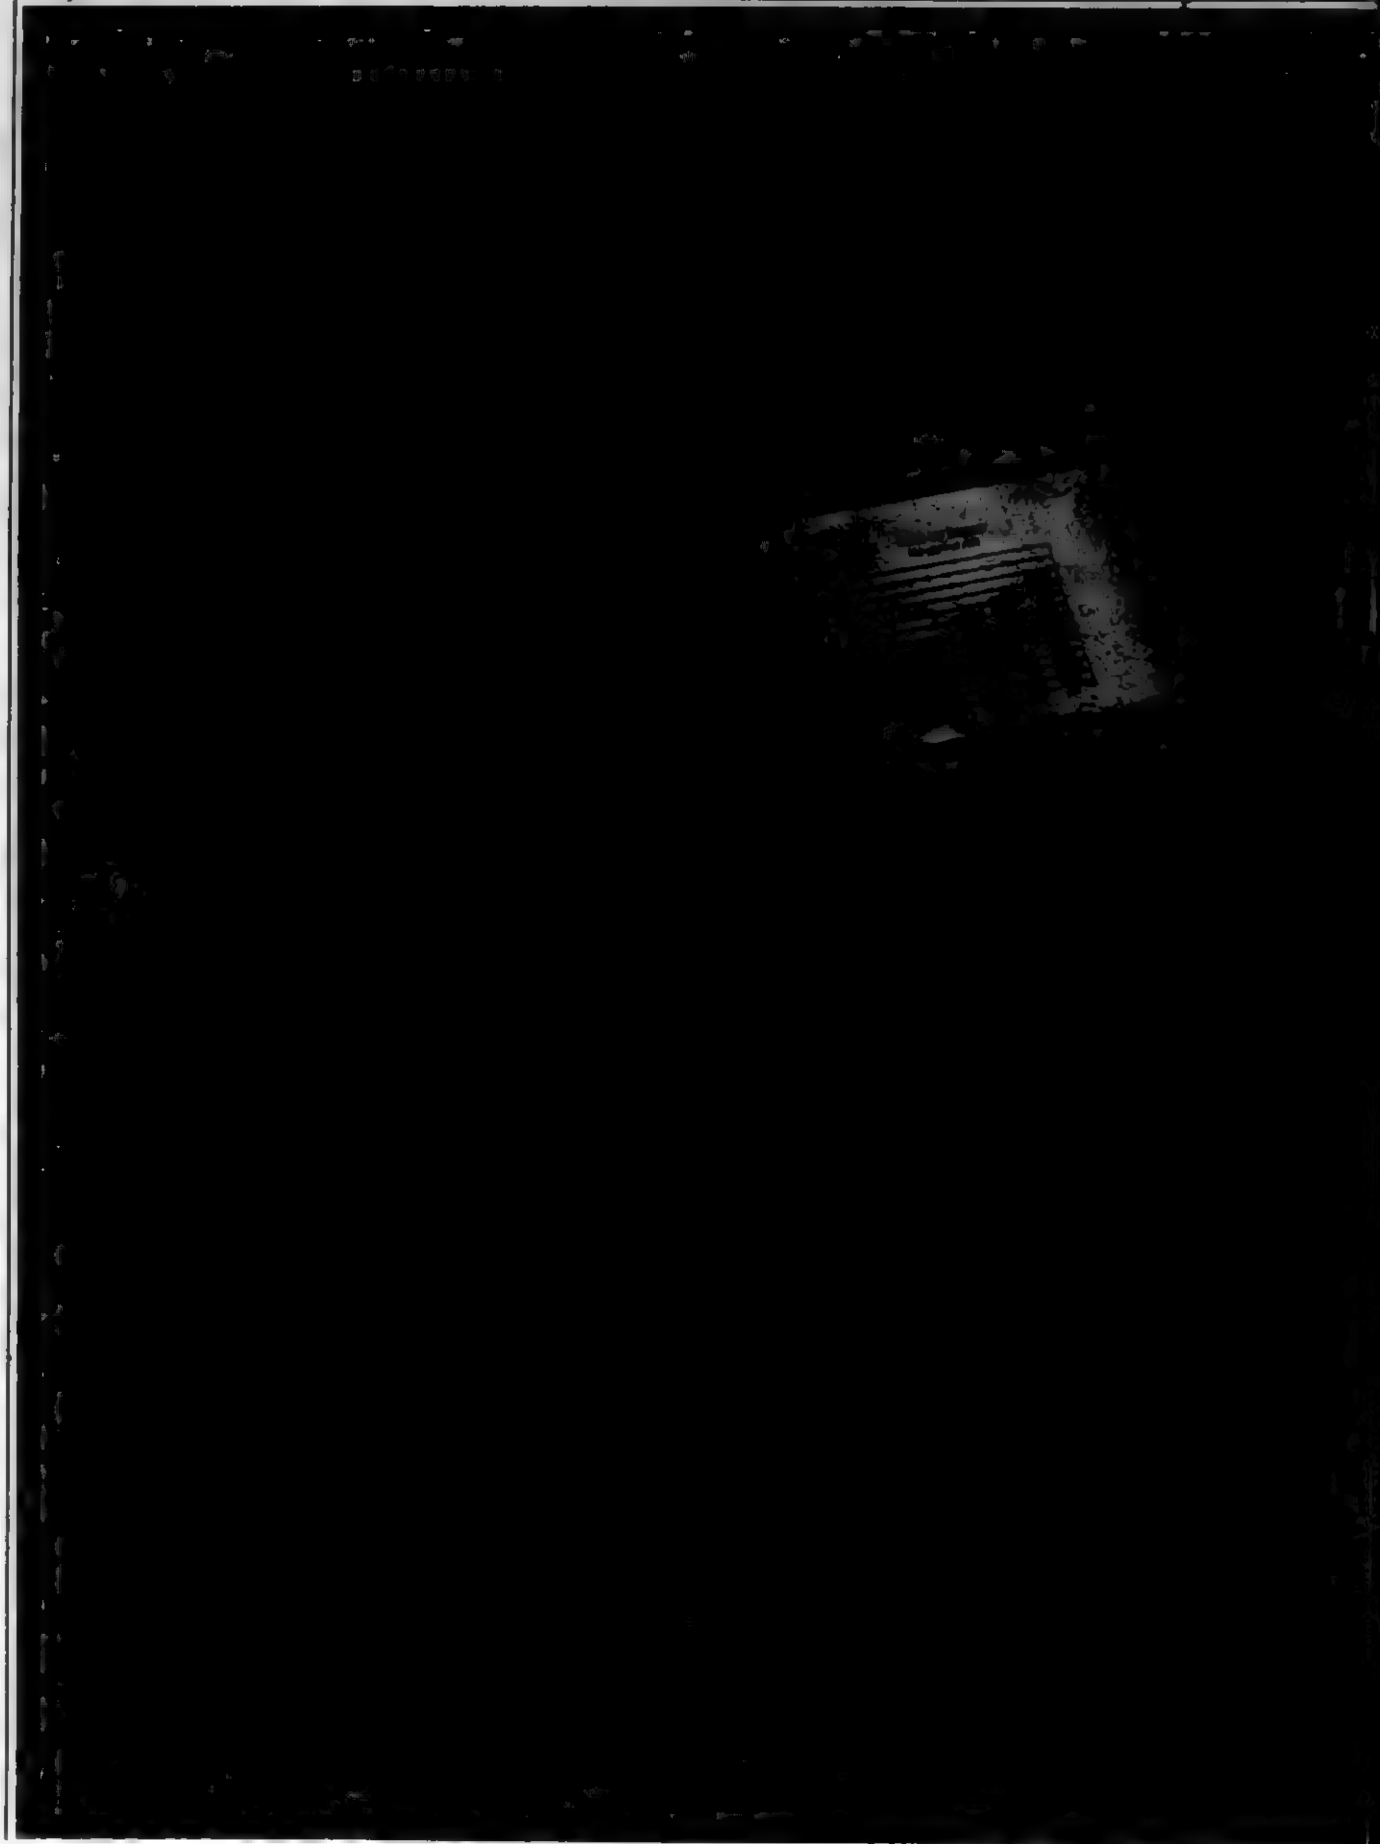
For mainframe off-loading, the units support networking with IBM mainframes, other Model 5000s and microcomputers, the vendor added.

"We are providing end users with DBMS-driven mainframe software applications as a dedicated resource," CCA President James Rothnie commented.

CCA's Model 204 relational DBMS is suited for defense and intelligence applications because of its applications development facilities, as well as fast retrieval and controlled access features, he said.

System prices, including the CCA software, range from $100,000 to $300,000, and the systems are currently available, according to the companies. The software portion costs $35,000 to $50,000, a CCA spokesman said.

General Dynamics also said it plans to offer four software lines for the Model 5000 series: office automation, program management and decision support, software engineering and computer-assisted engineering.



From page 85

Transaction sales to mushroom

means a 74% growth in unit shipments and a 79% growth in the value of those shipments between 1984 and 1990, according to IDC, which based its research on its computer installation data file.

IDC predicted that in 1990 vendors will ship 119,000 transaction-oriented systems worth a total of $12.2 billion, compared with 68,000 units worth $7 billion in 1984.

Because of their typical dollar value, mainframe-class transaction processing systems will show the greatest amount of growth, according to IDC.

The report noted that in many installations, only the very largest mainframe can act as the host system but that the operating environment forces smaller systems to handle the on-line portion of the application.

IDC added that most of the transaction processing growth will be in the area of on-line processing, where the transaction is completed and all data bases are fully updated during the process of the request and output stages.

In on-line processing, there are no edit files developed for later batch updates of the central data base.

The report was compiled for IDC's Continuous Information Services clients.

From page 86

Transaction units: no comparison

pal of Itom International in Los Altos, Calif. "The effort I started stalled. A fairly large number of people volunteered, but when the time came to make a decision they backed off and the project died," Serlin observed.

Officials of Tandem Computers, Inc. helped to organize that industry/user collaborative effort and have recently been calling for a standard benchmark.

Robert Jolls, director of data base products for the Cupertino, Calif., manufacturer of transaction processors, noted that such a standard will become more crucial as vendors and users drive toward a goal of 1,000 transaction/sec. He reported that high-end transaction processing systems are now approaching the 100 transaction/sec. level when running Debit Credit.

But Jolls added that even running Debit Credit leaves a customer unable to compare results for various processors unless each vendor runs the same transactions under the benchmark.

Key feature of Debit Credit

Serlin noted that a key feature of a Debit Credit-generated rating is that, unlike a Mips rating, it considers factors such as a customer's individual software, communications and I/O systems. Mips is essentially a measure of processor speed.

However, how those nonprocessor factors are considered is a stumbling block for a standardized benchmark.

Lawrence Sherman, manager of product support programs for Stratus Computer, Inc. of Marlboro, Mass., warned, "The complication comes in when you talk to a particular customer about his requirements and his work load, which will differ greatly from this simulated work load.

"You have to remember that communications and data base demands are going to vary greatly from customer to customer and user to user," he said.

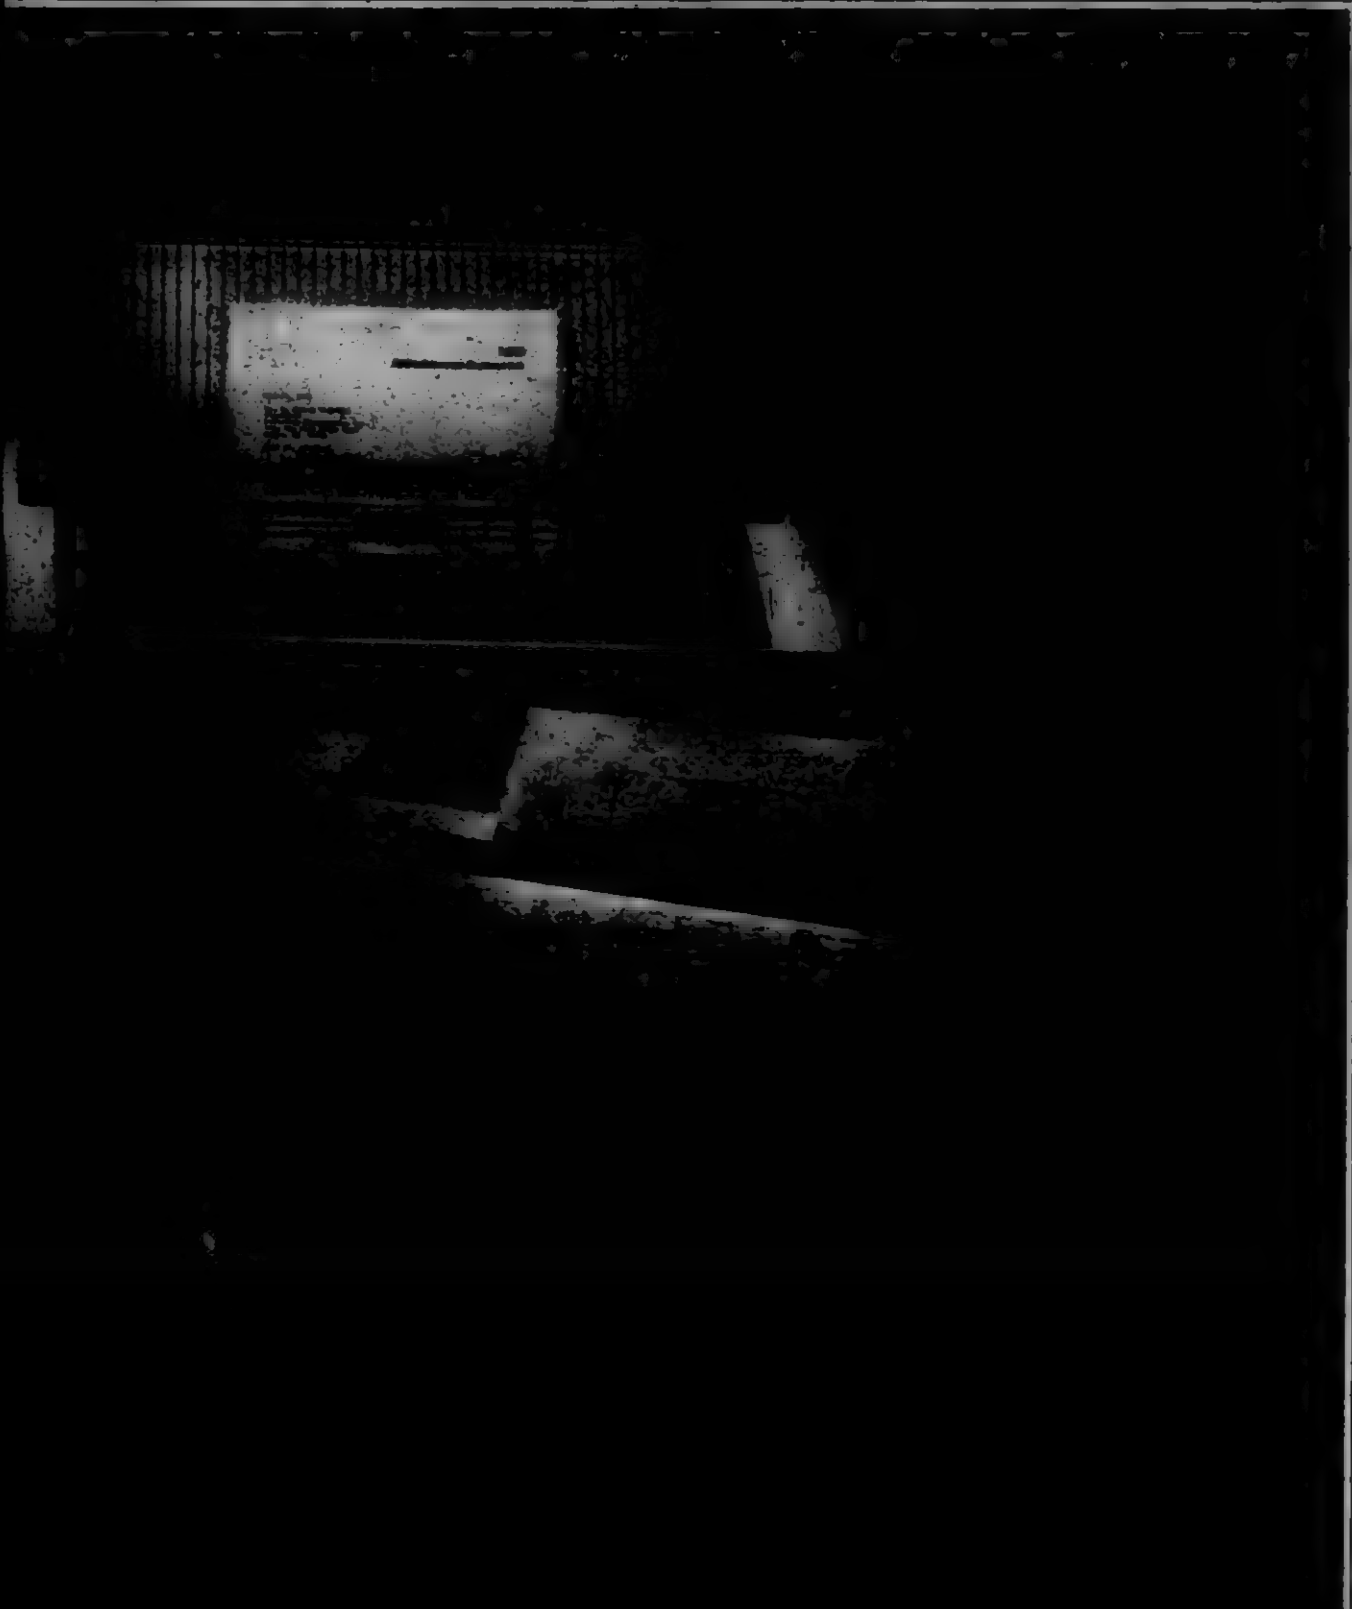
Sherman also suggested that even if vendors and users agree to set standards, they will need three or four standards for the different types of transactions, since a standard fit for the financial market may be inappropriate for a customer automating a factory.

Fuel efficiency for autos

Good cautioned that if any benchmarks are accepted they should be looked upon as are the U.S. Environmental Protection Agency's fuel efficiency ratings for automobiles — guideline numbers to put products in perspective with relation to each other.

But another observer from the user sector concluded that performance standards are a pipe dream.

That manager, who asked not to be identified, said, "The real issue is how you measure the performance available to the end user. Reporting performance from the glass house isn't the way to measure performance. It's not what the users see. They are the only ones who know how the system is performing."



SPECIAL REPORT

Display Terminals

October 28

It's no secret that display terminals continue to revolutionize today's work place. That's why it's essential for users and vendors to keep pace with what's happening in the terminals market. *Computerworld*'s October 28 Special Report on Display Terminals will help them do just that.

This Special Report will explore the latest terminal technologies . . . provide an update on high-resolution graphics terminals . . . and offer advice on buying the popular 3270 workstations.

What's more, we'll offer helpful hints to assist managers in selecting the *right* equipment for their corporate information system needs . . . and provide information on creating ergonomically designed work areas. Our features, tutorials, and application stories will tell the whole story.

If you market display terminals or compatible devices, here's your chance to reach *Computerworld*'s 687,000 paid subscribers and pass-along readers. To reserve space for your ad in the October 28 Special Report issue on Display Terminals, simply complete and return the coupon below. Or call Ed Marecki, Vice President/Sales, at (617) 879-0700. Don't delay — call today!

Advertising Close: October 11

☐ Yes, I want to reach active buyers of display terminals and compatible devices. Please send me advertising information for the October 28 Special Report issue.

☐ I'd like information about the upcoming Special Report issues of *Computerworld*. Please send me Rate Card No. 20.

Western Digital seeking reprieve from creditors

IRVINE, Calif. — A $13.4 million fourth-quarter loss has raised the possibility of a credit crunch at Western Digital Corp., knocking the company below its previously agreed level of equity in credit agreements with its banks.

The vendor of communications control boards and semiconductors is currently renegotiating the agreements with the creditor banks, which have temporarily waived Western Digital's equity requirements until Oct. 31.

William R. Benz, the company's vice-president of finance, said the revolving agreements with Bank of America National Trust & Savings Association, First Interstate Bank of California and Morgan Guaranty Trust Co. of New York cover a $40 million line of credit. He did not disclose the equity level specified by the bank covenants.

"I don't consider the situation a difficult one at all," Benz said. "The covenants have been restructured before. The bank group is solidly behind the company, and I don't expect any difficulty in compliance or any change in the nature of our relationship with the banks."

Western Digital's losses on $177.4 million in revenue for the year ended June 30 plunged the company into the red for fiscal 1985. The firm lost $4.6 million, or 71 cents per share, compared with profits of $7.8 million, or 49 cents per share, in fiscal year 1984.

Boosted by sales of $69.9 million compared with $41.7 million in the year-earlier quarter, Western Digital posted revenue growth of 56% for the year. But the sales increases came in lower margin, board-level products, such as Winchester disk controller boards, as the company shifted its focus away from higher margin controller chips.

Trade surplus up, Cbema says

WASHINGTON, D.C. — The U.S. trade surplus for computers and office equipment rose by 28.4% in the first half of 1985, ending two years of decline. But the U.S. computer trade deficit with Japan continued to rise with a 7.6% increase, according to statistics released recently by the Computer and Business Equipment Manufacturers Association (Cbema).

Imports of computers and related equipment and parts from Japan reached $1.66 billion in the six-month period. Business equipment imports from Japan rose by 20.4% to $1.28 billion.

The U.S. surplus of computer and business equipment worldwide climbed to $2.82 billion during the first half of the year, up from $2.2 billion in the same period in 1984. The association predicted a surplus of about $5.5 billion for the full year if current economic trends continue.

The U.S. high-tech balance of payments has been generally declining since its peak of $7 billion for the full year of 1981.

In a related development, Cbema President Vico E. Henriques recently testified against proposed protectionist legislation before Congress. Criticizing a proposed 25% duty on imports into the U.S., Henriques blamed the nation's overall record trade deficits on low savings rates and the federal deficit.

"This creates a situation in which the dollar is overvalued and the cost of capital is too high, preventing industrial expansion," Henriques said. He predicted retaliatory measures by foreign vendors against an import duty.

STC layoffs reach upper exec levels

By Clinton Wilder

LOUISVILLE, Colo. — Storage Technology Corp. (STC) recently announced it will lay off 500 more employees and consolidate several corporate functions in its effort to emerge from bankruptcy proceedings under Chapter 11 of the Federal Bankruptcy Act.

The mainframe storage device manufacturer will reorganize along functional rather than product lines, consolidating the management of its disk and tape drive operations under manufacturing, systems development, financial and MIS divisions. The resulting cutbacks of administration and management positions in the Denver area represent the highest level STC jobs cut to date, excluding the replacement of top management by the team headed by the firm's chief executive officer, Ryal R. Poppa.

STC's printer division, employing 400 people in Melbourne, Fla., is unaffected by the reorganization and will continue to maintain its own administrative functions.

The restructuring, part of the long-term business plan approved by STC creditors in July, will cut the firm's expenses by $60 million per year, a spokeswoman said. The reduction of the management payroll follows an overall reduction of 40% of the firm's employees since the Chapter 11 filing in October 1984. STC now employs fewer than 9,000 people, down from more than 15,000 one year ago.

"They've cut, and cut and cut, but they haven't really cut management positions before this," said Carol Lerner, a storage industry analyst at International Data Corp. in Framingham, Mass. "This is a major step for them and a smart move in facing the fact they're going to be a much smaller company." STC projects revenue of $650 million in 1985, compared with

Outlook bullish for service start-ups

Third-party service contracts expected to double by 1988

By Peter Bartolik

OSSINING, N.Y. — Tom McLaughlin ended his career at IBM in 1978 after 12 years spent climbing the rungs in field-engineering management. The decision to leave came when higher level executives rejected his proposal to cut prices on maintenance contracts.

"The manager said that the price of parts was so high [IBM doesn't] have to worry about competition," McLaughlin recalled in a recent interview in this New York suburb.

Today, third-party computer maintenance, much of it involving IBM equipment, is a booming industry and is attracting some of the larger equipment manufacturers. Total maintenance and service revenue in the U.S. was estimated at about $10 billion in 1984, and third-party providers — those companies servicing products made by others — raked in more than $1 billion of the total, according to Input, Inc. of Mountain View, Calif. But the third-party segment should double by 1988, according to Input. A study published last year by Arthur Andersen & Co. in cooperation with the Association of Field Service Managers projected that third-party revenue could reach $9 billion by 1990, much of it at the expense of manufacturers' service organizations.

After IBM executives rejected his recommendations in 1978, McLaughlin left to found Technical Support Services, Inc., now headquartered in an old high school undergoing renovation. It took 18 months to land his first account and five years to turn his first profit, he said. The privately held company, according to McLaughlin, posted revenue of $6 million last year, compared with $2.8 million the year before, and is on track for $10 million this year.

"We've had to slow down this year and get the management in place and the service in place for continued growth," McLaughlin said. The company carved its niche by providing depot maintenance for IBM point-of-sale and financial terminal equipment and in more recent years automated-teller machines. It now operates 17 depots throughout the country.

One fact of life that has not changed, however,

Eagle seeks cash to make micro fly

GARDEN GROVE, Calif. — Shareholders of Eagle Computer, Inc. recently voted to add 10 million shares of common stock to the company's holdings. Capital from the sale of the stock will be used to help finance the introduction of new versions of Eagle's Turbo microcomputer, expected by year-end.

According to an Eagle spokesman, 95% of the outstanding shares of stock were represented at the shareholders meeting earlier this month, and 91% of those present voted in favor of the common stock increase. The addition gives Eagle 35 million shares of common stock. The 10 million shares will not be sold immediately, according to the spokesman.

Shareholders also voted to issue one million shares of preferred stock.

One of several microcomputer firms wounded by the shakeout in the IBM-compatible market, Eagle is attempting to rebound from substantial losses that last year forced the company to close its Los Gatos, Calif., headquarters and consolidate

Chip owners find copyright protection under 1984 act

FIFTH IN A SERIES

By Jerome J. Roberts
and Michael P. Brownell
Special to CW

A new form of proprietary protection for semiconductor chips, the Semiconductor Chip Protection Act of 1984, was signed into law last year by President Reagan and is administered by the U.S. Copyright Office. The protection it affords differs from copyright in many respects; this article and the following will summarize many of the fundamental aspects of the act.

Protection under the act is achieved by giving the owner of a mask work from which a semiconductor chip is constructed certain exclusive rights regarding both the mask work and the semiconductor chip product in which the mask work is embodied.

A mask work is the group of masks that are used like stencils in the manufacturing process of a semiconductor chip to create the three-dimensional pattern of metallic, insulating and semiconductor material inherent in the chip.

EXCLUSIVE RIGHTS

The owner of a mask work who satisfies certain requirements of the act, as summarized below, will have the exclusive right to reproduce the mask work, import or distribute a chip in which the mask work is embodied and permit others to do both. The owner of a mask work may be the person who creates a mask work, the employer of an employee who creates a mask work within the scope of employment or a party receiving a signed written conveyance from the initial owner of all his rights in a mask work.

COMMENCEMENT AND DURATION OF PROTECTION

Protection begins when two requirements are satisfied. First, the mask work must be fixed in a chip. This means, essentially, that an actual chip prepared from the mask work must be in existence. The chip need not necessarily be in final form.

Second, the mask work must be registered as explained below, or the chip containing the mask work must be distributed to the public for commercial purposes. Once the mask work has been fixed in a chip and registered or commercially distributed, protection continues for 10 years. However, if protection began as a result of public distribution and not registration, protection will only last for two years unless the pertinent mask work is registered within the two-year period.

REGISTRATION

Formal registration of the mask work with the U.S Register of Copyrights is advisable for several reasons. First, without registration, protection lasts for only two years from the date the chip is commercially distributed. Registration extends protection to 10 years. Second, prompt registration provides the only way to effect the act's protection for a mask work during the period before commercial distribution of the chip but after fixation of the mask work. Third, a mask work must be registered prior to bringing an infringement action.

Registration is accomplished by submitting Form MW, a $20 registration fee and a deposit of certain identifying materials concerning the relevant chip to the U.S. Copyright Office.

In general, Form MW requests information concerning the title of the work, a description of the new or original elements of the work, the name and address of the current owner and the manner in which the current owner gained ownership in the event it did not create the work.

Regarding the identifying materials requirement, a registrant must submit a visually perceptible representation of each layer of a chip. The Copyright Office will accept any one of several formats concerning such representations. Further, if the chip has been commercially distributed, four reproductions of the actual chip must be deposited with the Copyright Office.

THE MASK WORK NOTICE

The owner of a mask work protected under the act should consider affixing notice of protection to the mask work. Such notice serves to lay a strong foundation from which to prosecute infringement and to prevent innocent infringement. Although recommended, such notice is not a condition of protection. A notice comprising the following elements will constitute a satisfactory notice of protection:

- The words "Mask Work."
- The symbol "M" or the letter "M" in a circle.
- The name of the mask work owner or a recognizable or generally known abbreviation thereof.

Roberts and Brownell are attorneys with the law firm of Berman, Roberts and Kelly in Chicago. The firm's practice deals with legal issues related to procurement, distribution, management and protection of computer resources.

Get your network under control!

Find out how, FREE by attending the NM/TC Exposition

NETWORK MANAGEMENT

November 20-21, 1985
Holiday Inn O'Hare,
Chicago

The place to
get hardware and software solutions to your networking problems is Network Management/Technical Control. NM/TC is the only show to zero in on multicarrier/vendor operating headaches, problems and error detection, correction and monitoring systems.

Get Control
of your network and see new ways to handle protocol conversion, LAN gateways and T-1 carrier.

Save money
when you pre-register for the exhibits-only. You save the $5 registration fee and we will send you your credentials in advance.

Save time
and register now to see tech control and software solutions; self-diagnostic modems and components; hardware for network optimization, measurement, feedback and performance monitoring.

NM/TC
is managed by CW/Conference Management Group, the team that brings you COMMUNICATION NETWORKS, a division of CW Communications/Inc., publishers of *Computerworld* and *On Communications.*

Sponsors
The following companies are NM/TC show sponsors and will be demonstrating their latest products and services at the exposition:
Datacomm Management Sciences Inc.
Dynatech Data Systems Inc.
General DataComm Industries Inc.
Paradyne Corp.
Racal-Milgo

Exhibitors
Other NM/TC Chicago exhibitors include:
ADC Telecommunications Inc.
Atlantic Research Corp.
COMM+ Systems, Inc.
Connections Telecommunications, Inc.
Digilog, Inc.
Digital Communications Associates
Digitech Data Industries, Inc.
Domain Systems, Inc.
Forest Computer, Inc.
GTE Telecom, Inc.
Infotron Systems
Network Technologies
Northern Telecom/Spectron Division
On Communications
Telecommunications Products + Technology
Teradata Systems
TEL electronics
Telephony
Versatec Systems
Versa-Lite Systems, Inc.

Admission to exhibits is FREE if you register now!
Fill out the coupon and mail to:
NM/TC, Box 880, Framingham MA 01701.

IBM offers dealers sales incentives

BOCA RATON, Fla. — In an apparent effort to move its rumored swollen inventories of micros and peripherals, IBM has begun a dealer rebate plan as sales incentive for the IBM Personal Computer AT, Personal Computer XT and PCjr.

The dealer rebates, which began Sept. 1, could herald an early start to an expected wave of holiday season price cuts by most leading micro vendors (CW, July 29). At least some of IBM's refunds, reportedly up to about $500 per machine, could be passed on to buyers in the form of discounts.

"We are offering a sales promotion in the form of incentives to dealers," said a spokesman for IBM's Entry Systems Division. "Fourth-quarter promotions are not uncommon. We did it last year in the same time frame."

Rebate terms vary for each computer model, but essentially give dealers a cash incentive for ordering a specified volume of XTs, ATs or PCjrs. The discontinued PCjr has already undergone one major price cut earlier this year.

Analyst Aaron Goldberg of International Data Corp. in Framingham, Mass., said the move was IBM's response to dealer sales of Big Blue micros equipped with lower priced, third-party hard disk drives, monitors and other peripherals. "It's simply an incentive for dealers, and I don't think the street price of the IBM machines will fall because of it," he said.

Net America buys Nestar

By Maura McEnaney

PALO ALTO, Calif. — A Dallas-based start-up common carrier took a bold stance in the communications market recently through the acquisition of Nestar Systems, Inc., a leader in personal computer local-area networks.

Net America, Inc., builders of a nationwide Integrated Services Digital Network, recently purchased 80% of Nestar's stockholdings from Rank Industries America, Inc., a subsidiary of a UK-based travel and leisure services firm that had been an investor in Nestar since 1980. The value of the acquisition was not disclosed.

Net America was founded three years ago by former Northern Telecom, Inc. executives Ed Jungerman and Ray Cotton.

Net America cofounder and Chairman Sam Wyly also founded University Computing Co. and serves as chairman of Sterling Software, Inc., which recently acquired Informatics General Corp.

According to Jungerman, Net America still needs to complete payment on $250 million in debt and eq-

Start-up to develop publishing software

By Eric Bender

MONTEREY, Calif. — A start-up firm that will develop and market computer-aided publishing software is being formed by managers from Digital Research, Inc.

Founders of the spin-off, Ventura Software, Inc., include John Meyer, Digital Research's marketing director, and two software engineers involved in the development of Digital Research's Graphics Environment Manager (GEM) software.

Ventura's first products, which will be announced early next year and shipped within a year from now, will provide desktop publishing capability within the GEM package, Meyer said.

Unlike most computer-aided publishing products now on the market, Ventura's offerings will run on the IBM Personal Computer and "give assistance to a user who is not really smart about how to lay out a page," according to Meyer.

The start-up plans to target several market niches, the first being users who already own desktop laser printers. Employees who work in corporate communications or in technical documentation also represent likely candidates, Meyer said.

While Ventura will be an independent software vendor for GEM and may sign a technology-exchange deal with Digital Research, the older firm will not make any investment in the start-up company.

Both Meyer and Digital Research President John Rowley told *Computerworld* that Digital Research decided against pursuing desktop publishing products at this time in order to concentrate on presentation graphics, graphics-enhanced applications and system software. Digital Research "has a tremendous number of opportunities it's already pursuing," Meyer commented.

Two characteristics of desktop publishing make it particularly appropriate ground for a start-up, he added. "First, it's not very well developed at the micro end. Second, it's a market that's going to require a different distribution channel."

From page 93

Net America buys Nestar

uity financing before it can implement its network, and the company expects to begin offering common carrier services by the end of 1986. Until that time, Net America has been operating with venture capital, much of which comes from Wyly.

According to Nestar President Charles Hart, the acquisition gives Net America Nestar's corporate installation base of approximately 1,000 networks and access to the company's intrafacility data distribution technology.

The Net America merger also includes the assets of Zynar, Inc., a London-based local-area network firm that had been under Nestar management for more than a year.

From page 91

Outlook bullish for service start-ups

is that the price of new IBM parts needed to service equipment can cost as much as an IBM service agreement. That requires small competitors to be fast on their feet by acquiring off-the-shelf parts from other suppliers at a fraction of the IBM list price and in-house manufacturing or repairing of frequently broken parts.

"If you buy parts from IBM, IBM is getting as much money anyway without having to provide the service," McLaughlin said.

Although IBM is required by a 1956 consent judgment to provide parts and documentation to users and third-party companies, it is not required to provide documentation on the schematics and components that make up a circuit board.

McLaughlin noted that a memory board for an IBM 4701 Finance Communication Controller is priced at $2,500, one-fourth the cost of the total unit.

Technical Support Services operates an electronics lab to draw up its own schematics and identify off-the-shelf integrated circuits that go into the boards. It also determines the functions of IBM proprietary integrated circuits; two boards with proprietary chips reportedly can be repaired by scavenging a third.

George Blagodatny, vice-president of engineering, said it takes two months to decode an IBM board, and new boards are introduced often, requiring the company to determine selectively those that it wishes to decode.

Because IBM builds nonstandard parts into its financial equipment, Technical Support Services has had to develop its own testing equipment, some of which it has begun to market. It also installs 4700 loop circuits and developed an alternative 4700 loop port module that it claims is more sophisticated and easier to use than IBM ports.

Committed to fast-growth goals, Technical Support Services has begun to branch out to offer service for 3270-type equipment and may move up further to service System/34, 36 and 38 processors.

Meanwhile, it wants to offer additional services to financial customers who use both IBM and non-IBM equipment, but McLaughlin claims at least two vendors have refused to provide parts.

Noting that one of those vendors has declared an interest in developing a third-party maintenance business, McLaughlin claims such refusal is a blatant attempt to restrain competition. But, despite his bitter denunciation, he expressed little concern about the current desire by mainstream vendors to enter his market. "With the exception of IBM, the manufacturers have their hands full servicing their own equipment," he said.

From page 91

Eagle seeks cash to make micro fly

its operations here. For the past year, Eagle has also been working out repayment plans with its unsecured creditors.

Last month, the company offered its trade creditors a repayment plan for $2.5 million in unsecured debt. The plan is designed to reduce Eagle's short-term debt, which reached $19.7 million in March 1984, to just under $3.1 million, a spokesman said.

Under the plan, debtors have the option of accepting the remaining 90% of the debt in the form of Eagle common stock at one share for $1 of debt or in a long-term unsecured note with 12% annual interest. Early this year, Eagle's unsecured creditors converted about $4.9 million in trade debt to equity.

Over the next few months, Eagle plans to introduce a line of multiuser supermicros and an enhanced version of its Turbo micro.

From page 91

STC layoffs reach upper exec levels

$808 million in 1984.

An STC spokeswoman said the firm expects to return to profitability and exit Chapter 11 by mid-1986. "That sounds realistic, if the industry holds together and [STC's] new products are delivered on schedule," said analyst Michael Geran of E. F. Hutton & Co. "They are now about half the size they were two years ago, and they have to bring their break-even point down to about $600 million."

Lerner said STC's return to profitability hinges on its ability to deliver a cartridge tape drive compatible with IBM's 3480 model.

The introduction of an automatic tape handler, which would speed the cartridge backup of IBM 3380-type disk drives, would greatly enhance STC's chances for recovery, Lerner added.

Introducing Q-Net,™ the intelligent "switch" that lets your whole mixed-bag of computers and peripherals work as one system!

For less than $100 a port!

Q-Net lets you add terminals, printers, modems and other peripherals to a maxi'd out multi-user micro…and interconnect dissimilar computers, operating systems, terminal types, etc., into a single system accessible to all users!

Note the diagram. Q-Net tames the wildest collection of PCs to mainframes, including any random mix of 8, 16 and 32-bit CPUs:

Q-Net is magic for facilities that have "grown up" in the computer age, and now have several generations of hardware in house. Q-Net users already include governments, universities, research institutions and companies of all sizes, and especially systems houses that no longer have to switch desks or cables every time a development assignment targets a different machine.

A QUICK LOOK AT Q-Net CAPABILITIES:

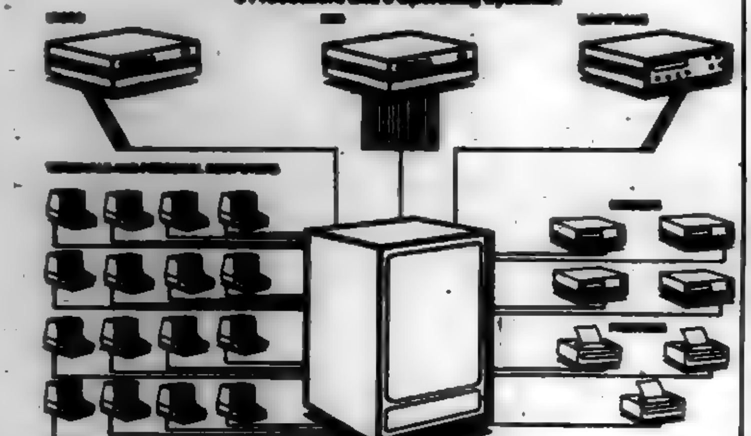
- There's no system degradation, regardless of the number of active users. Try that with a LAN. Any LAN!
- Q-Net lets you add more capacity to your present system by automatically logging off non-active users and queueing additional service requests for first availability. If you've walked down the halls of many businesses and peered in at blank computer screens on desk after desk, you know what we mean.

- Provides 32 RS-232 ports in the basic system, expandable to 128.
- Communications parameters are handled automatically.
- Stations can be reconfigured with keystrokes; no rewiring needed.
- Battery back-up retains stored system configurations automatically in the event of power failure.
- Security is under control of system administrator who, with keystrokes, can allow or deny access to any port or ports.

Call (800) 334-3595 toll free or (404) 998-6551 or write for literature and price list to Microscience Corporation, Dept. D, 8601 Dunwoody Place, Suite 136, Atlanta, GA 30338.

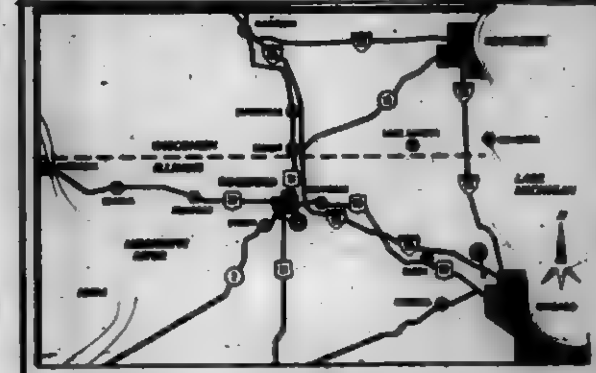
Inquiries from distributors, systems houses, and end users are welcome.

Typical Q-Net™ Installation with 3 Processors and 3 Operating Systems.



microscience corporation

POSITION ANNOUNCEMENTS



Sundstrand Corporation, a leading supplier of technology-based aerospace and industrial components, is greatly expanding its data processing operations.

We have the facilities
Together, our new data center in Rockford, Illinois (occupancy: July, 1986) and our recently completed center in Milwaukee, Wisconsin are designed to carry us into the 1990s. And there's room to grow as we push ahead to the next century.

We have the equipment
Our current Amdahl 5860/5870 and IBM 3081 mainframes will be joined next spring by an IBM 3090.

We have the plan
Current software includes MVS/SP, IMS 1.2, CICS 1.6.1, VM/PROFS, and a nationwide teleprocessing network. Projects for calendar 1986 include installation of MVS/XA, IMS 1.3, VM/SNA, and T1/Communication network.

We need the staff
We have some immediate openings and some for 1986 in both our Milwaukee and Rockford facilities. These are ground-floor opportunities in a freshly restructured organization, backed by the resources of a billion dollar corporation.

In Milwaukee, Wisconsin

Operating Systems Supervisor
As a supervisor in our Milwaukee Data Center, you will provide leadership and technical assistance to a staff of five systems programmers. Duties will include developing and overseeing software projects, assisting in the installation and maintenance of operating system and related software, coordinating activities with other Data Center departments, and interfacing with a large and varied user community.

You should have a four-year degree, 3-4 years as a systems programmer, and 1-2 years supervisory experience. A working knowledge of large-scale IBM and IBM-compatible hardware and software is required including MVS, JES2, SMP, and SPF.

MIDWEST CAREER OPPORTUNITIES

Systems Programmers

IMS Systems Programmer
Duties include the installation and maintenance of several IMS systems, locally at our Milwaukee Data Center and remotely at our Rockford Data Center. You will be responsible for problem resolution, system performance and tuning, and support of IMS-related products, including IMF, Logplus, SMU2, BTS-II, and Omegamon IMS. You will also work in modeling the IMS system and predicting the impact of work load changes.

You should have a degree in computer science or a related field, but we will consider equivalent experience. We have openings from entry-level to senior positions, commensurate with experience. Competence in COBOL, IBM Assembler, TSO/ISPF, SMP4 or SMP/E, and dump analysis is required at all levels.

CICS Systems Programmer
Duties include the installation and maintenance of several CICS systems, locally at our Milwaukee Data Center and remotely at our Rockford Data Center. You will be responsible for problem resolution, system performance and tuning, and support of CICS-related products.

You should have a degree in computer science or a related field, but we will consider equivalent experience. We have openings from entry-level to senior positions, commensurate with experience. Competence in COBOL, IBM Assembler, TSO/ISPF, SMP4, or SMP/E, and dump analysis is required at all levels. COPICS experience is a plus.

MVS Systems Programmer
Duties include installing and maintaining a variety of IBM and IBM-compatible software, identifying and resolving software problems, providing support and technical assistance for the Data Center staff and user community, and assisting in the design and development of software systems.

You should have a four-year degree or equivalent experience, 2-3 years as a systems programmer, and a working knowledge of large-scale IBM and IBM-compatible hardware and software including MVS, JES2, SMP, SPF, and BAL.

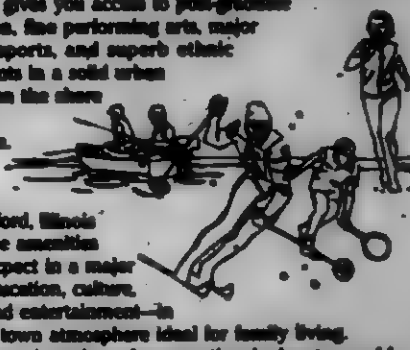
In Rockford, Illinois

Network Systems Programmer
Duties include installation and maintenance of NCP/VTAM systems in a large IBM mainframe environment, including support of network software at Milwaukee and Rockford data centers and three remote front-end processors. You will be responsible for problem resolution, system performance and tuning, and support of many network-related products.

You should have a degree in computer science or a related field, or equivalent experience. At least five years' experience is required, including three years as a network systems programmer in an MVS environment. You should also be competent in COBOL, IBM Assembler, TSO/ISPF, SMP4 or SMP/E, and dump analysis.

VM Systems Programmer
Duties include installation and maintenance of a VM system in an SNA network. You will be responsible for performance and tuning, capacity planning, program product installations, and problem resolution.

You should have a degree in computer science or a related field, or equivalent experience. At least five years' experience is required, including three years as a VM systems programmer. You should be competent in BAL programming, generating VM systems, dump analysis, and VM tuning. Familiarity with MVS JCL, MVS utilities, VTAM, and PROFS would be a plus.



As a Fortune 500 company, Sundstrand offers a competitive salary and excellent benefit package. Our Milwaukee location gives you access to post-graduate education, fine performing arts, major league sports, and superb ethnic restaurants in a solid urban setting on the shore of Lake Michigan.

Our location in Rockford, Illinois offers the amenities you'd expect in a major city—education, culture, sport, and entertainment—in a small-town atmosphere ideal for family living.

Both locations share the recreational advantages of four distinct seasons, realistic housing prices, and minimal driving times—often less than twenty minutes to work and just two hours to downtown Chicago.

To be considered for these positions, please send your resume and salary history to: Bill O'Keefe, The Falk Corporation, 3001 W. Canal St., P.O. Box 492, Milwaukee, WI 53201.

SUNDSTRAND

An Equal Opportunity Employer

SR. SYSTEMS ANALYST

Individual with ability to interface with user departments and coordinate the development and implementation of Mission Modules required. Prerequisites include 2-4 years NCR Mission manufacturing system experience and 6-8 years manufacturing background.

Work for the world leader in electronic article surveillance. We offer excellent company paid benefits. Please submit resume in strictest of confidence to:

Fred Baughman
SENSORMATIC
electronics corporation
P.O. Box 3046
Boca Raton, FL 33431

Equal Opportunity Employer M/F/H/V

PROGRAMMERS

BELCAN CORPORATION, a leading contract services firm with 13 offices nationwide, is currently seeking Programmers for the Dallas area.

These results-oriented individual must have at least 1 year experience with IDMS, CICS and COBOL.

We offer a good salary and benefits package as well as a pleasant work environment. All interested and qualified candidates should direct their resumes to:

BELCAN CORPORATION
P. O. Box 530734
Grand Prairie, TX 75053

Equal Opportunity Employer, M/F

When are you going to stop throwing your money away?

It is entirely possible that you are being paid less than you're worth in today's market. So, unless you change that condition, you will indeed continue to throw money away. You see, EDP salaries have been rising dramatically for some time now. Your own income may not have kept pace with that trend. While money, admittedly, is not everything, it is most certainly a major career consideration.

Don't underestimate your value in today's market. You owe it to yourself and to your family to make sure your income is what it should be. The very least you can do is to check it out.

All of our NCA firms can provide you with precise information about current salary levels both locally and nationally. If it turns out that your income is high level you can contentedly remain at your present position. If your income is less than you're worth we can help you to change that.

Come in. Call. Or mail your resume to the NCA firm nearest to you. Confidentiality is assured. Company clients pay our fees, so there is no charge to you ever for all our specialized services.

IBM P/C Network Experts
ASSEMBLER/COBOL MACRO/CICS

We have permanent and contract positions available in all of the above areas plus more. Salary, relocation package commensurate with abilities. When we place or hire you, your choice, we will send two (2) people from LAX to Hawaii, all expenses paid for 1 week as an incentive for utilizing Computer Logic. Try us, it works. When this ad runs, I'll be in Munich, Germany at Oktoberfest with three (3) professionals who were successful from our June 10th World Ad. Contact me or an associate and I'll amplify further, send letters of reference and we'll help you fulfill your career needs. This plan started in the early '70s and has helped me beyond your most vivid imagination.

COMPUTER LOGIC, INC.
14013 Old Harbor Lane #311
Marina del Rey, CA 90292
213/827-6040
Jerry Beatty

P.S. December is my favorite month of the year to be creative and if I place you then, a 1 week trip for 1 person to Paris or Tokyo will be given. Pack your bags for Hawaii and contact your mover.

DATA PROCESSING PROFESSIONALS

Positions are with prominent companies (in central U.S.A.) utilizing mainframe hardware. Salaries are above average and commensurate with level of experience. Fees & interviewing expenses are paid by the client company. ALL inquiries are kept confidential. Send a current resume for consideration or call us collect for more information.

DIRECTOR

WEST VIRGINIA NETWORK FOR EDUCATIONAL TELECOMPUTING SEARCH REOPENED

The West Virginia Board of Regents seeks a Director for the West Virginia Network for Educational Telecomputing. WVNET is a distributed computing network providing and facilitating instructional, research, and administrative computing for 16 state supported institutions of higher education. The WVNET Director will assume full responsibility for management of the network host site in Morgantown, West Virginia, directing 60 full time employees. This involves management of a $4 million operating budget, and developing capital equipment funding requests. The Director also will spearhead Board of Regents statewide planning for computing, and serve as primary interface with institutional presidents and computing authority regarding computing matters. The position demands a creative executive with significant experience in management of computing and information systems. The successful individual will have demonstrated competence in planning for and delivery of computing services in a similar environment. The successful candidate must hold a Master's degree and 10 years of relevant experience, including management in a computing environment or have equivalent combination of education and experience. Excellent communication and presentation skills are essential, as is state-of-the-art awareness of development in the technology and of computing in the educational arena. Management experience within a large academic setting or a computer network is desirable. Salary will be commensurate with the qualifications of the individual. Nominations and applications should be sent to:

Dr. W. Max Ivey at West Virginia Network
for Educational Telecomputing
837 Chestnut Ridge Rd.
Morgantown, WV 26505.

Applicants should furnish the names, addresses, and telephone numbers of five references. Closing date is November 4, 1985. EOE

COORDINATOR FOR COMMONWEALTH CAMPUSES

Department of Computer Science

The Pennsylvania State University is looking for a person who is interested in an exciting, challenging nontenure track position in Computer Science where you can have a significant influence on undergraduate education and the associate degree program in Computer Science. The position includes undergraduate teaching at the University Park campus as well as the monitoring of faculty on seventeen Commonwealth campuses. Limited travel is involved. Undergraduate teaching experience in Computer Science, including competence in COBOL, is required. A Master's degree is also required, although a Ph.D. is preferred. To learn more about this fine opportunity send a resume with names of three references to:

Professor Joseph M. Lambert, Head
Department of Computer Science
The Pennsylvania State University
333 Whitmore Laboratory
Box CW #1
University Park, PA 16802

Applications will be accepted until
October 30, 1985.

An Equal Opportunity/
Affirmative Action Employer.

Imagine finding ingenious applications for technology that turns complex blood tests into routine office procedures.

What an exciting time to work at Kodak.

Now, the blood tests critical to physical examinations can be completed by a Kodak desktop analyzer right in the physician's office—in minutes.

This compact marvel is the result of a number of Kodak innovations. Among the most unique is a new fiber optics system that gathers information and reports it to a microprocessor for analysis. We're already looking at new applications for this concept. What an exciting time to be working at Kodak.

Come, help us discover more high-tech excitement. The CS or EE with motivation, talent, and determination to continue intellectual growth can find a stimulating career at Kodak. From the first, newcomers face challenges as members of project teams—working in an environment that encourages initiative, recognizes ingenuity, and rewards contributions. This is high-tech excitement. And Kodak is where it's happening. Send your resume to Personnel Resources, Dept. DCPW,
Eastman Kodak Company,
Rochester, NY 14650.

An equal opportunity employer

Announcing the 1985 National Computer Career Conference

Over 6,000 career opportunities, $21,000 – $108,000
Call Dave Grinnell at 1-800-821-7700, extension 800B from 8 am to 8 pm any day this week

Do you know if you're in the best position? Are there other opportunities that will provide leading-edge exposure, greater income and maximum potential for long-term career growth? Are there better opportunities in other areas of the U.S. or Canada?

We'll provide all the facts

The Source Edp Computer Career Conference is designed to help computer professionals evaluate the current job market, and find out where they stand professionally and financially—all in complete confidence. Key information systems executives in your area and across North America will be available throughout the Conference—at your convenience—to explain their long-range plans and where you might fit in.

Exploring has never been easier

Firms participating in the Conference represent a broad cross section of user, consulting, vendor and service organizations. They are diverse in industry, size and location, and range from the dynamic new start-up to the larger well-established, growth-oriented company. Compensation levels are outstanding.

In all, over 6,000 specific positions are represented. The Conference offers you a convenient way to investigate a wide variety of career options—all in complete confidence. There are no forms to fill out—nor is a resume necessary. You will meet only those firms that you are interested in—or that have interest in you. Discussions will be held in strict privacy, at a time and day that's most convenient for you.

How to participate

The Source Edp Computer Career Conference is scheduled in a city near you soon. There is absolutely no charge for your involvement or attendance since participating client companies will assume our fees. And, all inquiries are held in confidence. To ensure your reservation and to learn about Conference dates in your area, call Dave Grinnell today at 1-800-821-7700, Ext. 800B. Or write: Career Conference Director, Source Edp, Dept. C-5, P.O. Box 7100, Mountain View, California 94039. Following is a summary of the kinds of positions and compensation offered.

Applications Programming
$23,000 – $54,000

Those with two or more years experience in applications programming will have an opportunity to learn new skills while ensuring maximum compensation. Positions exist in environments ranging from the largest scale mainframes through mini and microcomputer user, consulting and vendor firms.

Positions are available using a variety of languages including COBOL, PL/I, Assembly, RPGII, PASCAL, "C" or BASIC; operating systems like OS/MVS, VM/DOS/VSE, UNIX, AOS, and data base and data communications like IMS, CICS, INFOS, TOTAL, IDMS, ADABAS, System 2000, ADDS-0 and more. Significant opportunities exist for those with solid programming backgrounds to move into systems development, software, EDP auditing or systems evaluation.

Software Development/ Software Engineering
$28,000 – $60,000

Individuals with two or more years of software design and development or software engineering experience will be able to gain experience in and develop some or all of the following: operating systems, capacity planning and performance enhancement tools (OMEGAMON, MEAGAMON), compilers (C, PASCAL, ADA), I/O and device handlers and program generation tools. This development work will take place on a variety of systems including IBM 3083's, VAX 11/780's, Tandem Non-Stop, and variety of other mini and micro systems (Motorola 68000, Intel 8080's).

Many of the companies participating in the Conference offer formal training and experience in leading-edge technology as well as day-to-day contact with some of the top technical professionals in the country. A number of opportunities with new venture companies offer exceptional growth and equity potential.

Data Base/Data Communications
$25,000 – $55,000

Many openings exist for individuals with backgrounds in database and/or data communications. Exposure to a variety of technologies is possible, including: IMS DB/DC, ADABAS, IDMS, TOTAL, FOCUS, CICS, ENVIRON/1, TCAM/NCP, SDLC, SNA, X.25 and other database and/or data communications software.

Companies participating in the Conference include major computer and software manufacturers, Fortune 500 companies, prestigious consulting firms as well as many emerging high technology firms.

Systems Programming
$24,000 – $55,000

Opportunities provided by client firms that are participating in the Conference are broad and unique. Those with at least one year of systems programming experience will be able to strengthen their skills as well as gain knowledge of some or all of the following: UNIX, CPM, CICS, IMS, OS/VS, DOS/VS, ADABAS, DL/I, modems, duplex lines, switches, and more in both mainframe and mini or micro environments. Assignments range from program development and enhancement to systems support.

EDP Auditing
$25,000 – $58,000

Exploding opportunities exist in EDP auditing. There are many openings for those professionals who have a good technical background in programming or design plus exposure to accounting applications. Large firms are expanding their EDP auditing departments and are providing specific training in auditing for Programmer Analysts—particularly those with over two years experience.

Technical Writing
$21,000 – $38,000

Those Technical Writers/Documentation Specialists who have writing experience with state-of-the-art hardware and software are now in a position to capitalize on those skills due to high demand. Positions range from creating technical documents for users to the development of marketing and sales brochures for new products. Because of the growth of new hardware products and new software packages, the need for good technical writers has grown rapidly. In addition to a great need for creative writing, there are also many opportunities for the more senior level writers to become Technical Writing/Documentation Managers.

Systems Development/ Management Consulting
$31,000 – $78,000

A broad variety of openings exist for persons with systems design and development backgrounds ranging from systems analysis to senior project management and/or management consulting. Many leading-edge communications and data base-oriented information systems projects are being planned by Conference client firms. In addition, a number of small to intermediate size firms are just beginning to make their initial thrusts into computing—especially in mini/micro areas—and need new applications development expertise. Several nationally-respected management consulting firms will also be represented for those persons who are interested in a variety of new development assignments with high visibility to corporate management.

Sales, Marketing and Technical Marketing Support
$23,000 – $108,000

Those professionals who attend the Conference will learn about new opportunities in computer sales, marketing and marketing support. Many alternatives exist in various product areas including mainframes, mini/microcomputer technology, terminal systems, time-sharing, facilities management, proprietary software packages, OEM's, consulting and more. Many firms are just now entering new markets and will provide exceptional career and compensation growth potential—as well as equity participation.

Our National Career Conference is happening now in 36 major metropolitan areas across North America. Call 1-800-821-7700, extension 800B to ensure your reservation.

An Equal Opportunity Employer M/F

System Security Professional

A promotion has created an opportunity in our System Security group for a data processing professional with a working knowledge of the ACF-2 Security System.

We are a progressive system security group responsible for all security components of a large multiple CPU centralized data processing facility. As a member of our system security group you will utilize the latest technological tools and techniques in this challenging environment.

Primary responsibilities will include:

- Administration of corporate data and physical security policies/procedures.
- Technical administration of corporate data security procedures and techniques in support of MVS, VM/CMS, CICS, IDMS.
- Implementation, maintenance and testing of the corporate disaster recovery program.

Primary experience should include: ACF2 Data Security, OS/JCL and OS Utilities; TSO/SPF, and ROSCOE, IBM PC's, M&D Millenium, SDSF, RUSCO Access System, and Telecommunications.

Mail resume and salary requirements to the Employee Relations Department, or call 214-754-1171. Principals only please.

Central and South West Corporation
P.O. Box 660164 • Dallas, Texas 75266-0164

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $2 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

Equal Opportunity Employer

MVS AND CICS SUPERSTARS
$55,000-75,000

Do you have an exceptional aptitude for systems programming?

Did you know more about MVS and CICS after one year than do people with 10 years' experience?

Are you looking for a project that challenges you technically and uses the latest features of MVS and CICS?

If the answer to these questions is yes, you are the perfect candidate for a job at Oracle Corporation.

We are currently interfacing our DB2-compatible DBMS to MVS and CICS.

Oracle runs under MVS as a subsystem, and makes extensive use of Cross Memory Services.

If dual address space debugging and performance optimizations are the kinds of technical challenges you're looking for, this is the place.

While the majority of our technical staff holds CS degrees from the top schools in the country, your compensation will not be determined by your degrees (if any) or the number of years of experience that you have—just by your ability and discipline.

Oracle Corporation is the fastest-gro ving privately-held software company in the world. And, since our company is 65% owned by our employees, we offer a substantial piece of equity to go along with salaries that are far above industry standard.

Please send your resume to the Development Administrator at: Oracle Corporation, Department 122, 2710 Sand Hill Road, Menlo Park, CA 94025. No phone calls, and principals only, please.

SYNTREX

FLORIDA OPPORTUNITIES

Lockheed Space Operations Company (LSOC) is the prime contractor to NASA and the U.S. Air Force for the Shuttle Processing Contract. This long-range contract involves our employees in the support engineering of the orbiters' on-board equipment and associated ground support systems. We presently have a number of special opportunities for Computer Professionals having the appropriate experience and qualifications in the following areas:

DB DESIGN SPECIALIST

The candidate selected for this DB design specialist assignment will have an in-depth background demonstrating the ability to assume direct responsibility for the design of large DB structures which are employed in a high volume, on-line, transaction-oriented environment. We require three or more years' experience in DB Design utilizing Cullinet IDMS or Honeywell IDS II DB software. Further working knowledge will involve through-put consideration, clustering techniques, as well as effective sizing knowledge. A background in Honeywell is preferred, however, IDMS with Cullinet is also sought.

HONEYWELL

Immediate opportunities for Computer Professionals to join our team of Programmers and Programmer Analysts. These individuals are involved in the development, implementation and support of a large scheduling and production system based on a Honeywell DPS-8 environment utilizing COBOL. Preferred applicants will possess three or more years' experience and have a strong working knowledge of DM-4.

REAL-TIME SCIENTIFIC

This opportunity will afford you a unique step into the Manned Space Program. You will be involved in the software support of our real-time launch process systems, which is a distributed network of over 500 minicomputers utilizing FORTRAN and a space system unique software (GOAL). Qualified candidates will have a background of real-time data acquisitions within a multicomputer environment.

C/UNIX PROGRAMMER

We are seeking a unique individual who will be involved in the installation and support of our new intelligent stations which will be hosted by a VAX.

Lockheed Space Operations Company is located in the Florida Space Coast resort area. These high level career opportunities offer a very competitive salary and benefits package that is untaxed by either state or local income taxes. If you are qualified in any of the above areas and are interested in sharing in the adventure of the exciting space program, we suggest that you call Mr. Don Quirk collect at (305) 266-4070 or send your resume in confidence to: LOCKHEED SPACE OPERATIONS COMPANY, P.O. Box 2807, Titusville, FL 32781-2807.

Sr. Programmer Analyst

You'll enjoy living in Colorado Springs

...the sunshine capital of the Rockies. The air is clean and temperatures are mild. There are over 20 major ski areas nearby and a wide range of recreational/sports activities available, including golf, hiking, fishing, camping and white-water rafting. Denver is an easy drive away.

FELEC Services, Inc., a wholly owned subsidiary of ITT Federal Electric Corporation, is involved in the maintenance and operation of sophisticated radar, computer and communications systems worldwide. We currently have a senior level opportunity available at our headquarters office in beautiful Colorado Springs.

Responsibilities will include program maintenance and development, system/program analysis and design, dump analysis and task/project leadership.

Applicants must possess excellent written and verbal communication skills. A Bachelor's degree in Computer Science or MIS is required, although experience may be considered in lieu of degree. Formal training and expertise with ANSI COBOL 74, Honeywell Level 66/DPS-8 systems, DMIV and Honeywell IDS/II TP systems required. Minimum 4-6 years' programming analysis experience with at least 3 years' COBOL programming also required. Project leadership, supervision, GMAP, FORTRAN and other DP related experience a plus.

FELEC Services, Inc. offers a comprehensive benefits program including life/medical/dental insurance, investment and savings plan, pension plan and tuition assistance.

U.S. Citizenship required

If your background qualifies you for this opening, please forward your resume (including salary history) to: Employment Supervisor, Dept. CW-931, ITT FELEC Services, Inc., P.O. Box [illegible], Colorado Springs, CO [illegible]

An Equal Opportunity Employer, M/F/H/V

Information Processing Professionals

When you pass on what you know, everyone wins.

It's time to make your career move to the front with a fast-moving company. Electronic Data Systems (EDS) Corporation has grown to be the dominant company in the information processing field. We employ more than 40,000 people, generated over $947 million in annual revenues in 1984, and have an amazing growth rate of 29% per year. Daily transactions exceed six million from more than 90,000 on-line terminals, and we have created the nation's third largest communications network. In this environment of rapid growth, your opportunities for career advancement are virtually unlimited.

EDS is now looking for outstanding professionals to instruct recent college graduates through our dynamic Systems Engineering Development (SED) Program.

SED — a vital investment in our future.

The SED Program, nationally recognized as the model for the industry, is designed to turn out the best Systems Engineers. At EDS, a Systems Engineer is a computer programmer, programmer analyst, and systems analyst all in one — capable of solving complex business problems through computer applications. Obviously, this dynamic program requires instructors above the norm — in both ability and motivation.

Your career with EDS

These positions are highly visible and offer an excellent introduction into management. Our instructors are afforded the opportunity to supervise 20 employees, make performance evaluations, and provide career counseling. At the end of a typical 18-month to two-year assignment, instructors are given the opportunity to remain in the educational department, or to choose another career path within EDS according to their interests and capabilities.

Can you qualify?

The professionals we seek must have 3-5 years work experience and have a keen interest in both the technical and business aspects of information processing. Candidates must also have excellent comprehension of COBOL or ALC and recent IBM mainframe experience. Background in CICS, VSAM or in a data base environment is a plus. Although no previous teaching experience is required, you must have a professional image and be able to present your thoughts clearly in an organized manner. U.S. citizenship is required.

If you qualify, we would like to talk with you. Please send us your resume now. Your career time is too valuable to waste.

Innovation

Use it to expand the boundaries of technology.

When you're constantly challenged to break new ground, innovation becomes an integral part of your approach. That's what makes Lockheed Missiles & Space Company the ideal environment for technical professionals interested in advancing technology.

We offer a wide range of highly advanced programs representing a wellspring of opportunity for innovative professionals. Listed below is just a sampling of the many opportunities we have available. Look them over and then contact us to see where your talents can lead you.

- **Artificial Intelligence**
- **Data Base Management Systems**
- **Data Base Security**
- **Scientific Programmers/Analysts:** HP-3000/IMAGE DE; Manufacturing Applications; Sperry 1100 TELECON/CMS; Test Operations; VAX-11/750; VAX-11/780
- **Software Engineering:** Command Processing; Communication Processing; Data Routing & Compression; Mission Planning; Signal Processing; Simulation; Telemetry Formatting/Processing
- **Software Test**
- **Telecommunications Systems**
- **IMS Sr. Systems Programmers** – Configure and tune the IMS system to satisfy LMSC requirements, analyze/fix IMS system software failures, and develop new IMS software.
- **OS/MVS Sr. Systems Programmers** – Support, install and test MVS/SP system with the following IBM products: JES2, ISPF, ACF/VTAM, TSO, DFEP, SMPE. Also support the following non-IBM products: KOMAND, OMEGAMON, PANVALET, PANEXEC, DMS/OS, UCC1, SAS..
- **Field Service Engineer** – Must have expertise on DEC and VAX computer systems to resolve technical problems and perform engineering investigations of hardware and software leading to the repair of computer systems. A BSCS or BSEE and a background in computer hardware is required.

The challenge is waiting for you at Lockheed Missiles & Space Company. For immediate consideration, please forward your resume to **Professional Staffing, Dept. 653DN84, Lockheed Missiles & Space Company, P.O. Box 3504, Sunnyvale, CA 94088-3504.** We are an equal opportunity, affirmative action employer. U.S. citizenship is required.

You can also use your PC or Terminal to access our new JobNet On-Line Career Network. Simply call (408) 986-1292, press "return", and enter our password, "LMSC." Press "return" again and you will be on-line to review many additional career opportunities.

Data Processing

Our newest program for growth... Hardware!

The rapid growth of Dynamic Control is about to enter a new dimension. The success of our total software solutions for the healthcare industry has brought major career potential to our employees. There has never been a better time to join us.

Facilities Planner

This groundbreaking opportunity involves plenty of travel and broad systems exposure, and requires a "big picture" mentality grounded in solid knowledge of hardware architecture. Visit customer sites, identify equipment requirements and assist in producing proposals, based on your proven abilities in configuring and presenting IBM System 38 and 36 via direct client contact. Three-five years experience suits you for this marketing support role in IBM hardware sales and installation, along with cross-industry hardware knowledge.

Physical Planner

You will perform physical installation planning at customer sites, analyze U.P.S. requirements, and answer questions posed by customers and marketing reps. A minimum of 1 year experience configuring IBM System 38, 34, and 36 operational equipment, plus a good background in IBM physical planning, electrical, and equipment installation required.

Equipment Configuration

You will devise equipment configurations, create five-year equipment plans, forecast equipment annuities, take part in proposal development, and handle requests for purchases. This opportunity requires exposure to the IBM System 38—in addition to knowledge of room set-up procedures and hardware naming conventions.

IBM S/38 Systems Support Programmer

Provide programming support to internal systems, maintain system utilities and function as interface to IBM in addition to new system and product installation responsibilities. IBM S/38 operations and programming knowledge required.

Dynamic Control is a division of Travenol Laboratories, a Fortune 500 health industry leader. We are also a major force in the growing technical sophistication of major medical facilities around the world. The salary and benefits we offer are competitive, and your potential for growth with us is excellent. For immediate consideration, call Carol Winstead, TOLL FREE, at 1-800-[illegible] or send your resume to Human Resources Dept. [illegible], [illegible] S. [illegible] Springs Dr., Longwood, FL [illegible].

LOCKHEED PUTS THE ODDS IN YOUR FAVOR IN LAS VEGAS

Innovation

When you sit behind the screen at Lockheed, you're joining a team of other experienced, innovative computer professionals. And right now is your opportunity to join them at our Las Vegas Environmental Programs site.

COMPUTER PROGRAMMERS & COMPUTER ANALYSTS

Both positions require individuals who will be responsible for:

- designing, developing, and documenting scientific software systems;
- developing operational and test procedures;
- directing software conversion effects;
- integrating existing software requirements

Candidates should also be capable of consulting, problem solving, and proposing new applications and procedures in a highly scientific and technical work environment. Analysts should have a Bachelor's degree in Computer Science and nine years' directly related experience. Programmers should have three years' directly related experience in addition to their Bachelor's.

Recreational opportunities, southwest splendor and an attractive salary and benefits package make this a tempting offer. Send your resume and salary requirements to M.J. Pearson, Lockheed EMSCO, 1050 E. Flamingo Road, Suite 126, Las Vegas, NV 89119. We're an equal opportunity, affirmative action employer.

Come *on-line* with Information Systems Group

In the past few months, computer professionals across the country have taken us literally, and "passed the word" about how one opportunity leads to another at Information Systems Group.

Now it's your turn to come on-line and discover how our multidisciplinary systems approach to the design and development of microcomputers, mainframes, and office automation systems encourages individuals to grow within their fields—and master new ones. You'll find that joining Information Systems Group is like plugging into an entire career-opportunity network for data processing software and hardware professionals!

Explore these opportunities that are currently available:

- **MANAGER, OFFICE PRODUCTS TECHNICAL SUPPORT**
  Service Sperry Executive Office and Information Systems Group in Blue Bell, PA. Responsibilities include providing technical direction, centralized planning, guidance, and coordination of migration strategies for the integration of new office products with existing business information systems. Position requires Bachelor's degree and 8 years related experience in business systems, system planning, or systems migration.
- **MANAGER, OFFICE PRODUCTS OPERATIONS**
  Operate and administer an international office information systems network. Responsibilities include the development, coordination, and technical support of office information system data bases, electronic mail, data communications, and business information systems to provide an effective decision-support system for Sperry Executive Offices and Information Systems Group. Position requires a Bachelor's degree in Business or Systems Management with 8 years experience in business related systems development, operations management, and/or decision support data base development.
- **SOFTWARE ARCHITECTURE & PROGRAMMING**
  Perform key creative work in design and implementation of state-of-the-art operating systems for Sperry's premier computer line. These positions require 6-7 years of experience in operating systems design and development. Working knowledge of IBM-MVS, VM, XA or UNIX* is preferred. Applicable experience of message-based systems, operating system security, networking and high performance transaction processing a plus.

CONTACT US DIRECTLY THROUGH YOUR PERSONAL COMPUTER!

Use your PC or terminal to learn more about Information Systems Group's constantly expanding career opportunities. To call Sperry's on-line career network anytime— day or night—simply dial (617) 275-4112, press return, and enter the password "Sperry PA". Then press return again. If you don't have a PC, you can contact our talking "Recruiter Computer" by dialing (617) 275-4462. When asked, use the buttons on your telephone: User No. 200# 221#, password 123#. You'll immediately gain access to a whole new world of opportunity at Information Systems Group.

We offer excellent salaries and comprehensive benefits in addition to numerous opportunities for career advancement. Come on-line with Sperry by forwarding your resume to: Sperry Corporation, Information Systems Group, Sr. Professional Recruiter, Dept. CW-9-30, P.O. Box 500, E1-100, Blue Bell, PA 19424. An Equal Opportunity Employer.

DECONTROL YOURSELF!

Take the controls off your earnings potential, at PANSOPHIC — we have opportunities in McLean, VA; Saddle Brook, NJ; Lexington, MA; Atlanta, GA; Dallas, TX; Aurora, CO; Wayne, PA; El Segundo, CA; Burlingame, CA and Oak Brook, IL offering you the whole Big Blue world as your market . . . and ahead-of-the-art products such as PANVALET, EASYTRIEVE PLUS and TELON are setting the pace in IBM-mainframe systems software.

SALES

We seek the seasoned, 100+% quota degreed professional whose 3 to 5 years of software-sales success is evidence of technical understanding and sophisticated presentation skills.

Our TELON sales opportunities demand a strong background in IBM on-line IMS or CICS. Thorough knowledge of IBM-mainframe software terminology and data base environments are a plus.

Our MULTI-PRODUCT (PANVALET, EASYTRIEVE PLUS, GENER/OL, etc.) sales positions require proven sales experience with IBM-mainframe systems software or similar products.

TECHNICAL CONSULTING

Show the strength of your systems-software knowledge as the technical star of our sales team. Experience in applications programming, user education and consulting would be helpful.

Our TELON consultant positions require 3 years in IMS DB/DC systems software, with a strong IBM OS/DOS background. CICS is desirable, hands-on experience with TELON a plus.

Our Systems Representatives support products such as PANVALET, EASYTRIEVE PLUS, GENER/OL, etc., which demand extensive applications knowledge of OS/MVS, VM, and DOS/VSE in an IBM-mainframe environment, as well as experience in COBOL, PL/1, or Assembler. Experience with PANVALET, EASYTRIEVE PLUS and other Pansophic products is beneficial.

Compensation includes competitive salaries and results-based commissions/bonuses, as well as full benefits coverage. Travel requirements will enhance your visibility, and wide-open growth possibilities await superior performance. For information, send your resume and compensation history in confidence to Sally Brecht, Dept. 301, Pansophic Systems, Inc., 709 Enterprise Drive, Oak Brook, IL 60521. An Equal Opportunity Employer M/F/H. (Principals only, please.)

UNIVERSITY OF MINNESOTA DULUTH
Computing Services Director

The Duluth campus of the University of Minnesota (UMD) seeks a Director of Computing Services. The Director will provide leadership to a staff of 14 FTE in meeting the instructional and research computing needs of nearly 8000 students and over 500 faculty. UMD Computing Services functions in a Cyber/multiple VAX environment with over 100 time-sharing terminals and a variety of microcomputers. The Director will manage these on-campus computing facilities and assist Duluth users of other University computing facilities. It is intended that the Computing Services Director will work with other Directors in developing, implementing, and operating an intracampus telecommunications network and monitoring/expanding the existing intercampus network.

This is a five-year, renewable administrative appointment. Faculty appointment is possible; rank and status (non-regular/regular) dependent upon credentials and review by disciplinary department and administration. Minimum qualifications include a Ph.D. and three years administrative experience within computing services. Preference will be given to those with: experience in telecommunications; a Ph.D. in mathematics or computer science. The salary is negotiable and commensurate with qualifications and experience.

Application letters should be accompanied by a resume and list of three references and sent by November 30, 1985, to: Patricia A. Merrier, University of Minnesota, Duluth; 421 Darland Administration Building; Duluth, MN 55812.

THE UNIVERSITY OF MINNESOTA IS AN EQUAL OPPORTUNITY EDUCATOR AND EMPLOYER AND SPECIFICALLY INVITES AND ENCOURAGES APPLICATIONS FROM WOMEN AND MINORITIES

Programmer/ Analysts

Develop new application tools to streamline our advanced financial systems.

NCR Engineering & Manufacturing in Dayton is a pacesetter in the development of intelligent terminals and branch automation systems for banks, savings institutions, and other financial markets. We offer challenging, high-visibility roles to qualified professionals who are ready to make significant impact on the design of our next-generation systems.

In our Application Tools Development Group, you will be responsible for generating functional and implementation specifications, test plans and customer support. You will code, debug and test UNIX*-based system application development software.

To qualify, you must have a Bachelor's degree in Computer Science or Engineering backed by at least 3 years of programming experience that includes knowledge of "C" and experience with UNIX programming environment. Knowledge of banking applications and MS-DOS would be an asset.

Entry-level openings are also available for Programmer/Analysts and Design Engineers in our financial systems development organization. Requires BS or MS in Computer Science or Electrical Engineering.

We offer competitive salaries, excellent benefits and relocation assistance. To find out more about your fine career prospects with NCR, send resume and salary history to: **Ms. Jayne Rohl, NCR Corporation, Dept. 560, Engineering & Manufacturing, Dayton, OH 45479.** An equal opportunity employer.

NCR

When you know where we're going, you'll choose NCR.

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if...

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.

Central and South West Corporation

P.O. Box [illegible] • Dallas, Texas [illegible]

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $2 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

Equal Opportunity Employer

SCIENTIFIC PROGRAMMERS

KMS Fusion, a high-technology research-based company committed to a wide range of technical advances and achievements, has openings for:

SENIOR SCIENTIFIC PROGRAMMER — with significant experience in Image Analysis (2-3 years) and excellent FORTRAN programming ability. A BS (MS preferred) in Computer Science, the Physical Sciences, or Engineering (such as Electro Optics or Electrical) and proficiency with graduate level computer numerical analysis methods and math are required.

ASSOCIATE SCIENTIFIC PROGRAMMER — to be responsible for providing support for a research staff on a VAX Cluster, developing user interfaces and new applications and supervising system maintenance, operator and system backups. A BS in Computer Science or the Physical Sciences, experience with numerical analysis methods and graphics, proficiency in FORTRAN and a minimum of one years' experience on DEC VAX computers running VMS are required.

Both positions require U.S. citizenship and ability to obtain a security clearance.

We offer fully competitive salary/benefits packages, and a supporting environment conducive to professional achievement.

For prompt consideration, please send your resume and salary history to: KMS FUSION, INC., Code 85-084, P.O. Box 1567, Ann Arbor, MI 48106-1567.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Date(s): ______________________
Signature: ______________________
Name: ______________________
Title: ______________________
Company: ______________________
Address: ______________________

OUR NEWEST SOFTWARE TOOK $20 MILLION TO DEVELOP, 5 YEARS TO WRITE AND WE'RE GIVING IT AWAY.

No, we're not crazy. And no, we're not joking.

We're Management Science America, Inc. The largest independent applications software company in the world. And by Jan. 27, 1986, we plan to give $20 million worth of our newest software to over 2,000 of our customers. Instantly making it the industry standard for fourth generation technology.

If you're particular about what you get for free, here are the particulars.

We call this technology Information Expert.™ Because it allows all your software systems to carry on intelligent conversations. With one another. In English. And thanks to our data dictionary, nothing will ever sound like Greek.

For end users, our system makes it easy to design reports. Our menus guide you through the process with such ease and intelligence, they'll even tell you the proper responses to use for whatever job you need.

Information Expert also provides a fourth generation language that your data processing staff can use for applications development. So you can do in minutes what used to take hours. Or do in hours what used to take days.

It even allows borderless retrieval of information. That way, you can get all the information you need. Not all the information you don't need.

Why are we giving all this away? It's part of our customer support policy. And if that doesn't sound familiar to you, you should obviously become familiar with us. MSA.

MSA SOFTWARE
INTELLIGENCE OF A HIGHER ORDER.℠
